PUBLISHER'S NOTE TO THE SECOND EDITION

This book was first published as *The Handbook of the Birds of India and Pakistan: Compact Edition*. The title has now been changed to *Compact Handbook of the Birds of India and Pakistan*, Second Edition.

The second edition includes the revised texts of Volumes 1-4. The 113 colour plates by diverse artists which appeared in the original *Handbook* volumes have been replaced with 104 plates by the well-known American bird painter, John Henry Dick. These new illustrations originally appeared in *A Pictorial Guide to the Birds of the Indian Subcontinent* (1983) and depict *all* the bird species found in the subcontinent (the original plates contained only some 900 illustrations of the over 1220 species described). All references to the plates in the text of the *Compact* have now been altered to match the numbering of the new plates.

The Bombay Natural History Society and the authors acknowledge the munificence of the U.S. Fish & Wildlife Service (Department of the Interior) and John Henry Dick for the 104 plates which illustrate this edition of the *Compact Handbook*. They feel especially beholden to the U.S. Fish & Wildlife Service and to the U.S. Embassy in India for their continued good offices in arranging the transport of the plates between the U.S.A. and India; also for making possible the overseas travel of the artist for carrying out necessary alterations to some of the plates.

The birds illustrated in this edition are in adult plumage, unless otherwise stated. The following abbreviations and symbols are used in the plates:

ad- = subadult	↓ = from above	} for birds in flight
imm = immature	↑ = from below	
juv = juvenile	● = dark phase	
S = summer	○ = pale phase	
W = winter	◐ = intermediate phase	
br+ = breeding	SE = species extralimital	
br- = non-breeding	RE = race extralimital	

NOTE TO THE FIRST EDITION

The *Handbook* was first published in ten volumes from 1968 to 1975. Volumes 1–3 have since appeared in second editions and new editions of the remaining volumes are in preparation. The *Compact Edition* contains the complete descriptive text of the ten volumes as they stand. It thus includes the texts of the second editions of Volumes 1–3 and the first editions of Volumes 4–10. Like the original ten volumes, the *Compact Edition* contains 113 colour plates altogether; but twenty-four of these are new and replace most of those taken from Smythies' *Birds of Burma* for the first editions of the separate volumes.

In the *Compact Edition* the main descriptive text of the ten volumes, along with the references cited in each volume and the Appendices for Volumes 1–4, appear in a photographically reduced form, with four pages of the original text occupying one page of the *Compact Edition*. The page headings indicate the Volume and its relevant page numbers. The text type and black-and-white line drawings have been reduced to seventy per cent of their original size, but the magnifications printed below the drawings have not been altered. Users of this volume should thus note that the drawings are three-tenths smaller than suggested by the magnifications printed below them.

The preliminary pages of the *Compact Edition* include a systematic index and list of plates that are relevant for the complete work, as also the Introduction, which has been abstracted from Volume 1. The volume contains the Eclectic Bibliography and Consolidated Index of Scientific and English Names which were published in Volume 10, and all the colour plates are grouped together (in their original sizes) at the end of the book. There are a few minor variations between the captions to the plates and the text; the text has not been altered, but the captions incorporate taxonomic changes that have occurred since the *Handbook* was first published.

ACKNOWLEDGEMENTS

IN the Introduction to Volume I (pp. xxx-xxxi) we expressed our indebtedness to a number of individuals and institutions for various courtesies received. To these we must now add many more but for whose active and solicitous collaboration the progress of these volumes could not have been half so smooth or expeditious.

Gorman M. Bond, already named before, began his association with the project almost from its start in 1964. He provided much of the basic material for the preparation of the Keys in the earlier volumes. Subsequently this work was ably taken over by Michel Desfayes who was responsible also for the methodical and efficient arrangement of a part of Hugh Whistler's voluminous manuscript notes in conformity with the pattern laid down by the authors. Both these men laboured punctiliously in bringing up to date all references and citations — Desfayes also in preparing skeleton drafts of the text and sketches of the Distribution Maps for the later volumes. We are deeply beholden to them. We must also express high appreciation of the painstaking industry with which Miss Adele Issa typed the bulky first drafts of the MSS. from the Washington side. On the Indian side the conscientious and unflagging help of J. S. Serrao was indispensable. Throughout the execution of the project — from the initial extracting of the literature through the protracted drudgery of 'decoding', typing and retyping the first untidy handwritten drafts, and sometimes two or more redrafts, up to the final copy for the printer, the correcting of successive printer's proofs and revises, and the preparation and checking of the indexes and bibliography — he slogged ungrudgingly and even seemingly cheerfully! Furthermore it was a rare facility to have such skilful artists as Jamshed P. Irani and his wife Hutokshi, 'on tap' as it were, ever ready to render prompt help in all matters concerning art work.

The list of all the parties to whom we are indebted is too long to detail here. But one who has earned our very special obligation is Roy E. Hawkins. His personal interest and sense of participation in the project from its inception, first in his official capacity as head of the Indian branch of Oxford University Press, and after his retirement in 1970 as friend and fellow bird-watcher, were invaluable. Hawkins's long experience in book publishing, his meticulous eye for detail ('Hawk's eye'), and his running bombardment of helpful queries, suggestions and criticisms — right from the MS. stage to the finished product — made all the difference.

Biswamoy Biswas, whose association with the project was acknowledged in the Introduction (Vol. I), maintained his erudite and helpful cooperation throughout the work. His comments and criticisms of the MS. drafts have saved us from many a hidden pitfall, and we are deeply grateful to him.

In the Introduction we had also paid tribute to the outstanding contribution to Indian ornithology in the early years of the present century by Hugh Whistler and Claud Ticchurst who worked in intimate collaboration. During the preparation of these volumes we had abundant occasion for a closer scrutiny and assessment of their joint and several contributions. Whistler's MS. notes, now reposing in the British Museum (Natural History), bespeak a thoroughness and scientific acumen coupled with phenomenal industry that cannot but command unbounded admiration. Indian ornithology indeed owes a heavy debt to these two dedicated workers. And finally, we must record our grateful appreciation to the authorities of the Bird Room of the above museum for so readily making available to us xeroxed copies of Whistler's unpublished MSS. and collected extracts. This unique and authentic source material is a very valuable addition to the fund of literature on Indian birds in our respective institutions.

SYSTEMATIC INDEX

VOLUME I

Order GAVIIFORMES

- Family GAVIIDAE: Divers, Loons
1 Blackthroated Diver, *Gavia arctica uschinski* (Zarudnyi) 1
2 [Redthroated Diver, *Gavia stellata* (Pontoppidan)] 2

Order PODICIPITIFORMES

- Family PODICIPEDIDAE: Grebes
3 Great Crested Grebe, *Podiceps cristatus cristatus* (Linnaeus) 3
3a Rednecked Grebe, *Podiceps grisegena* (Boddaert) 5,369
4 Blacknecked Grebe, *Podiceps nigricollis nigricollis* Brehm 5
5 Little Grebe or Dabchick, *Podiceps ruficollis capensis* Salvadori 6

Order PROCELLARIIFORMES

- Family PROCELLARIIDAE: Petrels, Shearwaters
6 Cape Petrel, *Daption capensis* (Linnaeus) 10
7 Whitefronted or Streaked Shearwater, *Procellaria leucomelana* Temminck 11
8 Pinkfooted Shearwater, *Procellaria carmelis* (Gould) 11
9 Wedgetailed Shearwater, *Procellaria pacifica chlororhyncha* (Lesson) 12
10 Slenderbilled or Short-tailed Shearwater, *Procellaria tenuirostris* Temminck 13
11 Mauritius Shearwater, *Procellaria thermani* Baillon Bonaparte 13
12 Persian Shearwater, *Procellaria thermani perica* (Hume) 14
13 Mascarene Black Petrel, *Bulweria aterrima* (Bonaparte) 15
13a Jousanin's Gadfly Petrel, *Bulweria fallax* Jousanin 15
13b Bulwer's Gadfly Petrel, *Bulweria bulwerii* (Jardine & Selby) 16
Family HYDROBATIDAE: Storm Petrels
14 Wilson's Storm Petrel, *Oceanites oceanicus oceanicus* (Kuhl) 17
15 Duskyvented Storm Petrel, *Fregetta tropica melanogaster* (Gould) 20
16 Forktailed Storm Petrel, *Oceanodroma leucorhoa minoris* (Swinhoe) 21

Order PELECANIFORMES

- Family PHAETHONTIDAE: Tropic-birds
17 Short-tailed Tropic-bird, *Phaethon aethereus indicus* Hume 22
18 Redtailed Tropic-bird, *Phaethon rubricauda rubricauda* Boddaert 24
19 White Tropic-bird, *Phaethon lepturus lepturus* Daudin 24

- Family PELECANIDAE: Pelicans
20 White or Rosy Pelican, *Pelecanus onocrotalus* Linnaeus 27
21 Spottedbilled or Grey Pelican, *Pelecanus philippensis philippensis* Gmelin 29
22 Dalmatian Pelican, *Pelecanus philippensis crispus* Bruch 30

- Family SULIDAE: Boobies
23 Masked Booby, *Sula dactylatra melanops* Heuglin 32
24 Redfooted Booby, *Sula sula rubripes* Gould 33
25 Brown Booby, *Sula leucogaster plotus* (Forster) 34

- Family PHALACROCORACIDAE: Cormorants and Darter
26 Large Cormorant, *Phalacrocorax carbo sinensis* (Shaw) 37
27 Indian Shag, *Phalacrocorax fuscicollis* Stephens 39
28 Little Cormorant, *Phalacrocorax niger* (Vieillot) 41
28a Pygmy Cormorant, *Phalacrocorax pygmaeus* (Pallas) 42
Darter or Snake-bird, *Anhinga rufa melanogaster* Pennant 43

- Family FREGATIDAE: Frigate Birds or Man-of-war Hawks
30 Christmas Island Frigate Bird, *Fregata aendrii* Mathews 47
31 Lesser Frigate Bird, *Fregata minor albobrunis* Mathews 47
32 Least Frigate Bird, *Fregata ariel iridalei* Mathews 49

Order CICONIIFORMES

- Family ARDEIDAE: Herons, Egrets, Bitterns
33 Great Whitebellied Heron, *Ardea insignis* Hume 53
34 Giant Heron, *Ardea goliath* Cretzschmar 53
35 European Grey Heron, *Ardea cinerea cinerea* Linnaeus 54
36 Eastern Grey Heron, *Ardea cinerea rectirostris* Gould 55
37 Western Purple Heron, *Ardea purpurea manilensis* Meyen 57
37a Eastern Purple Heron, *Ardea purpurea purpurea* Linnaeus 59,369
45 Large Egret or Great White Heron, *Ardea alba alba* Linnaeus 68
46 Eastern Large Egret, *Ardea alba modesta* J. E. Gray 69
38 Little Green Heron, *Butorides striatus japonicus* (Horsfield) 59
39 Andaman Little Green Heron, *Butorides striatus spodiopater* Sharpe 61
40 Paler Maldivian Green Heron, *Butorides striatus didii* Phillips & Sims 62
41 Darker Maldivian Green Heron, *Butorides striatus albidulus* Bangs 62
42 Indian Pond Heron or Paddybird, *Ardeola grayii grayii* (Sykes) 63
42a Maldivian Pond Heron, *Ardeola grayii philippii* Scheer 65
43 Chinese Pond Heron, *Ardeola bacchus* (Bonaparte) 65
44 Cattle Egret, *Bubulcus ibis coromandus* (Boddaert) 66
47,48 Smaller or Median Egret, *Egretta intermedia intermedia* (Wagler) 71
49 Little Egret, *Egretta garzetta garzetta* (Linnaeus) 72
50 Indian Reef Heron, *Egretta gularis schistacea* (Hemprich & Ehrenberg) 74
51 Eastern Reef Heron, *Egretta sacra* (Gmelin) 77
52 Night Heron, *Nycticorax nycticorax nycticorax* (Linnaeus) 78
53 Malay or Tiger Bittern, *Gorachius melanolephus melanolephus* (Raffles) 80
54 Nicobar Tiger Bittern, *Gorachius melanolephus minor* Hachisuka 82
55 Little Bittern, *Isoerythrus minutus minutus* (Linnaeus) 83
56 Chestnut Bittern, *Isoerythrus cinnamomeus* (Gmelin) 84
57 Yellow Bittern, *Isoerythrus sinensis* (Gmelin) 85
58 Black Bittern, *Isoerythrus flavicollis flavicollis* (Latham) 88
59 Bittern, *Botaurus stellaris stellaris* (Linnaeus) 89

- Family CICONIIDAE: Storks
60 Painted Stork, *Mycteria leucorhyncha* (Pennant) 93
61 Openbill Stork, *Anastomus osculator* (Boddaert) 95
62 Whitenecked Stork, *Ciconia episcopus episcopus* (Boddaert) 98
63 White Stork, *Ciconia ciconia ciconia* (Linnaeus) 99
64 Eastern White Stork, *Ciconia ciconia boyciana* Swinhoe 102
65 Black Stork, *Ciconia nigra* (Linnaeus) 102
66 Blacknecked Stork, *Ephippiorhynchus asiaticus asiaticus* (Latham) 104
67 Adjutant Stork, *Leptoptilos dubius* (Gmelin) 105
68 Lesser or Haircrested Adjutant, *Leptoptilos javanicus* (Horsfield) 107

- Family THRESKIORNITHIDAE: Ibises, Spoonbill
69 White Ibis, *Threskiornis aethiopicus melanorhyncha* (Latham) 110
70 Indian Black Ibis, *Pseudibis papillosa papillosa* (Temminck) 112
71 Glossy Ibis, *Plagiodontus falcinellus falcinellus* (Linnaeus) 114
72 Spoonbill, *Platalea leucorodia major* Temminck & Schlegel 116

- Family PHOENICOPTERIDAE: Flamingos
73 Flamingo, *Phoenicopterus roseus* Pallas 118
74 Lesser Flamingo, *Phoeniconotus minor* (Geoffroy) 121

Order ANSERIFORMES

- Family ANATIDAE: Ducks, Geese, Swans
75 Redbreasted Goose, *Branta ruficollis* (Pallas) 124
76 Forest Bean Goose, *Anser fabalis middendorffi* Severtzov 125
77 Tundra Bean Goose, *Anser fabalis rufus* Butorlin 125
78 [Pinkfooted Goose, *Anser fabalis brachyrhynchus* Baillon] 126
79 Whitefronted Goose, *Anser albifrons albifrons* (Scopoli) 126
80 Lesser Whitefronted or Dwarf Goose, *Anser erythropus* (Linnaeus) 128
81 Eastern Greylag Goose, *Anser anser rubripennis* Swinhoe 129
82 Barheaded Goose, *Anser indicus* (Latham) 131
83 [Lesser Snow Goose, *Anser carolinensis carolinensis* (Linnaeus)] 133
84 Bewick's or Western Whistling Swan, *Cygnus columbianus bewickii* Yarrell 134

- 85 Jankowski's or Eastern Whistling Swan, *Cygnus columbianus jankowskii* Alpheraky 135
86 Whooper Swan, *Cygnus cygnus* (Linnaeus) 136
87 Mute Swan, *Cygnus olor* (Gmelin) 137
88 Lesser Whistling Teal or Tree Duck, *Dendrocygna jamaica* (Horsfield) 138
89 Large Whistling Teal, *Dendrocygna bicolor* (Vieillot) 139
90 Ruddy Shelduck or Brahminy Duck, *Tadorna ferruginea* (Pallas) 141
91 Common Shelduck, *Tadorna tadorna* (Linnaeus) 144
92 Marbled Teal, *Mareca marstonia angustirostris* (Ménétries) 147
93 Pintail, *Anas acuta* Linnaeus 149
94 Common Teal, *Anas crecca crecca* Linnaeus 151
95 Baikal, Clucking or 'Formosa' Teal, *Anas formosa* Georgi 154
96 Grey, Andaman or Oceanic Teal, *Anas gibberifrons albogularis* (Hume) 155
97 Spotbill Duck, *Anas poecilorhyncha poecilorhyncha* J. R. Forster 157
98 Burmese Spotbill Duck, *Anas poecilorhyncha haringtoni* (Oates) 159
99 Eastern Grey Duck, *Anas poecilorhyncha zonorhyncha* Swinhoe 159
100 Mallard, *Anas platyrhynchos* Linnaeus 160
101 Gadwall, *Anas strepera strepera* Linnaeus 163
102 Falcated or Bronzecapped Teal, *Anas falcata* Georgi 165
103 Wigeon, *Anas penelope* Linnaeus 167
104 Garganey or Bluewinged Teal, *Anas querquedula* Linnaeus 169
105 Shoveller, *Anas platyrhynchos* Linnaeus 172
106 Pinkheaded Duck, *Rhodessa coryphallacea* (Latham) 175
107 Redcrested Pochard, *Nettion rufum* (Pallas) 177
108 Common Pochard, *Aythya ferina* (Linnaeus) 180
109 White-eyed Pochard or Ferruginous Duck, *Aythya nyroca* (Gildenstädt) 182
110 Baer's Pochard or Eastern White-eye, *Aythya baeri* (Radde) 184
111 Tufted Duck, *Aythya fuligula* (Linnaeus) 185
112 Scaup Duck, *Aythya marila marila* (Linnaeus) 187
113 Mandarin Duck, *Aix galericulata* (Linnaeus) 189
114 Cotton Teal or Quacky-duck, *Nettion coromandelianus coromandelianus* (Gmelin) 190
115 Nakta or Comb Duck, *Sarkidiornis melanotos melanotos* (Pennant) 192
116 Whitewing Duck, *Cairina scutulata* (S. Müller) 194
117 Longtail Duck or Old Squaw, *Clangula himalayi* (Linnaeus) 196
118 Goldeneye Duck, *Bucephala clangula clangula* (Linnaeus) 198
119 Smew, *Mergus albellus* Linnaeus 201
120 Goosander or Common Merganser, *Mergus merganser merganser* Linnaeus 203
121 Eastern Merganser, *Mergus merganser orientalis* Gould 204
122 Redbreasted Merganser, *Mergus serrator* Linnaeus 206
123 Whiteheaded Stiff-tailed Duck, *Oxyura leucocephala* (Scopoli) 208

Order FALCONIFORMES

- Family ACCIPITRIDAE: Hawks, Vultures, etc.
124 Blackwinged Kite, *Elanus caeruleus caeruleus* (Latham) 212
125 Blyth's Baza or Northern Brown Lizard Hawk, *Aviceda jerdoni jerdoni* (Blyth) 215
126 Legge's Baza or Southern Brown Lizard Hawk, *Aviceda jerdoni ceylonensis* (Legge) 216
127 Indian Blackcrested Baza or Lizard Hawk, *Aviceda leuphotes leuphotes* (Dumont) 218
128 Burmese Blackcrested Baza or Lizard Hawk, *Aviceda leuphotes syama* (Hodgson) 220
128a Andaman Blackcrested Baza, *Aviceda leuphotes andamanica* Abdulali & Grubb 221,370
129 Siberian Honey Buzzard, *Pernis ptilorhynchus orientalis* Taczanowski 221
130 Crested Honey Buzzard, *Pernis ptilorhynchus ruficollis* Lesson 222
131 European or Red Kite, *Milvus milvus milvus* (Linnaeus) 225
132 Black Kite, *Milvus migrans migrans* (Boddaert) 226
133 Pariah Kite, *Milvus migrans grisea* Sykes 227
134 Blackeared or Large Indian Kite, *Milvus (migrans) lineatus* (Gray) 229
135 Brahminy Kite, *Haliastur indus indus* (Boddaert) 230
136 Eastern Goshawk, *Accipiter gentilis schvedoni* (Menzies) 233
137 Central Asian Shikra, *Accipiter badius cenchroides* (Severtzov) 235
138 Indian Shikra, *Accipiter badius dussumieri* (Temminck) 235
139 Ceylon Shikra, *Accipiter badius badius* (Gmelin) 237
140 Burmese Shikra, *Accipiter badius polioptus* (Hume) 237
141 Car Nicobar Shikra, *Accipiter badius butleri* (Gurney) 238
142 Kachal Shikra, *Accipiter badius obsoletus* (Richmond) 239
143 Horsfield's or Chinese Goshawk, *Accipiter solonensis* (Horsfield) 239
144 North Indian Crested Goshawk, *Accipiter tringatus indicus* (Hodgson) 240
145 South Indian Crested Goshawk, *Accipiter tringatus peninsularis* Koelz 242
146 Ceylon Crested Goshawk, *Accipiter tringatus layardi* (Whistler & Kinnear) 242
147 Asiatic Sparrow-Hawk, *Accipiter nisus nisus* (Tickell) 243
148 Indian Sparrow-Hawk, *Accipiter nisus melaschistis* Hume 245
149 West Himalayan Bera Sparrow-Hawk, *Accipiter virgatus kashmiriensis* Whistler & Kinnear 246
150 East Himalayan Bera Sparrow-Hawk, *Accipiter virgatus effinis* Hodgson 247
151 Southern Bera Sparrow-Hawk, *Accipiter virgatus bera* Jerdon 249
152 Eastern Sparrow-Hawk, *Accipiter virgatus gularis* (Temminck & Schlegel) 250
153 Longlegged Buzzard, *Buteo rufinus rufinus* (Cretzschmar) 252
154 Upland Buzzard, *Buteo hemilais* Temminck & Schlegel 253
155 Desert Buzzard, *Buteo buto vulpinus* (Gloger) 254
156 Buzzard, *Buteo buto japonicus* (Temminck & Schlegel) 255
157 White-eyed Buzzard-Eagle, *Buteo buto terra* (Franklin) 257
158 Hodgson's or Feathered Hawk-Eagle, *Spizaeus nipalensis nipalensis* (Hodgson) 259
159 Legge's or Ceylon Feathered Hawk-Eagle, *Spizaeus nipalensis kelaarti* Legge 260
160 Changeable Hawk-Eagle, *Spizaeus cirrhatus himalayensis* (Horsfield) 261
161 Indian Crested Hawk-Eagle, *Spizaeus cirrhatus gularis* (Gmelin) 262
162 Andamans Crested Hawk-Eagle, *Spizaeus cirrhatus andamanensis* Tytler 265
163 Bonelli's or Slender Hawk-Eagle, *Hieraeetus fasciatus fasciatus* (Vieillot) 266
164 Booted Hawk-Eagle, *Hieraeetus ternatus* (Gmelin) 268
165 Rufousbellied Hawk-Eagle, *Hieraeetus kinnierii kinnierii* (E. Geoffroy) 270
166 Himalayan Golden Eagle, *Aquila chrysaetos dzhungara* Severtzov 273
167 Imperial Eagle, *Aquila heliaca heliaca* Savigny 274
168 Tawny Eagle, *Aquila rapax ruficeps* Franklin 276
169 Eastern Steppe Eagle, *Aquila rapax nipalensis* Hodgson 278
170 Greater Spotted Eagle, *Aquila clanga* Pallas 279
171 Lesser Spotted Eagle, *Aquila pomarina hastata* (Lesson) 281
172 Black Eagle, *Icthyophaga malayensis periger* (Hodgson) 283
173 Whittailed Sea Eagle, *Haliaeetus albicollis* (Linnaeus) 286
174 Whitebellied Sea Eagle, *Haliaeetus leucogaster* (Gmelin) 287
175 Ringtailed or Pallas's Fishing Eagle, *Haliaeetus leucorhynchus* (Pallas) 289
176 Greyheaded Fishing Eagle, *Icthyophaga ichthyophaga ichthyophaga* (Horsfield) 292
177 Ceylon Greyheaded Fishing Eagle, *Icthyophaga ichthyophaga plumbeiceps* Baker 294
178 Himalayan Greyheaded Fishing Eagle, *Icthyophaga nana plumbeiceps* (Jerdon) 294
179 Black or King Vulture, *Sarcophaga calvus* (Scopoli) 296
180 Cinerous Vulture, *Argyrops vultur* (Linnaeus) 298
181 Indian Griffon Vulture, *Gyps fulvus fulvus* Hume 301
182 Himalayan Griffon Vulture, *Gyps himalayensis* Hume 302

182	Indian Longbilled Vulture, <i>Gyps indicus indicus</i> (Scopoli)	304	Family FALCONIDAE: Falcons	
184	Himalayan Longbilled Vulture, <i>Gyps indicus tenuirostris</i> G. R. Gray	306	204 Himalayan Redbreasted Falconet, <i>Microhierax caerulescens caerulescens</i> (Linnaeus)	338
185	Indian Whitebacked Vulture, <i>Gyps bengalensis</i> (Gmelin)	307	205 Whitelegged Falconet or Pied Pigmy Falcon, <i>Microhierax melanoleucus</i> (Blyth)	340
186	Egyptian Vulture, <i>Neophron percipiter percipiter</i> (Linnaeus)	310	206 Saker or Cherrug Falcon, <i>Falco biarmicus cherrug</i> J. E. Gray	342
187	Indian Scavenger Vulture, <i>Neophron percipiter ginglymus</i> (Latham)	312	207 Shanghai Falcon, <i>Falco biarmicus milvipes</i> Jerdon	344
188	Himalayan Bearded Vulture or Lämmergeier, <i>Cypaetus barbatus aureus</i> (Hablizl)	314	208 Laggar Falcon, <i>Falco biarmicus jugger</i> J. E. Gray	344
189	Hen Harrier, <i>Circus cyaneus cyaneus</i> (Linnaeus)	317	209 Eastern Peregrine Falcon, <i>Falco peregrinus japonensis</i> Gmelin	347
190	Pale Harrier, <i>Circus macrourus</i> (S. G. Gmelin)	319	210 Redcapped or Barbary Falcon, <i>Falco peregrinus babylonicus</i> P. L. Sclater	349
191	Montagu's Harrier, <i>Circus pygargus</i> (Linnaeus)	321	211 Shaheen Falcon, <i>Falco peregrinus peregrinator</i> Sundevall	350
192	Pied Harrier, <i>Circus melanoleucus</i> (Pennant)	323	212 Hobby, <i>Falco subbuteo subbuteo</i> Linnaeus	352
193	Marsh Harrier, <i>Circus aeruginosus aeruginosus</i> (Linnaeus)	324	213 Central Asian Hobby, <i>Falco subbuteo centralasiæ</i> (Buturlin)	353
194	Eastern Marsh Harrier or Striped Harrier, <i>Circus aeruginosus spilonorius</i> Kaup	326	214 Indian Hobby, <i>Falco severus rufipedoides</i> Hodgson	355
195	Short-toed Eagle, <i>Circus gallius gallius</i> (Gmelin)	327	215 Burmese Hobby, <i>Falco severus severus</i> Horsfield	356
196	Crested Serpent Eagle, <i>Spilornis cheela cheela</i> (Latham)	329	216 Sooty Falcon, <i>Falco concolor</i> Temminck	356
197	Lesser or Peninsular Crested Serpent Eagle, <i>Spilornis cheela melanotis</i> (Jerdon)	331	217 North Asiatic Merlin, <i>Falco columbarius insignis</i> (Clark)	357
198	Ceylon Crested Serpent Eagle, <i>Spilornis cheela spilogaster</i> (Blyth)	332	218 Pallid Merlin, <i>Falco columbarius pallidus</i> (Sushkin)	358
199	Burmese Crested Serpent Eagle, <i>Spilornis cheela burmanicus</i> Swann	333	219 Redheaded Merlin, <i>Falco chiqueira chiqueira</i> Daudin	359
200	Andaman Pale Serpent Eagle, <i>Spilornis cheela daniensis</i> Hume	333	220 Eastern Redlegged Falcon, <i>Falco vespertinus amurensis</i> Radde	361
201	Nicobar Crested Serpent Eagle, <i>Spilornis cheela minimus</i> Hume	334	221 Lesser Kestrel, <i>Falco naumanni Fleischer</i>	363
202	Great Nicobar Crested Serpent Eagle, <i>Spilornis klossi</i> Richmond	335	222 European Kestrel, <i>Falco tinnunculus tinnunculus</i> Linnaeus	365
202a	Andaman Dark Serpent Eagle, <i>Spilornis elgini</i> (Blyth)	335, 371	223 East Himalayan Kestrel, <i>Falco tinnunculus interstinctus</i> McClelland	367
203	Osprey, <i>Pandion haliaetus haliaetus</i> (Linnaeus)	336	224 Indian Kestrel, <i>Falco tinnunculus oburgatus</i> (Baker)	368

VOLUME 2

Order GALLIFORMES			
Family MEGAPODIDAE: Megapodes			
225	North Nicobar Megapode, <i>Megapodius freycinet nicobariensis</i> Blyth	1	
226	South Nicobar Megapode, <i>Megapodius freycinet abbotti</i> Oberholser	3	
Family PHASIANIDAE: Pheasants, Partridges, Quails, etc.			
227	Snow Partridge, <i>Lerwa lerwa</i> (Hodgson)	6	
228	Scese Partridge, <i>Ammoperdix griseogularis griseogularis</i> (J. F. Brandt)	8	
229	Tibetan Snowcock, <i>Tetraogallus tibetanus tibetanus</i> Gould	11	
230	Sikkim Snowcock, <i>Tetraogallus tibetanus aquilonifer</i> R. & A. Meinertzhagen	12	
231	Central Tibetan Snowcock, <i>Tetraogallus tibetanus centralis</i> Sushkin	13	
232	Himalayan Snowcock, <i>Tetraogallus himalayensis himalayensis</i> G. R. Gray	13	
233	Pheasant-Grouse, <i>Tetraophasis szechenyi</i> Madarasz	16	
234	Persian Chukor, <i>Alectoris chukar korovickovi</i> (Zarudny)	17	
235	Northern Chukor, <i>Alectoris chukar pallens</i> (Hume)	18	
236	Chukor Partridge, <i>Alectoris chukar chukar</i> (J. E. Gray)	18	
237	South Persian	21	
238	Indian Black I	22	
239	Assam Black F	24	
240	Northern Pain	25	
241	S	27	line & Selby)
242	C	27	
243	B	28	
244	Baluchistan Grey Partridge, <i>Francolinus pondicerianus mecranensis</i> Zarudny & Härms	29	
245	North Indian Grey Partridge, <i>Francolinus pondicerianus interpositus</i> Hartert	30	
246	South Indian Grey Partridge, <i>Francolinus pondicerianus pondicerianus</i> (Gmelin)	31	
247	Swamp Partridge or Kyah, <i>Francolinus gularis</i> (Temminck)	33	
248	L	35	Meinertzhagen
249	T	35	
250	C	37	
251	Japanese Grey Quail, <i>Coturnix coturnix japonica</i> Temminck & Schlegel	40	
252	Blackbreasted or Rain Quail, <i>Coturnix coromandelica</i> (Gmelin)	41	
253	Bluebreasted Quail, <i>Coturnix chinensis chinensis</i> (Linnaeus)	42	
254	Nicobar Bluebreasted Quail, <i>Coturnix chinensis trivittatus</i> (Richmond)	44	
255	Jungle Bush Quail, <i>Perdula asiatica asiatica</i> (Latham)	45	
256	Punjab Jungle Bush Quail, <i>Perdula asiatica punjabi</i> Whistler	47	
257	Konkan Jungle Bush Quail, <i>Perdula asiatica vidali</i> Whistler & Kinnear	48	
257a	Tamil Nadu Jungle Bush Quail, <i>Perdula asiatica vellorei</i> Abdulali & Reuben	48, 338	
258	Ceylon Jungle Bush Quail, <i>Perdula asiatica ceylonensis</i> Whistler & Kinnear	48	
259	Rajasthan Rock Bush Quail, <i>Perdula argoondah meinertzhageni</i> Whistler	49	
260	Deccan Rock Bush Quail, <i>Perdula argoondah argoondah</i> (Sykes)	49	
261	Mysore or Laterite Rock Bush Quail, <i>Perdula argoondah salimalii</i> Whistler	50	
262	Painted Bush Quail, <i>Perdula erythrorhynchos erythrorhynchos</i> (Sykes)	51	
263	Northern Painted Bush Quail, <i>Perdula erythrorhynchos blewittii</i> (Hume)	53	
264	Assam Painted Bush Quail, <i>Perdula manipurensis ingliai</i> (Ogilvie-Grant)	53	
265	Manipur Painted Bush Quail, <i>Perdula manipurensis manipurensis</i> Hume	54	
266	Simla Hill Partridge, <i>Arborophila torqueola torqueola</i> (Baker)	56	
267	Common Hill Partridge, <i>Arborophila torqueola torqueola</i> (Valenciennes)	57	
268	Assam Hill Partridge, <i>Arborophila torqueola interstincta</i> Ripley	58	
269	Kachin Hill Partridge, <i>Arborophila torqueola batemani</i> (Ogilvie-Grant)	59	
270	Rufous-throated Hill Partridge, <i>Arborophila rufogularis rufogularis</i> (Blyth)	59	
271	Arakan Hill Partridge, <i>Arborophila rufogularis intermedia</i> (Blyth)	61	
272	Whitecheeked Hill Partridge, <i>Arborophila atrogularis</i> (Blyth)	62	
273	Redbreasted Hill Partridge, <i>Arborophila mandellii</i> Hume	63	
274	Assam Bamboo Partridge, <i>Bambusiolela fytchii hopkinsoni</i> Godwin-Austen	64	
275	Red Spur-fowl, <i>Gallus padica padica</i> (Gmelin)	67	
276	Aravalli Red Spur-fowl, <i>Gallus padica cavinna</i> Blanford	68	
277	Travancore Red Spur-fowl, <i>Gallus padica steuarti</i> Baker	69	
278	Painted Spur-fowl, <i>Gallus padica torquata</i> (Valenciennes)	70	
279	Ceylon Spur-fowl, <i>Gallus padica bicolorata</i> (J. R. Forster)	71	
280	Mountain Quail, <i>Ophryotroica superciliosa</i> (J. E. Gray)	73	
281	Nepal Blood Pheasant, <i>Ithaginis cruentus cruentus</i> (Hardwicke)	75	
282	Sikkim Blood Pheasant, <i>Ithaginis cruentus affinis</i> Beebe	77	
283	Tibetan Blood Pheasant, <i>Ithaginis cruentus tibetanus</i> (Baker)	78	
284	Mishmi Blood Pheasant, <i>Ithaginis cruentus kusuri</i> Beebe	78	
285	Western Horned Pheasant, <i>Tragopan melanocephalus</i> (J. E. Gray)	80	
286	Crimson Horned Pheasant or Satyr Tragopan, <i>Tragopan satyra</i> (Linnaeus)	82	
287	Tibetan Greybellied Tragopan, <i>Tragopan blythii molesworthi</i> Baker	84	
288	Greybellied Tragopan, <i>Tragopan blythii blythii</i> (Jerdon)	85	
289	Temminck's Tragopan or Chinese Crimson Horned Pheasant, <i>Tragopan temminckii</i> (J. E. Gray)	86	
290	Impeyan or Himalayan Monal Pheasant, <i>Lophophorus impeyanus</i> (Latham)	88	
291	Sclater's or Mishmi Monal Pheasant, <i>Lophophorus sclateri</i> Jerdon	90	
292	Elwes's Eared Pheasant, <i>Grousephila crupellion hamrni</i> Elwes	92	
293	Whitecrested Kaleej Pheasant, <i>Leptura leucomelana hamiltoni</i> (J. E. Gray)	94	
294	Nepal Kaleej Pheasant, <i>Leptura leucomelana leucomelana</i> (Latham)	97	
295	Blackbacked Kaleej Pheasant, <i>Leptura leucomelana melanota</i> (Hutton)	98	
296	Blackbreasted Kaleej Pheasant, <i>Leptura leucomelana lathamii</i> (J. E. Gray)	99	
297	Williams's Kaleej Pheasant, <i>Leptura leucomelana williamsi</i> (Oates)	101	
298	Moffitt's Kaleej Pheasant, <i>Leptura leucomelana moffitti</i> (Hachisuka)	101	
299	Indian Red Junglefowl, <i>Gallus gallus margini</i> Robinson & Kloss	102	
300	Burmese Red Junglefowl, <i>Gallus gallus spadiceus</i> (Bonnaterre)	106	
301	Grey Junglefowl, <i>Gallus sonnerati</i> Temminck	106	
302	Ceylon Red Junglefowl, <i>Gallus lafeyettii</i> Lesson	109	
303	Chestnutmantled Koklas Pheasant, <i>Pucrasia macrolopha castanea</i> Gould	111	
304	Kashmir Koklas Pheasant, <i>Pucrasia macrolopha biddulphi</i> Marshall	113	
305	Koklas Pheasant, <i>Pucrasia macrolopha macrolopha</i> (Lesson)	113	
306	Nepal Koklas Pheasant, <i>Pucrasia macrolopha nipalensis</i> Gould	115	
307	Chir Pheasant, <i>Coturnix wallichii</i> (Hardwicke)	116	
308	Mrs Hume's Barredback Pheasant, <i>Symaticus humiae humiae</i> (Hume)	119	
309	Bhutan Peacock-Pheasant, <i>Polyplectron bicalcaratum bakeri</i> Lowe	120	
310	Burmese Peacock-Pheasant, <i>Polyplectron bicalcaratum bicalcaratum</i> (Linnaeus)	122	
311	Indian Peafowl, <i>Pavo cristatus</i> Linnaeus	123	
312	Burmese or Green Peafowl, <i>Pavo muticus spicifer</i> Shaw & Nodder	126	
Order GRUIFORMES			
Family TURNICIDAE: Bustard-Quails			
313	Little Bustard-Quail, <i>Turnix sylvatica dussumieri</i> (Temminck)	128	
314	Indian Yellowlegged Button Quail, <i>Turnix tanki tanki</i> Blyth	129	
315	Burmese Yellowlegged Button Quail, <i>Turnix tanki blanfordii</i> Blyth	131	
316	Northern Bustard-Quail, <i>Turnix susiator plumbeus</i> (Hodgson)	132	
317	Lower Bengal Bustard-Quail, <i>Turnix susiator bengalensis</i> Blyth	132	
318	Indian Bustard-Quail, <i>Turnix susiator taigoo</i> (Sykes)	133	
319	Ceylon Bustard-Quail, <i>Turnix susiator leggeti</i> Baker	135	
Family GRUIDAE: Cranes			
320	Eastern Common Crane, <i>Grus grus tilfordi</i> Sharpe	136	
321	Blacknecked Crane, <i>Grus nigricollis</i> Przevalski	139	
322	Hooded Crane, <i>Grus monacha</i> Temminck	140	
323	Indian Sarus Crane, <i>Grus antigone antigone</i> (Linnaeus)	141	
324	Burmese Sarus, <i>Grus antigone sharpi</i> Blanford	144	
325	Siberian or Great White Crane, <i>Grus leucogeranus</i> Pallas	144	
326	Demoiselle Crane, <i>Anthropoides virgo</i> (Linnaeus)	146	
Family RALLIDAE: Rails, Coots			
327	Turkestan Water Rail, <i>Rallus aquaticus korejewi</i> Zarudny	149	
328	Indian Water Rail, <i>Rallus aquaticus indicus</i> (Linnaeus)	151	
329	Indian Bluebreasted Banded Rail, <i>Rallus striatus albiventer</i> Swainson	152	
330	Andaman Bluebreasted Banded Rail, <i>Rallus striatus obscurus</i> (Hume)	153	
331	Malayan or Redlegged Banded Crane, <i>Rallina fasciata</i> (Raffles)	154	
332	Indian or Slaty-legged Banded Crane, <i>Rallina eurizonoides amauroptera</i> (Jerdon)	155	
333	Andaman Banded Crane, <i>Rallina cinnamini</i> (Blyth)	157	
334	Corncrake or Landrail, <i>Crex crex</i> (Linnaeus)	158	
335, 336	Little Crane, <i>Porzana parva parva</i> (Scopoli)	159	
337	Eastern Baillon's Crane, <i>Porzana pusilla pusilla</i> (Pallas)	160	
338	Spotted Crane, <i>Porzana porzana</i> (Linnaeus)	162	
339	Northern Ruddy Crane, <i>Porzana fusca fusca</i> (Linnaeus)	164	
340	Southern Ruddy Crane, <i>Porzana fusca zeylonica</i> (Baker)	165	
341	Elwes's Crane, <i>Amauornis bicolor</i> (Walton)	166	
342	Brown Crane, <i>Amauornis akool akool</i> (Sykes)	167	
343, 344	Indian Whitebreasted Waterhen, <i>Amauornis phoeniceus phoeniceus</i> (Pennant)	168	
345	Andamans Whitebreasted Waterhen, <i>Amauornis phoeniceus insularis</i> Sharpe	171	
346	Kora or Watercock, <i>Gallinula cinerea cinerea</i> (Gmelin)	172	
347	Indian Moorhen, <i>Gallinula chloropus indica</i> Blyth	175	
347a	Malay Moorhen, <i>Gallinula chloropus orientalis</i> Horsfield	177	
348	Baluchi Purple Moorhen, <i>Porphyrio porphyrio seistanicus</i> Zarudny & Härms	178	
349	Indian Purple Moorhen, <i>Porphyrio porphyrio poliocephalus</i> (Latham)	178	
350	Coot, <i>Fulica atra atra</i> Linnaeus	180	
Family HELIOTHIRIDAE: Finfoots			
351	Masked Finfoot, <i>Helipais personata</i> (G. R. Gray)	184	
Family OTIDIDAE: Bustards			
352	Great Bustard, <i>Otis tarda dybowskii</i> Taczanowski	185	
353	Eastern Little Bustard, <i>Otis tetrix orientalis</i> Hartert	187	
354	Great Indian Bustard, <i>Chlorotis nigripes</i> (Vigors)	188	
355	Houbara Bustard, <i>Chlamydotis undulata macquennii</i> (J. E. Gray)	191	
356	Bengal Florican, <i>Eupodotis bengalensis bengalensis</i> (Gmelin)	194	
357	Leekh or Lesser Florican, <i>Syrrhaptes indica</i> (J. F. Miller)	196	
Order CHARADRIIFORMES			
Family JACANIDAE: Jacanas			
358	Pheasant-tailed Jacana, <i>Hydrophasianus chirurgus</i> (Scopoli)	199	
359	Bronzewinged Jacana, <i>Metopidius indicus</i> (Latham)	201	
Family HAEMATOPODIDAE: Oystercatchers			
360	Oystercatcher or Sea-Pie, <i>Haematopus ostralegus ostralegus</i> Linnaeus	203	
361	Chinese Oystercatcher, <i>Haematopus ostralegus esculentus</i> Swinhoe	204	
Family CHARADRIIDAE: Plovers, Sandpipers, Snipe			
Subfamily CHARADRIINAE: Plovers			
362	Whitetailed Lapwing, <i>Vanellus leucurus</i> (Lichtenstein)	206	
363	Sociable Lapwing, <i>Vanellus gregarius</i> (Pallas)	208	
364	Pewit, Lapwing or Green Plover, <i>Vanellus vanellus</i> (Linnaeus)	210	
365	Grey-headed Lapwing, <i>Vanellus cinereus</i> (Blyth)	211	
366	Redwattled Lapwing, <i>Vanellus indicus indicus</i> (Boddaert)	212	
367	Ceylon Redwattled Lapwing, <i>Vanellus indicus lankae</i> (Koelz)	214	
368	Burmese Redwattled Lapwing, <i>Vanellus indicus atronuchalis</i> (Jerdon)	215	
369	Spurwinged Lapwing, <i>Vanellus spinosus ducaculii</i> (Lesson)	216	
370	Yellow-wattled Lapwing, <i>Vanellus malabaricus</i> (Boddaert)	218	
371	Blackbellied or Grey Plover, <i>Pluvialis squatarola</i> (Linnaeus)	220	
372	Golden Plover, <i>Pluvialis apricaria apricaria</i> (Linnaeus)	221	
373	Eastern Golden Plover, <i>Pluvialis dominica fulva</i> (Gmelin)	222	
374	Large Sand Plover, <i>Charadrius leschenaulti</i> Lesson	226	
375	Australian Blackfronted Plover, <i>Charadrius melanops</i> Vieillot	227	
376	Caspian Sand Plover, <i>Charadrius asiaticus asiaticus</i> Pallas	228	
377	Eastern Sand Plover, <i>Charadrius asiaticus versutus</i> Gould	229	

378	Eastern Ringed Plover, <i>Charadrius hiaticula tundrae</i> (Lowe)	230
379	European Little Ringed Plover, <i>Charadrius dubius curonici</i> Gmelin	231
380	Indian Little Ringed Plover, <i>Charadrius dubius jerdoni</i> (Legge)	231
381	Kentish Plover, <i>Charadrius alexandrinus alexandrinus</i> (Linnaeus)	235
382	Ceylon Kentish Plover, <i>Charadrius alexandrinus seebolmi</i> Hartert & Jackson	237
383	Longbilled Ringed Plover, <i>Charadrius placidus</i> J. E. Gray	237
384	Pamirs Lesser Sand Plover, <i>Charadrius mongolus atrifrons</i> Wagler	238
Subfamily SCOLOPACINAE: Curlews, Sandpipers, Snipe, Woodcock		
385	Whimbrel, <i>Numenius phaeopus phaeopus</i> (Linnaeus)	242
386	Eastern Whimbrel, <i>Numenius phaeopus variegatus</i> (Scopoli)	244
387	Curlew, <i>Numenius arguata arguata</i> (Linnaeus)	245
388	Eastern Curlew, <i>Numenius arguata orientalis</i> C. L. Brehm	246
389	Blacktailed Godwit, <i>Limosa limosa limosa</i> (Linnaeus)	249
390	Eastern Blacktailed Godwit, <i>Limosa limosa melanoides</i> Gould	251
391	Bartailed Godwit, <i>Limosa lapponica lapponica</i> (Linnaeus)	252
392	Spotted or Dusky Redshank, <i>Tringa erythropus</i> (Pallas)	255
393, 394	Common Redshank, <i>Tringa totanus totanus</i> (Linnaeus)	257
395	Marsh Sandpiper or Little Greenshank, <i>Tringa stagnatilis</i> (Bechstein)	259
396	Greenshank, <i>Tringa nebularia</i> (Gunnerus)	261
397	Green Sandpiper, <i>Tringa ochropus</i> Linnaeus	263
398	Wood or Spotted Sandpiper, <i>Tringa glareola</i> Linnaeus	265
399	Spotted Greenshank or Armstrong's Sandpiper, <i>Tringa guttifer</i> (Nordmann)	268
400	Terek Sandpiper or Avocet-Sandpiper, <i>Tringa terek</i> (Latham)	269
401	Common Sandpiper, <i>Tringa hypoleucos</i> Linnaeus	271
402	Turnstone, <i>Arenaria interpres interpres</i> (Linnaeus)	274
403	Snipebilled Godwit or Asian Dowitcher, <i>Limnodromus semipalmatus</i> (Blyth)	276
404	Eastern Solitary Snipe, <i>Gallinago solitaria solitaria</i> Hodgson	278
405	Wood Snipe, <i>Gallinago nemoralis</i> Hodgson	280
406	Pintail Snipe, <i>Gallinago stenura</i> Bonaparte	282
407	Swinhoe's Snipe, <i>Gallinago megala</i> Swinhoe	284
408	Great Snipe, <i>Gallinago media</i> (Latham)	286

409	Common or Fantail Snipe, <i>Gallinago gallinago gallinago</i> (Linnaeus)	287
410	Jack Snipe, <i>Gallinago minima</i> (Brünnich)	290
411	Woodcock, <i>Scolopax rusticola rusticola</i> Linnaeus	292
412	Knot, <i>Calidris canuta canuta</i> (Linnaeus)	296
413	Eastern Knot, <i>Calidris tenuirostris</i> (Horsfield)	297
414	Sanderling, <i>Calidris albus</i> (Pallas)	298
415	Eastern Little Stint, <i>Calidris ruficollis</i>	300
416	Little Stint, <i>Calidris minuta</i> (Leisler)	301
417	Temminck's Stint, <i>Calidris temminckii</i> (Leisler)	303
418	Longtoed Stint, <i>Calidris subminuta</i> (Middendorff)	305
419	Asian Pectoral or Sharptailed Sandpiper, <i>Calidris acuminata</i> (Horsfield)	307
420, 421	Dunlin, <i>Calidris alpina alpina</i> (Linnaeus)	308
422	Curlew-Sandpiper, <i>Calidris testacea</i> (Pallas)	310
423	Spoonbilled Sandpiper, <i>Eurythorhynchus pygmaeus</i> (Linnaeus)	313
424	Broadbilled Sandpiper, <i>Limicola falcinellus falcinellus</i> (Pontoppidan)	315
425	Eastern Broadbilled Sandpiper, <i>Limicola falcinellus sibirica</i> Dresser	317
425a	Buffbreasted Sandpiper, <i>Tryngites subruficollis</i> (Vieillot)	317
426	Ruff, <i>Philomachus pugnax</i> (Linnaeus)	318
Subfamily PHALAROPINAE: Phalaropes		
427	Grey Phalarope, <i>Phalaropus fulicarius</i> (Linnaeus)	322
428	Rednecked Phalarope, <i>Phalaropus lobatus</i> (Linnaeus)	323
Family ROSTRATULIDAE: Painted Snipe		
429	Painted Snipe, <i>Rostratula benghalensis benghalensis</i> (Linnaeus)	325
Family RECURVIROSTRIDAE: Stilts, Avocets, Ibisbills		
430	Indian Blackwinged Stilt, <i>Himantopus himantopus himantopus</i> (Linnaeus)	329
431	Ceylon Blackwinged Stilt, <i>Himantopus himantopus ceylonensis</i> Whistler	331
432	Avocet, <i>Recurvirostra avosetta</i> Linnaeus	332
433	Ibisbill, <i>Ibidorhynchos struthersii</i> Vigors	334
Family DROMADIDAE: Crab Plovers		
434	Crab Plover, <i>Dromas ardeola</i> Paykull	337
Appendix		
		341

VOLUME 3

Order CHARADRIIFORMES (cont.)

Family BURHINIDAE: Stone Curlews, Thick-knees		
435	Persian Stone Curlew, <i>Burhinus oediceramus harterti</i> Vaurie	1
436	Indian Stone Curlew, <i>Burhinus oediceramus indicus</i> (Salvadori)	2
437	Great Stone Plover, <i>Esacus magnirostris recurvirostris</i> (Cuvier)	5
438	Australian Stone Plover, <i>Esacus magnirostris magnirostris</i> (Vieillot)	6
Family GLAREOLIDAE: Coursers (Courier Plovers), Pratincoles		
439	Creamcoloured or Desert Courser, <i>Cursorius cursor cursor</i> (Latham)	8
440	Indian Courser, <i>Cursorius coromandelicus</i> (Gmelin)	9
441	Jerdon's or Doublebanded Courser, <i>Cursorius bitorquatus</i> (Blyth)	11
442	Collared Pratincole or Swallow-Plover, <i>Glareola pratincola pratincola</i> (Linnaeus)	12
443	Large Indian Pratincole or Swallow-Plover, <i>Glareola pratincola maldivarum</i> J. R. Forster	14
444	Small Indian Pratincole or Swallow-Plover, <i>Glareola lactea</i> Temminck	15
Family STERCORARIIDAE: Skuas, Jaegers		
445	Antarctic or Falkland Skua, <i>Catharacta skua antarctica</i> (Lesson)	18
446	Brown or Great Skua, <i>Catharacta skua lombergi</i> Mathews	19
446a	South Polar Skua, <i>Catharacta skua macrormicki</i> (Saunders)	19
447	Pomarine Skua or Jaeger, <i>Stercorarius pomarinus</i> (Temminck)	20
448	Parasitic or Richardson's Skua or Jaeger, <i>Stercorarius parasiticus</i> (Linnaeus)	21
Family LARIDAE: Gulls, Terns		
449	Sooty Gull, <i>Larus hemprichii</i> Bruch	24
450	Yellowlegged Herring Gull, <i>Larus argentatus heuglini</i> Bree	26
451	Pinklegged Herring Gull, <i>Larus argentatus mongolicus</i> Sushkin	27
452	Lesser Blackbacked Gull, <i>Larus fuscus fuscus</i> Linnaeus	28
452a	Great Blackbacked Gull, <i>Larus marinus</i> Linnaeus	29, 317
453	Great Blackheaded Gull, <i>Larus ichthyaeus</i> Pallas	29
454	Brownheaded Gull, <i>Larus brunneiceps</i> Jerdon	31
455	Blackheaded Gull, <i>Larus ridibundus ridibundus</i> Linnaeus	33
456	Slenderbilled Gull, <i>Larus geni</i> Brème	35
457	Little Gull, <i>Larus minutus</i> Pallas	37
	[Greater Blackbacked Gull, <i>Larus marinus</i> Linnaeus]	38
458	Indian Whiskered Tern, <i>Chlidonias hybridus indicus</i> (Stephens)	39
459	Whitewinged Black Tern, <i>Chlidonias leucophaea</i> (Temminck)	41
459a	Black Tern, <i>Chlidonias niger niger</i> (Linnaeus)	42
460	Gullbilled Tern, <i>Gelochelidon nilotica nilotica</i> (Gmelin)	42
461	Javan Gullbilled Tern, <i>Gelochelidon nilotica affinis</i> (Horsfield)	44
462	Caspian Tern, <i>Hydroprogne caspia caspia</i> (Pallas)	45
463	Indian River Tern, <i>Sterna aurantia</i> J. E. Gray	48
464	European Common Tern, <i>Sterna hiundo hiundo</i> Linnaeus	50
465	Tibetan Common Tern, <i>Sterna himalaia tibetana</i> Saunders	51
466	Rosate or Rosy Tern, <i>Sterna dougallii korstesi</i> (Hume)	52
466a	Arctic Tern, <i>Sterna macrura</i> Naumann	54
467	Whitecheeked Tern, <i>Sterna repressa</i> Hartert	55
468	Eastern Blacknaped Tern, <i>Sterna sumatrana sumatrana</i> Raffles	56
469	Western Blacknaped Tern, <i>Sterna sumatrana mathewi</i> Stresemann	57
470	Blackbellied Tern, <i>Sterna acuticauda</i> J. E. Gray	59
471, 472, 473	Brownwinged Tern, <i>Sterna anaethetus anaethetus</i> Scopoli	57
474	Sooty Tern, <i>Sterna fuscata nubilosa</i> Sparrman	62
475	Little Tern or Ternlet, <i>Sterna albifrons albifrons</i> Pallas	64
476	Blackshafted Ternlet, <i>Sterna saundersi</i> Hume	65
477	Whiteshafted Ternlet, <i>Sterna albifrons pusilla</i> Temminck	66
478	Red Sea Large Crested Tern, <i>Sterna bergii velox</i> Cretschmar	67
479	Indian Lesser Crested Tern, <i>Sterna bengalensis bengalensis</i> Lesson	69
480	Sandwich Tern, <i>Sterna sandwicensis sandwicensis</i> Latham	70
481	Noddy Tern, <i>Anous stolidus pileatus</i> (Scopoli)	71
482	Whitecapped Noddy, <i>Anous tenuirostris worcesteri</i> (McGregor)	72
483	Indian Ocean White or Fairy Tern, <i>Gygis alba monte</i> Mathews	73
484	Indian Skimmer or Scissorbill, <i>Rynchops albigularis</i> Swainson	75

Order COLUMBIFORMES

Family PTEROCLIDIDAE: Sandgrouse		
485	Tibetan Sandgrouse, <i>Synophaps tibetanus</i> Gould	77
485a	Pallas's Sandgrouse, <i>Synophaps paradoxus</i> (Pallas)	79
486	Large Pintail Sandgrouse, <i>Pterocles alchata caudatus</i> (S. G. Gmelin)	80
487	Indian Sandgrouse, <i>Pterocles exustus erlangeri</i> (Neumann)	82
488	Spotted Sandgrouse, <i>Pterocles senegalensis</i> (Linnaeus)	84
489	Imperial or Blackbellied Sandgrouse, <i>Pterocles orientalis orientalis</i> (Linnaeus)	86
490	Coronated Sandgrouse, <i>Pterocles coronatus atratus</i> Hartert	89
491	Closebarred Sandgrouse, <i>Pterocles indicus arabicus</i> Neumann	91
492	Painted Sandgrouse, <i>Pterocles indicus indicus</i> (Gmelin)	92
Family COLUMBIDAE: Pigeons, Doves		
493	Pintailed Green Pigeon, <i>Treron apicuda apicuda</i> Blyth	94
494	Kokla or Wedgetailed Green Pigeon, <i>Treron sphenura sphenura</i> (Vigors)	96
495	Thickbilled Green Pigeon, <i>Treron curvirostra nipalensis</i> (Hodgson)	97
496	Greyfronted Green Pigeon, <i>Treron pompadora effinis</i> (Jerdon)	99
497	Pompador or Ceylon Greyfronted Green Pigeon, <i>Treron pompadora pompadora</i> (Gmelin)	100
498	Nepal Greyfronted Green Pigeon, <i>Treron pompadora ceylonensis</i> Rand & Fleming	101

499	Ashyheaded Green Pigeon, <i>Treron pompadora phayrei</i> (Blyth)	102
500	Andaman Greyfronted Green Pigeon, <i>Treron pompadora chloroptera</i> Blyth	103
501	Indian Orangebreasted Green Pigeon, <i>Treron bicincta bicincta</i> (Jerdon)	104
502	Ceylon Orangebreasted Green Pigeon, <i>Treron bicincta leggei</i> Hartert	106
503	Bengal Green Pigeon, <i>Treron phoenicoptera phoenicoptera</i> (Latham)	106
504	Southern Green Pigeon, <i>Treron phoenicoptera chlorogaster</i> (Blyth)	108
505	Ceylon Green Pigeon, <i>Treron phoenicoptera philipini</i> Ripley	109
506	Northern Green Imperial Pigeon, <i>Ducula aenea sylvatica</i> (Tickell)	111
507	Southern Green Imperial Pigeon, <i>Ducula aenea pusilla</i> (Blyth)	112
508	Nicobar Green Imperial Pigeon, <i>Ducula aenea nicobarica</i> (Pelzeln)	113
508a	Andaman Green Imperial Pigeon, <i>Ducula aenea andamanica</i> Abdulali	114
509	Pied Imperial Pigeon, <i>Ducula bicolor</i> (Scopoli)	115
510	Hodgson's or Nepal Maroonbacked Imperial Pigeon, <i>Ducula badia insignis</i> Hodgson	116
511	Jerdon's or Southern Maroonbacked Imperial Pigeon, <i>Ducula badia cuprea</i> (Jerdon)	118
512	Greyheaded Imperial Pigeon, <i>Ducula badia griseicapilla</i> Walden	119
513	West Himalayan Snow Pigeon, <i>Columba leuconota leuconota</i> Vigors	120
514	East Himalayan Snow Pigeon, <i>Columba leuconota gradaria</i> Hartert	122
515	Turkestan Hill Pigeon, <i>Columba rupestris turkestanica</i> Buturlin	123
516	Blue Rock Pigeon, <i>Columba livia neglecta</i> Hume	125
517	Indian Blue Rock Pigeon, <i>Columba livia intermedia</i> Strickland	125
518	Eastern Stock Pigeon, <i>Columba eversmanni</i> Bonaparte	128
519	Eastern Wood Pigeon or Cushat, <i>Columba palumbus carotis</i> (Bonaparte)	129
520	Speckled Wood Pigeon, <i>Columba hodgsonii</i> Vigors	131
521	Nigiri Wood Pigeon, <i>Columba elphinstonii</i> (Sykes)	132
522	Ceylon Wood Pigeon, <i>Columba torringtoni</i> Bonaparte	134
523	Ashy Wood Pigeon, <i>Columba pulchricollis</i> Blyth	134
524	Purple Wood Pigeon, <i>Columba punicea</i> Blyth	135
525	Andaman Wood Pigeon, <i>Columba palumboides</i> (Hume)	137
526	Bartailed Cuckoo-Dove, <i>Macropygia unchall tusalia</i> (Blyth)	138
527	Nicobar Cuckoo-Dove, <i>Macropygia rufipennis rufipennis</i> Blyth	139
527a	Andaman Cuckoo-Dove, <i>Macropygia rufipennis andamanica</i> Abdulali	140
528	[Streptopelia turtur turtur (Linnaeus)]	141
529	Persian Turtle-Dove, <i>Streptopelia turtur arenicola</i> (Hartert)	141
530	Rufous Turtle-Dove, <i>Streptopelia orientalis orientalis</i> (Latham)	142
531	Western Turtle-Dove, <i>Streptopelia orientalis meena</i> (Sykes)	143
532	Rufous Turtle-Dove, <i>Streptopelia orientalis agricola</i> (Tickell)	145
533	Peninsular Turtle-Dove, <i>Streptopelia orientalis erythrocephala</i> (Bonaparte)	146
534	Indian Ring Dove, <i>Streptopelia decaocto decaocto</i> (Frivaldszky)	147
535	Indian Red Turtle-Dove, <i>Streptopelia tranquebarica tranquebarica</i> (Hermann)	149
536	Burmese Red Turtle-Dove, <i>Streptopelia tranquebarica humilis</i> (Temminck)	151
537	Indian Spotted Dove, <i>Streptopelia chinensis suratensis</i> (Gmelin)	152
538	Ceylon Spotted Dove, <i>Streptopelia chinensis ceylonensis</i> (Reichenbach)	153
539	Burmese Spotted Dove, <i>Streptopelia chinensis tigrina</i> (Temminck)	154
540	NEFA Spotted Dove, <i>Streptopelia chinensis edwardsi</i> Ripley	155
541	Indian Little Brown or Senegal Dove, <i>Streptopelia senegalensis camboynensis</i> (Gmelin)	155
542	Indian Emerald Dove, <i>Chalcophaps indica indica</i> (Linnaeus)	157
543	Ceylon Emerald Dove, <i>Chalcophaps indica robinsoni</i> Baker	159
544	Andaman Emerald Dove, <i>Chalcophaps indica maxima</i> Hartert	160
544a	Nicobar Emerald Dove, <i>Chalcophaps indica augusta</i> Bonaparte	161, 318
544b	Nicobar Pigeon, <i>Caloenas nicobarica nicobarica</i> (Linnaeus)	161

Order PSITTACIFORMES

Family PSITTACIDAE: Parrots		
545	Large Indian Parakeet, <i>Pittacula eupatria nipalensis</i> (Hodgson)	164
546	Large Ceylonese Parakeet, <i>Pittacula eupatria eupatria</i> (Linnaeus)	166
547	Large Burmese Parakeet, <i>Pittacula eupatria acensis</i> (Kloss)	167
548	Large Andaman Parakeet, <i>Pittacula eupatria magnirostris</i> (Ball)	168
549	Northern Roseringed Parakeet, <i>Pittacula krameri borealis</i> (Neumann)	169
550	Roseringed Parakeet, <i>Pittacula krameri manillensis</i> (Bechstein)	171
551	Indian Redbreasted Parakeet, <i>Pittacula alexandri fasciata</i> (P. L. S. Müller)	172
552	Andaman Redbreasted Parakeet, <i>Pittacula alexandri abbotti</i> (Oberholser)	174
553	Blyth's Nicobar Parakeet, <i>Pittacula caniceps</i> (Blyth)	175
554	Lord Derby's Parakeet, <i>Pittacula derbyana</i> (Fraser)	175
555	Andaman Redcheeked Parakeet, <i>Pittacula longicauda tyleri</i> (Hume)	176
556	Nicobar Redcheeked Parakeet, <i>Pittacula longicauda nicobarica</i> (Gould)	177
557	Northern Blossomheaded Parakeet, <i>Pittacula cyanocephala bengalensis</i> (Forster)	178
558	Southern Blossomheaded Parakeet, <i>Pittacula cyanocephala cyanocephala</i> (Linnaeus)	179
559	Assam Blossomheaded Parakeet, <i>Pittacula roseata roseata</i> Biswas	181
560	Arakan Blossomheaded Parakeet, <i>Pittacula roseata jinnae</i> Biswas	182
561	Rothschild's Parakeet, <i>Pittacula intermedia</i> (Rothschild)	182
562	Himalayan Slatyheaded Parakeet, <i>Pittacula himalayensis</i> (Lesson)	183
563	Eastern Slatyheaded Parakeet, <i>Pittacula frontalis</i> (Hume)	184
564	Bluwinged Parakeet, <i>Pittacula columboides</i> (Vigors)	185
565	Layard's Parakeet, <i>Pittacula calliope</i> (Blyth)	187
566, 567	Indian Lorikeet, <i>Loriculus vernalis</i> (Sparrman)	188
568	Ceylon Lorikeet, <i>Loriculus berylus</i> (J. R. Forster)	190

Order CUCULIFORMES

Family CUCULIDAE: Cuckoos		
569	Redwinged Crested Cuckoo, <i>Clamator coromandus</i> (Linnaeus) ..	192
570	Pied Crested Cuckoo, <i>Clamator jacobinus serratus</i> (Sparrrman) ..	194
571	Ceylon Pied Crested Cuckoo, <i>Clamator jacobinus jacobinus</i> (Boddaert) ..	197
572	Large Hawk-Cuckoo, <i>Cuculus sparveroides sparveroides</i> Vigors ..	198
573	Common Hawk-Cuckoo or Brainfever Bird, <i>Cuculus varius varius</i> Vahl ..	200
574	Ceylon Hawk-Cuckoo, <i>Cuculus varius cicelae</i> (Phillips) ..	202
575	Hodgson's Hawk-Cuckoo, <i>Cuculus fugax niscolor</i> Blyth ..	203
576	Indian Cuckoo, <i>Cuculus micropterus micropterus</i> Gould ..	204
577	Asiatic Cuckoo, <i>Cuculus canorus subtelephonus</i> Zarudny ..	207
578	Cuckoo, <i>Cuculus canorus canorus</i> Linnaeus ..	208
579	Khasi Hills Cuckoo, <i>Cuculus canorus bakeri</i> Hartert ..	210
580	Himalayan Cuckoo, <i>Cuculus saturatus saturatus</i> Blyth ..	211
580a	Horsfield's Cuckoo, <i>Cuculus saturatus horsfieldi</i> Moore ..	213, 319
581	Small Cuckoo, <i>Cuculus poliocephalus poliocephalus</i> Latham ..	213
582	Indian Baybanded Cuckoo, <i>Cacomantis sonneratii sonneratii</i> (Latham) ..	215
583	Ceylon Baybanded Cuckoo, <i>Cacomantis sonneratii waitii</i> (Baker) ..	217
584	Indian Plaintive Cuckoo, <i>Cacomantis passerinus</i> (Vahl) ..	218
585	Rufousbellied or Burmese Plaintive Cuckoo, <i>Cacomantis merulinus</i> Heine ..	220
586	Emerald Cuckoo, <i>Chalcites maculatus</i> (Gmelin) ..	221
587	Violet Cuckoo, <i>Chalcites xanthorhynchus xanthorhynchus</i> (Horsfield) ..	223
588	Indian Drongo-Cuckoo, <i>Sumiculus lugubris dicruroides</i> (Hodgson) ..	224
589	Ceylon Drongo-Cuckoo, <i>Sumiculus lugubris steuarti</i> Baker ..	226
590	Indian Koel, <i>Eudynamis scolopacea scolopacea</i> (Linnaeus) ..	227
591	Malay Koel, <i>Eudynamis scolopacea malayana</i> Cabanis & Heine ..	229
592	Andaman Koel, <i>Eudynamis scolopacea dolosa</i> Ripley ..	230
593	Large Greenbilled Malkoha, <i>Rhopodytes tristis tristis</i> (Lesson) ..	231
594	Burmese Large Greenbilled Malkoha, <i>Rhopodytes tristis saliens</i> Mayr ..	232
595	Small Greenbilled Malkoha, <i>Rhopodytes viridirostris</i> (Jerdon) ..	233
596	Western Sirkeer Cuckoo, <i>Taccocua leschenaultii sirkeer</i> (J. E. Gray) ..	234
597	Eastern Sirkeer Cuckoo, <i>Taccocua leschenaultii infusata</i> Blyth ..	236
598	Southern Sirkeer Cuckoo, <i>Taccocua leschenaultii leschenaultii</i> Lesson ..	237
599	Redfaced Malkoha, <i>Phaenitophaga pyrrhocephalus</i> (Pennant) ..	238
600	Common Crow-Pheasant or Coucal, <i>Centropus sinensis sinensis</i> (Stephens) ..	240
601	East Pakistan Crow-Pheasant, <i>Centropus sinensis intermedius</i> (Hume) ..	242
602	Southern Crow-Pheasant, <i>Centropus sinensis parroti</i> Stresemann ..	243
603	Andaman Crow-Pheasant, <i>Centropus (sinensis) andamanensis</i> Beavan ..	244
604	Ceylon Coucal, <i>Centropus chlororhynchus</i> Blyth ..	245
605	Lesser Coucal, <i>Centropus toulou bengalensis</i> (Gmelin) ..	246

Order STRIGIFORMES

Family STRIGIDAE		
Subfamily TYTONINAE: Barn Owls		
606	Indian Barn Owl, <i>Tyto alba stertens</i> Hartert ..	250
607	Andaman Barn Owl, <i>Tyto alba droopstorffii</i> (Hume) ..	251
608	Grass Owl, <i>Tyto capensis longimembris</i> (Jerdon) ..	252
609	Sikkim Bay Owl, <i>Phodilus badius saturatus</i> Robinson ..	253
610	Ceylon Bay Owl, <i>Phodilus badius assimilis</i> Hume ..	255
610a	Peninsular Bay Owl, <i>Phodilus badius ripleyi</i> Hussain & Khan ..	255, 319
Subfamily STRIGINAE: Owls		
611	Western Spotted Scops Owl, <i>Otus spilocephalus huttoni</i> (Hume) ..	256
612	Eastern Spotted Scops Owl, <i>Otus spilocephalus spilocephalus</i> (Blyth) ..	257
613	Andaman Scops Owl, <i>Otus balli</i> (Hume) ..	258
614	Striated or Pallid Scops Owl, <i>Otus brucei</i> (Hume) ..	259

615	Eastern Scops Owl, <i>Otus scops pulchellus</i> (Pallas) ..	261
616	North Indian Scops Owl, <i>Otus scops sumia</i> (Hodgson) ..	262
617	Peninsular Scops Owl, <i>Otus scops rufipennis</i> (Sharpe) ..	263
618	Ceylon Scops Owl, <i>Otus scops leggei</i> Ticehurst ..	264
618a	Andaman Scops Owl, <i>Otus scops modestus</i> (Walden) ..	265
618b	Nicobar Scops Owl, <i>Otus scops nicobariensis</i> (Hume) ..	265, 320
619	Punjab Collared Scops Owl, <i>Otus bakkamoena plumipes</i> (Hume) ..	266
620	West Pakistan Collared Scops Owl, <i>Otus bakkamoena deserticolor</i> Ticehurst ..	267
621	Gangetic Collared Scops Owl, <i>Otus bakkamoena gangeticus</i> Ticehurst ..	268
622	Central Indian Collared Scops Owl, <i>Otus bakkamoena marathae</i> Ticehurst ..	268
623	Ceylon Collared Scops Owl, <i>Otus bakkamoena bakkamoena</i> Pennant ..	269
624	Burmese Collared Scops Owl, <i>Otus bakkamoena lettia</i> (Hodgson) ..	270
625	Turkestan Horned or Eagle-Owl, <i>Bubo bubo turcomanus</i> (Eversmann) ..	271
626	Tibetan Horned or Eagle-Owl, <i>Bubo bubo tibetanus</i> Bianchi ..	272
626a	Himalayan Horned or Eagle-Owl, <i>Bubo bubo hemachalana</i> Hume ..	273
627	Indian Great Horned or Eagle-Owl, <i>Bubo bubo bengalensis</i> (Franklin) ..	273
628	Forest Eagle-Owl, <i>Bubo nipalensis nipalensis</i> Hodgson ..	276
629	Ceylon Forest Eagle-Owl, <i>Bubo nipalensis blighi</i> Legge ..	277
630	Dusky Horned Owl, <i>Bubo coromandus coromandus</i> (Latham) ..	278
631	Brown Fish Owl, <i>Bubo zeylonensis leschenaulti</i> (Temminck) ..	280
632	Ceylon Brown Fish Owl, <i>Bubo zeylonensis zeylonensis</i> (Gmelin) ..	282
633	Tawny Fish Owl, <i>Bubo flavipes</i> (Hodgson) ..	283
634	Snowy Owl, <i>Nyctea scandiaca</i> (Linnaeus) ..	284
635	Collared Pygmy Owllet, <i>Glaucidium brodiei brodiei</i> (Burton) ..	285
636	Barred Jungle Owlet, <i>Glaucidium radiatum radiatum</i> (Tickell) ..	286
637	Malabar Barred Jungle Owlet, <i>Glaucidium radiatum malabaricum</i> (Blyth) ..	288
638	Chestnutbacked Barred Owllet, <i>Glaucidium radiatum castanonotum</i> (Blyth) ..	288
639	West Himalayan Barred Owllet, <i>Glaucidium cuculoides cuculoides</i> (Vigors) ..	289
640	East Himalayan Barred Owllet, <i>Glaucidium cuculoides austerum</i> Ripley ..	291
641	Burmese Barred Owllet, <i>Glaucidium cuculoides rufescens</i> Baker ..	291
642	Indian Brown Hawk-Owl, <i>Ninox scutulata lugubris</i> (Tickell) ..	292
643	Burmese Brown Hawk-Owl, <i>Ninox scutulata burmanica</i> Hume ..	294
644	South Indian Brown Hawk-Owl, <i>Ninox scutulata hirsuta</i> (Temminck) ..	295
645	Hume's Brown Hawk-Owl, <i>Ninox scutulata obscura</i> Hume ..	295
646	Andaman Brown Hawk-Owl, <i>Ninox affinis affinis</i> Beavan ..	296
647	Nicobar Brown Hawk-Owl, <i>Ninox affinis isolata</i> Baker ..	297
648	Hutton's Owllet, <i>Athene noctua bactriana</i> Blyth ..	298
649	Tibet Owllet, <i>Athene noctua ludlowi</i> Baker ..	299
650	Northern Spotted Owllet, <i>Athene brama indica</i> (Franklin) ..	299
651	East Assam Spotted Owllet, <i>Athene brama ultra</i> Ripley ..	301
652	Southern Spotted Owllet, <i>Athene brama brama</i> (Temminck) ..	302
653	Forest Spotted Owllet, <i>Athene blewitti</i> (Hume) ..	302
654	Hume's Wood Owl, <i>Strix butleri</i> (Hume) ..	304
655	Saurashtra Mottled Wood Owl, <i>Strix ocellata grandis</i> Koelz ..	304
656	Northern Mottled Wood Owl, <i>Strix ocellata griseescens</i> Koelz ..	305
657	Southern Mottled Wood Owl, <i>Strix ocellata ocellata</i> (Lesson) ..	305
658	Himalayan Brown Wood Owl, <i>Strix leptogrammica newarensis</i> (Hodgson) ..	307
659, 660	Brown Wood Owl, <i>Strix aluco nivicola</i> (Blyth) ..	308
661	Scully's Wood Owl, <i>Strix aluco biddulphi</i> Scully ..	310
662	Himalayan Wood Owl, <i>Strix aluco nivicola</i> (Blyth) ..	311
663	Longeared Owl, <i>Asio otus otus</i> (Linnaeus) ..	313
664	Shorteared Owl, <i>Asio flammeus flammeus</i> (Pontoppidan) ..	314
665	Tengmalm's Owl, <i>Aegolius funereus caucasicus</i> (Buturlin) ..	317
Appendix		
665	Tengmalm's Owl, <i>Aegolius funereus caucasicus</i> (Buturlin) ..	319

VOLUME 4

Order CAPRIMULGIFORMES

Family PODARGIDAE: Frogmouths		
666	Ceylon Frogmouth, <i>Batrachostomus moniliger</i> Blyth ..	1
667	Hodgson's Frogmouth, <i>Batrachostomus hodgsoni hodgsoni</i> (G. R. Gray) ..	3
Family CAPRIMULGIDAE: Nightjars or Goatsuckers		
668	Great Eared Nightjar, <i>Eurostopus macrotis cerviniceps</i> (Gould) ..	5
669	ssp <i>bourdilloni</i> (Hume) ..	6
670	Indian Jungle Nightjar, <i>Caprimulgus indicus hazarae</i> Whistler & Kinnear ..	8
671	ssp <i>indicus</i> Latham ..	10
672	<i>kelaarti</i> Blyth ..	11
672a	<i>jataka</i> Temminck & Schlegel ..	12, 257
673	ssp <i>capensis</i> ..	12
673a	ssp <i>rtzov</i> ..	14, 258
674	ssp <i>ickell</i> ..	14
675	ssp <i>atripennis</i> Jerdon ..	16
676, 677	ssp <i>bimaculatus</i> Hartert ..	18
678	ssp <i>andamanicus</i> Hume ..	19
679	ssp <i>indicus</i> ..	20
680	Indian Little Nightjar, <i>Caprimulgus asiaticus asiaticus</i> Latham ..	21
681	ssp <i>eidus</i> Peters ..	23
682	Franklin's, or Allied, Nightjar, <i>Caprimulgus affinis monticola</i> Franklin ..	23

Order APODIFORMES

Family APODIDAE		
Subfamily APODINAE: Swifts		
683	Himalayan Swiftlet, <i>Collocalia brevirostris brevirostris</i> (Horsfield) ..	26
684	ssp <i>innominata</i> Hume ..	28
684a	Indomalayan or 'Black-nest' Swiftlet, <i>Collocalia maxima maxima</i> Hume ..	28
685	Indian Edible-nest Swiftlet, <i>Collocalia unicolor</i> (Jerdon) ..	29
686	Andaman Grey-rumped or 'White-nest' Swiftlet, <i>Collocalia fuciphaga inexpectata</i> Hume ..	31
687	Whitebellied Swiftlet, <i>Collocalia esculenta affinis</i> Beavan ..	32
688	Whitethroated Spinetail Swift, <i>Chaetura caudata nudipes</i> (Hodgson) ..	33
689	Cochinchina Spinetail Swift, <i>Chaetura cochinchinensis ruficincta</i> Biswas ..	35
690	ssp <i>cochinchinensis</i> Oustalet ..	35
691	Large Brown-throated Spinetail Swift, <i>Chaetura gigantea indica</i> Hume ..	36
692	Whiterumped Spinetail Swift, <i>Chaetura glystica</i> (Tickell) ..	37
693	Alpine Swift, <i>Apus melba melba</i> (Linnaeus) ..	39
694	ssp <i>nubifuga</i> Koelz ..	40
695	ssp <i>bakeri</i> Hartert ..	42
696	Swift, <i>Apus apus pekinnensis</i> (Swinhoe) ..	43
697	Pallid Swift, <i>Apus pallidus pallidus</i> (Shelley) ..	45
698	Darkbacked Swift, <i>Apus acuticauda</i> (Jerdon) ..	46
699	Large Whiterumped Swift, <i>Apus pacificus pacificus</i> (Latham) ..	47
700	ssp <i>leucorhynchus</i> (Blyth) ..	49
701	ssp <i>kawai</i> (Yamashina) ..	50

702	House-Swift, <i>Apus affinis galileensis</i> (Antinori) ..	50
703	ssp <i>affinis</i> (J. E. Gray) ..	51
704	<i>singalensis</i> Madarasz ..	54
705	<i>nipalensis</i> (Hodgson) ..	54
706	ssp <i>subfasciatus</i> (Blyth) ..	55
707	Palm Swift, <i>Cypsiurus parvus balaensis</i> (J. E. Gray) ..	56
708	ssp <i>infumatus</i> (Sclater) ..	57
Subfamily HEMIPROGNINAE: Crested Swifts		
709	Crested Swift, <i>Hemiprocne longipennis coronata</i> (Tickell) ..	58

Order TROGONIFORMES

Family TROGONIDAE: Trogons		
710	Trogon, <i>Harpactes fasciatus legeri</i> Koelz ..	61
711	ssp <i>malabaricus</i> (Gould) ..	61
712	<i>fasciatus</i> (Pennant) ..	63
713, 714	Redheaded Trogon, <i>Harpactes erythrocephalus hodgsonii</i> (Gould) ..	64
715	ssp <i>erythrocephalus</i> (Gould) ..	66
716	Ward's Trogon, <i>Harpactes wardi</i> (Kinnear) ..	66

Order CORACIIFORMES

Family ALCEDINIDAE: Kingfishers		
717	Pied Kingfisher, <i>Ceryle lugubris continentalis</i> Hartert ..	68
718	ssp <i>guttulata</i> Stejneger ..	70
719	Lesser Pied Kingfisher, <i>Ceryle rudis leucomelanura</i> Reichenbach ..	71
720	ssp <i>travancorensis</i> Whistler & Kinnear ..	73
721	Blyth's Kingfisher, <i>Alcedo hercules</i> Laubmann ..	74
722	Small Blue Kingfisher, <i>Alcedo althys pallasii</i> Reichenbach ..	75
723	ssp <i>bengalensis</i> Gmelin ..	76
724	ssp <i>laprobana</i> Kleinschmidt ..	77
725	Blue-eared Kingfisher, <i>Alcedo meninting collaris</i> Baker ..	78
726	ssp <i>philipini</i> Baker ..	79
726a	ssp <i>rufigaster</i> Walden ..	80
727	Threetoed Kingfisher, <i>Cox erythacus erythacus</i> (Linnaeus) ..	81
727a	ssp <i>rufidorsus</i> Strickland ..	82, 258
728	ssp <i>macrorhynchus</i> Oberholser ..	82

778	<i>spp magnifica</i> Baker	149	838, 839	Darjeeling Pied Woodpecker, <i>Picoides darjellensis darjellensis</i>	218
779	<i>mayri</i> Ripley	149		(Blyth)	219
780	Large Green Barbet, <i>Megalaima zeylanica caniceps</i> (Franklin)	150	840	Crimsonbreasted Pied Woodpecker, <i>Picoides cathpharius cathpharius</i> (Blyth)	219
781	<i>spp inornata</i> Walden	152	840a	<i>spp ludlowi</i> (Vaurie)	220
782	<i>zeylanica</i> (Gmelin)	152	841	<i>pyrrhorostris</i> (Hume)	221
783	Lineated Barbet, <i>Megalaima lineata rana</i> Ripley	153	842	Brownheaded Pied Woodpecker, <i>Picoides auriceps auriceps</i> (Vigors)	221
784	<i>spp hodgsoni</i> Bonaparte	154	843	<i>spp incognitus</i> (Scully)	222
785	Small Green Barbet, <i>Megalaima viridis</i> (Boddaert)	155	844	Stripebreasted Pied Woodpecker, <i>Picoides atratus</i> (Blyth)	223
786	Yellowfronted Barbet, <i>Megalaima flavifrons</i> (Cuvier)	157	845	Fulvousbreasted Pied Woodpecker, <i>Picoides macei macei</i> (Vieillot)	224
787	Goldthroated Barbet, <i>Megalaima franklinii franklinii</i> (Blyth)	157	846	<i>spp andamanensis</i> (Blyth)	225
788	Bluethroated Barbet, <i>Megalaima asiatica asiatica</i> (Latham)	158	847	Yellowfronted Pied Woodpecker, <i>Picoides maharattensis maharattensis</i>	226
789	Blue-eared Barbet, <i>Megalaima australis cyanotis</i> (Blyth)	160		(Latham)	226
790	Crimsonthroated Barbet, <i>Megalaima rubricapilla malabarica</i> (Blyth)	161	848	Greycrested Pigmy Woodpecker, <i>Picoides canicapillus mitchellii</i>	228
791	<i>spp rubricapilla</i> (Gmelin)	162		(Malherbe)	228
792	Crimsonbreasted Barbet or Coppermouth, <i>Megalaima haemacephala indica</i> (Latham)	163	849	<i>spp semicoronatus</i> (Malherbe)	229
Family INDICATORIDAE: Honeyguides					
793	Honeyguide, <i>Indicator xanthonotus raddiffi</i> Hume	165	850	<i>canicapillus</i> (Blyth)	230
794	<i>spp xanthonotus</i> Blyth	166	851	Pigmy Woodpecker, <i>Picoides nanus nanus</i> (Vigors)	231
795	<i>fulvus</i> Ripley	167	852	<i>spp hardwickii</i> (Jerdon)	231
Family PICIDAE					
Subfamily JYNGINAE: Wrynecks					
796	Wryneck, <i>Jynx torquilla torquilla</i> Linnaeus	168	853	<i>cinereigula</i> (Malherbe)	233
797	<i>spp chinensis</i> Hesse	170	854	<i>gymnophthalmus</i> (Blyth)	233
797a	<i>himalayana</i> Vaurie	170	855	Threetoed Woodpecker, <i>Picoides tridactylus funebris</i> Verreaux	234
Subfamily PICUMINAE: Piculets					
798	Speckled Piculet, <i>Picumnus inornatus inornatus</i> Burton	172	856	Heartspotted Woodpecker, <i>Hemicircus canente canente</i> (Lesson)	236
799	<i>spp malayorum</i> Hartert	174	857	Redeared Bay Woodpecker, <i>Blythipicus pyrrhotis pyrrhotis</i> (Hodgson)	238
800	Rufous Piculet, <i>Sasia ochracea ochracea</i> Hodgson	175	858	Blackbacked Woodpecker, <i>Chrysocolaptes festivus festivus</i> (Boddaert)	239
801	<i>spp reichenowii</i> Hesse	176	859	<i>spp tantus</i> Ripley	241
Subfamily PICINAE: Woodpeckers					
802	Rufous Woodpecker, <i>Micropternus brachyurus humei</i> Kloss	177	860	Larger Goldenbacked Woodpecker, <i>Chrysocolaptes lucidus sultaneus</i>	242
803	<i>spp phaeiceps</i> Blyth	178		(Hodgson)	242
804	<i>jerdonii</i> (Malherbe)	179	861	<i>spp guttauristatus</i> (Tickell)	243
Order PASSERIFORMES					
Family EURLAIMIDAE: Broadbills					
864	Collared Broadbill, <i>Serilophus lunatus rubropygius</i> (Hodgson)	247	862	<i>chersonesus</i> Kloss	244
865	Longtailed Broadbill, <i>Prarismomus dalhousiae dalhousiae</i> (Jameson)	248	863	<i>stricklandi</i> (Layard)	245
Family PITTIDAE: Pittas					
866	Bluenaped Pitta, <i>Pitta nipalensis nipalensis</i> (Hodgson)	250			
867	Indian Pitta, <i>Pitta brachyura brachyura</i> (Linnaeus)	252			
868	Bluewinged Pitta, <i>Pitta moluccensis megarhyncha</i> Schlegel	253			
869	Hooded or Greenbreasted Pitta, <i>Pitta sordida cucullata</i> Hartlaub	254			
870	<i>spp abbotti</i> Richmond	255			
871	Blue Pitta, <i>Pitta cyanea cyanea</i> Blyth	256			
Appendix					

VOLUME 5

Order PASSERIFORMES (cont.)

Family ALAUDIDAE: Larks

872	Singing Bush Lark, <i>Mirafra javanica cantillans</i> Blyth	2	891	Ganges Sand Lark, <i>Calandrella reyal reyal</i> (Blyth)	27
873	Bengal Bush Lark, <i>Mirafra asarumica assamica</i> Horsfield	4	892	Eastern Calandra Lark, <i>Melanocorypha bimaculata torquata</i> Blyth	29
874	Madras Bush Lark, <i>Mirafra assamica affinis</i> Blyth	5	893	Ladakh Longbilled Calandra Lark, <i>Melanocorypha maxima holdereri</i>	30
	<i>th</i>	7		Reichenow	30
	<i>th</i>	9	894	Sikkim Longbilled Calandra Lark, <i>Melanocorypha maxima maxima</i>	31
879	Blackcrowned Finch-Lark, <i>Eremophila nigricipes affinis</i> (Blyth)	10		Blyth	31
880	Indian Desert Finch-Lark, <i>Ammomanes deserti phoenicurus</i> (Blyth)	12	895	Pamir Horned Lark, <i>Eremophila alpestris albicula</i> (Bonaparte)	33
881	Persian Rufoustailed Finch-Lark, <i>Ammomanes phoenicurus zarudnyi</i>	13	896	Longbilled Horned Lark, <i>Eremophila alpestris longirostris</i> (Moore)	34
	Hartert	13	897	Sikkim or Elwes's Horned Lark, <i>Eremophila alpestris elwesi</i> (Blanford)	35
882	Indian Rufoustailed Finch-Lark, <i>Ammomanes phoenicurus phoenicurus</i>	14	898	Baluchistan Crested Lark, <i>Galerida cristata magna</i> Hume	37
	(Franklin)	14	899	Indian Crested Lark, <i>Galerida cristata chendoola</i> (Franklin)	37
883	Southern Rufoustailed Finch-Lark, <i>Ammomanes phoenicurus testaceus</i>	16	900	Gilgit Crested Lark, <i>Galerida cristata lynei</i> Whistler	39
	Koelz	16	901	Malabar Crested Lark, <i>Galerida malabarica</i> (Scopoli)	39
884	Large Desert Lark, <i>Alaemon alaudipes doriae</i> (Salvadori)	19	902	Deccan or Sykes's Crested Lark, <i>Galerida drea</i> (Sykes)	40
885	Yarkand Short-toed Lark, <i>Calandrella cinerea longipennis</i> (Eversmann)	19	903	West Siberian Skylark, <i>Alauda arvensis dulcior</i> Brooks	42
886	Rufous Short-toed Lark, <i>Calandrella cinerea dukhunensis</i> (Sykes)	21	903a	Caucasian Skylark, <i>Alauda arvensis cantarella</i> Bonaparte	43
887	Karakoram or Hume's Short-toed Lark, <i>Calandrella acutirostris acutirostris</i> Hume	23	904	Turkestan Small Skylark, <i>Alauda gulgula inornata</i> Severtzov	44
888	Tibet Short-toed Lark, <i>Calandrella acutirostris tibetana</i> Brooks	24	905	Kashmir Small Skylark, <i>Alauda gulgula thamarum</i> R. & A. Meinertzhagen	44
888a	Persian Short-toed Lark, <i>Calandrella rufescens persica</i> (Sharpe)	25	906	Tibetan Small Skylark, <i>Alauda gulgula inornata</i> Bianchi	45
889	Indus Sand Lark, <i>Calandrella reyal adarisi</i> (Hume)	26	907	Indian Small Skylark, <i>Alauda gulgula gulgula</i> Franklin	46
890	Saurashtra Sand Lark, <i>Calandrella reyal krishnakumarsinhji</i> Vaurie & Dharmakumarsinhji	27	908	Nilgiri Small Skylark, <i>Alauda gulgula australis</i> Brooks	47
			909	Yunnan Small Skylark, <i>Alauda gulgula terna</i> Mayr	48
Family HIRUNDINIDAE: Swallows					
910	Siberian Collared Sand Martin, <i>Riparia riparia dilata</i> (Sharpe & Wyatt)	49			

- 911 Eastern Collared Sand Martin, *Riparia riparia ijimae* (Lönngberg) .. 51
 912 Indian Greythroated Sand Martin, *Riparia paludicola chinensis* (J. E. Gray) .. 51
 913 Crag Martin, *Hirundo rupestris* Scopoli .. 53
 914 Dusky Crag Martin, *Hirundo concolor concolor* Sykes .. 55
 915 Pale Crag Martin, *Hirundo obsoleta pallida* (Hume) .. 56
 916 Western Swallow, *Hirundo rustica rustica* Linnaeus .. 57
 917 Eastern Swallow, *Hirundo rustica gutturalis* Scopoli .. 59
 918 Tytler's or Chestnutbellied Swallow, *Hirundo rustica tytleri* Jerdon .. 60
 919 .. 61
 920 .. 62
 921 .. 63
 922 Indian Cliff Swallow, *Hirundo fluvicola* Blyth .. 64
 923 Daurian Striated or Redrumped Swallow, *Hirundo daurica daurica* Linnaeus .. 66
 924 European Striated or Redrumped Swallow, *Hirundo daurica rufula* Temminck .. 67
 925 Himalayan Striated or Redrumped Swallow, *Hirundo daurica nipalensis* Hodgson .. 68
 926 Japanese Striated or Redrumped Swallow, *Hirundo daurica japonica* Temminck & Schlegel .. 70
 927 Indian Striated or Redrumped Swallow, *Hirundo daurica erythrogygia* Sykes .. 70
 928 Ceylon Striated or Redrumped Swallow, *Hirundo daurica hyperythra* Blyth .. 72
 929 Chinese Striated or Redrumped Swallow, *Hirundo striolata mayri* Hall .. 73
 930 European House Martin, *Delichon urbica urbica* (Linnaeus) .. 74
 931 Kashmir House Martin, *Delichon urbica cashmeriensis* (Gould) .. 75
 932 Nepal House Martin, *Delichon nipalensis nipalensis* Moore .. 76
- Family LANIIDAE: Shrikes or 'Butcher Birds'
- 933 Indian Grey Shrike, *Lanius excubitor lahtora* (Sykes) .. 79
 934 Baluchistan Grey Shrike, *Lanius excubitor pallidirostris* Cassin .. 81
 935 Persian Grey Shrike, *Lanius excubitor aucheri* Bonaparte .. 82
 936 Turkestan Grey Shrike, *Lanius excubitor homeyeri* Cabanis .. 82
 937 Lesser Grey Shrike, *Lanius minor* Gmelin .. 83
 938 Chestnutrumped Shrike, *Lanius collurioideus* Lesson .. 83
 939 Baluchistan Baybacked Shrike, *Lanius vittatus nargianus* Vaurie .. 84
 940 Indian Baybacked Shrike, *Lanius vittatus vittatus* Valenciennes .. 85
 941 Redbacked Shrike, *Lanius collurio collurio* Linnaeus .. 87
 942 Rufous Shrike, *Lanius collurio phoenicoides* (Schalow) .. 88
 943 Pale Brown Shrike, *Lanius collurio isabellinus* Hemprich & Ehrenberg .. 89
 944 Ladakh Greybacked Shrike, *Lanius tephronotus lahulensis* Koelz .. 91
 945 Eastern Tibet Greybacked Shrike, *Lanius tephronotus tephronotus* (Vigors) .. 92
 946 Rufousbacked Shrike, *Lanius schach erythronotus* (Vigors) .. 93
 947 South Indian Greybacked Shrike, *Lanius schach caniceps* Blyth .. 96
 948 Blackheaded Shrike, *Lanius schach tricolor* (Hodgson) .. 96
 949 Brown Shrike, *Lanius cristatus cristatus* Linnaeus .. 98
 950 Philippine Shrike, *Lanius cristatus lucionensis* Linnaeus .. 100
 951 Eastern Woodchat Shrike, *Lanius senator niloticus* (Bonaparte) .. 101
- Family ORIOOLIDAE: Orioles
- 952 European Golden Oriole, *Oriolus oriolus oriolus* (Linnaeus) .. 102
 953 Indian Golden Oriole, *Oriolus oriolus kundoo* Sykes .. 103
 954 Eastern Blacknaped Oriole, *Oriolus chinensis diffusus* Sharpe .. 105
 955 Slenderbilled Blacknaped Oriole, *Oriolus chinensis tenuirostris* Blyth .. 106
 956 Andaman Blacknaped Oriole, *Oriolus chinensis andamanensis* Tytler .. 107
 957 Nicobar Blacknaped Oriole, *Oriolus chinensis macrourus* Blyth .. 108
 958 North Indian Blackheaded Oriole, *Oriolus xanthornus xanthornus* (Linnaeus) .. 108
 959 South Indian Blackheaded Oriole, *Oriolus xanthornus maderaspatanus* Franklin .. 110
 960 Ceylon Blackheaded Oriole, *Oriolus xanthornus ceylonensis* Bonaparte .. 111
 960a Andaman Blackheaded Oriole, *Oriolus xanthornus andamanensis* Abdulali footnote .. 109
 961 Indian Maroon Oriole, *Oriolus trailii trailii* (Vigors) .. 112
- Family DICURURIDAE: Drongos
- 962 North Indian Black Drongo or King Crow, *Dicrurus adsimilis albirictus* (Hodgson) .. 114
 963 South Indian Black Drongo or King Crow, *Dicrurus adsimilis macrocerus* Vieillot .. 117
 964 Ceylon Black Drongo or King Crow, *Dicrurus adsimilis minor* Blyth .. 118
 965 Indian Grey Drongo, *Dicrurus leucophaeus longicaudatus* Hay .. 119
 966 Assam Grey Drongo, *Dicrurus leucophaeus hopwoodi* Baker .. 121
 966a Whitecheeked Grey Drongo, *Dicrurus leucophaeus salangensis* Reichenow .. 121
 967 Indian Whitebellied Drongo, *Dicrurus caerulescens caerulescens* (Linnaeus) .. 122
 968 Ceylon Whitebellied Drongo, *Dicrurus caerulescens insularis* (Sharpe) .. 123
 969 Ceylon Whitevented Drongo, *Dicrurus caerulescens leucopygialis* Blyth .. 124
 970 Crowbilled Drongo, *Dicrurus annectans* (Hodgson) .. 125
 971 Bronzed Drongo, *Dicrurus aeneus aeneus* Vieillot .. 126
 972 Lesser Racket-tailed Drongo, *Dicrurus remifer tectirostris* (Hodgson) .. 128
 973 Haircrested or Spangled Drongo, *Dicrurus hottentottus hottentottus* (Linnaeus) .. 131
 974 Large Andaman Drongo, *Dicrurus andamanensis dicruriformis* (Hume) .. 134
 975 Small Andaman Drongo, *Dicrurus andamanensis andamanensis* Tytler .. 134
 976 Northern Large Racket-tailed Drongo, *Dicrurus paradiseus grandis* (Gould) .. 136
 977 Southern Large Racket-tailed Drongo, *Dicrurus paradiseus paradiseus* (Linnaeus) .. 137
 978 Ceylon Large Racket-tailed Drongo, *Dicrurus paradiseus ceylonicus* Vaurie .. 140
 979 Ceylon Crested Black Drongo, *Dicrurus paradiseus lophorhinus* Vieillot .. 140
 980 Andaman Racket-tailed Drongo, *Dicrurus paradiseus otiosus* (Richmond) .. 142
 981 Nicobar Racket-tailed Drongo, *Dicrurus paradiseus nicobariensis* (Baker) .. 142
- Family ARTAMIDAE: Swallow-Shrikes or Wood Swallows
- 982 Ashy Swallow-Shrike, *Artamus fuscus* Vieillot .. 143
 983 Whitebreasted Swallow-Shrike, *Artamus leucorhynchus humei* Stresemann .. 145
- Family STURNIDAE: Starlings, Mynas
- 984 Spottedwinged Stare, *Saroglossa spiloptera* (Vigors) .. 147
 985 Tipperah Glossy Stare, *Aplonis panayensis affinis* (Blyth) .. 149
 986 Andaman Glossy Stare, *Aplonis panayensis tytleri* (Hume) .. 150
 987 .. (Gmelin) .. 152
 988 .. don) .. 154
 989 .. Jerdon) .. 155
 990 Andaman Whitecheeked Myna, *Sturnus erythropygius andamanensis* (Tytler) .. 156
 991 Nicobar Whiteheaded Myna, *Sturnus erythropygius erythropygius* (Blyth) .. 157
 992 Katchal Whiteheaded Myna, *Sturnus erythropygius katchalensis* (Richmond) .. 158
 993 Ceylon Whiteheaded Myna, *Sturnus sinex* (Bonaparte) .. 159
 994 Blackheaded or Brahminy Myna, *Sturnus pagodarum* (Gmelin) .. 160
 995 Daurian Myna, *Sturnus sturninus* (Pallas) .. 162
 996 Rosy Starling or Rosy Pastor, *Sturnus roseus* (Linnaeus) .. 163
 997 Finsch's or Common Indian Starling, *Sturnus vulgaris pollardskyi* Finsch .. 166
 998 .. Hume .. 168
 999 .. tus Sharpe .. 169
 1000 .. 170
 1001 .. 170
 1002 Indian Pied Myna, *Sturnus contra contra* Linnaeus .. 172
 1003 Eastern Pied Myna, *Sturnus contra sordidus* Ripley .. 175
 1004 Burmese Pied Myna, *Sturnus contra superciliosus* (Blyth) .. 175
 1005 Chinese or Greybacked Myna, *Sturnus sinensis* (Gmelin) .. 176
 1006 .. 177
 1007 .. 180
 1008 .. 181
 1009 Northern Jungle Myna, *Acridotheres fuscus fuscus* (Wagler) .. 183
 1010 .. 185

1489	Western Spotted Bush Warbler, <i>Bradypterus thoracicus przewalskii</i> (Sushkin)	20	1561	Largebilled Reed Warbler, <i>Acrocephalus stentoreus orinus</i> Oberholser	115	
1490	Eastern Spotted Bush Warbler, <i>Bradypterus thoracicus thoracicus</i> (Blyth)	21	1562	Siberian Booted Tree Warbler, <i>Hippolais caligata caligata</i> (Lichtenstein)	117	
1491	Largebilled Bush Warbler, <i>Bradypterus major major</i> (Brooks)	22	1563	Indian Booted Tree Warbler, <i>Hippolais caligata rama</i> (Sykes)	118	
1492	Chinese Bush Warbler, <i>Bradypterus taczanowskii taczanowskii</i> (Swinhoe)	24	1564	Upcher's Tree Warbler, <i>Hippolais languida</i> (Hemprich & Ehrenberg)	119	
1493	Brown Bush Warbler, <i>Bradypterus luteocentris luteocentris</i> (Hodgson)	25	1564a	Barred Warbler, <i>Sylvia nisoria</i> (Bechstein)	121	
1494	Ceylon Bush Warbler, <i>Bradypterus pallieri</i> (Blyth)	26	1565	Eastern Orphean Warbler, <i>Sylvia hortensis jerdoni</i> (Blyth)	122	
1495	Moustached Sedge Warbler, <i>Luscinola melanocephala mimica</i> Madarász	27	1566	Indian Whitethroat, <i>Sylvia communis icterops</i> Menétrics	124	
1496	Redheaded Fantail Warbler, <i>Cisticola exilis erythrocephala</i> Blyth	30	1567	Siberian Lesser Whitethroat, <i>Sylvia curruca blythi</i> Ticehurst & Whistler	126	
1497	Yellowheaded Fantail Warbler, <i>Cisticola exilis tyleri</i> Jerdon	31	1568	Kirghiz Lesser Whitethroat, <i>Sylvia curruca halimodendri</i> Sushkin	128	
1498	Streaked Fantail Warbler, <i>Cisticola juncidis curvatus</i> (Franklin)	33	1569	Small Whitethroat, <i>Sylvia curruca minuta</i> Hume	128	
1499	Kerala Streaked Fantail Warbler, <i>Cisticola juncidis salimellii</i> Whistler	35	1570	Hume's Lesser Whitethroat, <i>Sylvia curruca althaea</i> Hume	129	
1500	Ceylon Streaked Fantail Warbler, <i>Cisticola juncidis omalura</i> Blyth	36	1571	Desert Warbler, <i>Sylvia nana nana</i> (Hemprich & Ehrenberg)	130	
1500a	Malay Streaked Fantail Warbler, <i>Cisticola juncidis malaya</i> Lynes	37	1572	Northern Leaf Warbler, <i>Phylloscopus trochilus acredula</i> (Linnaeus)	134	
1501	Rufous Wren-Warbler, <i>Prinia rufescens rufescens</i> Blyth	38	1573	Siberian Leaf Warbler, <i>Phylloscopus trochilus yakutensis</i> Ticehurst	135	
1502	Northern Ashy-grey Wren-Warbler, <i>Prinia hodgsonii rufula</i> Godwin-Austen	40	1574	European Chiffchaff, <i>Phylloscopus collybita collybita</i> (Vieillot)	136	
1503	Franklin's Ashy-grey Wren-Warbler, <i>Prinia hodgsonii hodgsonii</i> Blyth	42	1575	Brown Chiffchaff, <i>Phylloscopus collybita tristis</i> Blyth	137	
1504	Southern Ashy-grey Wren-Warbler, <i>Prinia hodgsonii albogularis</i> Walden	44	1576	Sind Chiffchaff, <i>Phylloscopus collybita sindicus</i> Brooks	138	
1505	Ceylon Ashy-grey Wren-Warbler, <i>Prinia hodgsonii pectoralis</i> Legge	45	1577	Plain Leaf Warbler, <i>Phylloscopus neglectus</i> Hume	139	
1506	Rufousfronted Wren-Warbler, <i>Prinia buchanani</i> Blyth	46	1578	Tyler's Leaf Warbler, <i>Phylloscopus tyleri</i> Brooks	141	
1507	Hodgson's Wren-Warbler, <i>Prinia cinereocapilla</i> Hodgson	48	1579	Tickell's Leaf Warbler, <i>Phylloscopus affinis affinis</i> (Tickell)	142	
1508	Indian Streaked Wren-Warbler, <i>Prinia gracilis lepida</i> Blyth	49	1580	Buffbellied Leaf Warbler, <i>Phylloscopus affinis arcuatus</i> Ripley	144	
1509	Eastern Streaked Wren-Warbler, <i>Prinia gracilis sterceni</i> Hartert	51	1581	Olivaceous Leaf Warbler, <i>Phylloscopus griseolus</i> Blyth	145	
1510	Northwestern Plain Wren-Warbler, <i>Prinia subflava terrioris</i> (Hume)	52	1582	Smoky Leaf Warbler, <i>Phylloscopus fulviger fulviger</i> (Hodgson)	146	
1511	Central India Plain Wren-Warbler, <i>Prinia subflava inornata</i> Sykes	53	1583	Tibetan Smoky Leaf Warbler, <i>Phylloscopus fulviger tibetanus</i> Ticehurst	147	
1512	Eastern Plain Wren-Warbler, <i>Prinia subflava fusca</i> (Hodgson)	55	1584	Szechuan Dusky Leaf Warbler, <i>Phylloscopus fuscatus weigoldi</i> Stresemann	148	
1513	Nilgiri Plain Wren-Warbler, <i>Prinia subflava franklinii</i> Blyth	56	1585	Manipur Dusky Leaf Warbler, <i>Phylloscopus fuscatus mariae</i> Ripley	148	
1514	Ceylon Plain Wren-Warbler, <i>Prinia subflava insularis</i> (Legge)	57	1586	Siberian Dusky Leaf Warbler, <i>Phylloscopus fuscatus fuscatus</i> (Blyth)	149	
1515	Northern Ashy Wren-Warbler, <i>Prinia socialis sterceni</i> Blyth	57	1587	Western Orangebarred Leaf Warbler, <i>Phylloscopus pulcher kangrae</i> Ticehurst	151	
1516	Assam Ashy Wren-Warbler, <i>Prinia socialis inglii</i> Whistler & Kinnear	59	1588, 1589	Eastern Orangebarred Leaf Warbler, <i>Phylloscopus pulcher pulcher</i> Blyth	152	
1517	Southern Ashy Wren-Warbler, <i>Prinia socialis socialis</i> Sykes	59	1590	Hume's Yellowbrowed Leaf Warbler, <i>Phylloscopus inornatus humei</i> (Brooks)	153	
1518	Ceylon Ashy Wren-Warbler, <i>Prinia socialis brevicauda</i> Legge	61	1591	Mandelli's Yellowbrowed Leaf Warbler, <i>Phylloscopus inornatus mandelli</i> (Brooks)	155	
1519	Gangetic Jungle Wren-Warbler, <i>Prinia sylvatica gangetica</i> (Blyth)	62	1592	Siberian Yellowbrowed Leaf Warbler, <i>Phylloscopus inornatus inornatus</i> (Blyth)	156	
1520	Northwestern Jungle Wren-Warbler, <i>Prinia sylvatica insignis</i> (Hume)	64	1593	Brooks's Leaf Warbler, <i>Phylloscopus subviridis</i> (Brooks)	157	
1521	Peninsular Jungle Wren-Warbler, <i>Prinia sylvatica sylvatica</i> Jerdon	64	1594	Western Pallas's Leaf Warbler, <i>Phylloscopus proregulus similis</i> Ticehurst	158	
1522	Orissa Jungle Wren-Warbler, <i>Prinia sylvatica mahendras</i> Koelz	65	1595	Nepal Pallas's Leaf Warbler, <i>Phylloscopus proregulus chloronotus</i> (Gray)	159	
1523	Ceylon Jungle Wren-Warbler, <i>Prinia sylvatica valida</i> (Blyth)	65	1596	Eastern Pallas's Leaf Warbler, <i>Phylloscopus proregulus newtoni</i> Gäcke	160	
1524	Sind Yellowbellied Wren-Warbler, <i>Prinia flaviventris sindiana</i> Ticehurst	66	1597	Western Greyfaced Leaf Warbler, <i>Phylloscopus maculipennis virens</i> Ticehurst	161	
1525	Assam Yellowbellied Wren-Warbler, <i>Prinia flaviventris flaviventris</i> (Delessert)	67	1598	Central Greyfaced Leaf Warbler, <i>Phylloscopus maculipennis centralis</i> Ripley	161	
1526	Sind Brown Hill Warbler, <i>Prinia criniger striatula</i> (Hume)	69	1599	Eastern Greyfaced Leaf Warbler, <i>Phylloscopus maculipennis maculipennis</i> (Blyth)	162	
1527	Himalayan Brown Hill Warbler, <i>Prinia criniger criniger</i> Hodgson	70	1600	Arctic Leaf Warbler, <i>Phylloscopus borealis borealis</i> (Blasius)	163	
1528	Assam Brown Hill Warbler, <i>Prinia criniger catharia</i> Reichenow	71	1601	Largebilled Leaf Warbler, <i>Phylloscopus magnirostris</i> Blyth	164	
1529	Himalayan Blackthroated Hill Warbler, <i>Prinia atrogularis atrogularis</i> (Moore)	72	1602	Western Greenish Leaf Warbler, <i>Phylloscopus trochiloides viridans</i> Blyth	166	
1530	Assam Blackthroated Hill Warbler, <i>Prinia atrogularis khasiana</i> (Godwin-Austen)	73	1603	Baltistan Greenish Leaf Warbler, <i>Phylloscopus trochiloides ludlowi</i> Whistler	168	
1531	Western Longtailed Grass Warbler, <i>Prinia burnesii burnesii</i> (Blyth)	74	1604	Eastern Greenish Leaf Warbler, <i>Phylloscopus trochiloides trochiloides</i> (Sunderwall)	169	
1532	Eastern Longtailed Grass Warbler, <i>Prinia burnesii cinerascens</i> (Walden)	76	1605	Bright Green Leaf Warbler, <i>Phylloscopus trochiloides nitidus</i> Blyth	170	
1533	Streaked Scrub Warbler, <i>Scotocerca inquieta striata</i> (Brooks)	77				
1534	Large Grass Warbler, <i>Gremicinia bengalensis bengalensis</i> Jerdon	78				
1535	Indian Tailor Bird, <i>Orthotomus sutorius guzeratus</i> (Latham)	81				
1536	Bengal Tailor Bird, <i>Orthotomus sutorius petio</i> Hodgson	84				
1537	Mishmi Tailor Bird, <i>Orthotomus sutorius luteus</i> Ripley	84				
1538	Ceylon Tailor Bird, <i>Orthotomus sutorius sutorius</i> (Pennant)	85				
1539	Ceylon Highland Tailor Bird, <i>Orthotomus sutorius fremdeni</i> Whistler	86				
1540	Blacknecked Tailor Bird, <i>Orthotomus atrogularis nitidus</i> Hume	86				
1541	Goldenheaded Tailor Bird, <i>Orthotomus cucullatus coreatus</i> Blyth	87				

1605a	Palelegged Leaf Warbler, <i>Phylloscopus tenellipes</i> Swinhoe	171	1634	Tibetan Tit-Warbler, <i>Leptopoeile sophiae obscura</i> Przevalski	202
1606	Large Crowned Leaf Warbler, <i>Phylloscopus occipitalis occipitalis</i> (Blyth)	172		Subfamily TURDINAE: Thrushes and Chats	
1607	Eastern Crowned Leaf Warbler, <i>Phylloscopus occipitalis coronatus</i> (Temminck & Schlegel)	174	1635		204
1608	Small Crowned Leaf Warbler, <i>Phylloscopus reguloides kashmirensis</i> Ticehurst	175	1636		205
1609	Blyth's Crowned Leaf Warbler, <i>Phylloscopus reguloides reguloides</i> (Blyth)	177	1637		206
1610	Assam Crowned Leaf Warbler, <i>Phylloscopus reguloides assamensis</i> Hartert	178	1638		206
1611	Yunnan Crowned Leaf Warbler, <i>Phylloscopus reguloides claudiae</i> (La Touche)	178	1639		207
1612	Blackbrowed or Yellowfaced Leaf Warbler, <i>Phylloscopus cantator cantator</i> (Tickell)	179	1640		209
1613	Allied Flycatcher-Warbler, <i>Seiurus affinis</i> (Hodgson)	180	1641	(Ménétries)	210
1614	Western Blackbrowed Flycatcher-Warbler, <i>Seiurus burkii whistleri</i> Ticehurst	182	1642	Persian Nightingale, <i>Eriothacus megarhynchus hafizi</i> (Severtzov)	214
1615	Eastern Blackbrowed Flycatcher-Warbler, <i>Seiurus burkii burkii</i> (Burton)	183	1643	Rubythroat, <i>Eriothacus calliope</i> (Pallas)	215
1615a	Burmese Blackbrowed Flycatcher-Warbler, <i>Seiurus burkii lephrocephalus</i> (Anderson)	184	1644	Northern Bluethroat, <i>Eriothacus svecicus svecicus</i> (Linnaeus)	217
1616	Western Greyheaded Flycatcher-Warbler, <i>Seiurus xanthoschistos albosuperciliaris</i> (Jerdon)	185	1645	Turkistan Bluethroat, <i>Eriothacus svecicus pallidigularis</i> (Zarudny)	218
1617	Nepal Greyheaded Flycatcher-Warbler, <i>Seiurus xanthoschistos xanthoschistos</i> (Gray)	186	1646	Ladakh Bluethroat, <i>Eriothacus svecicus abbotti</i> (Richmond)	220
1618	Mishmi Greyheaded Flycatcher-Warbler, <i>Seiurus xanthoschistos flavogularis</i> (Godwin-Austen)	187	1646a	Central Asian Bluethroat, <i>Eriothacus svecicus saturator</i> (Sushkin)	221
1619	Assam Greyheaded Flycatcher-Warbler, <i>Seiurus xanthoschistos tephrodia</i> Sick	187	1647	West Himalayan Rubythroat, <i>Eriothacus pectoralis pectoralis</i> (Gould)	221
1620	Greycheeked Flycatcher-Warbler, <i>Seiurus poliogenys</i> (Blyth)	188	1648	Eastern Rubythroat, <i>Eriothacus pectoralis confusus</i> (Hartert)	224
1621	Chestnut-headed Flycatcher-Warbler, <i>Seiurus castaneiceps castaneiceps</i> (Hodgson)	189	1649	Tibetan Rubythroat, <i>Eriothacus pectoralis tschebawicus</i> (Przevalski)	225
1622	Sikkim Yellowbellied Flycatcher-Warbler, <i>Abroscopus superciliaris flaviventris</i> (Jerdon)	190	1650	1651 Indian Blue Chat, <i>Eriothacus brunneus</i> (Hodgson)	226
1623	Arunachal Yellowbellied Flycatcher-Warbler, <i>Abroscopus superciliaris drastius</i> Deignan	191	1652	Firethroat, <i>Eriothacus pectoralis</i> (David)	228
1624	Nepal Blackfaced Flycatcher-Warbler, <i>Abroscopus schisticeps schisticeps</i> (Gray)	192	1653	Siberian Blue Chat, <i>Eriothacus cyane cyane</i> (Pallas)	229
1625	Assam Blackfaced Flycatcher-Warbler, <i>Abroscopus schisticeps flavimentalis</i> (Baker)	193	1654	Kashmir Redflanked Bush Robin, <i>Eriothacus cyanurus pallidior</i> (Baker)	230
1626	Whitethroated Flycatcher-Warbler, <i>Abroscopus albogularis albogularis</i> (Horsfield & Moore)	194	1655	Eastern Redflanked Bush Robin, <i>Eriothacus cyanurus rufilatus</i> (Hodgson)	232
1627	Broadbilled Flycatcher-Warbler, <i>Abroscopus hodgsoni hodgsoni</i> (Moore)	195	1656	Japanese Blue Chat, <i>Eriothacus cyanurus cyanurus</i> (Pallas)	233
1628	Turkistan Goldcrest, <i>Regulus regulus tristis</i> Pleske	196	1657	Western Golden Bush Robin, <i>Eriothacus chrysaeus whistleri</i> (Ticehurst)	234
1629	Himalayan Goldcrest, <i>Regulus regulus himalayensis</i> Bonaparte	197	1658	Eastern Golden Bush Robin, <i>Eriothacus chrysaeus chrysaeus</i> (Hodgson)	234
1630	Sikkim Goldcrest, <i>Regulus regulus sikkimensis</i> R. & A. Meinertzhagen	198	1659	Whitebrowed Bush Robin, <i>Eriothacus indicus indicus</i> (Vieillot)	236
1631	Yunnan Goldcrest, <i>Regulus regulus yunnanensis</i> Rippon	199	1660	Rufousbellied Bush Robin, <i>Eriothacus hyperythrus</i> (Blyth)	237
1632	Crested Tit-Warbler, <i>Leptopoeile elegans</i> Przevalski	199	1661	Indian Magpie-Robin, <i>Copsychus saularis saularis</i> (Linnaeus)	239
1633	Turkistan Tit-Warbler, <i>Leptopoeile sophiae sophiae</i> Severtzov	201	1662	Ceylon Magpie-Robin, <i>Copsychus saularis ceylonensis</i> Selater	242
			1663	Assam Magpie-Robin, <i>Copsychus saularis erimialis</i> Oberholser	243
			1664	Andaman Magpie-Robin, <i>Copsychus saularis andamanensis</i> Hume	243
			1665	Malabar Shama, <i>Copsychus malabaricus malabaricus</i> (Scopoli)	244
			1666	Ceylon Shama, <i>Copsychus malabaricus leggei</i> (Whistler)	245
			1667	Indian Shama, <i>Copsychus malabaricus indicus</i> (Baker)	246

VOLUME 9

Order PASSERIFORMES (cont.)

Family MUSCICAPIDAE (cont.)

Subfamily TURDINAE: Thrushes and Chats (cont.)					
1681	Whitetailed Blue Robin, <i>Cinclidium leucurus</i> (Hodgson)	1	1741	Smallbilled Mountain Thrush, <i>Zoothera dauma dauma</i> (Latham)	97
1682	Bluefronted Robin, <i>Cinclidium frontale frontale</i> Blyth	3	1742	Nilgiri Thrush, <i>Zoothera dauma nilgherrensis</i> (Blyth)	100
1683	Grandala, <i>Grandala coelestis</i> Hodgson	4	1743	Ceylon Scaly Thrush, <i>Zoothera dauma imbricata</i> Layard	100
1684	Little Forktail, <i>Enicurus scouleri scouleri</i> Vigors	7	1744	Golden Thrush, <i>Zoothera dauma aurea</i> (Holandre)	101
1685	Blackbacked Forktail, <i>Enicurus immaculatus</i> (Hodgson)	9	1745	Large Brown Thrush, <i>Zoothera monticola monticola</i> Vigors	104
1686	Slatybacked Forktail, <i>Enicurus schistaceus</i> (Hodgson)	10	1746	Lesser Brown Thrush, <i>Zoothera marginata</i> Blyth	106
1687	Leschenault's Forktail, <i>Enicurus leschenaulti indicus</i> Hartert	12	1747	Blackbreasted Thrush, <i>Turdus dissimilis dissimilis</i> Blyth	108
1688	Western Spotted Forktail, <i>Enicurus maculatus maculatus</i> Vigors	13	1748	Tickell's Thrush, <i>Turdus unicolor</i> Tickell	110
1689	Eastern Spotted Forktail, <i>Enicurus maculatus guttatus</i> Gould	15	1749	Whitethroated Blackbird, <i>Turdus albocinctus</i> Royle	110
1690	Purple Cochoa, <i>Cochoa purpurea</i> Hodgson	16	1750	Greywinged Blackbird, <i>Turdus boulboul</i> (Latham)	112
1691	Green Cochoa, <i>Cochoa viridis</i> Hodgson	18	1751	Turkistan Blackbird, <i>Turdus merula intermedia</i> (Richmond)	115
1692	Brown Rock Chat, <i>Cercomela fusca</i> (Blyth)	20	1752	Tibetan Blackbird, <i>Turdus merula maximus</i> (Seebom)	116
1693	Stoliczka's Bush Chat, <i>Saxicola macrorhynchos</i> (Stoliczka)	23	1753	Blackcapped Blackbird, <i>Turdus merula nigropilus</i> (Lafresnaye)	117
1694	Hodgson's Bush Chat, <i>Saxicola insignis</i> Gray	24	1754	Eastern Ghats Blackbird, <i>Turdus merula spenceri</i> Whistler & Kinnear	119
1695	West Siberian Collared Bush Chat, <i>Saxicola torquata maurea</i> (Pallas)	26	1755	Nilgiri Blackbird, <i>Turdus merula similis</i> Jerdon	120
1696	Tibetan Collared Bush Chat, <i>Saxicola torquata przewalskii</i> (Pleske)	27	1756	Bourdon's Blackbird, <i>Turdus merula bourdilloni</i> (Seebom)	121
1697	Indian Collared Bush Chat, <i>Saxicola torquata indica</i> (Blyth)	28	1757	Ceylon Blackbird, <i>Turdus merula kinneari</i> (Kelaart)	122
1698	East Siberian Collared Bush Chat, <i>Saxicola torquata stejnegeri</i> (Parrot)	29	1758	Western Greyheaded Thrush, <i>Turdus rubrocanus rubrocanus</i> G. R. Gray	124
1699	Whitetailed Bush Chat, <i>Saxicola leucura</i> (Blyth)	30	1759	Eastern Greyheaded Thrush, <i>Turdus rubrocanus gouldii</i> (Verreaux)	124
1700	Northern Pied Bush Chat, <i>Saxicola caprata bicolor</i> Sykes	32	1760	Kessler's Thrush, <i>Turdus kessleri</i> Przevalski	125
1701	Burmese Pied Bush Chat, <i>Saxicola caprata burmanica</i> Baker	34	1761	Fea's Thrush, <i>Turdus feai</i> (Salvadori)	126
1702	Nilgiri Pied Bush Chat, <i>Saxicola caprata nilgiriensis</i> Whistler	34	1762	Dark Thrush, <i>Turdus obscurus</i> Gmelin	126
1703	Ceylon Pied Bush Chat, <i>Saxicola caprata atrata</i> (Kelaart)	35	1763	Blackthroated Thrush, <i>Turdus ruficollis atrogularis</i> Jarocki	127
1704	Jerdon's Bush Chat, <i>Saxicola jerdoni</i> (Blyth)	36	1764	Redthroated Thrush, <i>Turdus ruficollis ruficollis</i> Pallas	129
1705	Dark-grey Bush Chat, <i>Saxicola ferrea</i> Gray	37	1765	Dusky Thrush, <i>Turdus naumanni eunomus</i> Temminck	130
1706	Isabelline Chat, <i>Oenanthe isabellina</i> (Temminck)	40	1766	Fieldfare, <i>Turdus pilaris</i> Linnaeus	131
1707	Redtailed Chat, <i>Oenanthe xanthopyrma kingi</i> (Hume)	42	1767	Redwing, <i>Turdus iliacus</i> Linnaeus	132
1708	Wheatear, <i>Oenanthe oenanthe</i> (Linnaeus)	44	1768	Mistle Thrush, <i>Turdus viscivorus bonapartei</i> Cabanis	133
1709	Tibetan Desert Wheatear, <i>Oenanthe deserti orophila</i> (Oberholser)	45		Family TROGLODYTIDAE: Wrens	135
1710	Central Asian Desert Wheatear, <i>Oenanthe deserti deserti</i> (Temminck)	47	1769	Magrath's Wren, <i>Troglodytes troglodytes magrathi</i> (Whitehead)	136
1711	Barnes's Chat, <i>Oenanthe finchii barnesi</i> (Oates)	48	1770	Kashmir Wren, <i>Troglodytes troglodytes neglectus</i> Brooks	137
1712	Pied Chat, <i>Oenanthe picaea</i> (Blyth)	50	1771	Nepal Wren, <i>Troglodytes troglodytes nipalensis</i> Blyth	137
1713	Hooded Chat, <i>Oenanthe monacha</i> (Temminck)	52		Family CINCLIDAE: Dippers	139
1714	Hume's Chat, <i>Oenanthe alboniger</i> (Hume)	53	1772	Whitebellied Dipper, <i>Cinclus cinclus leucogaster</i> Bonaparte	140
1715	Pleschanka's Chat, <i>Oenanthe pleschanka pleschanka</i> (Lepechin)	55	1773	Whitebreasted Dipper, <i>Cinclus cinclus cashmeriensis</i> Gould	141
1716	Whitethroated Redstart or River Chat, <i>Chaimarrornis leucocephalus</i> (Vigors)	57	1774	Eastern Whitebreasted Dipper, <i>Cinclus cinclus przewalskii</i> Bianchi	142
1717		60	1775		144
1718		61		Family PRUNELLIDAE: Accentors or 'Hedge Sparrows'	145
1719		62	1777	Turkistan Alpine Accentor, <i>Prunella collaris rufilata</i> (Severtzov)	146
1720	Blackbacked Indian Robin, <i>Saxicoloides fulicata fulicata</i> (Linnaeus)	62	1778	Garhwal Alpine Accentor, <i>Prunella collaris uhympieri</i> (Baker)	147
1721	Ceylon Black Robin, <i>Saxicoloides fulicata leucopetra</i> (Lesson)	65	1779	Eastern Alpine Accentor, <i>Prunella collaris nipalensis</i> (Blyth)	148
1722	Rock Thrush, <i>Monticola saxatilis</i> (Linnaeus)	66	1780	Altai Accentor, <i>Prunella himalayana</i> (Blyth)	150
1723	Bluecheeked Rock Thrush, <i>Monticola cinclorhynchus</i> (Vigors)	67	1781	Robin Accentor, <i>Prunella rubeculoides</i> (Moore)	152
1724	Chestnutbellied Rock Thrush, <i>Monticola rufiventris</i> (Jardine & Selby)	70	1782	Western Rufousbreasted Accentor, <i>Prunella strophata jerdoni</i> (Brooks)	154
1725	Iranian Blue Rock Thrush, <i>Monticola solitarius longirostris</i> (Blyth)	72	1783	Eastern Rufousbreasted Accentor, <i>Prunella strophata strophata</i> (Blyth)	155
1726	Indian Blue Rock Thrush, <i>Monticola solitarius pandoo</i> (Sykes)	73	1784	Turkistan Brown Accentor, <i>Prunella fulvescens fulvescens</i> (Severtzov)	156
1727	Ceylon Whistling Thrush, <i>Miyophobus blighi</i> (Holdsworth)	76	1785	Tibet Brown Accentor, <i>Prunella fulvescens sushkini</i> Collin & Hartert	157
1728	Malabar Whistling Thrush, <i>Miyophobus horsfieldii</i> (Vigors)	77	1785a	Radde's Accentor, <i>Prunella fulvescens ocularis</i> (Radde)	157

1928	Assam Yellowbacked Sunbird, <i>Aethopyga siparaja tabacula</i> (Horsfield) ..	49	1962	Indian Streaked Weaver Bird, <i>Ploceus manyar flaviceps</i> Lesson ..	98
1929	Vigors's Yellowbacked Sunbird, <i>Aethopyga siparaja vigorsii</i> (Sykes) ..	49	1963	Burmese Streaked Weaver Bird, <i>Ploceus manyar peguensis</i> Baker ..	101
1929a	Nicobar Yellowbacked Sunbird, <i>Aethopyga siparaja nicobarica</i> Hume ..	50		Subfamily ESTRILINAE: Avadavat, Munias	
1930	Firetailed Yellowbacked Sunbird, <i>Aethopyga ignicauda ignicauda</i> (Hodgson) ..	50	1964	Red Munia or Avadavat, <i>Estrilda erythrura erythrura</i> (Linnaeus) ..	101
1931	Little Spiderhunter, <i>Arachnothera longirostris longirostris</i> (Latham) ..	52	1965	Green Munia, <i>Estrilda formosa</i> (Latham) ..	103
1932	Streaked Spiderhunter, <i>Arachnothera magna magna</i> (Hodgson) ..	54	1966	White-throated Munia, <i>Lonchura malabarica malabarica</i> (Linnaeus) ..	105
			1967	Whitebacked Munia, <i>Lonchura striata acuticauda</i> (Hodgson) ..	107
			1968	Southern Whitebacked Munia, <i>Lonchura striata striata</i> (Linnaeus) ..	108
			1969	Andaman Whitebacked Munia, <i>Lonchura striata fumigata</i> (Walden) ..	110
			1970	Nicobar Whitebacked Munia, <i>Lonchura striata semistriata</i> (Hume) ..	110
			1971, 1972	Jerdon's Rufousbellied Munia, <i>Lonchura kelaarti jerdoni</i> (Hume) ..	111
			1973	Ceylon Hill Munia, <i>Lonchura kelaarti kelaarti</i> (Jerdon) ..	112
			1974	Indian Spotted Munia, <i>Lonchura punctulata punctulata</i> (Linnaeus) ..	113
			1975	Burmese Spotted Munia, <i>Lonchura punctulata subundulata</i> (Godwin-Austen) ..	115

1976	Nepal Blackheaded Munia, <i>Lonechura malacca rubreniger</i> (Hodgson) ..	116
1977	Eastern Blackheaded Munia, <i>Lonechura malacca atricapilla</i> (Vieillot) ..	117
1978	Southern Blackheaded Munia, <i>Lonechura malacca malacca</i> (Linnaeus)	118
1978a	Java Sparrow, <i>Padda oryzivora</i> (Linnaeus)	119
 Family FRINGILLIDAE: Finches		
Subfamily FRINGILLINAE: Chaffinches		
1979	Chaffinch, <i>Fringilla coelebs coelebs</i> Linnaeus	121
1980	Brambling, <i>Fringilla montifringilla</i> Linnaeus	122
 Subfamily CARDUELINAE: Goldfinches and Allies		
1981	Hawfinch, <i>Coccothraustes coccothraustes humii</i> Sharpe	123
1982	Black-and-Yellow Grosbeak, <i>Mycerobas icteroides</i> (Vigors)	124
1983	Allied Grosbeak, <i>Mycerobas affinis</i> (Blyth)	126
1984	Persian Whitewinged Grosbeak, <i>Mycerobas carnipes speculigerus</i> (Brandt)	128
1985	Himalayan Whitewinged Grosbeak, <i>Mycerobas carnipes carnipes</i> (Hodgson)	129
1986	Scallopedwinged Grosbeak, <i>Mycerobas minckleyi</i> (Hodgson) ..	130
1987	" nswski	133
1988	" (Gloger)	134
1989	Greyheaded Goldfinch, <i>Carduelis carduelis caniceps</i> Vigors	135
1990	Himalayan Greenfinch, <i>Carduelis spinoides spinoides</i> Vigors ..	136
1991	Tibetan Greenfinch, <i>Carduelis spinoides taylori</i> (Kinnear)	138
1992	Mt Victoria Greenfinch, <i>Carduelis spinoides himrichi</i> Stresemann	139
1993	Tibetan Siskin, <i>Carduelis thibetana</i> (Hume)	139
1994	Eastern Linnet, <i>Acanthis cannabina bella</i> (Brehm)	141
1995	Stoliczka's Twite, <i>Acanthis flavovestris montanella</i> (Hume) ..	142
1996	Tibetan Twite, <i>Acanthis flavovestris rufostrigata</i> (Walton) ..	143
1997	Redbrowed Finch, <i>Callacanthus burloni</i> (Gould)	145
1998	Goldfronted Finch, <i>Serinus pusillus</i> (Pallas)	146
1999	Western Plaincoloured Mountain Finch, <i>Leucosticte nemoricola altaica</i> (Eversmann)	148
2000	Eastern Plaincoloured Mountain Finch, <i>Leucosticte nemoricola</i> <i>nemoricola</i> (Hodgson)	150
2001	Brandt's Mountain Finch, <i>Leucosticte brandtii brandtii</i> Bonaparte ..	151
2002	Pamirs Mountain Finch, <i>Leucosticte brandtii pamirensis</i> Severtsov ..	152
2003, 2004	Himalayan Mountain Finch, <i>Leucosticte brandtii haematopygia</i> (Gould)	153
2005	Kun Lun Mountain Finch, <i>Leucosticte brandtii pallidior</i> Bianchi ..	154
2006	Trumpeter Bullfinch, <i>Rhodopexys githagenea crassirostris</i> (Blyth) ..	155
2007	Mongolian Desert Finch, <i>Rhodopexys mongolica</i> (Swinhoe)	156
2008	Lichtenstein's Desert Finch, <i>Rhodopexys obsoleta</i> (Lichtenstein) ..	158
2009	Crimsonwinged Desert Finch, <i>Rhodopexys sanguinea sanguinea</i> (Gould)	159
2010	Turkistan Rosefinch, <i>Carpodacus erythrurus ferghanensis</i> (Kozlova) ..	163
2011	Indian Rosefinch, <i>Carpodacus erythrurus roseatus</i> (Blyth)	164
2012	Caucasian Rosefinch, <i>Carpodacus erythrurus kabanensis</i> Laubmann ..	166
2013	Common Rosefinch or Scarlet Grosbeak, <i>Carpodacus erythrurus</i> <i>erythrurus</i> (Pallas)	166
2014	Garhwil Dark Rosefinch, <i>Carpodacus nipalensis kangrae</i> (Whistler) ..	167
2015	Nepal Dark Rosefinch, <i>Carpodacus nipalensis nipalensis</i> (Hodgson) ..	168
2016	Blanford's Rosefinch, <i>Carpodacus rubescens</i> (Blanford)	169

2017	Pinkbrowed Rosefinch, <i>Carpodacus rhodochrous</i> (Vigors)	172
2017a	Vinaceous Rosefinch, <i>Carpodacus vinaceus vinaceus</i> Verreaux	172
2018	Redmantled Rosefinch, <i>Carpodacus rhodochlamys grandis</i> Blyth	173
2019	Spottedwinged Rosefinch, <i>Carpodacus rhodopeplus rhodopeplus</i> (Vigors)	175
2020	Kashmir Whitebrowed Rosefinch, <i>Carpodacus thura blythi</i> (Biddulph)	176
2021	Sikkim Whitebrowed Rosefinch, <i>Carpodacus thura thura</i> Bonaparte & Schlegel	177
2022	Yunnan Whitebrowed Rosefinch, <i>Carpodacus thura femininus</i> Rippon	178
2023	Himalayan Beautiful Rosefinch, <i>Carpodacus pulcherrimus pulcherrimus</i> (Moore)	179
2024	Tibet Beautiful Rosefinch, <i>Carpodacus pulcherrimus waltoni</i> (Sharpe)	181
2025	Sikkim Large Rosefinch, <i>Carpodacus edwardsii rubicunda</i> (Greenway)	181
2026	Threebanded Rosefinch, <i>Carpodacus trifasciatus</i> Verreaux	183
2027	Great Rosefinch, <i>Carpodacus rubicilla severizoni</i> Sharpe	183
2028	Eastern Great Rosefinch, <i>Carpodacus rubicilloides lucifer</i> R. & A. Meinertzhagen	185
2029	Kun Lun Redbreasted Rosefinch, <i>Carpodacus puniceus kilianensis</i> Vaurie	187
2030	Western Redbreasted Rosefinch, <i>Carpodacus puniceus humii</i> (Sharpe)	188
2031	Eastern Redbreasted Rosefinch, <i>Carpodacus puniceus puniceus</i> (Blyth)	189
2032	Crossbill, <i>Loxia curvirostra himalayensis</i> Blyth	190
2033	Redheaded Rosefinch, <i>Propyrrhula subhimachala</i> (Hodgson)	192
2034	Scarlet Finch, <i>Haematospiza sipahi</i> (Hodgson)	194
2035	Goldheaded Black Finch, <i>Pyrhophlectes epauleta</i> (Hodgson)	195
2036	Nepal Brown Bullfinch, <i>Pyrhula nipalensis nipalensis</i> Hodgson	197
2037	Chinese Brown Bullfinch, <i>Pyrhula nipalensis ricketti</i> La Touche	199
2038	Beavan's Bullfinch, <i>Pyrhula erythaca erythaca</i> Blyth	199
2039	Redheaded Bullfinch, <i>Pyrhula erythrocephala</i> Vigors	201
2040	Orange Bullfinch, <i>Pyrhula aurantiaca</i> Gould	202
Family EMBERIZIDAE : Buntings		
2041	Corn Bunting, <i>Emberiza calandra</i> Linnaeus	205
2042	Pine Bunting, <i>Emberiza leucocephala leucocephala</i> S. G. Gmelin	206
2043	Blackheaded Bunting, <i>Emberiza melanocephala</i> Scopoli	207
2044	Redheaded Bunting, <i>Emberiza hortulana</i> Linnaeus	209
2045	Blackfaced Bunting, <i>Emberiza hortulana</i> Linnaeus	211
2046	Whitethroated Bunting, <i>Emberiza hortulana</i> Linnaeus	213
2047	Blackfaced Bunting, <i>Emberiza spodocephala sordida</i> Blyth	215
2048	Whitethroated Bunting, <i>Emberiza stewarti</i> (Blyth)	216
2049	Oortolan Bunting, <i>Emberiza hortulana</i> Linnaeus	219
2050	Greynecked Bunting, <i>Emberiza buchanani buechanani</i> Blyth	219
2051	Transcasian Rock Bunting, <i>Emberiza cia par</i> Hartert	222
2052	Himalayan Rock Bunting, <i>Emberiza cia stracheyi</i> Moore	223
2053	Tibetan Rock Bunting, <i>Emberiza cia khamensis</i> Sushkin	224
2054	Yunnan Rock Bunting, <i>Emberiza cia yunnanensis</i> Sharpe	225
2055	Indian Greyheaded Bunting, <i>Emberiza fucata arcuata</i> Sharpe	227
2055a	Amur Greyheaded Bunting, <i>Emberiza fucata fucata</i> Pallas	228
2056	Little Bunting, <i>Emberiza pusilla</i> Pallas	229
2057	Great Bunting, <i>Emberiza hortulana</i> Linnaeus	230
2058	Blackfaced Bunting, <i>Emberiza hortulana</i> Linnaeus	232
2059	Blackfaced Bunting, <i>Emberiza hortulana</i> Linnaeus	232
2060	Blackfaced Bunting, <i>Emberiza hortulana</i> Linnaeus	232

LIST OF PLATES

Drawings by John Henry Dick

Plate 1

- 1 *Gavia arctica*, Blackthroated Diver (1)
- 2 *Gavia stellata*, Redthroated Diver (2)
- 3 *Podiceps cristatus*, Great Crested Grebe (3)
- 4 *Podiceps nigricollis*, Blacknecked Grebe (4)
- 5 *Podiceps grisegena*, Rednecked Grebe (3a)
- 6 *Podiceps ruficollis*, Little Grebe (5)
- 7 *Heliopais personata*, Masked Finfoot (351)

Plate 2

- 1 *Oceanites oceanicus*, Wilson's Storm Petrel (14)
- 2 *Oceanodroma leucorhoa*, Leach's, or Forktailed Storm Petrel (16)
- 3 *Oceanodroma matsudairae*, Matsudaira's Storm Petrel (SE)
- 4 *Fregata tropica*, Duskyvented Storm Petrel (15)
- 5 *Bulweria bulwerii*, Bulwer's Gadfly Petrel (13b)
- 6 *Bulweria fallax*, Jouanin's Gadfly Petrel (13a)
- 7 *Procellaria pacifica*, Wedgetailed Shearwater (9)
- 8 *Procellaria carinipes*, Pinkfooted Shearwater (8)
- 9 *Procellaria tenuirostris*, Short-tailed Shearwater (SE)
- 10 *Calonectris leucamelas*, Streaked Shearwater (SE)
- 11 *Pelagodroma marina*, Whitefaced Storm Petrel (SE)
- 12 *Deption cepensis*, Cape Petrel (6)
- 13 *Procellaria herminieri*, Audubon's Shearwater (11)

Plate 3

- 1 *Pelecanus philippensis*, Spottedbilled Pelican (21)
- 2 *Pelecanus orocrotalus*, Rosy or White Pelican (20)
- 3 ssp *crispus* of 21, Dalmatian Pelican (22)
- 4 *Fregata ariel*, Least Frigate Bird (32)
- 5 *Fregata minor*, Lesser Frigate Bird (31)
- 6 *Phoeniconaias minor*, Lesser Flamingo (74)
- 7 *Phoenicopterus roseus*, Flamingo (73)
- 8 *Cygnus cygnus*, Whooper Swan (86)
- 9 *Cygnus olor*, Mute Swan (87)
- 10 ssp *bericikii* of 86, Bewick's Swan (84)

Plate 4

- 1 *Phalacrocorax carbo*, Cormorant (26)
- 2 *Phalacrocorax fuscicollis*, Indian Shag (27)
- 3 *Phalacrocorax niger*, Little Cormorant (28)
- 4 *Phalacrocorax pygmaeus*, Pygmy Cormorant (28a)
- 5 *Anhinga rufa*, Darter (29)
- 6 *Botaurus stellaris*, Bittern (59)
- 7 *Egretta garzetta*, Little Egret (49)
- 8 *Gorsachius melanolephus*, Malay or Tiger Bittern (53)
- 9 *Ardeola grayii*, Pond Heron or Paddybird (42)
- 10 *Nycticorax nycticorax*, Night Heron (52)

Plate 5

- 1 *Phaethon rubricauda*, Redtailed Tropic-Bird (18)
- 2 *Phaethon aethereus*, Redbilled (or Short-tailed) Tropic-Bird (17)
- 3 *Sula dactylatra*, Masked Booby (23)
- 4 *Phaethon lepturus*, Longtailed Tropic-Bird (19)
- 5 *Sula sula*, Redfooted Booby (24)
- 6 *Sula leucogaster*, Brown Booby (25)

Plate 6

- 1 *Butorides stratus*, Little Green Heron (38)
- 2 *Ardea goliath*, Giant Heron (34)
- 3 *Ardea insignis*, Great Whitebellied Heron (33)
- 4 *Ardea cinerea*, Grey Heron (36)
- 5 *Ardea purpurea*, Purple Heron (37)
- 6 *Ardeola ralloides*, Squacco Heron (SE)
- 7 *Ardeola bacchus*, Chinese Pond Heron (43)
- 8 *Ardeola grayii*, Pond Heron or Paddybird (42)
- 9 *Ixobrychus cinnamomeus*, Chestnut Bittern (56)
- 10 *Ixobrychus sinensis*, Yellow Bittern (57)
- 11 *Ixobrychus minutus*, Little Bittern (55)
- 12 *Ixobrychus flavicollis*, Black Bittern (58)
- 13 *Botaurus stellaris*, Bittern (59)
- 14 *Nycticorax nycticorax*, Night Heron (52)
- 15 *Gorsachius melanolephus*, Malay or Tiger Bittern (53)

Plate 7

- 1 *Ardea alba*, Large Egret (46)
- 2 *Egretta intermedia*, Smaller Egret (47)
- 3 *Egretta garzetta*, Little Egret (49)
- 4 *Egretta alularis*, Indian Reef Heron (50)
- 5 *Butorides ibis*, Cattle Egret (44)
- 6 *Grus leucogeranus*, Siberian Crane (325)
- 7 *Grus antigone*, Sarus Crane (323)
- 8 *Anthropoides virgo*, Demoiselle Crane (326)
- 9 *Grus nigricollis*, Blacknecked Crane (321)
- 10 *Grus grus*, Common Crane (320)
- 11 *Grus ugonacha*, Hooded Crane (322)

Plate 8

- 1 *Ephippiorhynchus asiaticus*, Blacknecked Stork (66)
- 2 *Microna leucocephala*, Painted Stork (60)
- 3 *Ciconia ciconia*, White Stork (63)
- 4 *Ciconia nigra*, Black Stork (65)
- 5 *Anastomus osculator*, Openbill Stork (61)
- 6 *Ciconia erythrorhynchos*, Whiteneked Stork (62)
- 7 *Pseudibis papilion*, Black Ibis (70)
- 8 *Pseudibis leucorhynchos*, Spoonbill (72)
- 9 *Plegadis falcinellus*, Glossy Ibis (71)
- 10 *Leptoptilos dubius*, Adjutant (67)
- 11 *Threskiornis aethiopia*, White Ibis (69)
- 12 *Leptoptilos javanicus*, Lesser Adjutant (68)

Plate 9

- 1 *Anas platyrhynchos*, Mallard (100)
- 2 *Anas acuta*, Pintail (93)
- 3 *Anas poecilorhynchos*, Spotbill Duck (97)
- 4 *Anas penelope*, Wigeon (103)
- 5 *Anas gibberifrons*, Grey Teal (96)
- 6 *Anas clypeata*, Shoveller (105)
- 7 *Anas formosa*, Baikal Teal (95)
- 8 *Marmarometta angustirostris*, Marbled Teal (92)
- 9 *Anas crecca*, Common Teal (94)
- 10 *Anas querquedula*, Garganey (104)
- 11 *Anas falcata*, Falcated Teal (102)
- 12 *Anas strepera*, Gadwall (101)

Plate 10 (Ducks in flight)

- 1 *Anas platyrhynchos*, Mallard (100)
- 2 *Anas acuta*, Pintail (93)
- 3 *Anas poecilorhynchos*, Spotbill Duck (97)
- 4 *Anas penelope*, Wigeon (103)
- 5 *Anas gibberifrons*, Grey Teal (96)
- 6 *Anas clypeata*, Shoveller (105)
- 7 *Anas formosa*, Baikal Teal (95)
- 8 *Marmarometta angustirostris*, Marbled Teal (92)
- 9 *Anas crecca*, Common Teal (94)
- 10 *Anas querquedula*, Garganey (104)
- 11 *Anas falcata*, Falcated Teal (102)
- 12 *Anas strepera*, Gadwall (101)

Plate 11

- 1 *Tadorna ferruginea*, Ruddy Shelduck (90)
- 2 *Tadorna tadorna*, Common Shelduck (91)
- 3 *Dendrocygna bicolor*, Large Whistling Teal (89)
- 4 *Dendrocygna javanica*, Lesser Whistling Teal or Tree Duck (88)
- 5 *Netta rufina*, Redcrested Pochard (107)
- 6 *Aythya ferina*, Common Pochard (108)
- 7 *Aythya fuligula*, Tufted Duck (111)
- 8 *Aythya marila*, Scaup Duck (112)
- 9 *Aythya baeri*, Baer's Pochard (110)
- 10 *Aythya nyroca*, White-eyed Pochard or Ferruginous Duck (109)
- 11 *Mergus albellus*, Smew (119)
- 12 *Nettion coromandelianus*, Cotton Teal or Quacky-Duck (114)
- 13 *Rhodessa caryophyllata*, Pinkheaded Duck (106)

Plate 12

- 1 *Oxyura leucocephala*, Whiteheaded Stiffailed Duck (123)
- 2 *Bucephala clangula*, Goldeneye Duck (118)
- 3 ssp *caerulea* of 118, Old Squaw Duck (117)
- 4 ssp *melanotos* of 118, Common Merganser (119)
- 5 *Sarkidiornis melanotos*, Comb Duck (115)
- 6 *Cairma scutulata*, Whitewinged Wood Duck (116)
- 7 *Branta ruficollis*, Siberian Redbreasted Goose (75)
- 8 *Anser erythropus*, Lesser Whitefronted Goose (80)
- 9 *Anser fabalis*, Bean Goose (76)
- 10 *Anser albifrons*, Whitefronted Goose (79)
- 11 *Anser anser*, Greylag Goose (81)
- 12 *Anser indicus*, Barheaded Goose (82)

Plate 13 (Ducks in flight)

- 1 *Tadorna ferruginea*, Ruddy Shelduck (90)
- 2 *Tadorna tadorna*, Common Shelduck (91)
- 3 *Dendrocygna bicolor*, Large Whistling Teal (89)
- 4 *Dendrocygna javanica*, Lesser Whistling Teal or Tree Duck (88)
- 5 *Netta rufina*, Redcrested Pochard (107)
- 6 *Aythya ferina*, Common Pochard (108)
- 7 *Aythya fuligula*, Tufted Duck (111)
- 8 *Aythya nyroca*, White-eyed Pochard or Ferruginous Duck (109)
- 9 *Aythya marila*, Scaup Duck (112)
- 10 *Mergus albellus*, Smew (119)
- 11 *Mergus merganser*, Goosander or Common Merganser (121)
- 12 *Nettion coromandelianus*, Cotton Teal or Quacky-Duck (114)
- 13 *Oxyura leucocephala*, Whiteheaded Stiffailed Duck (123)

Plate 14

- 1 *Haliaeetus leucogaster*, Whitebellied Sea Eagle (173)
- 2 *Ichthyophaga ichthyoretus*, Greyheaded Fishing Eagle (175)
- 3 *Ichthyophaga nana*, Himalayan Greyheaded Fishing Eagle (177)
- 4 *Haliaeetus albicollis*, Whitetailed Eagle (172a)
- 5 *Haliaeetus leucorhynchus*, Pallas's Fishing Eagle (174)
- 6 *Pandion haliaetus*, Osprey (203)
- 7 ssp *gorinda* of 132, Pariah Kite (133)
- 8 *Milvus migrans*, Black Kite (132)
- 9 ssp *lineatus* of 132, Blackeared or Large Indian Kite (134)
- 10 *Milvus milvus*, Red Kite (131)
- 11 *Haliastur indus*, Brahminy Kite (135)
- 12 *Circus melanoleucos*, Pied Harrier (192)
- 13 *Circus macrourus*, Pale Harrier (190)
- 14 *Circus aeruginosus*, Marsh Harrier (193)

Plate 15

(Kites and Eagles in flight)

- 1 *Milvus milvus*, Red Kite (131)
- 2 ssp *lineatus* of 132, Blackeared or Large Indian Kite (134)
- 3 ssp *gorinda* of 132, Pariah Kite (133)
- 4 *Milvus migrans*, Black Kite (132)
- 5 *Ichthyophaga nana*, Himalayan Greyheaded Fishing Eagle (177)
- 6 *Haliaeetus leucogaster*, Whitebellied Sea Eagle (173)
- 7
- 8
- 9

Plate 16

- 1
- 2
- 3
- 4 *Gyps indicus*, Indian Longbilled Vulture (182)
- 5 *Gyps fulvus*, Griffon Vulture (180)
- 6
- 7
- 8

Plate 17

(Kites, Vultures and Eagles in flight)

- 1 *Milvus migrans gorinda*, Pariah Kite (133)
- 2 *Haliastur indus*, Brahminy Kite (135)
- 3 *Milvus milvus*, Red Kite (131)
- 4 *Neophron percnopterus*, Egyptian or Scavenger Vulture (186)
- 5 *Hieraaetus pennatus*, Booted Hawk-Eagle (164)
- 6 *Gypsaetus barbatus*, Bearded Vulture or Lämmergeier (188)
- 7
- 8
- 9
- 10 *Gyps fulvus*, Griffon Vulture (180)
- 11 *Gyps bengalensis*, Indian Whitebacked Vulture (185)
- 12 *Gyps indicus*, Indian Longbilled Vulture (182)

Plate 18

(Vultures in flight)

- 1 *Neophron percnopterus*, Egyptian or Scavenger Vulture (186)
- 2
- 3
- 4
- 5 *Gyps bengalensis*, Indian Whitebacked Vulture (185)
- 6 *Gyps himalayensis*, Himalayan Griffon (181)
- 7 *Gyps indicus*, Indian Longbilled Vulture (182)
- 8 *Gyps fulvus*, Griffon Vulture (180)

Plate 19

(Harriers in flight)

- 1 *Circus cyaneus*, Hen-Harrier (189)
- 2 *Circus macrourus*, Pale Harrier (190)
- 3 *Circus pygargus*, Montagu's Harrier (191)
- 4 *Circus melanoleucos*, Pied Harrier (192)
- 5 *Circus aeruginosus*, Marsh Harrier (193)
- 6 ssp *spilonotus* of 193, (Eastern) Marsh Harrier or Striped Harrier (194)

Plate 20

- 1 *Hieraaetus fasciatus*, Bonelli's Eagle (163)
- 2 *Hieraaetus pennatus*, Booted Hawk-Eagle (164)
- 3 *Hieraaetus kiennerii*, Rufousbellied Hawk-Eagle (165)
- 4 *Spizaetus nivalensis*, Hodgson's Hawk-Eagle (158)
- 5 ssp *limacatus* of 161, Changeable Hawk-Eagle (160)
- 6 *Spizaetus cirrhatus*, Crested Hawk-Eagle (161)
- 7 *Circus gallicus*, Short-toed Eagle (195)
- 8 *Spilornis cheela*, Crested Serpent Eagle (196)
- 9 ssp *divisioni* of 196, Andaman Pale Serpent Eagle (200)
- 10 ssp *rimurus* of 196, Nicobar Crested Serpent Eagle (201)
- 11 *Spilornis klossi*, Great Nicobar Serpent Eagle (202)
- 12 *Spilornis elgisi*, Andaman Dark Serpent Eagle (202a)

Plate 21

(Raptors in flight)

- 1 *Pandion haliaetus*, Osprey (203)
- 2
- 3
- 4
- 5
- 6 *Spilornis elgisi*, Andaman Dark Serpent Eagle (202a)
- 7 *Spizaetus cirrhatus*, Crested Hawk-Eagle (161)
- 8 *Ardea gerydoni*, Blyth's Baza (125)
- 9 ssp *limacatus* of 161, Changeable Hawk-Eagle (160)
- 10 *Spizaetus nivalensis*, Hodgson's Hawk-Eagle (158)

Plate 22

- 1 *Elaeus caruleus*, Blackwinged Kite (124)
- 2 *Arceea lephotes*, Blackcrested Baza (127)
- 3 *Arceea gerydoni*, Blyth's Baza (125)
- 4 *Accipiter badius*, Shikra (139)
- 5 *Accipiter trivirgatus*, Crested Goshawk (144)
- 6 *Accipiter solomonis*, Horsfield's Goshawk (143)
- 7 ssp *butleri* of 139, Car Nicobar Shikra (141)
- 8 *Accipiter virgatus besra*, Besra Sparrow-Hawk (151)
- 9 *Accipiter virgatus galari*, Eastern Besra Sparrow-Hawk (152)
- 10 *Accipiter gentilis*, Goshawk (136)
- 11 *Accipiter nisus nison-milis*, Sparrow-Hawk (147)
- 12 *Accipiter nisus melaschistos*, Sparrow-Hawk (148)

LIST OF PLATES

Plate 23
(Raptors in flight)

- 1 *Aviceda leuphotes*, Blackcrested Baza (127)
- 2 *Aviceda jerdoni*, Blyth's Baza (125)
- 3
- 4
- 5
- 6 *Accipiter solensis*, Horsfield's Goshawk (143)
- 7 *Accipiter virgatus gularis*, Eastern Besra Sparrow-Hawk (152)
- 8 *ssp butleri* of 139, Car Nicobar Shikra (141)
- 9 *Accipiter virgatus berra*, Besra Sparrow-Hawk (151)
- 10 *Accipiter nirus*, Sparrow-Hawk (148)
- 11 *Accipiter gentilis*, Goshawk (136)

Plate 24

- 1 *Pernis ptilorhynchus*, Honey Buzzard (130)
- 2 *Buteo buteo japonicus*, Japanese Buzzard (156)
- 3 *Buteo buteo vulpinus*, Desert Buzzard (155)
- 4 *Buteo lagopus*, Roughlegged Buzzard (SE)
- 5 *Buteo hemilasius*, Upland Buzzard (154)
- 6 *Buteo rufinus*, Longlegged Buzzard (153)
- 7 Typical buzzard flight style

Plate 25

(Kites, Buzzards and Eagles in flight)

- 1 *Pernis ptilorhynchus*, Honey Buzzard (130)
- 2 *Haliastur indus*, Brahminy Kite (135)
- 3 *Butastur teesa*, White-eyed Buzzard-Eagle (157)
- 4 *Buteo buteo vulpinus*, Desert Buzzard (155)
- 5 *Buteo buteo japonicus*, Japanese Buzzard (156)
- 6 Typical buzzard flight style
- 7 *Buteo lagopus*, Roughlegged Buzzard (SE)
- 8 *Buteo rufinus*, Longlegged Buzzard (153)
- 9 *Buteo hemilasius*, Upland Buzzard (154)
- 10 *Hieraetus kienrii*, Rufousbellied Hawk-Eagle (165)
- 11 *Hieraetus pennatus*, Booted Hawk-Eagle (164)

- 5
- 6
- 7 *Perdula erythrorhynchos*, Painted Bush Quail (262)
- 8 *Coturnix coromandelica*, Blackbreasted or Rain Quail (252)
- 9 *Perdula manipurensis*, Manipur Bush Quail (265)
- 10
- 11
- 12
- 13 *Ammoperdix griseogularis*, Seesee Partridge (228)
- 14 *Lerua lerua*, Snow Partridge (227)
- 15
- 16
- 17
- 18 *Megapodius freycinet*, Megapode (225)

Plate 33

- 1 *Pavo cristatus*, Common Peafowl (311)
- 2 *Pavo multicus*, Burmese Peafowl (312)

Plate 34

- 1
- 2
- 3
- 4 *Tragopan temminckii*, Temminck's Tragopan (289)
- 5 *Tragopan blythii*, Blyth's or Greybellied Tragopan (288)
- 6 *Lophophorus impejanus*, Impeyan or Monal Pheasant (290)
- 7 *Lophophorus sclateri*, Sclater's Monal (291)
- 8 *Tetraogallus tibetanus*, Tibetan Snowcock (229)
- 9 *Tetraogallus himalayensis*, Himalayan Snowcock (232)
- 10 *Crossoptilon crossoptilon*, Eared Pheasant (292)

Plate 35

- 1 *Pucrasia macrolopha*, Koklas Pheasant (305)
- 2 *Catreus walliichii*, Chir Pheasant (307)
- 3
- 4
- 5
- 6
- 7 *Symaticus humiae*, Mrs Hume's Barredback Pheasant (308)
- 8 *Gallus lafayetii*, Ceylon Junglefowl (302)
- 9 *Gallus sonneratii*, Grey or Sonnerat's Junglefowl (301)
- 10 *Polyplectron bicalcaratum*, Peacock-Pheasant (310)

Plate 36

- 1 *Rallus aquaticus*, Water Rail (327)
- 2 *Rallus striatus*, Bluebreasted Banded Rail (329)
- 3 *Rallina fasciata*, Redlegged Banded Crake (331)
- 4 *Porzana parva*, Little Crake (335)
- 5 *Rallina eurizonoides*, Banded Crake (332)
- 6 *Porzana pusilla*, Baillon's Crake (337)
- 7 *Crex crex*, Corn Crake (334)
- 8 *Porzana porzana*, Spotted Crake (338)
- 9 *Porzana fusca*, Ruddy Crake (339)
- 10 *Amaurornis akool*, Brown Crake (342)
- 11 *Amaurornis bicolor*, Elwes's Crake (341)
- 12 *Rallina canningi*, Andaman Banded Crake (333)
- 13 *Gallinix cinerea*, Water Cock (346)
- 14 *Gallinula chloropus*, Moorhen (347)
- 15 *Fulica atra*, Coot (350)
- 16 *Hydrophasianus chirurgus*, Pheasant-tailed Jacana (358)
- 17 *Amaurornis phoeniceus*, Whitebreasted Waterhen (343)
- 18 *Metopidius indicus*, Bronzewing Jacana (359)
- 19 *Porphyrio porphyrio*, Purple Moorhen (349)

Plate 37

- 1 *Otis tetrax*, Little Bustard (353)
- 2 *Otis tarda*, Great Bustard (352)
- 3 *Eupodotis bengalensis*, Bengal Florican (356)
- 4 *Chlamydotis undulata*, Houbara (355)
- 5 *Choriotis nigricaps*, Great Indian Bustard (354)
- 6 *Sypheotides indica*, Likh or Lesser Florican (357)

Plate 38

- 1 *Cursorius cursor*, Creamcoloured Courser (439)
- 2 *Cursorius coromandelicus*, Indian Courser (440)
- 3 *Cursorius bitorquatus*, Jerdon's or Doublebanded Courser (441)
- 4 *Glareola pratincola*, Collared Pratincole (443)
- 5 *Glareola lactea*, Small Indian Pratincole (444)
- 6 *Pluvialis squatarola*, Grey or Blackbellied Plover (371)
- 7 *Pluvialis dominica*, Eastern Golden Plover (373)
- 8
- 9

- 7
- 8 *Calidris minuta*, Little Stint (416)
- 9 *Calidris temminckii*, Temminck's Stint (417)
- 10 *Calidris subminuta*, Longtoed Stint (418)
- 11 *Calidris acuminata*, Asian Pectoral Sandpiper (419)
- 12 *Calidris tenuirostris*, Eastern Knot (413)
- 13 *Calidris canuta*, Knot (412)
- 14 *Calidris alpina*, Dunlin (420)
- 15 *Calidris testacea*, Curlew-Sandpiper (422)
- 16 *Limicola falcinellus*, Broadbilled Sandpiper (424)
- 17 *Phalaropus lobatus*, Rednecked Phalarope (428)
- 18 *Euryorhynchus pygmaeus*, Spoonbilled Sandpiper (423)
- 19 *Calidris alba*, Sanderling (414)

Plate 41

(Waders in flight)

- 1
- 2
- 3
- 4 *Charadrius mongolus*, Lesser Sand Plover (381)
- 5 *Calidris alba*, Sanderling (414)
- 6 *Calidris alpina*, Dunlin (420)
- 7 *Calidris testacea*, Curlew-Sandpiper (422)
- 8 *Calidris minuta*, Little Stint (416)
- 9 *Calidris temminckii*, Temminck's Stint (417)
- 10 *Calidris canuta*, Knot (412)
- 11 *Calidris tenuirostris*, Eastern Knot (413)
- 12 *Phalaropus lobatus*, Rednecked Phalarope (428)
- 13 *Gallinago gallinago*, Fantail Snipe (409)
- 14 *Scolopax rusticola*, Woodcock (411)
- 15
- 16
- 17
- 18 *Cursorius coromandelicus*, Indian Courser (440)

Plate 42

- 1 *Haematopus ostralegus*, Oystercatcher (360)
- 2 *Limnodromus semipalmatus*, Snipebilled Godwit or Asian Dowitcher (403)
- 3 *Ibidorhyncha struthersii*, Ibisbill (433)
- 4 *Numenius arquata*, Curlew (388)
- 5
- 6
- 7
- 8 *Himantopus himantopus*, Blackwinged Stilt (430)
- 9 *Dromas ardeola*, Crab Plover (434)
- 10 *Recurvirostra avosetta*, Avocet (432)
- 11 *Burhinus oedicephalus*, Stone Curlew (436)
- 12 *Esacus magnirostris*, Great Stone Plover (437)

Plate 43

- 9 *Tringa hypoleucos*, Common Sandpiper (401)
- 10 *Gallinago minima*, Jack Snipe (410)
- 11 *Gallinago gallinago*, Fantail Snipe (409)
- 12 *Philomachus pugnax*, Ruff and Reeve (426)
- 13 *Scolopax rusticola*, Woodcock (411)

Plate 44

(Waders in flight)

- 1 *Pluvialis squatarola*, Grey Plover (371)
- 2 *Glareola pratincola*, Collared Pratincole (442)
- 3 *ssp maldianum* of 422, (Oriental) Collared Pratincole (443)
- 4 *Glareola lactea*, Small Indian Pratincole (444)
- 5 *Pluvialis apricaria*, Golden Plover (372)
- 6 *Arenaria interpres*, Turnstone (402)
- 7 *Pluvialis dominica*, Eastern Golden Plover (373)
- 8
- 9
- 10 *Tringa nebularia*, Greenshank (396)
- 11 *Tringa glareola*, Wood Sandpiper (398)
- 12
- 13
- 14
- 15

Plate 45

- 1 *Catharacta skua antarctica*, Antarctic Skua (445)
- 2 *Stercorarius pomarinus*, Pomatorhine Skua or Jaeger (447)
- 3 *Rynchops albigollis*, Indian Skimmer (484)
- 4 *Catharacta skua macconnicki*, (Macconnick's Skua) Antarctic Skua (446a)
- 5 *Stercorarius parasiticus*, Parasitic or Richardson's Skua or Jaeger (448)
- 6 *Larus ichthyæetus*, Great Blackheaded Gull (453)
- 7 *Larus hemprichii*, Sooty Gull (449)
- 8 *Larus argentatus*, Herring Gull (450)
- 9 *Larus fuscus*, Lesser Blackbacked Gull (452)
- 10 *Larus minutus*, Little Gull (457)
- 11 *Larus ridibundus*, Blackheaded Gull (455)
- 12 *Larus genei*, Slenderbilled Gull (456)
- 13 *Larus brunnecephalus*, Brownheaded Gull (454)

Plate 46

- 1 *Chlidonias niger*, Black Tern (459a)
- 2 *Chlidonias leucopterus*, Whitewinged Black Tern (459)
- 3 *Chlidonias hybrida*, Whiskered Tern (458)
- 4 *Sterna albifrons*, Little Tern (475)
- 5 *Cygis alba*, Indian Ocean White Tern or Fairy Tern (483)
- 6 *Sterna dougallii*, Roseate or Rosy Tern (466)
- 7 *Sterna repressa*, Whitechecked Tern (467)
- 8 *Sterna hirundo*, Common Tern (464)
- 9 *Sterna aurantia*, Indian River Tern (463)
- 10 *Sterna bergii*, Common Tern (462)
- 11 *Sterna bergii*, Common Tern (478)
- 12 *Sterna bergii*, Common Tern (468)
- 13 *Sterna acuticauda*, Blackbellied Tern (470)
- 14 *Sterna bengalensis*, Indian Lesser Crested Tern (479)
- 15 *Gelochelidon nilotica*, Gullbilled Tern (460)
- 16 *Sterna fuscata*, Sooty Tern (474)
- 17 *Anous stolidus*, Noddy Tern (481)
- 18 *Sterna sandwicensis*, Sandwich Tern (480)
- 19 *Sterna anathetus*, Brownwinged Tern (471)

Plate 47

- 1 *P.*
- 2 *P.*
- 3 *P.*
- 4 *P.*
- 5 *Pterocles indicus*, Painted Sandgrouse (492)
- 6 *Pterocles senegallus*, Spotted Sandgrouse (488)
- 7 *Pterocles alchata*, Large Pintail Sandgrouse (486)
- 8 *Syrhaptes paradoxus*, Pallas's Sandgrouse (485a)
- 9 *Syrhaptes tibetanus*, Tibetan Sandgrouse (485)

Plate 48

- 1 *Columba livia*, Blue Rock Pigeon (517)
- 2 *Columba oenas*, Stock Pigeon (SE)
- 3 *Columba eversmanni*, Eastern Stock Pigeon (518)
- 4 *Columba rupestris*, Hill Pigeon (515)
- 5 *Columba livia*, Blue Rock Pigeon (517a)
- 6 *Columba livia*, Blue Rock Pigeon (517b)
- 7 *Columba livia*, Blue Rock Pigeon (517c)
- 8 *Columba livia*, Blue Rock Pigeon (517d)
- 9 *Columba livia*, Blue Rock Pigeon (517e)
- 10 *Columba livia*, Blue Rock Pigeon (517f)
- 11 *Columba livia*, Blue Rock Pigeon (517g)
- 12 *Columba livia*, Blue Rock Pigeon (517h)
- 13 *Columba livia*, Blue Rock Pigeon (517i)
- 14 *Columba livia*, Blue Rock Pigeon (517j)
- 15 *Columba livia*, Blue Rock Pigeon (517k)

Plate 49

- 1 *Treron sphenura*, Wedgetailed Green Pigeon (494)
- 2 *Treron phoenicoptera*, Yellowlegged Green Pigeon (503)
- 3 *Treron pompadora*, Pompadour or Greyfronted Green Pigeon (496)
- 4 *Treron curvirostra*, Thickbilled Green Pigeon (495)
- 5 *Treron apicauda*, Pintailed Green Pigeon (493)
- 6 *Treron curvirostra*, Thickbilled Green Pigeon (495a)
- 7 *Treron curvirostra*, Thickbilled Green Pigeon (495b)
- 8 *Treron curvirostra*, Thickbilled Green Pigeon (495c)
- 9 *Chalcophaps indica*, Emerald or Bronzewinged Dove (542)
- 10 *Macropygia rufipennis*, Andaman Cuckoo-Dove (527)
- 11 *Streptopelia tranquebarica*, Red Turtle Dove (535)
- 12 *Streptopelia decaocto*, Indian Ring Dove (534)
- 13 *Streptopelia senegalensis*, Little Brown or Senegal Dove (541)
- 14 *Streptopelia chinensis*, Spotted Dove (537)
- 15 *Streptopelia turtur*, Turtle Dove (529)
- 16 *Streptopelia orientalis*, Rufous Turtle Dove (532)

Plate 50

- 1 *Prittacula caniceps*, Nicobar Parakeet (553)
- 2 *Prittacula derbyana*, Lord Derby's Parakeet (554)
- 3 *Prittacula eupatria*, Alexandrine Parakeet (546)
- 4 *Prittacula finschii*, Eastern Slaty-headed Parakeet (563)
- 5 *Prittacula cyanocephala*, Blossomheaded Parakeet (558)
- 6 *Prittacula himalayana*, Slaty-headed Parakeet (562)
- 7 *Prittacula roseata*, Eastern Blossomheaded Parakeet (559)
- 8 *Prittacula longicauda*, Redchecked Parakeet (555)
- 9 *Prittacula krameri*, Roseringed Parakeet (550)
- 10 *Prittacula columboides*, Bluewinged Parakeet (564)
- 11 *Prittacula krameri*, Roseringed Parakeet (551)
- 12 *Prittacula krameri*, Roseringed Parakeet (551a)
- 13 *Prittacula krameri*, Roseringed Parakeet (551b)
- 14 *Prittacula krameri*, Roseringed Parakeet (551c)

Plate 51

- 1 *Cuculus sparverioides*, Large Hawk-Cuckoo (572)
- 2 *Cuculus fugax*, Hodgson's Hawk-Cuckoo (575)
- 3 *Cuculus varius*, Common Hawk-Cuckoo or Brainfever Bird (573)
- 4 *Chalcites maculatus*, Emerald Cuckoo (586)
- 5 *Cacomantis merulinus*, Rufousbellied Plaintive Cuckoo (585)
- 6 *Cacomantis sonneratii*, Indian Banded Bay Cuckoo (582)
- 7 *Chalcites xanthorhynchus*, Violet Cuckoo (587)
- 8 *Cacomantis passerinus*, Indian Plaintive Cuckoo (584)
- 9 *Cuculus poliocephalus*, Small Cuckoo (581)
- 10 *Cuculus micropterus*, Indian Cuckoo (576)
- 11 *Cuculus canorus*, The Cuckoo (578)

Plate 52

- 1 *Rhopodytes viridirostris*, Small Greenbilled Malkoha (595)
- 2 *Clamator jacobinus*, Pied Crested Cuckoo (571)
- 3 *Clamator coromandus*, Redwinged Crested Cuckoo (569)
- 4 *Rhopodytes tristis*, Large Greenbilled Malkoha (593)
- 5 *Taccocua leichenaultii*, Sirkeer Cuckoo (598)
- 6 *Centropus toulou*, Lesser Coucal (605)
- 7 *Phaenicepharus pyrrhophthalmus*, Redfaced Malkoha (599)
- 8 *Centropus sinensis*, Crow-Pheasant or Coucal (600)
- 9 *Centropus chlororhynchus*, Ceylon Coucal (604)
- 10 *Centropus (sinensis) andamanensis*, Andaman Crow-Pheasant (603)

Plate 53

- 1 *Bubo bubo*, Eagle-Owl or Great Horned Owl (627)
- 2 *Bubo nipalensis*, Forest Eagle-Owl (628)
- 3 *Bubo coromandus*, Dusky Horned Owl (630)
- 4 *Strix leptogramma*, Brown Wood Owl (659)
- 5 *Strix ocellata*, Mottled Wood Owl (657)
- 6 *Asio otus*, Longeared Owl (663)
- 7 *Asio flammeus*, Shorteared Owl (664)
- 8 *Bubo zeylonensis*, Brown Fish Owl (631)
- 9 *Strix aluco*, Himalayan Wood Owl (662)
- 10 *Strix butleri*, Hume's Wood Owl (654)
- 11 *Bubo flaviger*, Tawny Fish Owl (633)

Plate 54

- 1 *Otus brucei*, Striated, or Pallid, Scops Owl (614)
- 2 *Otus spilcephalus*, Spotted Scops Owl (612)
- 3 *Otus scops*, Scops Owl (617)
- 4 *Otus bakkamoena*, Collared Scops Owl (623)
- 5 *Otus castaneotum*, of 636. (638)
- 6 *Glaucidium cuculoides*, Barred Owlet (639)
- 7 *Glaucidium brodiei*, Collared Pigmy Owlet (635)
- 8 *Glaucidium radiatum*, Jungle Owlet (636)
- 9 *Aegolius funereus*, Tengmalm's Owl or Boreal Owl (665)
- 10 *Athene noctua*, Little Owl (648)
- 11 *Athene blueitii*, Forest Spotted Owlet (653)
- 12 *Athene brama*, Spotted Owlet (652)
- 13 *Otus obscura* of 642. (645)
- 14 *Ninox scutulata*, Brown Hawk-Owl (642)
- 15 *Phodius badius*, Bay Owl (609)
- 16 *Tyto alba*, Barn Owl (606)
- 17 *Tyto capensis*, Grass Owl (608)

Plate 55

- 1 *Pterodroma melanotos*, Common Frigatebird (666)
- 2 *Pterodroma melanotos*, Common Frigatebird (666a)
- 3 *Pterodroma melanotos*, Common Frigatebird (666b)
- 4 *Pterodroma melanotos*, Common Frigatebird (666c)
- 5 *Pterodroma melanotos*, Common Frigatebird (666d)
- 6 *Pterodroma melanotos*, Common Frigatebird (666e)
- 7 *Pterodroma melanotos*, Common Frigatebird (666f)
- 8 *Pterodroma melanotos*, Common Frigatebird (666g)
- 9 *Caprimulgus macrurus*, Longtailed Nightjar (663)
- 10 *Eurostodops macrotis*, Great Eared Nightjar (669)

Plate 56

- 1 *Chaetura sylvatica*, Whiterumped Spinetail (692)
- 2 *Collocalia brevirostris*, Himalayan Swiftlet (683)
- 3 *Collocalia esculenta*, Whitebellied Swiftlet (687)
- 4 *Apus affinis*, House Swift (703)
- 5 *Apus pallidus*, Pallid Swift (697)
- 6 *Apus apus*, The Swift (696)
- 7 *Apus pacificus*, Large Whiterumped Swift (699)
- 8 *Collocalia unicolor*, Indian Edible-nest Swiftlet (685)
- 9 *Apus acuticauda*, Darkbacked Swift (698)
- 10 *Chaetura gigantea*, Large Brownthroated Spinetail Swift (691)
- 11 *Chaetura cochinchinensis*, Cochinchina Spinetail Swift (690)
- 12 *Apus melba*, Alpine Swift (693)
- 13 *Cyprius parvus*, Palm Swift (707)
- 14 *Chaetura caudacuta*, Whitethroated Spinetail Swift (688)

Plate 57

- 1 *Coracias benghalensis*, Indian Roller (755)
- 2 *Eurostodops macrotis*, Broadbilled Roller (758)
- 3 *Eurostodops macrotis*, Broadbilled Roller (758a)
- 4 *Merops leichenaultii*, Lutescent-headed Bee-eater (744)
- 5 *Nyctornis albertoni*, Bluebearded Bee-eater (753)
- 6 *Merops superciliosus*, Bluecheeked Bee-eater (747)
- 7 *Merops superciliosus*, Bluecheeked Bee-eater (746)
- 8 *Merops superciliosus*, Bluecheeked Bee-eater (746a)
- 9 *Merops superciliosus*, Bluecheeked Bee-eater (746b)
- 10 *Merops superciliosus*, Bluecheeked Bee-eater (746c)
- 11 *Coracias benghalensis*, Indian Roller (755)
- 12 *Eurostodops macrotis*, Broadbilled Roller (758)

Plate 58

- 1 *Ceryle lugubris*, Himalayan Pied Kingfisher (717)
- 2 *Ceryle lugubris*, Himalayan Pied Kingfisher (717a)
- 3 *Ceryle rudis*, Lesser Pied Kingfisher (719)
- 4 *Ceryle rudis*, Lesser Pied Kingfisher (719a)
- 5 *Ceryle rudis*, Lesser Pied Kingfisher (719b)
- 6 *Ceryle rudis*, Lesser Pied Kingfisher (719c)
- 7 *Ceryle rudis*, Lesser Pied Kingfisher (719d)
- 8 *Ceryle rudis*, Lesser Pied Kingfisher (719e)
- 9 *Ceryle rudis*, Lesser Pied Kingfisher (719f)
- 10 *Ceryle rudis*, Lesser Pied Kingfisher (719g)
- 11 *Ceryle rudis*, Lesser Pied Kingfisher (719h)
- 12 *Ceryle rudis*, Lesser Pied Kingfisher (719i)
- 13 *Ceryle rudis*, Lesser Pied Kingfisher (719j)
- 14 *Ceryle rudis*, Lesser Pied Kingfisher (719k)

Plate 59

- 1 *Rhyticeros phacatus*, Narcondam Hornbill (773)
- 2 *Tockus birostris*, Common Grey Hornbill (767)
- 3 *Ptilolaemus tickelli*, Whitethroated Brown Hornbill (770)
- 4 *Buceros bicornis*, Great Pied Hornbill (776)
- 5 *Tockus griseus*, Malabar Grey Hornbill (768)
- 6 *Anthracoeros malabaricus*, Indian Pied Hornbill (774)
- 7 *Rhyticeros undulatus*, Wreathed Hornbill (772)
- 8 *Anthracoeros coronatus*, Malabar Pied Hornbill (775)
- 9 *Aceros nipalensis*, Rufousnecked Hornbill (771)

Plate 60

- 1 *Megalaima rubricapilla*, Crimsonthroated Barbet (791)
- 2 *Megalaima rubricapilla*, Crimsonthroated Barbet (791a)
- 3 *Megalaima rubricapilla*, Crimsonthroated Barbet (791b)
- 4 *Megalaima rubricapilla*, Crimsonthroated Barbet (791c)
- 5 *Megalaima rubricapilla*, Crimsonthroated Barbet (791d)
- 6 *Megalaima rubricapilla*, Crimsonthroated Barbet (791e)
- 7 *Megalaima rubricapilla*, Crimsonthroated Barbet (791f)
- 8 *Megalaima rubricapilla*, Crimsonthroated Barbet (791g)
- 9 *Megalaima rubricapilla*, Crimsonthroated Barbet (791h)
- 10 *Megalaima rubricapilla*, Crimsonthroated Barbet (791i)
- 11 *Megalaima rubricapilla*, Crimsonthroated Barbet (791j)
- 12 *Megalaima rubricapilla*, Crimsonthroated Barbet (791k)
- 13 *Megalaima rubricapilla*, Crimsonthroated Barbet (791l)
- 14 *Megalaima rubricapilla*, Crimsonthroated Barbet (791m)
- 15 *Megalaima rubricapilla*, Crimsonthroated Barbet (791n)
- 16 *Megalaima rubricapilla*, Crimsonthroated Barbet (791o)
- 17 *Megalaima rubricapilla*, Crimsonthroated Barbet (791p)
- 18 *Megalaima rubricapilla*, Crimsonthroated Barbet (791q)

Plate 61

- 1 *Dendrocopos moluccensis*, Browncrested Woodpecker (SE)
- 2 *Picumnus innominatus*, Speckled Piculet (798)
- 3 *Picoides cancapillus*, Grey-crowned Pigmy Woodpecker (850)
- 4 *Hemicircus canente*, Heartspotted Woodpecker (856)
- 5 *Sasia ochracea*, Rufous Piculet (800)
- 6 *Picoides auriceps*, Brownfronted Pied Woodpecker (842)
- 7 *Picoides tridactylus*, Threetoed Woodpecker (855)
- 8 *Picoides atratus*, Stripebreasted Pied Woodpecker (844)
- 9 *Picoides maharattensis*, Yellowfronted Pied Woodpecker (847)
- 10 *Picoides maci*, Fulvousbreasted Pied Woodpecker (845)
- 11 *Hypopicus hyperythrus*, Rufousbellied Woodpecker or Sapsucker (833)
- 12 *Picoides assimilis*, Sind Pied Woodpecker (835)
- 13 *Picoides cathaphanus*, Crimsonbreasted Pied Woodpecker (840)
- 14 *Picoides major*, Great Spotted, or Redcrowned Pied, Woodpecker (834)
- 15 *Picoides himalayensis*, Himalayan Pied-Woodpecker (837)
- 16 *Picoides albesens* of 837. (836)
- 17 *Dendrocopos leucopertus*, Whitemantled Woodpecker (SE)
- 18 *Picoides darjellensis*, Darjeeling Pied Woodpecker (838)

Plate 62

- 1 *Jynx torquilla*, Wrenneck (796)
- 2 *Picus chlorolophus*, Small Yellownaped Woodpecker (815)
- 3 *Picus chlorogaster* of 815. (816)
- 4 *Picus flavinucha*, Large Yellownaped Woodpecker (813)
- 5 *Picus canus*, Blacknaped Green Woodpecker (809)
- 6 *Picus squamatus*, Scalybellied Green Woodpecker (807)
- 7 *Picus myrmecophonus*, Little Scalybellied Green Woodpecker (808)
- 8 *Dryocopus javensis*, Indian Great Black Woodpecker (830)
- 9 *Picus hodgii* of 830. (831)
- 10 *Mulleripicus pulverulentus*, Himalayan Great Slaty Woodpecker (828)
- 11 *Picus vittatus*, Laced Woodpecker (SE)
- 12 *Geococcyx granta*, Paleheaded Woodpecker (827)
- 13 *Blythipicus pyrrhotis*, Red-eared Bay Woodpecker (857)
- 14 *Micropternus brachyurus*, Rufous Woodpecker (804)

Plate 63

- 1 *Pterinopus dalhousiae*, Longtailed Broadbill (865)
- 2 *Oriolus oriolus*, Golden Oriole (953)
- 3 *Serilophus lunatus*, Collared Broadbill (864)
- 4 *Oriolus xanthornus*, Blackheaded Oriole (958)
- 5 *Oriolus chinensis diffusus*, Blacknaped Oriole (954)
- 6 *Oriolus chinensis tenuirostris*, Slenderbilled Blacknaped Oriole (955)
- 7 *Oriolus trailii*, Maroon Oriole (961)
- 8 *Pitta cyanea*, Blue Pitta (871)
- 9 *Pitta sordida*, Hooded or Greenbreasted Pitta (869)
- 10 *Pitta nipalensis*, Bluenaped Pitta (866)
- 11 *Pitta malacensis*, Bluenaped Pitta (868)
- 12 *Pitta brachyura*, Indian Pitta (867)

Plate 64

- 1
- 2
- 3
- 4
- 5
- 6
- 7
- 8 *Alarmon alaudipes*, Bifasciated, or Large Desert, Lark (884)
- 9 *Ammonanthes phoenixus*, Rufoustailed Finch-Lark (882)
- 10 *Ammonanthes sinensis*, Bristle-tailed Desert Lark (881)
- 11 *Melanocorypha bimaculata*, Eastern Calandra Lark (892)
- 12 *Melanocorypha calandra*, Calandra Lark (SE)
- 13 *Calandrella rufescens*, Lesser Short-toed Lark (888a)
- 14 *Calandrella cinerea*, Short-toed Lark (886)
- 15 *Calandrella raytal*, Sand Lark (891)
- 16 *Melanocorypha maxima*, Longbilled Calandra Lark (894)
- 17 *Eremophila alpestris*, Horned Lark (897)
- 18 *ssp albigula* of 897. (895)
- 19 *Galerida deva*, Sykes's Crested Lark (902)
- 20 *Galerida cristata*, Crested Lark (899)
- 21 *Galerida malabarica*, Malabar Crested Lark (901)
- 22 *Alauda gulula*, Eastern Skylark (907)
- 23 *Alauda arvensis*, Skylark (903)

Plate 65

- 1 *Hemiprocne longipennis*, Crested Tree Swift (709)
- 2 *Riparia riparia*, Collared Sand Martin (910)
- 3 *Riparia paludicola*, Plain Sand Martin (912)
- 4
- 5
- 6
- 7
- 8 *Delichon dasypus*, Asian House Martin (SE)
- 9 *Hirundo smithii*, Wiretailed Swallow (921)
- 10 *Delichon urbica*, House Martin (931)
- 11 *Hirundo rustica*, Swallow (916)
- 12 *ssp tyleri* of 916. (918)
- 13 *Hirundo tahitica*, House Swallow (919)
- 14 *Hirundo daurica*, Striated or Redrumped Swallow (927)
- 15 *ssp hyperythra* of 927. (928)
- 16 *Artamus leucorhynchus*, Whitebreasted Swallow-Shrike (983)
- 17 *Hirundo fluvicola*, Indian Cliff Swallow (922)
- 18 *Artamus fuscus*, Ashy Swallow-Shrike (982)

Plate 66

- 1 *Hypothymus azurea*, Blacknaped Flycatcher (1465)
- 2 *Terpsiphone paradisi*, Paradise Flycatcher (1461)
- 3 *ssp albogularis* of 1455. (1458)
- 4 *Rhipidura aureola*, Whitebrowed Fantail Flycatcher (1451)
- 5 *Rhipidura albicollis*, Whitethroated Fantail Flycatcher (1455)
- 6 *Lanius vittatus*, Baybacked Shrike (940)
- 7 *ssp isabellinus* of 941. (943)
- 8 *ssp phoenicurus* of 941. (942)
- 9 *Lanius cristatus*, Brown Shrike (949)
- 10 *Lanius collunoides*, Burmese Shrike (938)
- 11 *Lanius minor*, Lesser Grey Shrike (937)
- 12 *Lanius excubitor*, Grey Shrike (933)
- 13 *Lanius collurio*, Redbacked Shrike (941)
- 14 *Lanius senator*, Woodchat Shrike (951)
- 15 *Lanius tephronotus*, Greybacked or Tibetan Shrike (945)
- 16 *Bombycilla garrulus*, Waxwing (1062)
- 17 *Lanius schach*, Rufousbacked Shrike (946)
- 18 *ssp tricolor* of 946. (948)
- 19 *Hypocolius ampelinus*, Grey Hypocolius (1063)

Plate 67

- 1 *Dicrurus adsimilis*, Black Drongo or King-Crow (963)
- 2 *Dicrurus remifer*, Lesser Racket-tailed Drongo (972)
- 3 *Dicrurus annectans*, Crowbilled Drongo (970)
- 4 *Dicrurus paradiseus*, Greater Racket-tailed Drongo (976)
- 5 *ssp lophorhinus* of 976. (979)
- 6 *Dicrurus aeneus*, Bronzed Drongo (971)
- 7 *Dicrurus hottentottus*, Haircrested or Spangled Drongo (973)
- 8 *Dicrurus leucophaeus*, Grey or Ashy Drongo (965)
- 9 *ssp salangensis* of 965. (966a)
- 10 *Dicrurus andamanensis*, Andaman Drongo (975)
- 11
- 12
- 13
- 14 *Cinclus pallasi*, Brown Dipper (1773)

Plate 68

- 2
- 3
- 4
- 5
- 6
- 7
- 8 *ssp blythi* of 987. (988)
- 9 *Sturnus pagodarum*, Blackheaded or Brahminy Myna (994)
- 10 *Sturnus sturninus*, Daurian Myna (995)
- 11 *Sturnus senex*, Ceylon Whiteheaded Myna or Starling (993)
- 12 *Sturnus erythropygius*, Whiteheaded Myna (991)
- 13 *Sturnus vulgaris*, Starling (997)
- 14 *Sturnus roseus*, Rosy Pastor (996)
- 15 *Sturnus contra*, Pied Myna (1002)
- 16 *Acridotheres tristis*, Common Myna (1006)
- 17 *Sturnus sinensis*, Chinese or Greybacked Myna (1005)
- 18 *Acridotheres ginginianus*, Bank Myna (1008)
- 19 *Acridotheres fuscus*, Jungle Myna (1009)
- 20 *Mina coronatus*, Goldcrested Myna (1014)
- 21 *Acridotheres albocinctus*, Collared Myna (1013)
- 22 *Acridotheres tristis*, Common Myna (1012)

Plate 69

- 1 *Garrulus lanceolatus*, Blackthroated Jay (1022)
- 2
- 3
- 4
- 5
- 6
- 7
- 8
- 9 *Dendrocitta leucogastra*, Whitebellied Tree Pie (1036)
- 10 *Dendrocitta vagabunda*, Indian Tree Pie (1032)
- 11 *Dendrocitta frontalis*, Blackbrowed Tree Pie (1035)
- 12 *Dendrocitta bayleyi*, Andaman Tree Pie (1040)
- 13 *Nucifraga caryocatactes*, Nutcracker (1042)
- 14 *ssp hemispila* of 1042. (1043)
- 15 *Podoces humilis*, Hume's Ground Chough (1041)

Plate 70

- 1 *Eudynamis scolopacea*, Koel (590)
- 2 *Pyrhocorax graculus*, Yellowbilled or Alpine Chough (1045)
- 3 *Corvus monedula*, Jackdaw (1053)
- 4 *Pyrhocorax pyrrhocorax*, Redbilled Chough (1046)
- 5 *Corvus frugilegus*, Rook (1052)
- 6 *Corvus splendens*, House Crow (1049)
- 7 *Corvus macrorhynchos*, Jungle Crow (1057)
- 8 *Corvus corone*, Carrion Crow (1058)
- 9 *ssp sharpii* of 1058. (1058a)
- 10 *Corvus ruficollis*, Brown-necked Raven (1061)
- 11 *Corvus corax*, Raven (1059)

Plate 71

- 1 *Pericrocotus roseus*, Rosy Minivet (1089)
- 2 *Pericrocotus erythropygius*, Whitebellied Minivet (1096)
- 3 *Pericrocotus cinnamomeus*, Small Minivet (1093)
- 4 *Pericrocotus solaris*, Yellowthroated Minivet (1088)
- 5 *Pericrocotus brevirostris*, Shortbilled Minivet (1084)
- 6 *Pericrocotus ethologus*, Longtailed Minivet (1085)
- 7 *Pericrocotus disparicatus*, Ashy Minivet (1089a)
- 8 *Pericrocotus flammeus*, Scarlet Minivet (1081)
- 9 *ssp speciosus* of 1081. (1080)
- 10 *Tephrodornis pondicerianus*, Common Wood Shrike (1070)
- 11 *Coracina novaehollandiae*, Large Cuckoo-Shrike (1072)
- 12 *Hemipus picatus*, Pied Flycatcher-Shrike (1055)
- 13 *Tephrodornis virgatus*, Large Wood Shrike (1068)
- 14 *Coracina melanoptera*, Blackheaded Cuckoo-Shrike (1079)
- 15 *Coracina nigra*, Pied Cuckoo-Shrike (1079a)
- 16 *Coracina melaschistos*, Smaller Grey Cuckoo-Shrike (1077)
- 17 *Coracina striata*, Barred Cuckoo-Shrike (1076)

Plate 72

- 1
- 2
- 3

- 8 *Muscicapa poliopteryx*, Brooks's Flycatcher (1436)
- 9 *Muscicapa pallipes*, Whitebelly Blue Flycatcher (1435)
- 10 *Muscicapa thalassina*, Verditer Flycatcher (1445)
- 11 *Muscicapa unicolor*, Pale Blue Flycatcher (1439)
- 12 *Muscicapa sordida*, Dusky Blue Flycatcher (1444)
- 13 *Muscicapa albicaudata*, Nilgiri Flycatcher (1446)
- 14 *Muscicapa sundara*, Rufousbelly Niltava (1432)
- 15 *Muscicapa concreta*, Whitetailed Blue Flycatcher (1434)
- 16 *Muscicapa virida*, Rufousbelly Blue Flycatcher (1433)

Plate 83

- 1 *Cettia pallidipes*, Palefooted Bush Warbler (1474)
- 2 *Cettia diphone*, Chinese Bush Warbler (1476)
- 3 *Cettia montana*, Strongfooted Bush Warbler (1478)
- 4 *Cettia flavolivacea*, Aberrant Bush Warbler (1481)
- 5 *Cettia brunnsfrons*, Rufouscapped Bush Warbler (1486)
- 6 *Cettia major*, Large Bush Warbler (1479)
- 7 *Cettia acanthizoides*, Verreaux's Bush Warbler (1484)
- 8 *Bradypterus luteocentris*, Brown Bush Warbler (1493)
- 9 *Bradypterus palliseri*, Palliser's Warbler (1494)
- 10 *Bradypterus thoracicus*, Spotted Bush Warbler (1490)
- 11 *Cettia cetti*, Cetti's Warbler (1488)
- 12 *Acrocephalus bistrigatus*, Blackbrowed Reed Warbler (1555)
- 13 *Bradypterus major*, Largebilled Bush Warbler (1491)
- 14 *Acrocephalus aedon*, Thickbilled Warbler (1549)
- 15 *Bradypterus tacsanovskius*, Central Asian Bush Warbler (1492)
- 16 *Acrocephalus dumetorum*, Blyth's Reed Warbler (1556)
- 17 *Acrocephalus agricola*, Paddyfield Warbler (1557)
- 18 *Acrocephalus scirpaceus*, Reed Warbler (1555a)
- 19 *Acrocephalus stentoreus*, Indian Great Reed Warbler (1550)

Plate 84

- 1 *Sylvia nisoria*, Barred Warbler (1564a)
- 2 *Sylvia communis*, Whitethroat (1566)
- 3 *Sylvia hortensis*, Orphean Warbler (1565)
- 4 *Sylvia curruca minula*, Lesser Whitethroat (1569)
- 5 *Sylvia curruca althata*, Lesser Whitethroat (1570)
- 6 *Sylvia curruca blythi*, Lesser Whitethroat (1567)
- 7 *Sylvia nana*, Desert Warbler (1571)
- 8 *Leptopoeile sophiae*, Stolizka's Tit-Warbler (1633)
- 9 *ssp obscura* of 1633. (1634)
- 10 *Regulus regulus*, Goldcrest (1629)
- 11 **Sylvia mystacea*, Menetries's Warbler (1571a)
- 12 *Leptopoeile elegans*, Crested Tit-Warbler (1632)
- 13 *Prinia socialis*, Ashy Wren-Warbler (1517)
- 14 *ssp steuarti* of 1517. (1515)
- 15 *Prinia cinereocapilla*, Hodgson's Wren-Warbler (1507)
- 16 *Prinia rufescens*, Rufous Wren-Warbler (1501)
- 17 *Prinia hodgsonii*, Franklin's Wren-Warbler (1503)

* This species is an addition to the Indian avifauna included in the second edition of the *Synopsis of the Birds of India and Pakistan* as No. 1571a on the basis of eight individuals sighted in the Sorkhab valley, c. 1650 m. Pishin district, 30°33' N., 67°12' E. A complete description of the bird will appear in the second edition of the *Handbook* Volume 8.

Plate 85

- 1 *Locustella certhiola*, Pallas's Grasshopper Warbler (1543)
- 2 *Schoeniola platyura*, Broadtailed Grass Warbler (1546)
- 3 *Locustella naevia*, Grasshopper Warbler (1545)
- 4 *ssp obscurior* of 1545. (RE)
- 5 *Megalurus platuris*, Striated Marsh Warbler (1548)
- 6 *Chaetornis striatus*, Bristled Grass Warbler (1547)
- 7 *Prinia gracilis*, Streaked Wren-Warbler (1508)
- 8 *Prinia buchanani*, Rufousfronted Wren-Warbler (1506)
- 9 *Locustella lanceolata*, Streaked Grasshopper Warbler (1544)
- 10 *Acrocephalus melanopogon*, Moustached Sedge Warbler (1495)
- 11 *Prinia atrogularis*, Blackthroated Hill Warbler (1529)
- 12 *Prinia subflava*, Plain Wren-Warbler (1511)
- 13 *Prinia sylvatica*, Jungle Wren-Warbler (1521)
- 14 *ssp sindiana* of 1521. (1524)
- 15 *Prinia flaticentris*, Yellowbelly Wren-Warbler (1525)
- 16 *ssp cnerascens* of 1531. (1532)
- 17 *Prinia burnesii*, Longtailed Grass Warbler (1531)
- 18 *Scolecera inquieta*, Streaked Scrub Warbler (1533)
- 19 *Prinia crinigera*, Brown Hill Warbler (1527)
- 20 *Cisticola juncidis*, Streaked Fantail Warbler (1498)
- 21 *Graminicola bengalensis*, Large Grass Warbler (1534)
- 22 *Cisticola exilis*, Fantail Warbler (1497)

- 20 *Phylloscopus reguloides*, Blyth's Leaf Warbler (1609)
- 21 *Phylloscopus trochiloides*, Dull Green Leaf Warbler (1605)
- 22 *Phylloscopus magnirostris*, Largebilled Leaf Warbler (1601)

Plate 87

- 1 *Rhipidura hypoxantha*, Yellowbelly Fantail Flycatcher (1450)
- 2 *Seicercus burkii*, Blackbrowed Flycatcher-Warbler (1615)
- 3 *Abroscopus albugularis*, Whitethroated Flycatcher-Warbler (1626)
- 4 *Abroscopus schisticeps*, Blackfaced Flycatcher-Warbler (1624)
- 5 *Seicercus affinis*, Allied Flycatcher-Warbler (1613)
- 6 *Abroscopus supercilii*, Yellowbelly Flycatcher-Warbler (1622)
- 7 *Seicercus xanthoschistos*, Greyheaded Flycatcher-Warbler (1617)
- 8 *Callicircus cydonensis*, Greyheaded Flycatcher (1448)
- 9 *Seicercus poliopteryx*, Greychecked Flycatcher-Warbler (1620)
- 10 *Abroscopus hodgsoni*, Broadbilled Flycatcher-Warbler (1627)
- 11 *Orthotomus sutorius*, Tailor Bird (1535)
- 12 *Orthotomus cucullatus*, Goldenheaded Tailor Bird (1541)
- 13 *Seicercus castaneiceps*, Chestnut-headed Flycatcher-Warbler (1621)
- 14 *Orthotomus atrogularis*, Blacknecked Tailor Bird (1540)
- 15 *Tesia cyanenter*, Dull Slatybelly Ground Warbler (1471)
- 16 *Tesia olivea*, Slatybelly Ground Warbler (1472)
- 17 *Tesia castaneocoronata*, Chestnut-headed Ground Warbler (1473)

Plate 88

- 1 *Brachypteryx stellata*, Gould's Shortwing (1635)
- 2 "
- 3 "
- 4 "
- 5 "
- 6 "
- 7 *Erithacus pectoralis*, Himalayan Rubythroat (1647)
- 8 *Erithacus stercus*, Bluethroat (1644)
- 9 *Erithacus pectoralis*, Firethroat (1652)
- 10 *Erithacus brunneus*, Blue Chat (1650)
- 11 *Erithacus cyane*, Siberian Blue Chat (1653)
- 12 *Erithacus indicus*, Whitebrowed Bush Robin (1659)
- 13 *Erithacus cyanurus*, Orangebacked Bush Robin (1655)
- 14 *Erithacus chrysaeus*, Golden Bush Robin (1658)
- 15 *Irania gutturalis*, Whitethroated Robin (SE)
- 16 *Erithacus hyperythrus*, Rufousbelly Bush Robin (1660)

Plate 89

- 1 *Erythropygia galactotis*, Rufous Chat (1641)
- 2 *Phoenicurus erythronotus*, Eversmann's Redstart (1669)
- 3 *Phoenicurus ochruros ruficentris*, Black Redstart (1672)
- 4 *Phoenicurus ochruros phoenicuroides*, Black Redstart (1671)
- 5 *Phoenicurus caeruleocephalus*, Blueheaded Redstart (1670)
- 6 *Phoenicurus phoenicurus*, Redstart (1673)
- 7 *Phoenicurus hodgsoni*, Hodgson's Redstart (1674)
- 8 *Phoenicurus frontalis*, Bluefronted Redstart (1675)
- 9 *Phoenicurus schisticeps*, Whitefronted Redstart (1676)
- 10 *Phoenicurus erythrogaster*, Guldenstadt's Redstart (1678)
- 11 *Phoenicurus auroreus*, Daurian Redstart (1677)
- 12 *Rhyacornis fuliginosus*, Plumbeous Redstart (1679)
- 13 *Hodgsonius phoenicuroides*, Hodgson's Shortwing (1680)

Plate 90

- 1 *Coppychus malabaricus*, Shama (1665)
- 2 *ssp albicentris* of 1665. (1668)
- 3 *Grandala coelicolor*, Hodgson's Grandala (1683)
- 4 *Coppychus saularis*, Magpie-Robin (1661)
- 5 *Enicurus scouleri*, Little Forktail (1684)
- 6 *Enicurus schistaceus*, Slatybacked Forktail (1685)
- 7 *Enicurus immaculatus*, Blackbacked Forktail (1685)
- 8 *Enicurus maculatus*, Spotted Forktail (1688)
- 9 *Enicurus leschenaulti*, Leschenault's Forktail (1687)
- 10 *Cochoa viridis*, Green Cochoa (1691)
- 11 *Cochoa purpurea*, Purple Cochoa (1690)
- 12 *Atalapha blythi*, Chestnut-bellied Thrush (1727)
- 13 "
- 14 "

Plate 91

- 1 *Saxicola macrorhyncha*, Stolizka's Bush Chat (1693)
- 2 *Saxicola torquata*, Stone Chat or Collared Bush Chat (1697)
- 3 *ssp przewalskii* of 1697. (1696)
- 4 *Saxicola insignis*, Hodgson's Bush Chat (1694)
- 5 *Saxicola caprata*, Pied Bush Chat (1701)
- 6 *Saxicola jerdoni*, Jerdon's Bush Chat (1704)
- 7 *Saxicola leucura*, Whitetailed Stone Chat (1699)
- 8 *Saxicola ferrea*, Dark-Grey Bush Chat (1705)
- 9 *Oenanthe oenanthe*, Wheatear (1708)
- 10 *Oenanthe isabellina*, Isabelline Chat (1706)
- 11 *Oenanthe xanthopygma*, Redtailed Chat (1707)
- 12 *Oenanthe deserti*, Desert Wheatear (1710)
- 13 *Oenanthe pleschanka*, Pleschanka's Pied Chat or Wheatear (1715)
- 14 *Oenanthe alboniger*, Hume's Chat (1714)
- 15 *Oenanthe finschi*, Barnes's Chat (1711)
- 16 *Oenanthe monacha*, Hooded Chat (1713)
- 17 *Oenanthe picata*, Pied Chat (1712)

Plate 92

- 1 *Monticola rufiventris*, Chestnutbelly Rock Thrush (1724)
- 2 *Zoothera atrina*, Orangeheaded Ground Thrush (1733)
- 3 *ssp cyanus* of 1733. (1734)
- 4 *Monticola solitarius*, Blue Rock Thrush (1726)
- 5 *Monticola cinclorhynchus*, Blueheaded Rock Thrush (1723)
- 6 *Turdus unicolor*, Tickell's Thrush (1748)
- 7 *Monticola saxatilis*, Rock Thrush (1722)
- 8 *Turdus boulboul*, Greywinged Blackbird (1750)
- 9 *Turdus albocinctus*, Whitecollared Blackbird (1749)
- 10 *ssp kinnisii* of 1752. (1757)
- 11 *ssp nigropileus* of 1752. (1753)
- 12 *ssp similis* of 1752. (1755)
- 13 *Turdus merula*, Blackbird (1752)
- 14 *Turdus feai*, Fea's Thrush (1761)
- 15 *Turdus kessleri*, Kessler's Thrush (1760)
- 16 *Turdus rubrocanus*, Greyheaded Thrush (1758)
- 17 *ssp gouldii* of 1758. (1759)

Plate 93

- 1 *Zoothera wardii*, Pied Ground Thrush (1731)
- 2 *Zoothera spiloptera*, Spottedwinged Ground Thrush (1737)
- 3 *Zoothera sibirica*, Siberian Ground Thrush (1732)
- 4 *Zoothera mollissima*, Plainbacked Mountain Thrush (1739)
- 5 *Zoothera marginata*, Lesser Brown Thrush (1746)
- 6 *Zoothera dixoni*, Longtailed Mountain Thrush (1740)
- 7 *Zoothera monticola*, Large Brown Thrush (1745)
- 8 *Zoothera dauma*, Golden, or Smallbilled, Mountain Thrush (1741)
- 9 *Turdus naumanni*, Dusky Thrush (1765)
- 10 *Turdus dissimilis*, Blackbreasted Thrush (1747)
- 11 *Turdus obscurus*, Dark Thrush (1762)
- 12 *Turdus ruficollis*, Redthroated Thrush (1764)
- 13 "
- 14 "
- 15 "
- 16 *Turdus cisticorvus*, Mistle Thrush (1768)

Plate 94

- 1 *Prunella collaris*, Alpine Accentor (1779)
- 2 *Prunella strophilata*, Rufousbreasted Accentor (1783)
- 3 *Prunella rubeculoides*, Robin Accentor (1781)
- 4 *Prunella umaculata*, Maroonbacked Accentor (1788)
- 5 *Prunella himalayana*, Altai Accentor (1780)
- 6 *Prunella atrogularis*, Blackthroated Accentor (1787)
- 7 *ssp ocellaris* of 1784. (1785a)
- 8 *Prunella montanella*, Siberian Accentor (1787a)
- 9 *Prunella fulvescens*, Brown Accentor (1784)
- 10 "
- 11 "
- 12 "
- 13 "
- 14 "
- 15 *Leucosticte nemoralis*, Hodgson's Mountain Finch (1953)
- 16 *Montifringilla rusticola*, Rednecked Snow Finch (1954)
- 17 *Leucosticte brandii*, Brandi's Mountain Finch (2003)
- 18 *Montifringilla theresae*, Bartailed Snow Finch (SE)

Plate 95

- 1 *Argythos leucogenys*, Whitecheeked Tit (1821)
2 *Argythos leucogenys*, Whitecheeked Tit (1822)
3 *Argythos leucogenys*, Whitecheeked Tit (1823)
4 *Argythos leucogenys*, Whitecheeked Tit (1818)
5
6 *Cephaloporus flammeiceps*, Firecapped Tit (1815)
7 *Remiz pendulinus*, Penduline Tit (1817)
8 *ssp nigricans* of 1817. (RE)
9 *Parus dichrous*, Brown Crested Tit (1808)
10 *Parus ater*, Coal Tit (1803)
11 *Parus ater*, Coal Tit (1803)
12 *Parus ater*, Coal Tit (1803)
13 *Parus ater*, Coal Tit (1803)
14 *Parus ater*, Coal Tit (1803)
15 *Parus cyanus flaypectus*, Yellowbreasted Blue Tit or Azure Tit (1800)
16 *Parus cyanus transchanicus* (Tien Shan) Yellowbreasted Blue Tit (1800a)
17 *Parus monticolus*, Greenbacked Tit (1799)
18 *Parus major*, Grey Tit (1794)
19 *Parus nuchalis*, Whitewinged Black Tit (1798)
20 *Parus nuchalis*, Whitewinged Black Tit (1799)
21 *Parus nuchalis*, Whitewinged Black Tit (1799)
22
23 *Parus bokharensis*, Blue-Grey Tit (SE)

Plate 96

- 1 *Sitta europea nagaensis*, European Nuthatch (1826)
2 *Sitta himalayensis*, Whitetailed Nuthatch (1834)
3 *Sitta castanea*, Chestnutbellied Nuthatch (1830)
4
5
6
7
8 *Sitta formosa*, Beautiful Nuthatch (1837)
9 *Tichodroma murina*, Wall Creeper (1839)
10 *Certhia familiaris*, Tree Creeper (1843)
11 *Certhia himalayana*, Himalayan Tree Creeper (1847)
12 *Certhia nipalensis*, Nepal Tree Creeper (1851)
13 *Certhia discolor*, Sikkim Tree Creeper (1849)
14 *Salpornis spilonotos*, Spotted Grey Creeper (1841)
15 *Panurus biarmicus*, Bearded Tit-Babbler or Reedling (1235)
16 *Paradoxornis gularis*, Greyheaded Parrotbill (1249)
17 *Paradoxornis gularis*, Greyheaded Parrotbill (1251)
18 *Paradoxornis gularis*, Greyheaded Parrotbill (1252)
19 *Paradoxornis gularis*, Greyheaded Parrotbill (1247)
20 *ssp ontes* of 1246 (1245)
21 *Paradoxornis atrovsuperillaris*, Lesser Redheaded Suthora or Parrotbill (1246)
22 *Paradoxornis nipalensis humis*, Orange Suthora (1241)
23 *Paradoxornis nipalensis poliots*, Orange Suthora (1242)
24 *Paradoxornis fulvifrons*, Fulvousfronted Suthora or Parrotbill (1238)

Plate 97

- 1 *ssp richards* of 1859 (1857)
2 *Anthus novaeseelandiae*, Paddyfield Pipit (1859)
3 *Anthus campestris*, Tawny Pipit (1861)
4 *Anthus similis*, Brown Rock Pipit (1868)
5 *Anthus pratensis*, Meadow Pipit (1856)
6 *Anthus cervinus*, Redthroated Pipit (1864)
7 *Anthus roseatus*, Vinaceousbreasted Pipit (1865)
8 *Anthus hodgsoni*, Indian Tree Pipit (1852)
9 *Anthus trivialis*, Tree Pipit (1854)
10 *Anthus spinoletta*, Water Pipit or Alpine Pipit (1871)
11 *Anthus nilghiriensis*, Nilgiri Pipit (1870)
12 *Anthus sylvanus*, Upland Pipit (1873)
13 *Motacilla alba personata*, Pied or White Wagtail (1886)
14 *Motacilla alba dukhunensis*, Pied or White Wagtail (1885)
15 *Motacilla alba dukhunensis*, Pied or White Wagtail (1874)

INTRODUCTION

Good historical accounts of ornithology and ornithologists in India, chiefly since the beginning of the nineteenth century, and the more important contributions to the science up to the publication of the last volume of Stuart Baker in 1930 are chronicled progressively in the introductory portions of all the standard books on Indian ornithology of that period — Jerdon's *Birds of India*, and the two editions of the Fauna of British India series on *Birds*. They call for no more than a brief reference here. The first six decades of the nineteenth century, up till the publication of the former in 1862, were dominated by the virtual founders of Indian ornithology, T. C. Jerdon, Brian Hodgson and Edward Blyth; but this pioneering period was marked also by a number of other active field workers among whom deserving mention are Adams, Franklin, Hutton, McClelland, Sykes, Tickell, and Tytler in India, and Kelaart and Layard in Ceylon. *Birds of India* epitomizes the knowledge up to that date, based on the vast collections of Hodgson (chiefly from Nepal), and of Blyth and Jerdon themselves and their many protégés and correspondents, including the above named, in various parts of the Indian Peninsula. 'Jerdon' contains some excellent field notes on habits and ecology which is a refreshing feature for a period when the main accent was, understandably, on amassing large numbers of skins — often through the help of local shikaris — and classifying them. Some of these accounts, particularly relating to the rarer species, have not been added to or improved upon since, and as a whole they still remain the hard core of our knowledge of certain aspects of bird study. The book continued as the standard work on Indian ornithology for many years and is of considerable usefulness even today. Unfortunately it covers only a portion of our area, leaving out practically the whole of the present West Pakistan and Kashmir, as well as Assam, Manipur, East Pakistan, the Andaman and Nicobar islands, and Ceylon. Nevertheless the appearance of such a handy comprehensive manual embodying all the hitherto more or less scattered and region-wise information available only in learned journals — such as *Proceedings of the Zoological Society* of London, and the journals of the Linnaean and Asiatic Societies — at once gave a marked impetus to bird study. It found new devotees who in turn were soon to become prominent names in Indian ornithology. The period thence, and right up to the publication of the first edition of the government-sponsored Fauna of British India series on *Birds*¹ was completely dominated by A. O. Hume, who had meanwhile appeared on the scene. Hume, who by the way is memorable also as being one of the founders of the Indian National Congress while still in active civil service, was a truly remarkable man. He has with good justification been called 'The Father' — and as a dubious compliment by those who were sometimes irked by his seeming dogmatism 'the Pope' — of Indian ornithology. Hume collected methodically and very intensively himself and with the help of his numerous band of competent colleagues and protégés and correspondents widely scattered over the country, chiefly between about 1870 and 1885. His collection totalled over 60,000 bird skins and large numbers of nests and eggs, all of which he later presented to the British Museum, where a large part of Hodgson's Nepal collection of over 20,000 skins had already found its way. Little wonder then that, together with the other vast collections such as those of Col. Sykes, the Marquis of Tweeddale (Viscount Walden), Mr John Gould, and the many others continually acquired since, the British Museum collection of Indian birds has come to be the most complete to be found under a single roof anywhere in the world.

Hume founded and edited '*Stray Feathers*' — *A journal of ornithology for India and dependencies* between 1872 and 1888. Its eleven volumes are a veritable gold-mine for the ornithologist and an eloquent memorial to the zeal, industry and erudition of their editor who by constant goading, advice and encouragement so ably contrived to get the best out of his tentacular band of correspondents and collaborators. The most notable of these were Anderson, Ball, Barnes, Beavan, Biddulph, Blanford, Brooks, Davison, Godwin-Austen, Hutton, Legge, Mandelli, McMaster, Oates, Scully, Sharpe, Stoliczka, Tweeddale, Vidal, Wardlaw-Ramsay, and others.

For the serious worker in Indian ornithology, *Stray Feathers* is an absolutely indispensable source. During the period of its existence this journal was the principal repository of the most important papers on Indian birds. When it ceased publication, after December 1888, many of its former contributors, as well as other workers who had gained prominence meanwhile, diverted their writings to *The Ibis* — the journal of the British Ornithologists' Union, and to the *Journal of the Bombay Natural History Society*. The last, which made its initial appearance in January 1886, has maintained unbroken publication since then. It has become increasingly important as a medium for disseminating knowledge of Indian birds and is now in its 65th volume. The *Journal* has grown progressively in international reputation and scientific stature since the turn of the century, and it is true to say that no work on Indian ornithology can be complete, or is indeed possible, without constant delving into its contents. Many significant contributions on birds have appeared in the pages of the *Journal* during the last 60 years. Even up to as recently as 1925 almost all the writers have been British — chiefly Government officials from all branches of the services — Army, Police, Civil, Forest, and others — with a sprinkling of business and professional men. The more prominent of these have already been named in the introductory chapters

of the Fauna, 2nd edition. Many of them continued to make significant contributions in the years subsequent to the completion of that work in 1930. This chronicle takes up the thread chiefly from that period on.

Bird study in India had received its second great boost by the publication between 1889 and 1898 of the four bird volumes by Eugene W. Oates and W. T. Blanford in the Fauna of British India series. As in the case of its predecessor, Jerdon's *Birds of India*, it brought together and up to date all the advances in knowledge due to the extensive work in the field and in the museum during the intervening twenty-seven years, from scattered sources including the most important — Hume's *Stray Feathers*. It took count of the areas omitted from Jerdon's manual, together with Burma, thus covering the entire British Indian Empire as it then stood, with the addition — on biological considerations — also of Ceylon. The inclusion of the extra territory increased the number of species described by more than half, and with the replacement of Jerdon's archaic nomenclature and obsolete system of classification by the more rational and progressive one that had since emerged from the anatomical researches of men like Huxley, Garrod, and Forbes, the Fauna gave a new look to Indian ornithology. It represented a marked improvement over its predecessor in every sense but one. Owing to limitations of space it was unhappily deemed fit to curtail drastically the descriptions of habits, migration etc. or omit them altogether, thus reducing very considerably the appeal and usefulness of the publication for the non-technical bird lover. This was a distinctly retrograde step.

Nevertheless the renewed filip that the volumes gave to Indian bird study was clearly responsible for the eruption of the notable crop of outstanding field ornithologists that distinguished the next thirty-three years up to the publication of Vol. 1 of the 'New Fauna', including its author E. C. Stuart Baker himself.

A feature of the period between the two World Wars, and more particularly since the end of the Second, is the increasing popularity enjoyed by bird watching and field study as discrete from specimen collecting. This may be said to have given a new dimension to the study of Indian birds. The development and perfection of precision instruments such as field-glasses, cameras, and telephoto lenses, fast films, colour photography and sound recording have contributed not a little to this. They have helped to produce an ever-widening circle of competent bird watchers whose photographic records and penetrating observations of habits and nidification have added immensely to our knowledge, not only of the ecology but also of the systematics of Indian birds.

Thus, one of the more refreshing features of the 2nd edition of the Fauna by Stuart Baker (the 'New Fauna' for short) is the section on habits under each bird, in addition to fuller notes on nidification than in its predecessor. To Baker must also go the credit for introducing trinomials, officially as it were, into Indian ornithology although this system had been increasingly in vogue in Europe for almost two decades previously, and especially since the publication of Ernst Hartert's great work *Die Vögel der paläarktischen Fauna* began in 1910.

With the innovation of trinomials in Indian ornithology, a certain amount of disagreement and conflict of opinion was inevitable among ornithologists who had concerned themselves specially with its related problems; and indeed controversies have not ceased forty years after its introduction. No sooner was the first volume of the New Fauna published (in 1922) than the criticisms and arguments began. Whistler and Ticehurst in particular joined issue with Baker on a number of his statements and dicta. Many of their objections derived from the fact that large tracts of the country had as yet not been sufficiently explored ornithologically and there remained considerable gaps in our knowledge of the geographical distribution of many 'resident' birds — knowledge which is crucial for a proper application of the subspecies concept.

Nevertheless it must be conceded that by and large the New Fauna represented a distinct advance on its predecessors, though here and there it might suffer from obvious defects and inaccuracies of fact and geography. Among the many workers on Indian birds prominent during the period between the two World Wars (c. 1917 to 1943), and the years that followed, perhaps the most significant were E. C. Stuart Baker, Hugh Whistler, Dr Claud B. Ticehurst, Sir Norman Kinnear, Frank Ludlow, B. B. Osmaston, A. E. Jones, Charles M. Inglis, Sálím Ali, W. W. A. Phillips, R. S. P. Bates, and E. H. N. Lowther.

Besides these there are numerous others who made important contributions to Indian ornithology and whose names constantly recur in the *Journal of the Bombay Natural History Society* and other scientific periodicals. Foremost among them all must certainly rank Hugh Whistler, who had not only collected birds diligently during his seventeen years in the Imperial Police Service in the Punjab, but also amassed copious notes on every aspect of Indian bird life. These data were intended for a handbook of Indian birds which he and his close friend and collaborator Dr Ticehurst had commenced to write jointly. It was indeed a tragic blow for Indian ornithology when both these men — two of the most meticulous workers we have ever had — died before the manuscript had made much progress, Ticehurst in 1941 and Whistler in 1943.* A portion of Whistler's manuscript notes and files, relating particularly to the Passeres, passed into the hands of one of us (SA) through the friendly offices of the Honourable Mrs Joan

¹ Vols. 1 (1889) and 2 (1890) by Eugene W. Oates under the editorship of W. T. Blanford, Vols. 3 (1895) and 4 (1896) by Blanford himself.

* Obituaries CBT, *Ibis* 1941: 321; HW, *Ibis* 1943: 524.

Whistler. This material will be of the greatest usefulness when that section of the present *Handbook* is reached. It has proved invaluable to the second author (SDR) in the preparation of his *Synopsis* which forms the groundwork of this book.

It was in order to rectify the deficiencies in our knowledge, chiefly of geographical distribution within the country pin-pointed by the publication of the new Fauna, that, at the instigation of Whistler, the Bombay Natural History Society with the financial sponsorship of Mr Arthur Vernay — an American business magnate and patron of Natural History — undertook, in 1929, a well-planned survey of the birds of the Eastern Ghats, at that time one of the least known areas in the Peninsula. The extensive survey collections, most excellently prepared by V. S. Lapersonne, the Society's field collector, were studied in England by Messrs Whistler and Kinnear with the collaboration of Dr Ticehurst. The scientific report of the Eastern Ghats Survey, in sixteen parts spread over several volumes of the *Journal* of the Bombay Natural History Society, graphically highlighted the gaps in our knowledge and supplied the incentive for a series of similar investigations in other poorly known parts of the country. These later surveys covered Jodhpur, Hyderabad, Travancore, Cochin, Gwalior, Indore, Bhopal, Mysore, Bahawalpur, Gujarat, Kutch, Bastar and Kankar (eastern Madhya Pradesh), and Orissa, in that order. All the field work, except in Jodhpur, was carried out by Sálím Ali chiefly with funds donated by the rulers of the States concerned and others, and supplemented from his own resources — and in close liaison with Hugh Whistler up to the time of the latter's death. The then newly introduced air mail service between India and the U.K. enabled running contact to be maintained from the field, and the rapid exchanges proved invaluable in the elucidation of many problems that required prompt collection of material and ancillary data. This close coordination between field and museum greatly enhanced the scientific worth of the surveys. Besides, Sálím Ali being more particularly interested in the living bird, devoted special attention to ecology and habits, and was able to accumulate a considerable amount of new data on these aspects in the course of his field work, adding substantially to what was recorded before. The late Dato Loke Wan Tho of Malaya, an exceptionally keen ornithologist and generous patron of ornithology, financed a bird survey of Sikkim during three separate field seasons between 1955 and 1957. The field work was again carried out by Sálím Ali, once with the active participation of Loke himself, and resulted in the publication by the former of the book *Birds of Sikkim* (1962). A few years earlier, in 1948, Loke had also made it financially possible for Sálím Ali to undertake a joint ornithological expedition to the Mishmi Hills of north-east Assam (now Luhit Frontier Division, NEFA) with S. Dillon Ripley, the results of which were reported in the *JBNHS* (1948, 48: 1-37). Incidentally it was on the Mishmi expedition that the idea of the present *Handbook* was first mooted between the authors. All these newly accumulated data soon made it plain that Stuart Baker's Fauna left much room for correction, addition and improvement in many respects, and emphasized the need for an early revision. Added to all the wealth of material procured by these regional bird surveys, mention must be made of the very fruitful collecting expeditions of Ripley himself in Nepal, and the Naga Hills of Assam (now Nagaland), during the post-war years. Further, during the war period Ripley had found opportunities for selective collecting in Ceylon while on duty with the American armed forces in that island, thus supplementing the excellent work zealously carried on there by W. W. A. Phillips over a long series of years. A major contribution to bird collections from India was made by another American, Walter Koelz, during an extended sojourn of some fourteen years (c. 1939-53) in the subcontinent and neighbouring countries. While collecting specimens of grains on behalf of the U.S. Department of Agriculture, he managed also to amass a stupendous collection of some 40,000 bird skins — partly in Iran and Afghanistan, but mainly in Pakistan, Nepal, Assam, and various other insufficiently worked areas of the Indian Subregion. Koelz was an indefatigable field collector. By dint of unsparing effort and fanatical industry he managed to procure large series of many birds poorly represented even in the foremost world collections, including some of the rarest forms. Unfortunately he does not seem to have kept field notes on habits, ecology, etc. He certainly never published any, nor have we been privileged to see them in MS. — thus depriving Indian ornithology of what could undoubtedly have been his greatest contribution to it. Unfortunately also the vast Koelz collection was broken up and dispersed among a number of museums in the U.S.A., a circumstance which has deprived students of the convenience of having all this material available for study in one central institution.

The standard manuals of ornithology mentioned earlier were excellent in their own way, but they presumed a basic familiarity with birds and were difficult to use by the uninitiated layman. Besides, it was widely realized that now — over thirty years since their publication — Stuart Baker's Fauna volumes were outmoded in many respects and stood in urgent need of revision. What was obviously needed at this stage was not merely the Fauna in its old format brought up to date, but a work which combined strict scientific accuracy with non-technical language and popular appeal — concise accounts of life history and habits and, above all, good coloured illustrations supplemented by simple clues to field identification. Since the change in the political set-up in India (in 1947) and the departure of British officials, among whom were to be found some of the keenest and most knowledgeable bird-watchers, field activity suffered a noticeable setback. A serious impediment to the development of scientific ornithology in India, where bird-watching as a hobby has never been very popular even among the more affluent and educated classes, was certainly the lack of illustrated literature

on the birds of the country. The stimulus given to purposeful bird-watching as a first step to deeper study by the publication in recent years of illustrated books like Whistler's *Popular Handbook of Indian Birds* and Sálím Ali's *Book of Indian Birds* clearly pointed to the need of a more comprehensive work on the same lines.

Our inspiration was derived from the admirable *Handbook of British Birds* by Witherby and others, which combines all the desired features in a manner that has seldom been excelled. But though our book is so entitled as a tribute to its British original, we are only too conscious of the loss it suffers by comparison since our information on most topics of the life history and ecology of Indian birds — even of distribution — is as yet quite elementary compared with that in the British handbook. Nevertheless it seems desirable to record whatever is known if only to show the extent of its incompleteness, so that the deficiencies may in time be rectified.

The first essential, before a beginning with such a book could be made, was an up-to-date checklist as basis for the descriptive volumes to follow, a need admirably fulfilled by Ripley's *A Synopsis of the Birds of India and Pakistan* published by the Bombay Natural History Society in 1961. It lists some 1,200 species in nearly 2,100 forms within the above limits, with which is also included Ceylon from biological considerations.

In the past the greater part of the ornithological work in India consisted of specimen or egg collecting, sometimes rather haphazardly. Within recent years these activities have been increasingly replaced by bird-watching at various levels of scientific competence. Most of the observers have been government officials or tea, coffee or rubber planters, fortuitously stationed for varying periods in different parts of the country. Few of them possessed any formal biological background, and though a number contributed substantially to our knowledge such were, for the size of the country, too few and far between. For us — the present authors — difficulty lay in assessing the authenticity of the distributional and other records by observers of unproved competence in field identification especially where they rested solely on sight, or related to topics of a controversial nature. There is no doubt that in the past many unwarranted records and observations have been uncritically accepted in this way. The need for caution has doubled in recent years because of the expanding circle of casual bird-watchers of vastly divergent expertness, and the decline in the vogue of shooting specimens to support identification. Thus it is possible that in exercising our judgement in this regard we may sometimes have erred on the side of overcaution.

Even after suitable compression of the available data, meagre as they are on the whole, a coverage of this magnitude is estimated to require 10 volumes of approximately 400 pages each, and many years to complete. Such a work must inevitably be a compilation to a large extent, collating our own notes with the sifted publications and MSS. of a large number of field observers and museum workers. In view of the coloured illustrations, 'feather by feather' descriptions of plumages, as in the Fauna, were considered redundant. The pictures, supplemented by the Keys and the paragraphs on Field Characters and Museum Diagnosis, should suffice to identify a bird in the field as well as in the hand.

The New Fauna has already listed active workers in Indian ornithology up to the time of its completion in 1930; that account now merely needs carrying forward to the publication of the present volume. In addition to the persons named below there are others who have made minor but significant contributions and who will appear in the text. During the progress of these volumes it is hoped that further names will also need to be added. The major continuing contributors as well as new ones since the completion of the second edition of the Fauna have been Humayun Abdulali, Sálím Ali, E. C. Stuart Baker, R. S. P. Bates, F. N. Betts, Biswamoy Biswas, F. S. Briggs, P. T. L. Dodsworth, E. A. D'Abreu, R. S. Dharmakumarsinhji, C. H. Donald, K. R. Eates, R. L. Fleming (Sr.), J. C. Higgins, Charles M. Inglis, A. E. Jones, N. B. Kinnear, Walter Koelz, Satya Churn Law, Loke Wan Tho, E. H. N. Lowther, Frank Ludlow, R. Meinertzhagen, B. B. Osmaston, W. W. A. Phillips, Mrs Desirée Proud, S. Dillon Ripley, Claud B. Ticehurst, H. W. Waite and Hugh Whistler. Foremost among those active in Burma up to the time of its fall to the Japanese invaders in the war (1941) were P. F. Garthwaite, T. R. Livesey, H. C. Smith, B. E. Smythies, and J. K. Stanford. Since the end of hostilities little work seems to have been done in that country, or since the partition (1947) in Pakistan.

ACKNOWLEDGEMENTS

To all the above and the many more on whom we have drawn freely we feel greatly beholden. Particular mention must be made of Dr Biswamoy Biswas who has been associated with the preparation of the MS. in various ways and whose critical comments and suggestions on various matters have always been most valuable.

We have to express our indebtedness to the National Institute of Sciences of India and its then President, the late Dr Sunder Lal Hora, for the award of a Research Fellowship to one of us (SA) for two years (1952-3) to forward the extraction of relevant material from the literature. The Bombay Natural History Society, under whose sponsorship this book is being produced, has provided facilities at every stage, especially the use of its excellent collection of Indian bird skins and ornithological library. We wish to express our appreciation of the unflinching cooperation we have received from its staff at all times.

Without the substantial grant-in-aid from the Government of India, Ministry of Scientific Research, for the preparation of the four-colour blocks, and for secretarial assistance to one of us (SA) in preparing the MS., it is doubtful if such an ambitious project could have been entertained or carried through. Likewise would it have been im-

possible to find the foreign exchange needed for payment of the artists' fees, since most of these are of necessity European, but for the generous underwriting by friends in the United States of America of the substantial amount needed for the purpose.

The dichotomous keys to genera, species, and subspecies have been constructed by one of us (SDR) with the most valuable aid of his research assistant Mr Gorman M. Bond, Museum Specialist of the Smithsonian Institution, Washington, to whom warm thanks are due. We are indebted to Mr Bertram E. Smythies and Messrs Oliver & Boyd Ltd, the author and publishers respectively of *The Birds of Burma*, for their generous permission to use a number of the coloured plates painted for that book by Commander A. M. Hughes. A few of the figures on these depict a different subspecies to that found within Indian limits, but the differences are mostly minor enough to be reconciled by a short verbal correction. We have been similarly privileged to use the coloured plates from *The Birds of Travancore and Cochin* (now *Birds of Kerala*) and *The Birds of Sikkim* by courtesy of the sponsors of those books, the University of Kerala and the Government of Sikkim respectively, and of the publishers, the Oxford University Press.¹

Most of the line drawings in the text are the same as appeared in the first edition of the *Fauna of British India: Birds*, and again in the second edition of that work by E. C. Stuart Baker (Taylor & Francis, for the Government of India). In addition, Messrs H. F. & G. Witherby

¹ The plates used in the second edition of the *Compact Handbook* have been drawn by John Henry Dick. See Publisher's Note to the Second Edition, p.xi

have generously permitted us to reproduce some of the very useful text figures from their *Handbook of British Birds*. All this considerate cooperation has not only helped to cut down costs, especially of painting the extra coloured plates and block-making, but also resulted in a considerable saving of time.

The distribution maps have been constructed or adapted from a number of different sources the chief of which are *Atlas of European Birds* by K. H. Voous (Nelson), *Waterfowl of the World* by Jean Delacour (Country Life), and *Birds of the Soviet Union* by G. P. Dementiev, H. Gladkov *et al.*

Lastly, our particular and grateful appreciation is due to the staff of the Oxford University Press. But for their running bombardment of queries and suggestions many more inaccuracies, inconsistencies and ambiguities would have persisted in this volume than the reader is perhaps still likely to discover.

GENERAL

ORNITHOLOGISTS conditioned to the sequence of Orders and Families in Stuart Baker's *Fauna* volumes may experience some initial inconvenience and confusion by the arrangement in the present handbook. In the main this represents the scheme proposed by Wetmore (*Proc. U.S. Nat. Museum*, 76, Art. 24, 1930, pp. 1-8) now used more or less internationally with minor shufflings chiefly in the Passeriform ('Song bird') families. This system was formally introduced into Indian ornithology by the publication in 1961 of *A Synopsis of the Birds of India and Pakistan* by S. Dillon Ripley, our latest authentic checklist, which virtually forms the index volume and basis of the present work. Superficially this system is little more than the old one in reverse. Whereas the *Fauna* began with the Order Passeriformes as containing the putatively highest developed forms and worked down to the lowest, namely to the Gaviiformes (Loons and Divers), we now begin at the bottom of the evolutionary tree and work up to the highest evolved forms.

The sequence of Orders and Families followed in the second editions of Vols. 1-4 and the first editions of Vols. 5-10 is as under. Some taxonomic changes made in the second editions of the *Handbook* volumes are in accordance with the second edition of the *Synopsis*.

Volume 1 (Nos. 1-224)

- Order GAVIIFORMES
 Family Gaviidae: Divers, Loons
 Order PODICIPITIFORMES
 Family Podicipedidae: Grebes
 Order PROCELLARIIFORMES
 Family Procellariidae: Petrels, Shearwaters
 Hydrobatidae: Storm Petrels
 Order PELECANIFORMES
 Family Phaethontidae: Tropic-birds
 Pelecanidae: Pelicans
 Sulidae: Boobies
 Phalacrocoracidae: Cormorants and Darter
 Fregatidae: Frigate Birds
 Order CICONIIFORMES
 Family Ardeidae: Herons, Egrets, Bitterns
 Ciconiidae: Storks
 Threskiornithidae: Ibises, Spoonbill
 Phoenicopteridae: Flamingos
 Order ANSERIFORMES
 Family Anatidae: Ducks, Geese, Swans
 Order FALCONIFORMES
 Family Accipitridae: Hawks, Vultures, etc.
 Falconidae: Falcons

Volume 2 (Nos. 225-434)

- Order GALLIFORMES
 Family Megapodiidae: Megapodes
 Phasianidae: Pheasants, Partridges, Quails
 Order GRUIFORMES
 Family Turnicidae: Bustard-Quails
 Gruidae: Cranes
 Rallidae: Rails, Coots
 Heliornithidae: Finfoots
 Otidae: Bustards
 Order CHARADRIIFORMES
 Family Jacanidae: Jacanas
 Haematopodidae: Oystercatchers
 Charadriidae:
 Subfamily Charadriinae: Plovers
 Scolopacinae: Curlews, Sandpipers, Snipe, Woodcock
 Phalaropinae: Phalaropes
 Family Rostratulidae: Painted Snipe
 Recurvirostridae: Stilts, Avocets, Ibisbills
 Dromadidae: Crab Plovers

Volume 3 (Nos. 435-665)

- Family Burhinidae: Stone Curlews, Thick-knees
 Glareolidae: Coursers, Pratincoles
 Stercorariidae: Skuas, Jaegers
 Laridae: Gulls, Terns
 Order COLUMBIFORMES
 Family Pteroclididae: Sandgrouse
 Columbidae: Pigeons, Doves
 Order PSITTACIFORMES
 Family Psittacidae: Parrots
 Order CUCULIFORMES
 Family Cuculidae: Cuckoos
 Order STRIGIFORMES
 Family Strigidae:
 Subfamily Tytoninae: Barn Owls
 Striginae: Owls

Volume 4 (Nos. 666-871)

- Order CAPRIMULGIFORMES
 Family Podargidae: Frogmouths
 Caprimulgidae: Nightjars or Goatsuckers
 Order APODIFORMES
 Family Apodidae:
 Subfamily Apodinae: Swifts
 Hemiprocninae: Crested Swifts
 Order TROGONIFORMES
 Family Trogonidae: Trogons
 Order CORACIIFORMES
 Family Alcedinidae: Kingfishers
 Meropidae: Bee-eaters
 Coraciidae: Rollers or Blue Jays
 Upupidae: Hoopoes
 Bucerotidae: Hornbills
 Order PICIFORMES
 Family Capitonidae: Barbets
 Indicatoridae: Honeyguides
 Picidae:
 Subfamily Jynginae: Wrynecks
 Picumninae: Piculets
 Picinae: Woodpeckers
 Order PASSERIFORMES
 Family Eurylaimidae: Broadbills
 Pittidae: Pittas

Volume 5 (Nos. 872-1063)

- Family Alaudidae: Larks
 Hirundinidae: Swallows
 Laniidae: Shrikes or 'Butcher Birds'
 Oriolidae: Orioles
 Dicruridae: Drongos
 Artamidae: Swallow-Shrikes or Wood Swallows
 Sturnidae: Starlings, Mynas
 Corvidae: Crows, Magpies, Jays, etc.
 Bombycillidae:
 Subfamily Bombycillinae: Waxwings
 Hypocoliinae: Hypocolius

Volume 6 (Nos. 1064-1271)

- Family Campephagidae: Cuckoo-Shrikes, Minivets
 Irenidae: Fairy Bluebirds, Ioras, Leaf Birds
 Pycnonotidae: Bulbuls
 Muscicapidae:
 Subfamily Timaliinae: Babbler (part)

Volume 7 (Nos. 1272-1470)

- Family Muscicapidae (cont.):
 - Subfamily Timaliinae: Babbblers (cont.)
 - Muscicapinae: Flycatchers
 - Pachycephalinae: Thickheads or Shrikebilled Flycatchers

Volume 8 (Nos. 1471-1680)

- Family Muscicapidae (cont.):
 - Subfamily Sylviinae: Warblers
 - Turdinae: Thrushes, Robins, Chats

Volume 9 (Nos. 1681-1891)

- Subfamily Turdinae: Thrushes, Robins, Chats (cont.)
- Family Troglodytidae: Wrens
- Family Cinclidae: Dippers
 - Prunellidae: Accentors or 'Hedge Sparrows'
 - Paridae:
- Subfamily Parinae: True Tits
 - Remizinae: Penduline Titmice
 - Aegithalinae: Longtailed Titmice
- Family Sittidae:
 - Subfamily Sittinae: Nuthatches
 - Tichodromadinae: Wall Creepers
 - Salpornitinae: Spotted Creepers
- Family Certhiidae: Tree Creepers
 - Motacillidae: Pipits, Wagtails

Volume 10 (Nos. 1892-2060)

- Family Dicaeidae: Flowerpeckers
- Nectariniidae: Sunbirds, Spiderhunters
- Zosteropidae: White-eyes
- Ploceidae:
 - Subfamily Passerinae: House and Rock Sparrows
 - Ploceinae: Weaver Birds or Bayas
 - Estrildinae: Munias
- Family Fringillidae:
 - Subfamily Fringillinae: Chaffinches
 - Carduelinae: Goldfinches and allies
- Family Emberizidae: Buntings

Measurements. At the head of each description, before **FIELD CHARACTERS**, is given an indication of **SIZE**, first as compared with some well-known and familiar bird (the signs + and - denoting larger or smaller than, and ± more or less equal to), and then by length in centimetres and inches. This refers to the length from tip of bill to tip of tail of a freshly killed bird laid on its back, unstretched, or of a similarly made up museum skin. This measure is purely as a matter of convenience in field identification since it is easy enough for anyone to hold his two hands apart and visualize what 'about 15 cm. or 6 inches' means. It has no scientific value.

Under **MUSEUM DIAGNOSIS** the measurements given for wing, bill, tarsus, and tail are those taken by the standard methods as shown in the Explanatory Figures. It must be mentioned, however, that in all of Stuart Baker's measurements quoted from the Fauna, the bill has been measured from the *forehead feathers* to the tip (i.e. culmen), and not from the *skull* as is now the accepted practice. Wing measurement in particular can be more satisfactorily taken in the flesh — either on a freshly killed bird or a living one — while the joints are still flexible and easy to manipulate. There is some slight shrinkage on drying which can largely be compensated for by not pressing and straightening out the fresh wing on the rule too much (as when measuring a dry skin) but merely leaving it in a fully extended natural position. This precaution is necessary in order to make the wing comparable

STANDARD METHOD OF MEASURING BIRDS

- 1 **Wing** Pressed out on the rule until it is quite flat, giving the longest measurement obtainable. For very large birds (e.g. eagles and swans), a measuring tape is stretched from the carpal joint to the longest feather along the upper side of the wing. This is known as the chord measurement.
- 2 **Bill** From skull. One end of the dividers is slid along the culmen and pressed to the skull, which is usually concealed by feathers. This gives a more consistent measurement than from the end of feathering to the tip ('culmen' or 'bill from feathers').
- 3 **Tarsus** One end of the dividers is pressed to the tibiotarsal or 'knee' joint, the other passed to the joint at the base of the middle toe.
- 4 **Tail** One end of the dividers is slid between the central tail feathers and pressed to the body while the other is passed to the tip of the longest feather.

with dry museum skins later.

Weight. Field collectors have paid little attention to this detail in the past except perhaps in the case of some game birds. Apart from being a record of sexual differences in many species, fluctuations in weight due to seasonal physiological changes and deposition of body fat have an important bearing for the study of bird migration; therefore, wherever possible weights should be accurately recorded. With small birds like most passerines this is easily done by slipping the bird, dead or alive, into a plastic bag and hooking it on to a suitable spring balance, the tare having been previously ascertained. With large live birds some device to prevent them from fluttering during weighing is necessary.

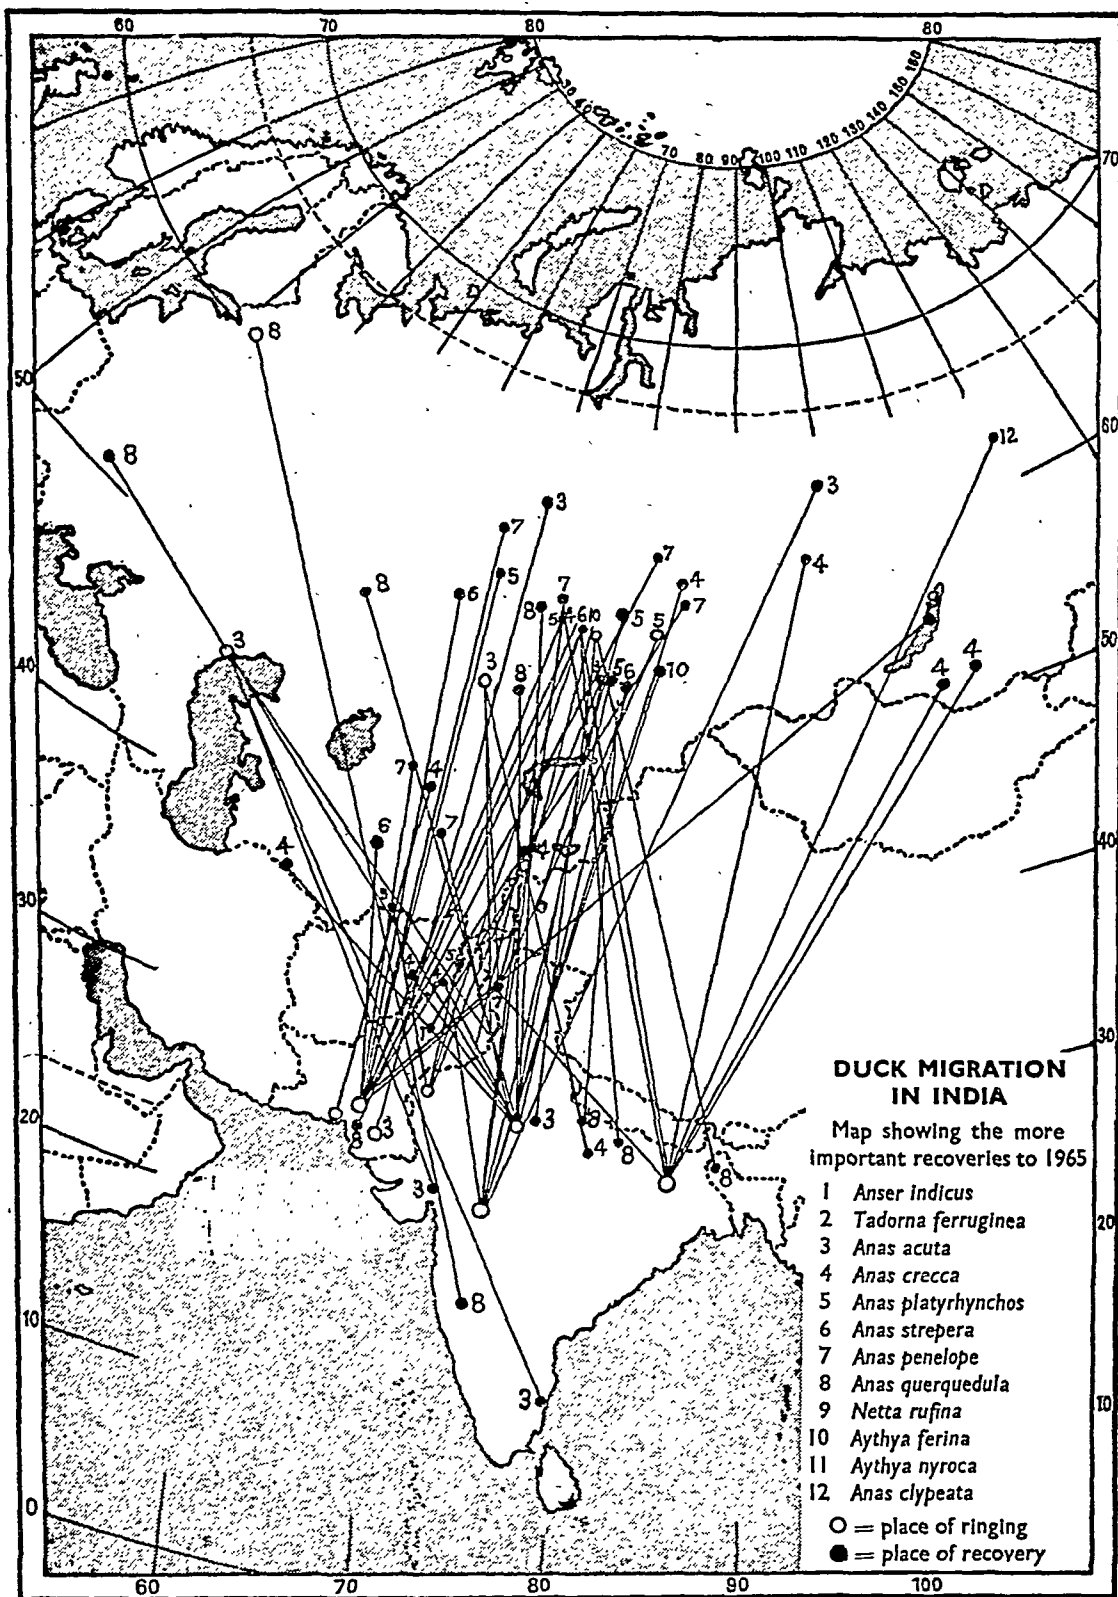

NOTE. Much of our information relating to nesting has been culled from Stuart Baker, either from FBI or from his *Nidification of Birds of the Indian Empire*. Though these are authentic sources by and large, it needs to be emphasized that some of this author's data concerning clutch sizes, and even his identifications of certain eggs, are suspect or demonstrably erroneous. Baker, although an experienced oologist himself, often collected his eggs and information vicariously with the help of local shikaris and hired jungle people, or purchased them in lots from minor professional collectors whose testimony was not always dependable. Therefore any of his published data that differ widely from those of other workers or from personal experience must be treated with caution since they are more than likely to have been vitiated in this manner. Every effort has here been made to weed out all palpably doubtful records.

MIGRATION

THE 2100 odd species and subspecies of birds that comprise the avifauna of the Indian subcontinent and Ceylon include land birds as well as pelagic forms such as petrels, shearwaters, frigate birds, boobies, and skuas normally found only out at sea but which get blown in sporadically on our seaboard during heavy monsoon gales. Roughly about 350 forms are extralimital seasonal immigrants, meaning that they breed outside our territory, mostly in the Palaearctic Region beyond the Himalayas — in central and northern Asia, and eastern and northern Europe. The most abundant and regular winter migrants are the ducks and geese (Anatidae), Wading or Shore birds (Charadriidae) especially of the subfamilies Charadriinae and Scolopacinae, Cranes (Gruidae), and the passerine families Hirundinidae (Swallows), Muscicapidae especially Muscicapinae (Flycatchers), Sylviinae (Warblers), Turdinae (Thrushes and Chats), Motacillidae (Pipits and Wagtails), Fringillidae (Finches), and Emberizidae (Buntings). But many other families are represented among the migrants as well. Moreover, every gradation of migration is met with, from local movements of no more than a few kilometres, or a few hundred metres altitudinally in the Himalayas or peninsular mountains, to enormous trans-Himalayan journeys involving several thousand kilometres each way.

Besides the large number of extralimital migrants, there are numerous others whose palaearctic breeding range just encroaches our boundaries from the Afghanistan-West Pakistan border, and also into Gilgit, Ladakh, Garhwal, Nepal, Sikkim, Bhutan, and NE. Assam. Many of these species spread over northern India in winter, and many

over the rest of the Peninsula as well. In all respects they behave like the true migrants from beyond, arriving with them and spreading out over the country in autumn, chiefly between September and November, and leaving again for their northern breeding grounds before our hot weather commences in March/April. Considering the hundreds of species and the millions of individuals involved in these biannual journeys, year after year, it is amazing how little precise information we possess concerning the provenance, routes and goals, and other factual details of the migrants. Practically all that is known is based on somewhat scrappy and haphazard observations, chiefly of British army and civil service personnel who happened to be stationed along the strategic Indo-Afghan border within the last 100 years. Some of these men were excellent field naturalists and have contributed vastly to our basic knowledge of Indian ornithology. The names of Scully, Biddulph, the two Marshall brothers, Magrath, Whitehead and Donald stand out from amongst the many others in this connexion. Their observational data, though primarily relating to sporting birds such as ducks, geese, and cranes, form the hard core of practically all that is known of trans-Himalayan bird migration. They outlined the broad pattern of the seasonal movements and indicated that the main migration route between Siberia and central Asia on the one hand and the Indian peninsula on the other was the Indus Valley in the northwest. Similar though even more fragmentary bits of information from the northeastern outposts of India suggest that from NE. Asia the Tsangpo or Brahmaputra river and its affluents constitute the principal flyway. The two migrational streams enter from either

end of the Himalayan mountain chain in a pincer movement and converge on the tip of the Peninsula, weakening as they advance southward and trickle over into Ceylon which virtually forms the terminus. However, increasing evidence is being procured by mountaineers in recent years that migrants also fly directly across the Himalayas, even over some of the highest sections of the mountain barrier, thereby in effect shortening their journeys very considerably. Not only have many migrating geese, waders and passerine birds been visually recorded during daytime¹ and heard passing over the high altitude camps at night, but climbers have also come across remains of migratory birds such as ducks, cranes, waders, and eagles² strewn on high glaciers in the Himalayas and Karakoram which had evidently perished in storms and blizzards. At Dehra Dun geese have been observed through a telescope flying northward in spring at a height of c. 29,500 feet (8830 m.) across the face of the moon. Indeed there is now sufficient evidence of this kind to suggest that a far greater amount of passage must take place directly over the High Himalayas than had hitherto been credited. Recent migration studies by radar in Europe and America have shown that, contrary to older beliefs, even small passerine birds may travel at unsuspected heights of 6000 metres or more, which lends colour to this probability. Nevertheless it is true that a large proportion of the migratory birds, especially ducks and geese, that enter the subcontinent from the northwest in autumn — when the journey is more leisurely performed — sweep down the valley of the Indus river. One arm of the migrational tide branches off early in a SE. direction and debouches into the north Indian plains through Hazara, Kashmir, and the Punjab. The Kagan and Kurram Valleys on the northwest frontier of Pakistan have been specifically named in this connexion (Whitehead, Magrath). The other arm continues southward down the Indus and, avoiding the inhospitable expanse of the Thar or Indian Desert to the east, veers further south in a southeasterly direction to cross the Great Rann of Kutch, northern Gujarat and Saurashtra and enter the Indian peninsula. This stream is augmented in its course by migrants travelling SSE. from W. Asia — from the Caspian-Aral region through Iran, Afghanistan, Baluchistan, and Lower Sind. This, in broad outline, is the general picture that emerges from a consideration of the data available. But it is largely conjectural and hypothetical and needs verifying by more intensive studies. There is reason to believe that for many species the pattern of the spring migration, which is usually more hurried and direct, with fewer stopovers and also at higher altitudes, is very different. Kutch also lies on the extreme eastern fringe of a broad stream of through migration that sweeps down from central and northern Asia in a southwesterly direction in autumn. This current passes over Afghanistan and the former NW. Frontier Province, down through Baluchistan and Sind, then across the Arabian Sea and the tip of southern Arabia into Somalia, Abyssinia, and further south in the African continent. Such species as the Kashmir Roller (*Coracias garrulus semenowi*), European Nightjar (*Caprimulgus europaeus univini*), European and Bluechecked Bee-eaters (*Merops apiaster* and *M. s. persicus*), Redbacked Shrike (*Lanius collurio*), Rock Thrush (*Monticola saxatilis*), Greybacked Chat (*Erythropygia galactotes familiaris*), Indian Whitethroat (*Sylvia communis ictorophis*), Spotted Flycatcher (*Muscicapa striata neumanni*), and others, travel regularly by this route. From the absence of Indian records on spring passage it is evident that most of them, at any rate, take a different route for the return journey north.

Far less is known about bird migration across our northeastern frontiers. This is largely due to the uninhabited, rugged and mostly inaccessible nature of the terrain in the eastern Himalayas, and to the fact of this frontier having been considered of too little strategic importance in the past to necessitate the stationing of British military personnel such as have provided most of our data for the northwest. The recent Chinese incursions in that quarter have dictated greater vigilance and logistic developments, and with the opening up of the North-east Frontier Agency tracts (NEFA) to 'civilizing' influences it is to be hoped that our knowledge of bird migration in that area will profit.

In so far as Ceylon is concerned there is some evidence for the presumption that not only do both the western and eastern arms of the palaearctic migration into the Indian peninsula cross over into the island, but also of a third route that brings NE. Asiatic migrants

through Indochina and Thailand via the Andamans. So far, however, direct proof of this has been provided by ring recoveries (Phillips 1956).

Our knowledge of Indian bird migration has so far consisted of fragmentary records, often of a subjective and conjectural nature. The first attempt to rectify this deficiency was a modest scheme of bird-ringing initiated in 1926 by the Bombay Natural History Society with the active cooperation of the then Maharaja of Dhar (Sir U. Puar) and the rulers of a few other Indian States, as well as some larger zamindars of Sind. Considering the meagreness and nature of that experiment, which virtually petered out by 1934, lack of funds, the results proved unexpectedly gratifying. Those ring recoveries constituted our first positive confirmation that our migratory ducks are in fact derived from Siberia and from and northeastern Asia, often over distances of 3000 to 5000 km. more. In addition to Indian-ringed birds recovered in the U.S.S. some highly significant recoveries of European-ringed birds in India were also obtained during the same period: a Green Sandpiper (*Tringa ochropus*) ringed near Moscow, in Kerala; a White Stork (*Ciconia ciconia*) ringed in western Germany, in Rajasthan; and a Ring-billed Gull (*Larus argentatus*) ringed in Hungary, in the Punjab.

It was not till the year 1960 that a more comprehensive project for bird-ringing in India became possible through the cooperation of various scientific organizations interested in the problem of possible dissemination of arthropod-borne viruses by migrating birds. During the seven years of operation of this scheme nearly a hundred thousand migratory birds have been ringed, chiefly waders (Motacillidae) and of several other passerine families, in addition to ducks (Anatidae) and waders (Charadriidae). So far all the work has been done departmentally by the Bombay Natural History Society in a few selected localities, but it is proposed to expand the programme with the cooperation of individual ornithologists and naturalists' associations into a coordinated network of ringing field stations giving the widest possible coverage over the subcontinent. The intensive ringing of migratory birds, combined with visual records and other data regularly maintained by competent observers and over prolonged periods of time, and supplemented by modern migration study techniques and mechanical devices such as radar, can alone provide an unequivocal picture of the situation in our area. Of all these, perhaps large-scale bird-ringing is the most immediately important.

The aluminium rings used by the Society are of several appropriate sizes. They bear the inscription INFORM BOMBAY NAT. HIST. SOCIETY together with a serial number prefixed by a letter of the alphabet denoting size. In order to coordinate all ringing activities in the subcontinent and minimize dissipation of effort and data, it is desirable that only the Bombay Natural History Society's rings should be used, as is being done in Ceylon. All recoveries, whether of these rings or foreign ones in India, should be reported (preferably accompanied by the actual ring) to the Society as the central organization in this part of the world for ringing and maintaining records and furnishing up-to-date information.

Very little has been published on Indian bird migration, and that largely as haphazard parochial arrival and departure dates of random species in random parts of the country. Most of these records are scanty and irregular. They are, moreover, buried away among regional bird papers published from time to time chiefly in the *Journal of the Bombay Natural History Society* or *The Ibis*, and difficult to unearth and collate.

The map indicates the pattern of Anatid migration as revealed by the recoveries of ringed ducks in and from the subcontinent to date. This, in general, is the pattern gradually developing in the case of other palaearctic migrants as well, but it may be a long time before we have sufficient authentic data to deduce satisfactory specific conclusions. Details of a few significant recoveries will be found under the species concerned.

ZOOGEOGRAPHY OF THE INDIAN SUBREGION

The 'Oriental Region' (or Indian Region as he called it) was first proposed as one of the six zoogeographic regions of the world by Philip Lutley Sclater in 1858. His subdivisions were based on the study of birds for he was an ornithologist. In spite of the century of discussion and research that has ensued, his arrangement is still followed today. A more specific discussion of the zoogeography of India followed in the paper of Blanford (1901).

Broadly speaking the Oriental Region encompasses most of what is today known politically as India, excluding the higher reaches of the Himalayan mountains although the Oriental fauna and flora extend up to 11,000 feet in some cases (Ripley, 1961). Nepal, Ceylon and adjacent islands, East Pakistan, and large areas of southeast Asia are included in the Oriental Region.¹ West Pakistan is a much drier area

and belongs to a transition zone of southern Eurasia, partly Palaearctic Region so-called, with drier, more temperate climate partly trending towards the hot dry Somali arid zone of Chapman (1932), as described for Arabia (Ripley, 1954).

In his excellent general book on zoogeography, Darlington (1954) has pointed out that the interpretation and study of the pattern of distribution of animals which makes the subject of zoogeography consists of a number of subpatterns. The first and broadest of these is limitation, the final limits of a species or a larger grouping — a family or class of animal. Within geographical limits certain classes of animals exhibit roughly parallel distributions. The assembling of animals according to the limits then to which cold-adapted or warm-adapted animals proceed, tends to bring into rough focus the concept of zoogeographical regions of the world. Thus the Oriental Region besides

¹ For a fuller account see Salim Ali 1964, Article 'Oriental Region' in Thomson, A. L. (ed.), *New Dict. Birds* (London & New York).

a geographic part of the land and fresh waters of the world, has a certain limit imposed on it by climate and temperature within which groupings of animals find their preferred home.

A second subpattern is *zonation*, implying climate, and it is fundamental to the land divisions of the Oriental Region that it falls primarily within the tropical zone with fingers extending up into the mountains. Mountains of course in tropical latitudes serve as islands. By proceeding upwards and gaining altitude the tropical zone is lost gradually and at a steady rate. Gradually the subtropical, then the temperate zones are encountered, and finally at the greatest heights, the alpine zone may be reproduced as it were, duplicating conditions found in the tundras of the far north or the subantarctic.

A third pattern is that of *geographical radiation*, of spreading outwards of a particular group of animals from some geographic centre. A powerful world centre for animal evolution has apparently been the old-world tropics so-called, the heartland of which is the Oriental Region. Thus in the case of birds, the dominant families of birds in India belong to what is sometimes called the 'Indochinese' fauna, the birds adapted to life in warm, moist tropical southeast Asia, birds primarily of jungle or heavy forest. The geographical ramifications of southeast Asia, the tangled patterns of mountain chains, river drainage systems and a long period of stable climate seem to have been ideal for the evolution of a wide array of species of birds.

A fourth subpattern is that of *differentiation of faunas*. Here in the tropics of the Oriental Region this is well illustrated in birds where there is great diversity. Over sixty per cent of all the endemic species of Indian birds (endemic meaning restricted to a particular place) are of the 'Indochinese' subregion so-called, confined to the Oriental Region.

Darlington's fifth subpattern is that of *concentration in the largest, most favourable areas*. Here again this phenomenon is well-illustrated in the response of the bird fauna of India which, being predominantly tropical, occurs in greatest concentration in the largest areas of rainfall in eastern India, East Pakistan, along the mountain chains wherever the monsoon shadow occurs, especially in southwest India, in parts of Ceylon and in the Andaman and Nicobar Islands.

Of all the zoogeographical regions of the world, perhaps the Oriental is the least limited by barriers, but at the same time it is one of the principal if not the principal one from the point of view of evolution and of having acted as a centre of dispersal. Only northern South America has a richer fauna, only tropical America, and some of the most isolated areas like New Zealand, have a higher rate in proportion of species formation and evolutionary response.

A brief review of geological origins may be appropriate here. In Permian times, more than two hundred million years ago, the peninsula of India and an inter-connected Ceylon, all the area south of the Ganges river basin, was part of a continental region. This massif is composed of ancient rocks which to the geologist are representative of a continent. These rocks are known as the Gondwana formation and the outlines of this ancient continent can be traced up to northwestern India on the west, towards Calcutta on the east, with the edges of marine sediments marking old coastlines, and old river beds emptying into areas of former seas. The special fossil shells of this rock show that the continent was rimmed by far cooler seas than today. What the continent of Gondwanaland consisted of may never be known, but there are clues from the presence of similar rock formations. It may have spread south as far as the Seychelles Islands to Madagascar, east to western Australia, and perhaps even farther south and west. Whatever the connexions of this ancient past, we do know that the continents were presumably closer together many aeons ago. Recent studies of oceanographers and geophysicists show systems of ridges deep in the oceans which parallel the continental masses and may well indicate a gradual expansion of the earth's exterior surface by the process of internal connexion or the transfer of rock materials under great heat and pressure. The continents thus may be drifting apart under the slow convection of the earth's interior at a rate of perhaps one centimetre a year. But from the point of view of the distribution of warm-blooded vertebrates these ancient connexions have little if any influence.

Between Palaeozoic times (including the Permian) and Recent time comes the vast stretch of the Mesozoic or Age of Reptiles, occupying more than one hundred thirty million years. Birds probably had their origin during the middle of this Era but it is the Cenozoic or Recent Era of the last seventy million years which has seen the evolution of birds as we know them today, warm-blooded, with feathers, untoothed bills and the other physical features of their class.

Large parts of the northern Oriental Region were under water until well on in the Recent, the Cenozoic Era. The northern fringes of the Himalayas were under the water of the great central Eurasian sea, the Sea of Tethys which continued into Pliocene times, less than twenty million years ago, gradually drying and retreating to leave behind the Mediterranean, the Black, Caspian and Aral seas. The former boundaries of the Tethys Sea extend south to West Pakistan and central India and included the drainage basin lowlands of the Indus and Ganges river systems. As the seas gradually disappeared and land rose, violent stresses in the outer layers of the earth produced foldings of the mantle to raise up mountain chains from the Alps east to the Pamirs and the Himalayas and the north-south systems of ridges of eastern Assam, Burma and southwest China.

The most recent geological period has been the Pleistocene or Ice Age, marked by four successive cold periods with cycles of glaciation, lowered climate and increased rainfall alternating with milder, drier intervening times. During these alternations, the locking up of water in the form of ice lowered the sea surface to connect many continental shelf islands such as Ceylon with the mainland. Our present climate of relative warmth and unlocking of ice with rising seas has persisted for approximately ten thousand years.

In terms of climatic history, India and the related components of the Oriental Region have been stable for a very long time. The recent

ice ages of the Pleistocene may well have coincided with increased rainfall or pluvial periods in the tropics. Greater humidity and accompanying cloud cover help to create cooler average temperatures. All these conditions would suffice to lower temperatures sufficiently on mountain ranges or highlands so that temporary avenues or highways for mountain stepping-stone-hopping can be provided for species of animals and plants adapted to cooler climates. Much of the spread then of mountain-adapted or cool climate-adapted species into the highlands of the tropical zones and their later isolation and evolution in time into a radiating network of related species can be postulated as a result of one's knowledge of the changes in the climate cycles in the Pleistocene. Thus geographical isolation could combine with small climate changes to promote adaptive changes in species. Subsequent climatic events bringing together former isolated populations a second or third time would serve as the testing ground to determine if genetic isolation had been achieved. If so, new species had been born in the process.

One of the most noted current zoogeographers of India was the late Dr Sunder Lal Hora of the Zoological Survey who developed an important thesis of the distribution of torrential river fish. His Satpura Hypothesis (1950) postulates that by middle Eocene times at the beginning of the Recent or Cenozoic Era, the Himalayan mountains began to erupt, rising up and starting the cutting off of the Tethys Sea. This rising has been slow and continuous down through the Pleistocene. South of the Himalayas in the northern Indian Peninsula volcanic action occurred in late Cretaceous and early Eocene times covering some 20,000 square miles of land with a thick series of volcanic layers known as the Deccan traps. The result was that formerly continuously distributed tropical climate species of plants, insects and vertebrates became isolated in south India and Ceylon, separated from related populations in eastern India and east to China. These upheavals, traced by geologists, affected the drainage of rivers and the distribution of related fish. Originally, peninsular Indian streams up to the Miocene Epoch had drained north into the Sea of Tethys or its related river systems. The Deccan explosives and the Himalayan rise turned peninsular Indian drainage systems to the east. Contemporary rivers of southern China and southeast Asia changed their courses from east to south and west enabling their fish species to reach Burma. Dr Hora believed that these fish from southern China eventually populated the Himalayas from the east, spreading very gradually westwards. Fossils of the Pliocene Epoch just before the Pleistocene show that fish species were becoming distributed west along the feeders of the great river called by geologists the Indobrahm, which drained the enormous marshes left by the disappearance of the Sea of Tethys.

South of the Indobrahm at the edge of the Deccan traps arose an elevated series of hills running from east to west from the southern edge of the Himalayas in Bengal and Bihar nearly to the sea at Bombay. Hora explained the distribution of the hill-stream fish along these Satpura Hills from the eastern Himalayas to western peninsular India and eventually gradually south to Kerala, and, in a few cases of related forms of higher vertebrates and plants, aided by the climate cycles, south into Ceylon.

By Pliocene times the Ganges system of today began to form, draining the Himalayas and flowing south and east instead of west as had the Indobrahm. A recent feature of this system has been the capture of the Tsangpo, the eastward-flowing river of Tibet, through the penetration by climatic erosion of the upper Assam gorges by the Brahmaputra, a tributary of the Ganges system. Presumably the Brahmaputra did not manage to erode its way north into the Tibetan gorges to capture the Tsangpo, turning it away from the Yellow River and Yangtse systems very recently. But in a relative sense it must have been rather recently in the Pleistocene Epoch.

Even though much of this history is old, as far back as Pleistocene or late Miocene times, the resulting evolution, the resulting patterns of distribution of the avifauna of India as it is understood today, show distinct traces of these events. Salim Ali (1949) has pointed out the importance of the Satpura Hills as an ornithogeographical highway, as has Ripley (1949).

In regard to the great marshes of late Pliocene time, aftermath of the Sea of Tethys, it would appear that several bird species in their peculiar evolution and adaptation mark the long persistence of this phenomenon. They can be thought of as living relics of a past epoch. The preference of these species is for marshes of large extent along the remains of the system, the 'Indobrahm system'. That they remain today means only that the resulting river and marsh habitats have not been too unsuitable, although one of the species has unfortunately very likely become extinct in the last thirty years. This is the Pink-headed Duck, *Rhodonessa caryophyllacea*, a relict species of the present Ganges river drainage area (Ripley, 1953).

Two other species of local distribution in marshy areas in the central and northwestern parts of the subcontinent are: 1) the Bristled Grass Warbler, *Chalornis striatus*, and 2) the Sind Jungle Sparrow, *Passer pyrrhonotus*, the latter found as far west as eastern Iran.

Indian zoogeography shows evidence for two of the well-known zoogeographic theories. The first of these is Gloger's theory, which states that in areas of increased humidity warm-blooded animals tend to have darker surfaces than their immediate relatives living in drier areas. Many species of birds and mammals which live in the forests along the foot of the Himalayas, in the Western Ghats, or in Ceylon tend to substantiate Gloger's theory. Such small forest birds as partridges, babblers, flycatchers, warblers and sunbirds have paler populations—geographical subspecies so-called—living to the west in areas of decreased rainfall. Along the sweep of the Himalayas where the monsoon rains fall more heavily in the east, east of eastern Nepal, this phenomenon shows as a break, a discontinuity in the continuous gradual progression of colour tones of the bird populations. West of this break in the climate,

bird populations tend to be paler, to the east darker.

Another theory is that of Bergmann. Bergmann's hypothesis states that warm-blooded animals tend to become larger than their nearest relatives, in areas of increased cold climate. This genetic selection is in response to the physical fact that a larger animal has a diminished exposure of surface in relation to its internal volume than a smaller animal. Thus a mouse, for example, has a greatly increased surface area compared to its internal volume than has a larger rat. The theory implies, however, that only closely related geographical subspecies of the same species be compared. Certain bird species in the Himalayas appear to respond to this hypothesis as their high-altitude populations are larger than their plains relatives. Some warblers, magpies, bush chats, robins, mynas and a nuthatch seem to show size differences. Again throughout the Indian plains there seems to be a similar correlation with degrees of latitude. Many species of birds living year-round in the plains south of 20–22° N. latitude tend to average smaller in overall proportions than the populations of the same species living farther north. Examples of this may be found in the pigeons, parakeets, trogons, drongos, mynas and bulbuls among others.

Zoogeography is certainly not a static study, for one of its major principles is that no climatic zone, no set of physical circumstances connected with a geographic area, none of these, are ever stable or immutable. The dry zone areas from Egypt and the Red Sea countries north to the mountains of northern Iraq and Iran and east into West Pakistan have had much the same climate for the last eight thousand years, but overall desiccation has been progressive during this period, greatly speeded up perhaps in the last fifteen hundred years, and galloping indeed in the last three hundred years. This area has become the arena in which sheep and goats are triumphant. The pastoral flocks and herds have prevented the acacia and thorn scrub which once covered the land from perpetuating itself. With the scrub has gone the grass, and eventually the decline of streams, resulting in all the forced counter-measures at enormous expense and effort which from time to time have been invented to stop the relentless march of desert created by man's domestic helpmates.

Records of the seventeenth century in India tell of the Mughal court and the hunting exploits of emperors like Jehangir who personally killed 3203 large mammals between the age of twelve and forty-eight.¹ These records show a strikingly different environmental pattern from our own. Rhinoceros, found today in India in two limited areas in the northeast, in West Bengal and Assam, and in the central Nepal terai, then occurred north to Peshawar on the northwest frontier of West Pakistan. Northwestern India and much of West Pakistan are semi-deserts today. Heavy swampy undergrowth and savannah forest suitable for rhino must have been continuous in extent in the seventeenth century at least eight hundred miles to the northwest of where it occurs at present. And here climate itself has not been a factor. It is worth remembering in the context of zoogeography that human beings can affect the habitat rapidly and irreversibly through overgrazing and fires, and eventually animal distribution itself. The discipline of zoogeography thus has much to teach conservationists. Certain species of animals which are on the lists of threatened species made up by various international organizations today are in this perilous state directly as a result of long-range changes in the environment brought on by overgrazing or over-cultivation or similar land-use habits which have become an almost immemorial pattern in many cases.

In this context it is vital to recall that birds, just as other animals, are pinned to that environment for which genetic selection and adaptation have suited them just as surely as other animals. Though mobile and air-borne, birds select the habitat whether on migration or through cycles of wandering in search of food, or through protracted residence, which most nearly suit their special, their own adaptations for food-gathering, roosting and nesting, for protection from predators or for adaptations to climate. It is worth considering some of the fifteen or so forest types found in India and pointing out how closely birds are related to these environmental conditions. These types have been delineated by Champion (1936) and are described and illustrated in *Synopsis* (1961), pp. ix-xvi. Here certain species of birds may be seen, and only here.

A) Tidal Forest can be described as an evergreen forest of species of mangrove trees reaching c. 30 m. in height, found usually on soil covered at high tide, with an undergrowth of *Pandanus*, canes, some grasses, and many low-height mangrove species, especially nearer the sea. The mean annual temperature is 27° C. with an annual rainfall of about 270 cm. The soil is entirely river-borne silt, often with a coating of overlying sand. This type of forest is found along creeks on the west coast of India and West Pakistan (near the mouths of the Indus), and on the east coast at the mouths of the Mahanadi, Krishna and Godavari rivers, in the Sunderbans of India and East Pakistan, along brackish creeks in Ceylon, and in the offshore islands, particularly the Andamans and Nicobars.

Certain species of birds are primarily only to be found in this habitat:

1) Brownwinged Kingfisher, *Pelargopsis amauroptera* (No. 729 of *Synopsis*). East Pakistan and southeastern West Bengal.

2) Blackcapped Kingfisher, *Halcyon pileata* (739), more likely to occur in tidal forest than anywhere else, although wanders inland in the cold weather.

3) Whitecollared Kingfisher, *Halcyon chloris* subspecies (740–743), southern Maharashtra, Sunderbans, and offshore islands.

4) Bluewinged Pitta, *Pitta moluccensis megarhyncha* (868), tidal forest and adjacent semi-evergreen forest in the Sunderbans of East Pakistan.

5) Grey Thickhead or Mangrove Whistler, *Pachycephala cinerea* (1470), Calcutta east through the Sunderbans, mostly in tidal forest, but also inland in semi-evergreen forest; Andaman Islands.

6) Orangebellied Flowerpecker, *Dicaeum trigonostigma* (1898), tidal forest in Sunderbans and adjacent semi-evergreen and moist deciduous forest.

In addition certain hawks, eagles or rails may be found in tidal forest but these species have a wider tolerance for a variety of conditions.

Related to the tidal forest in space and in food supply are the sea beaches themselves, where characteristic migrant shore birds, gulls and terns can be found. Some of these species prefer the open pure salt water and adjacent beach, others the tidal mudflats and brackish reaches of water, and many of these forms, particularly the terns, nest in the mangroves. The Reef Herons, *Egretta gularis schistacea* and *Egretta sacra* (50, 51), are found only on brackish or salt water, along tidal mudflats or reefs, the Crab and Great Stone Plovers *Dromas ardeola* and *Esacus magnirostris* (434, 437, 438) are found only on sea beaches, though the latter may occur on sandy river beds of the largest rivers, an *ersatz* or substitute biotope as it were.

In contrast to the tidal forest zone, the birds of which show affinities with species of Indonesia and the China coast — the Indochinese subregion as it has been termed by zoogeographers — consider for a moment another zone which recalls the Somali arid zone of east Africa. This is

B) Tropical Thorn Forest. This is a low open forest, characterized by *Acacia* species, reaching 6–9 m. in height, desert-like undergrowth with sparse grass, thick, woody weeds, succulents, a so-called xerophytic type of vegetation, mean temperature annually 25° C., reaching a maximum of c. 40° C., and a minimum of c. 4° C. The annual rainfall varies from 48 to 76 cm. and is sometimes as low as c. 25 cm. The soil is shallow, often alkaline. This zone occurs from sea level to c. 600 m. altitude. Thorn forest occurs in non-desert parts of West Pakistan, south of the frost line, large parts of western India, in East Punjab, Rajasthan, Kutch and Saurashtra and southwest Madhya Pradesh running south in Maharashtra to East Khandesh, Aurangabad, south to northern Mysore and east in Andhra to Guntur district; also in the Jaffna area and other parts of northern Ceylon, Rameswaram Island and the adjacent southeast Indian coast. In central peninsular India the heart of this zone occurs in the Deccan plateau, site of much of the Deccan trap rock-formations mentioned earlier.

The birds of this zone show distinct affinities with those of eastern Africa as pointed out by Meinertzhagen (1951), and emphasize that Africa itself has been a centre of dispersal as shown by Moreau (1952) and noted in one case by Husain (1958). Typical of these are:

1) Grey Partridge, *Francolinus pondicerianus* (244–246), West Pakistan and India.

2) Likh-or Lesser Florican, *Sypheotides indica* (357), tropical thorn, scrub, grassland, and cultivation in southern West Pakistan and western and central India.

3) Jerdon's Courser, *Cursorius bitorquatus* (441), perhaps extinct, Deccan tropical thorn forest.

4) The Bee-eaters have two species which suggest strongly a preference for this zone, though their more wandering habits and wider distribution make them less good examples. These are the Bluechecked, *Merops superciliosus* (747) which breeds in West Pakistan and India and winters in Africa, and the Green, *Merops orientalis* (749–752), which occurs in tropical thorn forest from Iran to Ceylon, although one population of the species reaches Assam and Burma.

5) Two Finch-larks of the genus *Eremopterix*, namely *grisea* and *nigriceps*, the Ashycrowned and the Blackcrowned (878, 879), are Ethiopian in their affinities and live in thorn scrub and the edges of desert in tropical thorn areas.

6) Sykes's Crested Lark, *Galerida deva* (902), is found in parts of northern India and the Deccan on rather dark soils.

7) Yellowthroated Bulbul, *Pycnonotus xantholaemus* (1135), peninsular India, perhaps ranging too high in altitude to be completely in this zone.

8) Common Babbler, *Turdoides caudatus* and its relatives, Large Grey Babbler, *T. malcolmi*, and Whiteheaded Babbler, *T. affinis* (1253, 1254, 1258, 1267, 1268), West Pakistan, peninsular and northern India and Ceylon.

9) Rufousfronted Longtail Warbler, *Prinia buchanani* (1506), West Pakistan and northern and central India to the Deccan.

10) Three of the Whitethroats, the Lesser, *Sylvia curruca*, the Small, *S. minula*, and Hume's Lesser, *S. althaea* (1567, 1569, 1570), breed or winter in tropical thorn forest in West Pakistan and India.

11) Two of the Leaf Warblers, the Brown or Chiffchaff in its Indian subspecies, and the Plain, *Phylloscopus collybita sindianus* and *P. neglectus* (1576, 1577), occupy this habitat in West Pakistan and northern India.

12) Brown Rock Chat, *Ceromela fusca* (1692), West Pakistan and northern India.

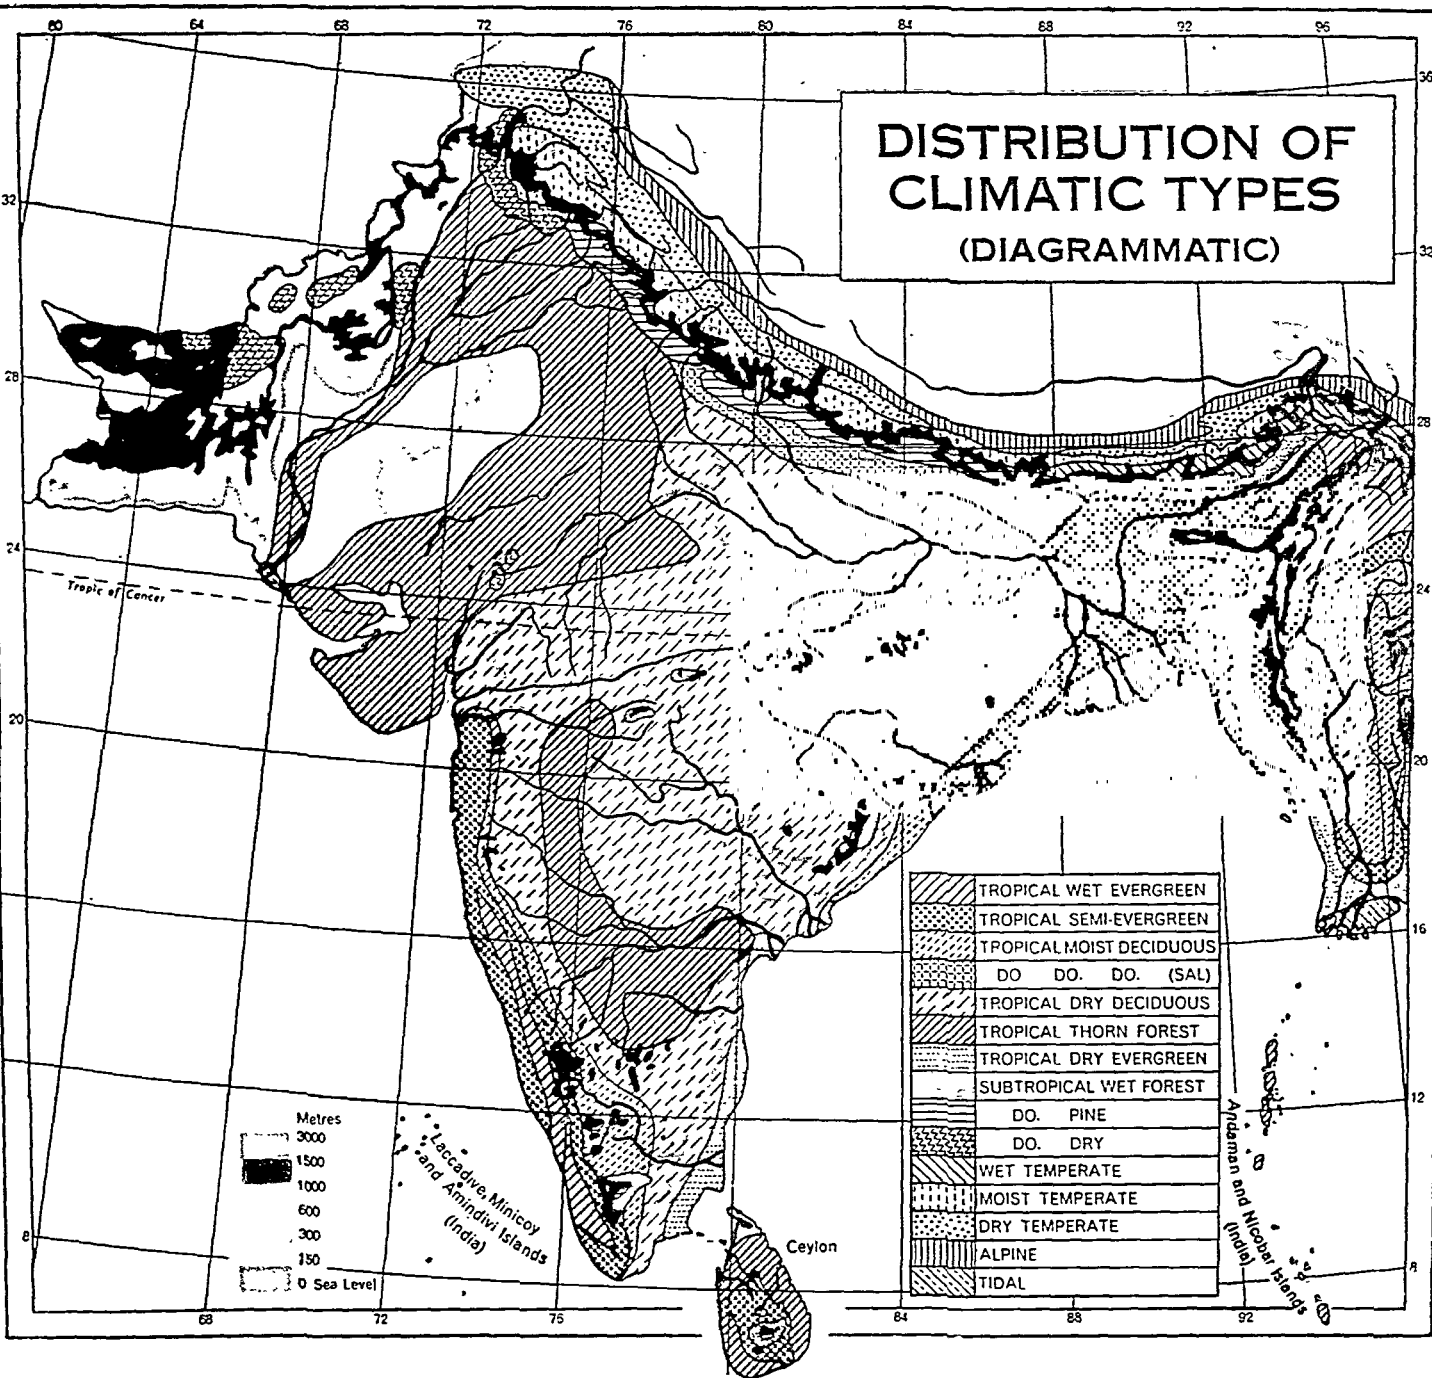

13) Whitewinged Black Tit, *Parus nuchalis* (1798), India.

14) The Spanish Sparrow, *Passer hispaniolensis* (1940), winters in tropical thorn forest. Some other sparrows have ranges suggestive of a preference for the tropical thorn biotope, but have spread out into cultivation or into reed-beds and tamarisk groves.

With the exception of the warblers, virtually all of these species are related most closely to Ethiopian (= African in the zoogeographical sense) species, suggesting an origin from a former continuously distributed population or a common ancestor in some form.

As was pointed out in more detail in the *Synopsis*, there are certainly 176 endemic (local) species of Indian birds (confined to the zoogeographic subregion of the Indian Peninsula and its environs) and of these the following affinities appear:

DISTRIBUTION OF CLIMATIC TYPES (DIAGRAMMATIC)

TROPICAL WET EVERGREEN
TROPICAL SEMI-EVERGREEN
TROPICAL MOIST DECIDUOUS
DO. DO. DO. (SAL)
TROPICAL DRY DECIDUOUS
TROPICAL THORN FOREST
TROPICAL DRY EVERGREEN
SUBTROPICAL WET FOREST

TIDAL

(1) (a) related to Palaearctic species (i.e. Europe and Asia)		
number 30	Percentage of total 17	
(b) questionable, perhaps Palaearctic	2	1
(2) related to Indochinese (i.e. SE. Asian species)	109	62
(3) (a) related to Ethiopian species	30	17
(b) questionable, perhaps Ethiopian	1	1
(4) relict species, discussed earlier (Pinkheaded Duck etc.)	4	2

Thus the overwhelming proportion of Indian bird species are related to species of the eastern, tropical Orient, with almost an equal minor share being related proportionally either to African or to European-northern Asian (Palaearctic) species. This is important as a

principle of Indian ornithobiography. The Himalayas have served as a barrier, encouraging the spread of tropical, Indochinese-related bird species into the Indian habitat, preventing the invasion of Eurasian-related species as much more than winter migrants. The entomological and botanical evidence, such as it is, suggests that in spite of glaciation in the Himalayas during the Pleistocene, climatically conditions were not too severe and that indeed the southern flanks of the mountains served as a refugium for relict species related to cold-climate adapted northern species, rather than serving as a continuous chain of contact along which dominant northern species could infiltrate. The habitats to the south of the Himalayas thus being continuously occupied, very few invaders could wage successful competition or find empty niches and room to spread out.

India's avifauna is one of the most interesting in the world and provides ample opportunity for further significant research in zoogeography and its related aspects of ecology.

SYSTEMATICS OF BIRDS OF THE INDIAN SUBREGION

BIRDS from the 'Indies', the areas now encompassed by Pakistan, India, Ceylon and east to Java, have been known to zoologists for as long as there has been an organized science of zoology. Travellers and explorers of both the eastern and the western worlds have collected colourful birds from the countries which they visited since the chronicles of these travels have existed. These creatures, brought back to the courts of emperors and kings, inspired wonderment as well as scientific curiosity. Attempts to list the products of nature are apparently a natural phenomenon of man's orderly and tidy mind. Man is instinctively an arranger. Subjectively man strives to create a rational order out of what otherwise he assumes to be chaos. Religion demands it. Science requires it.

The literature of these attempts at organization is classical, extending back to the philosophers, Hippocrates, Aristotle and Plato, at least to the fifth century B.C. Systematics, or taxonomy as it is often interchangeably called, is the science of classification of animals. It is built up out of the basic study of the anatomy or morphology of an animal, as well as its physiology, or the living interactions of the organ systems and structure of the animal. Modern taxonomy also includes a compilation of evidence obtained from genetics, the study of the breeding of animals including the cellular phenomena associated with the union of components from egg and sperm. An additional requirement is a knowledge of the environment and its effect upon animals, or ecology, as that study is called, as well as environmental and animal history derived from the study of geology. Thus a modern taxonomist becomes perforce an evolutionist, and an evolutionist should properly be one of the most widely trained of all zoologists, proficient in genetics, morphology, zoogeography, systematics, embryology, physiology, ecology and palaeontology.

Present-day systematics developed in the eighteenth century with the attempts to create 'systems' of nature. A number of authors such as John Ray (1627-1705) pioneered attempts to characterize the genus, or *genos*, and species, or *eidos*, of Aristotle, but it is the Swedish naturalist, Carolus Linnaeus (1707-78), who laid the foundation of systematic zoology. The tenth edition of his *Systema Naturae* (1758) is considered the fundamental work and the date, the foundation date for species names. Each animal then known to the scientific world could be given, under the Linnaean concept, a binomial name: Genus, a name including all forms considered to be related to one another, and Species, the distinctive or specific name which in a sense separated that animal from all others. All ducks belonged to the genus *Anas* for example, and the different ducks had different specific names, *anata* for the pintail, *crecca* for the common teal, *penelope* for the widgeon, *ferina* for the common pochard or diving duck. Above these categories was the Order, and above this of course the Class, which in the case of birds, involved all birds in one animal class, AVES. The great merit of the Linnaean volume is that the class and the orders and genera are characterized by keys, groups of characters which give them uniqueness and distinction one from the other.

This arrangement then, this attempt at the creation of order from chaos, immediately won general recognition and has persisted down to the present. Subsequent modifications of the system have derived more from man's understanding of the evolutionary process and the resultant interpretation of what is meant, than from any tampering with the mechanics. In essence the philosophy of arrangement has changed with the influence on scientific thought of the Darwinian school of evolutionists. In Linnaeus's concept, each species was a distinct act of Creation, immutable and set apart. The Lord had created the world and all that lay within it in six days and on the seventh he rested. Darwin and related scientists of the mid-nineteenth century were able to show that species were not immutable, that changes occurred dating back through the panorama of geologic time and continuing on into the present and future. Species could arise out of other species, by a process involving physical isolation and the gradual accretion of small differences.

Over the years the acceptance of a dynamic rather than a static concept for species formation broadened and modified systematics. As knowledge of a wide spectrum of variations in populations of biological species increased, new terms came to be used for these differences. Linnaeus himself used the word 'variety' to describe a specimen that appeared to be atypical. Later nineteenth-century

authors like Kleinschmidt began to use the word 'race'. Gradually the concept began to be refined as it became generally understood that what scientists were trying to characterize were not individuals, aberrations that is to say, individual variants, but rather groups or populations all members of which, in interaction with each other, were expressing an evolutionary trend. Thus the concept of subspecies was evolved. The definition of this category was not really refined until the twentieth century when a number of authors particularly in ornithology, such as Rensch and Mayr, reached a consensus. Two great principles are involved here. The names typifying these evolutionary categories are applied to a type specimen certainly, but they refer to an interbreeding population of common genetic inheritance. In addition a subspecies must have some geographic locus and some complex of external mechanisms which allow it to maintain genetic isolation. A subspecies must also have some essentially morphological characters in order to allow it to be recognizable. Morphological rather than physiological or behavioural characters are still more acceptable to taxonomists than any others as they are more feasibly preserved in specimens.

All of this history of description and characterization of species has resulted in an elaborate series of rules of nomenclature over which systematic biologists have laboured for many years. The rules, after meetings and international congresses, eventually become codified into a Code for Zoological or Botanical Nomenclature. The latest official International Code of Zoological Nomenclature was published in 1961, reissued with some amendments and corrections in 1964 and will undoubtedly be reissued again and yet again. For it has become apparent over the past fifty years that man approaches his own attempts at systematizing the affairs of nature in an essentially subjective manner. Science has not yet afforded us visions of illimitable truth. Many of the essential facts of nature still elude us, and so even man's rules for order and precedence are finite. At least in the meantime we reach towards stability as we attempt to order nature.

The first bird from India to reside in the stable nomenclature of Linnaeus in 1758 was the Brown Shrike, *Lanius cristatus*, which appears on page 93 of *Systema Naturae*, the 10th edition, and is described thus: having a 'wedge-shaped tail', a 'crested head', a 'reddish body' etc. and, as with all proper names a type locality must be supplied, in this case 'Benghala' or Bengal. There is a citation to an illustration, plate 54, in George Edwards's volumes, published 1743-51, *A Natural History of Birds*. And so the type was established, a specimen figured in a published book and with a locality. The second species from 'Benghala', named by Linnaeus on page 95, is *Lanius caeruleus*, which is also illustrated in Edwards and which is now understood to be the Whitebellied Drongo, *Dicrurus caeruleus*, belonging to a different family. Linnaeus's name as author is suffixed to both *Lanius cristatus* and *Lanius caeruleus* when these names are used formally in citations in ornithological literature. But for the second bird it is placed in parentheses, as *Dicrurus caeruleus* (Linnaeus), to express the fact that the genus name has been changed or shifted subsequent to Linnaeus's original description of the species.

The third mention of Bengal in Linnaeus is *Psittacus alexandri*, whose habitat was said to be 'China, Benghala, Aethiopia', named after Alexander the Great, through whose expeditions the Redbreasted Parakeet had come to the notice of Pliny. The type of the species has subsequently been restricted to Java. Subsequently a larger subspecies has been recognized as occurring on the Asian mainland. A name for this was available, *fasciatus* of P. L. S. Müller, 1776. Consequently when subspecies are arranged in linear form, the parakeet of India becomes *Psittacula alexandri fasciatus* (P. L. S. Müller)¹, and *Psittacula alexandri alexandri* (Linnaeus) is found in parts of Indonesia, the type locality being Java. And so zoology proceeded apace. Thomas Pennant's *Indian Zoology* 1791 (1790), incorporating the work of J. R. Forster and Loten's notes on new birds of south India and Ceylon, was succeeded by the really masterful work of T. C. Jerdon, whose *Birds of India*, 1862-4 in two volumes, was the first thorough work on the subcontinent.

¹ The author's initials are used in some cases as in this, because several Müllers have written on zoology.

Allan O. Hume added greatly to Jerdon's work by expanding the areas covered, particularly in the east in Assam and East Pakistan and describing many new birds for science. He also prepared the first checklist, in 1879, taken from Volume VIII of the random journal *Stray Feathers*, which he had organized and published himself. Hume's list included Pakistan, India, Ceylon and Burma east to northern Malaya, and comprised over 1700 species. He attempted to codify the rules of nomenclature as involving birds of the area by using the rules for nomenclature adopted at a meeting of the British Association in 1842. Wisdom was not infinite even then.

Hume says (p. 7): 'I say "based on the Code" because it must be clearly understood that I am not prepared to re-argue points definitely settled by that Code. I do not personally agree with many of its *dicta*, but I consider uniformity of such paramount importance as to render it the plain duty of every British naturalist to abide strictly by *all* its *dicta*.' Worthy ambition indeed; the Code is still venerated, but still manages to alter itself occasionally.

Oates and Blanford's great *Handbook* volumes of 1889-98 again included Burma, and again, like all preceding volumes, dealt only with the classification of birds down to the species level. It remained for E. C. Stuart Baker first to add subspecies names, or trinomials as they are sometimes called, to the Indian subregion avifauna. In this he followed Ernst Hartert, whose fundamental *Vögel der paläarktischen Fauna*, of 1910-22, reflected much of that changing philosophy of systematics which had been evolving since the close of the nineteenth century. The ideas, essentially held in America and in Germany at this time, produced the present concept of the polytypic species, a species consisting of a group of populations, closely related to each other, separated only by geographic boundaries, which could presumably interbreed should the barriers separating them break down, and which were far more closely related among themselves than in the case of any other separate species. At first these ideas presented considerable difficulty but by 1910 Hartert had been won over, and by 1920, Baker's *Handlist of the Birds of the Indian Empire* had begun to appear in serial parts in the *Journal of the Bombay Natural History Society*. This nomenclature has continued to the present day, with minor variations. The greatest changes perhaps appear between the publication of Baker's handbook, *The Fauna of British India including Ceylon and Burma*, 1922-30, and the publication of *A Synopsis of the Birds of India and Pakistan together with those of Nepal, Sikkim, Bhutan and Ceylon* in 1961. As one of us (Ripley) said in the Introduction to that volume, 'It is perhaps unfortunate but true that no such listing as this or Baker's earlier work is ever final'. We can only attempt to fill in additional small gaps in the nomenclatorial picture, at the subspecific level for the most part in systematics, or in chinks or wider gaps in the understanding of the habits of birds themselves as living things.

Naturalists, environmental biologists, epidemiologists and others including amateur bird-watchers, all tend to be highly impatient of changes in the nomenclature of birds or related vertebrates as they

know them. Systematists in ornithology are particularly liable to attack if changes in established or current bird scientific names are made as a result of evolutionary study. There is a good deal to be said on both sides. On the one hand the users of names want stability and a sense of ultimate finality to be maintained at all costs. On the other, evolutionists, with whom some ecologists are today beginning to be aligned, are continually seeking for the truth of the phenomena of evolution. If in the process of delineating living and organic processes, nomenclatorial stability suffers, then suffer it must. Both sides deplore pedantic name-shufflers who collect scientific names of organisms like postage stamps and are said to extract personal prestige therefrom. These days actually would seem to be gone for ever in ornithology. Only rational trained biologists tend to be concerned with systematics nowadays, and in certain areas such as botany and entomology, *alpha* taxonomy, or the mere descriptions of natural living objects, is still a responsibility of paramount importance. In birds certainly there are few surprises around the corner. New species may continue to be found at a diminishing rate in remote corners of the globe and a few new subspecies may turn up almost anywhere. But where they do, and where they are described as *new*, it is for a secondary reason, an attempt to express reality, to show that organic processes are occurring around the clock at an appreciable rate and that change is the order of the day.

Two of the most recent subspecies of birds of our subregion have been described in 1960: *Chalcophaps indica salimalii* Mukherjee, and *Ardeola grayii phillipsi* Scheer. Additional subspecies from islands of the Bay of Bengal may appear shortly.

A more depressing corollary to our changing world is that subspecies as well as species are probably disappearing today at an accelerated rate. In some areas, particularly in the tropics, and particularly in plants and in such classes of animals as the invertebrates, many of these species and subspecies may disappear before they have even been described as new to science, leaving no ascertainable ripple in man's time to mark their passing. Only the world's pool of genetic recombination is deprived here, not man's recording of it by ascribed names. Let us hope that biologists of the future will not know many species of the great subcontinent of southern Asia only by names as we today, by accident, commemorate the lost Dodo of Mauritius or the Solitaire. For all that they have gone, they were seen by knowing men, recorded, and their bony remnants described. In India the Pink-headed Duck was described as locally tolerably common in Oates and Blanford's day; as 'most shy and secretive' by Baker thirty-one years later; and as probably extinct by ourselves thirty-six years later still. And so in two generations, within the lifetime of many people, one of the most curious species of birds in the world has vanished. 'What's in a name?' indeed. Meanwhile the science and order of systematics continues, a service, a function to those who would use it knowledgeably, an attempt to delineate forces of nature in progress both now and *in statu nascendi*.

GLOSSARY OF TERMS FOR PHYSICAL UNITS

particularly as used in this book

bhābār	The zone or belt of alluvial loamy soil stretching along the northern edge of the dun or terai and up to c. 600 metres in the Himalayan foothills, from Kumaon in Uttar Pradesh to Assam (known as duar in northern Bengal and Assam). Supports a type of high dense forest usually containing sāl (<i>Shorea robusta</i>), sheesham (<i>Dalbergia sissoo</i>), and simul (<i>Salmalia malabarica</i>).
biotope	A broad physiographical unit epitomizing the interaction of diverse physical factors, chiefly temperature, rainfall, and humidity. Examples: Evergreen biotope, Desert biotope.
duār	The easternmost section of the bhabar found in northern West Bengal, Bhutan, and adjacent Upper Assam.
dūn	Hummocky broken country, often broad valleys within the outer ranges of the Himalayas, that in some sections intervenes between the bhabar and terai.
facies	A smaller but easily recognized division of a biotope, e.g. the Sandy facies, or Rocky facies, of Desert biotope.
jheel	A shallow lake in a low-lying natural depression produced by rain or floods, or spillage from a river, usually with floating and underwater vegetation and reed-beds, and partially submerged trees.
mohālla	A special quarter of a town or village where different communities or professional groups live in virtual segregation, such as harijans, silver-smiths, and bead-sellers.
nullah	Watercourse or ravine, usually dry. In Hindi, <i>nālā</i> .
shola	A patch of montane evergreen wet temperate forest, usually in a sheltered nullah or hill stream valley amongst rolling grassy hills (or downs), from c. 1500 metres up, in South India and Ceylon.
terāi	The undulating alluvial, often marshy, strip of country stretching along the southern edge of the bhabar and dun south to the Gangetic Plain. The terai extends through U.P., Nepal, and northern W. Bengal to Assam. It supports 'seas' of tall elephant grass interspersed with tracts of dense forest. Large parts of it have now been cleared and drained for cultivation. ¹

¹ The descending order in which the different zones occur is: Himalayan foothills → bhabar (or duars) → dun → terai → Gangetic Plain.

CHANGES IN TERRITORIAL NAMES

The *Handbook* relies on observations made during the last hundred years, during which period many areas have changed their names and boundaries. The authors have striven to keep up with changes which have taken place during the writing and publication of the ten volumes, and hope the following notes will be helpful in interpretation. They should be supplemented by reference to atlases.

ANDHRA PRADESH. Until 1953 the northern half of Madras State, including the deltas of the Krishna and Godavari rivers and the arid hills of the Eastern Ghats, and the former Hyderabad State.

ARUNACHAL PRADESH. 'The Province of the Dawn.' The Himalayas east of Bhutan, including the Daffa, Abor, Miri and Mishmi hills. Before 1972 this area was the North-East Frontier Agency (NEFA), comprising the Kameng, Subansiri, Siang and Luhit frontier divisions.

ASSAM. Before 1947 this province included Arunachal Pradesh, Meghalaya, Mizoram and Nagaland (qq.v.). In 1972 it was restricted to the Brahmaputra Valley.

BANGLADESH. Constituted in 1971, formerly East Pakistan. Besides the Brahmaputra plains it includes the Chittagong Hill Tracts in the south.

BENGAL. Prior to 1947 the Ganges-Brahmaputra delta area, later divided into Bangladesh (q.v.) and West Bengal.

HARYANA. The fertile plains area north and west of Delhi, formerly part of the Punjab (q.v.).

HIMACHAL PRADESH. 'The Snowy Province.' The Himalayan hill States were united under this name in 1948, and in 1966 the area was enlarged by the hill regions of the Punjab.

KARNATAKA. The official name of Mysore since 1973.

LAKSHADWEEP. The official name of the Laccadive Islands group since 1973.

MEGHALAYA. 'Cloud-land.' The Garo, Jaintia, Khasi and Cachar hill districts, constituted a separate State in 1972.

MIZORAM. The Lushai or Mizo Hills area, constituted a separate State in 1972.

NAGALAND. The Naga Hills area, constituted a separate State in 1962.

NEFA. Now Arunachal Pradesh, q.v.

ODUH (= Awadh). The eastern Gangetic plains, now part of Uttar Pradesh ('Northern Province'), the name given in 1950 to the United Provinces (of Agra and Oudh).

PAKISTAN. Before 1972 West Pakistan, including Sind, Baluchistan, Punjab (q.v.), the North-West Frontier Province and Bahawalpur.

PUNJAB. Prior to 1947 the whole of the northern plains area watered by the Indus, and its five tributaries namely Jhelum, Chenab, Ravi, Beas and Sutlej. Divided in 1947 into West Punjab (Pakistan) and East Punjab (India). In 1966 East Punjab was further divided into Punjab, Haryana and Himachal Pradesh (qq.v.).

SAURASHTRA. The union of States was merged with Bombay in 1956 and since 1960 has been part of Gujarat.

SRI LANKA. The official name of Ceylon since 1972.

TAMIL NADU. The name given to Madras State in 1969.

DESCRIPTIVE TEXTS, REFERENCES
CITED AND APPENDICES

Order GAVIIFORMES

Family GAVIIDAE: Divers, Loons

Aquatic birds superficially like grebes but differing in a number of characters and probably not very closely related to them. Toes fully webbed like duck's, not lobed or scalloped. Wing of 11 primaries, the outermost minute. Rectrices 18 or 20, short but well developed. Plumage dense, compact and rather harsh, not silky as in grebes. Tarsi reticulate, laterally compressed. Legs short and set far back, almost at end. Wings short, narrow, and tapering; set well back as in a Boeing jet plane. Sexes alike.

For other anatomical characters see Stresemann 1927-34, Aves: 779-80; Witherby *et al.* 1940, 4: 111; Palmer 1962, 1: 20.

Genus GAVIA J. R. Forster

Gavia J. R. Forster, 1788, Enchirid. Hist. Nat.: 38. Type, by subsequent designation, *Colymbus immer* Brünich

Characters as of the Family. Genus northern Holarctic.

Key to the Species

	Page
A Bill straight	1
B Bill upturned	2
1 Upperparts uniformly dark	<i>G. arctica</i> (winter) 1
Upperparts 'scaly'	<i>G. arctica</i> (juvencal) 1
2 Upperparts sprinkled with white spots	<i>G. stellata</i> (winter) 2

1. Blackthroated Diver. *Gavia arctica suchkini* (Zarudny)

Urinator arcticus suchkini Zarudny, 1912, Orn. Mitt. 3: 11 (Russian Turkestan)

Baker, FBI No. 2293, Vol. 6: 485

Plate 1, fig. 1

LOCAL NAMES. None recorded.

SIZE. Domestic duck \pm ; length c. 65 cm. (25 in.).

FIELD CHARACTERS. A practically tailless aquatic bird, in winter dark grey above white below without black throat. Pointed straight bill. Overall aspect that of Little Grebe or Dabchick, but much larger and heavier. Neck stouter and proportionately shorter than grebe's. Confusable only with the commoner Crested Grebe, but larger size, stouter neck, and absence of ruff of elongated feathers below head diagnostic. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. A rare vagrant in winter. Only once recorded: a single specimen on flooded land bordering the W. Jumna Canal at Jagadhri, Ambala District, Punjab — 19 February 1922 (A. E. Jones 1922, JBNHS 28: 1134).

EXTRALIMITAL. Breeding from the Ural Mts to Lake Baikal and the Yenisey, Turkestan, and Kirghiz Steppes.

MIGRATION. ?

1

GREBES

	Page
2 Needle-like bill with slightly upturned appearance.....a	
Bill rather thick and straight.....b	
a Head and neck black, tufts of golden brown feathers on sides of head.....	5
Head and neck dark greyish black; white of throat extending around nape.....	5
b Checks and lower throat chestnut, cap and back of neck greyish black, upper throat black.....	6
Sides of head and foreneck pale rufous, cap darker, upper throat white.....	6

3. Great Crested Grebe. *Podiceps cristatus cristatus* (Linnaeus)

Colymbus cristatus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 35 (Sweden)

Baker, FBI No. 2290, Vol. 6: 477

Plate 1, fig. 3

LOCAL NAME. *Shira-hin* (Assam).

SIZE. Domestic duck —; length c. 50 cm. (c. 19 in.).

FIELD CHARACTERS. A tailless aquatic bird dark greyish brown above, silky white below, with slender longish neck and pointed bill. Two up-standing, backwardly directed blackish ear-tufts above head and a frill or ruff (looking like puffed-out throat) of chestnut-and-black elongated feathers below the head, conspicuous and diagnostic; less developed in female than male. In winter (non-breeding plumage) these 'ears' much reduced; in young birds absent. A white wing patch (secondaries) and white leading edge of wing concealed at rest, conspicuous in flight, when humpbacked profile is reminiscent of Merganser. Sexes alike. Singly, pairs, and small scattered parties on jheels and littoral waters.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor in small numbers to northern India from Sind (where it is commoner at sea along the coast) to NE. Assam and Manipur; south through Rajasthan (Bharatpur) to Gujarat on the west (Kutch, Porbandar, Jasadn, Viramgam, Bhavnagar), and Orissa on the east (near Puri — sight record, H. G. Alexander). Affects jheels and littoral waters.

EXTRALIMITAL. The Palaearctic Region — Europe to China and Japan, south to our limits in Ladakh, Kashmir and Nepal.

MIGRATION. No specific information.

GENERAL HABITS. Usually seen in separated pairs or scattered parties on vegetation-covered reed-bordered jheels swimming about with neck

2

PODICIPITIFORMES

GENERAL HABITS. Swims low, often only with the head showing. Rises from water with effort, running long distances on surface with quick-flapping short wings, but is a swift and powerful flier once air-borne. Hunchbacked merganser-like profile in flight with legs projecting behind distinctive. Hits water with chest when landing; cannot take off from dry land. Expert deep-water diver and submarine swimmer, using feet as propellers and wings to turn and twist. Keeps to inland lakes.

FOOD. Mainly fish.

VOICE AND CALLS. ?

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. For plumage etc. see Witherby *et al.* 1940, 4: 119. This race, *suehikini*, differs only in details from the nominate race there described.

The Ambala specimen, a first-year female, had a wing measuring 290 mm. Hartert (1920: 1461) gives the wing measurements of this race as 291-337 mm.

[2. The Redthroated Diver, *Gavia stellata* (Pontoppidan), has been recorded once from the Makran Coast (Baker 1931, 8: 703). It conceivably may occur again as a vagrant in West Pakistan.]

Order PODICIPITIFORMES

Family PODICIPEDIDAE: Grebes

Aquatic birds with soft rudimentary tail, very small wings, and compressed sharply pointed bill. Legs placed far back, especially adapted for swimming and diving. Tarsi scutellated in front, laterally compressed. Front toes with broad lateral vane like lobes. Hind toe small, raised, vertically lobed. Nails broad and flattened. Plumage dense and silky. Primaries 12, the 1st from the outside (= ascendant) being rudimentary. Sexes alike. Downy young boldly striped blackish and white.

For further anatomical details see Witherby *et al.* 1940, 4: 84; Stresemann 1927-34 Aves: 780-82; Palmer 1962, 1: 62.

Genus PODICEPS Latham

Podiceps Latham, 1787, Gen. Syn. Bds.; Suppl., 1: 294. Type, by subsequent designation, *Colymbus cristatus* Linnaeus

Characters as of the Family. Genus cosmopolitan; represented within our limits by three species.

Key to the Species

	Page
A Size of duck (c. 50-60 cm. = 19.5-23.5 in.)	1
B Smaller than duck (c. 23-35 cm. = 9-13 in.)	2
1 Long slender neck with straight bill, head ornamented with backward pointing tufts above and a frill or ruff of black chestnut feathers below	3
Head ornamentation reduced or lacking, white above eye conspicuous, bill pinkish	3

4

PODICIPITIFORMES

erect. When alarmed, disappears smoothly or with a little leap and swims away under water; surfaces then dives again, and so on till it gains the safety of distance and open water. Is loth to fly, rising with effort, pattering along the surface for long stretches, half running half flying till airborne. But is capable of covering long distances on migration or when shifting from one jheel to another. Flight swift though seemingly laboured, with rapid flaps of the short wings. Seldom seen on land, where the backwardly placed legs enable it merely to shuffle along clumsily with breast on ground. Courtship display, first described by J. S. Huxley (1914, PZS: 491-562), consists of the pair facing each other with rigid neck, ear-tufts erect and ruff expanded, both birds diving and coming up with water weeds in their bills, suddenly rising upright breast to breast and swaying — and variations of this theme.

FOOD. Fish, tadpoles, frogs, water insects, etc., with some vegetable matter. Stomachs of three specimens collected by Meinertzhagen in Ladakh contained exclusively freshwater shrimps (*Gammarus*). A quantity of feathers has frequently been reported among the stomach contents.

VOICE AND CALLS. Described as a harsh *krek-krek* and a variety of discordant barks and shrill trumpeting expressive of different emotions.

BREEDING. Within our limits recorded from Khushdil Khan lake in Baluchistan (alt. c. 1750 m.) and from the high-elevation lake Tso Kar in Rupshu, Ladakh (alt. c. 5200 m.). In W. Tibet SA found it nesting on Ding Tso lake (alt. c. 5300 m.) NE. of Manasarovar. *Season*, chiefly June to August. *Nest*, a conspicuous mass of water weeds c. 45 to 60 cm. in diameter with a depression in the middle, on floating mounds of grass and rubbish 20 to 100 metres from the bank, loosely anchored to growing weeds. Often clusters of several nests together, from a few metres apart to almost touching one another. *Eggs*, 3 to 5, very pale sea-green with an overlay of chalky white calcium deposit, usually becoming stained brown by contact with the soggy nest. Fourteen eggs taken by Ludlow on the Kala Tso in Tibet average 54.50 x 25.00 mm. Compared with the average size of 100 British-taken eggs as given by Witherby (54.8 x 36.7 mm.) they are considerably narrower. Both parents incubate. Ludlow observed that the male frequently sat on the nest alongside of the brooding female. The incubation period is recorded as 28 days. When leaving the nest to feed, or on alarm, the sitting bird usually covers up the eggs with loose nest material.

From the fact that a few pairs may usually be seen on the great swamps north of the Brahmaputra river in Assam during the breeding season every year, Baker (1932-5, 4: 518) surmises that they breed there sporadically and maybe even regularly. Bulkley (JBNHS 6: 501) found a nest near Kharaghoda, Gujarat, in August 1891, and there is some indirect evidence that odd pairs may also breed irregularly in Gujarat and Saurashtra.

MUSEUM DIAGNOSIS. For description of plumage etc. see Witherby 1940, 4: 91.

MEASUREMENTS. Three specimens collected by Meinertzhagen in Ladakh measure:

	Wing	Bill (from feathers)
2 ♂♂	202, 203	43, 45 mm.
1 ♀	192	41 mm.

GREBES

5

Baker, loc. cit., gives range for ♂ ♀ W. 176-211; Culm. 45-53; Tar. 52-64 mm. COLOURS OF BARE PARTS. Iris carmine-red, crimson with a narrow inner ring of orange, or orange with an inner ring of pale yellow; bill dark brown, the tip paler and slaty grey, the extreme base suffused with crimson, obsolete in winter; legs and feet olive-green externally, yellowish-green inside; webs yellowish, the nails bluish.

3a. Rednecked Grebe. *Podiceps griseigena* (Boddaert). See Appendix.

4. Blacknecked Grebe. *Podiceps nigricollis nigricollis* Brehm

Podiceps nigricollis Brehm, 1831, Handb. Naturg. Vog. Deutschl.: 963 (E. Germany) Baker, FBI No. 2291, Vol. 6: 480 Plate 1, fig. 4

LOCAL NAMES. Unrecorded.

SIZE. Dabchick+; length c. 33 cm. (13 in.).

FIELD CHARACTERS. Distinguished from the familiar Dabchick or Little Grebe in winter by larger size and the silvery white flanks, flashing in good light. Sexes alike.

Winter plumage, x c. 4

Adult (winter). Above, dark brown with darker (blackish) cap to below eyes. Below, chin and throat mixed black and white, foreneck dark brown, rest of underparts white. No dusky brown on flanks. Bill slender, pointed, slightly upturned in profile. In summer plumage has black head and neck and lengthened rufous-golden feather tuft from below eye.

STATUS, DISTRIBUTION AND HABITAT. Uncommon winter visitor, sporadically recorded in Baluchistan (nr. Quetta), Sind (Karachi, Makran Coast littoral, Manchar Lake), Punjab (Bahawalpur), Uttar Pradesh (Pyagpur), Maharashtra (near Poona), Nepal (R. L. Fleming, 1957, *Fieldiana*, Zool. 41(1): 48). Possibly occurs more generally in northern India than is identified. Recently (winter 1964-5) reported on Khabakki lake, W. Pakistan Salt Range, in gatherings of 300 to 600 individuals, vastly outnumbering *Podiceps ruficollis* (C. D. W. Savage, in *epist.*). On duck-shooting jheels.

Extralimital. Breeds in the Palearctic Region from Europe to China and Japan, south to Turkestan.

MIGRATION. ?

GENERAL HABITS. Frequents reed-bordered jheels with floating vegetation interspersed with expanses of open water, in company with dabchicks. Prefers reedbeds in the shallows to open water, and is inclined to segregation. Otherwise very similar to the dabchick.

GREBES

7

possibly also migratory. Common throughout the Indian subcontinent, east to Assam and Manipur, south into Ceylon, from the plains to c. 1800 m. altitude (in Kashmir). Absent in the Andaman and Nicobar islands. Frequents all types of inland waters with or without floating vegetation or reeds — irrigation reservoirs, village tanks, ponds, moats of ancient forts, etc., even flooded roadside ditches and borrow-pits. Hardly ever rivers or the sea.

x c. 1

Extralimital. Our race *capensis* occurs in much of N. Africa, Madagascar Middle East, and SE. Asia.

MIGRATION. Unknown, but an exhausted specimen picked up on Jakko Hill, Simla (c. 1500 m.) — quite out of its normal range — on 17 September 1942 (A. E. Jones, JBNHS 43: 661) seems clearly suggestive of migratory movement.

GENERAL HABITS. Usually keeps in separated pairs or small scattered parties. Enormous gatherings of hundreds strong may commonly be met with on the bigger jheels such as the Manchar lake in Sind, and the Logtak in Manipur (Assam). Also on the 'Salt Lakes' near Calcutta. An excellent diver and underwater swimmer. Disappears smoothly below the surface without leaving a ripple, or takes a little upward leap to plunge vertically with astonishing suddenness. After being fired at once, will often vanish before the charge of shot can reach it a second time! The birds are fond of disporting themselves at sunset, chasing one another, pattering on the surface half running half flying with rapid flapping (vibrating) of the diminutive wings, to the accompaniment of shrill tittering or trilling duets and choruses. They are loth to fly, and when alarmed will either dive for safety or patter along and fly a short distance close to the surface presently to flop down again. Once properly airborne, however, they can fly incredibly well and strongly, and often travel long distances.

FOOD. Fish, frogs, tadpoles, crustacea, molluscs, aquatic insects, etc. As in other grebes some feathers also swallowed. Food mostly procured by diving, but also on surface from under floating vegetation by swift spurts forward, neck outstretched, to seize escaping quarry.

VOICE AND CALLS. In addition to the runs of shrill, rather musical trilling, a sharp monosyllabic *click* is uttered repeatedly when agitated, as on approach of nest by intruder; and also sharp squeaks like an unrolled bicycle wheel.

BREEDING. Season varies in different parts of the country depending on rainfall and availability of suitable breeding waters; chiefly April to October in northern and peninsular India, December to February in the

6

PODICIPITIFORMES

FOOD. Fish, tadpoles, shrimps, aquatic insects, etc., with which a quantity of feathers (its own?) is usually taken.

VOICE AND CALLS. Unrecorded in India.

BREEDING. Within our limits recorded only from Baluchistan (Khushdill Khan lake near Quetta) where Meinertzhagen found over 70 nests with eggs on 20 June 1913. Season, June-July. Nest, a floating pad of weed stalks, c. 37-43 cm. across, firmly attached to the bottom as shown by all the above nests drowning on rise of water level in flood. Sited in reedbed, not open water as with Crested Grebe. Eggs, 3-5, like the latter's but smaller. Average size c. 44 x 32 mm. Both parents brood. Incubation period recorded as 19-20 days. Small striped downy young often carried on swimming parent's back, cradled between slightly raised wings, sometimes even when parent dives. Newly hatched young often nestled in fluffy plumage of back of incubating parent to keep away from soggy nest, and fed by other parent in this position (W. Wüst, *J. Orn.*, 1934: 311-18).

MUSEUM DIAGNOSIS. For description of plumages etc. see Witherby 1940, 4: 105-6.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus
♂ ♀	123-137	39-43	c. 20-26, generally 21-24 mm. (Baker)

Wing of a ♂ from Poona in BNHS Coll. 142 mm.

COLOURS OF BARE PARTS. Iris reddish brown to orange-pink with silvery inner ring round pupil. Bare loreal skin, brownish flesh. Bill bluish plumbeous, black on ridge of culmen, whitish at tip. Legs and feet blackish and greenish to bluish.

MISCELLANEOUS. Longevity (from ringing data) 6+ years (Ring, 1962, 33: 148).

5. Little Grebe or Dabchick. *Podiceps ruficollis capensis* Salvadori

Podiceps capensis Salvadori, 1884, Ann. Mus. Civ. Genova (2), I: 252 (Shoa, Africa) Baker, FBI No. 2292, Vol. 6: 481

Plate 1, fig. 6

LOCAL NAMES. Pāndubi, Pānti, Dūdbūbi, Churaka (Hindi); Dūdbūbi, Pāndūbi, Dūbiri (Bengal); Muvu-gudi-kodi (Telugu); Mūkkūlippān, Tānni pūllū (Tamil); Pind (Kashmir); Tūbino (Sind)

SIZE. Tailless pigeon ±; length c. 23 cm. (9 in.).

FIELD CHARACTERS. A small squat tailless aquatic bird with short pointed bill and backwardly placed legs specially adapted for swimming and diving. Rides on the water with rear end raised and fluffed out producing a bluntly rounded effect.

Adult. Above, dark brown, the crown darker; sides of head, throat and neck chestnut. Below, silky smoky white with the flanks dusky brown (contra P. n. *nigricollis*). A white patch on wing (secondaries) conspicuous only in flight. Base of bill and swollen fleshy gape yellowish green, prominent. In non-breeding plumage, mostly in winter, a drab brown bird with whitish chin, pale rufous neck and whitish underparts. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Chiefly resident, but shifting locally and long distances dependent on drought and flood. Part of populations

8

PODICIPITIFORMES

south and in Ceylon. Nest, a rough pad of sodden weeds and rushes, c. 30 cm. across the top of the shallow central depression. Floating or bedded on water weeds, and usually anchored to the reeds or substrate; often in clusters or colonies partly submerged and liable to drown by flood. It has been noted (Williams, JBNHS 33: 619) that the temperature of the water round the eggs within a half-submerged nest is higher than that of the lake, perhaps as a result of the fermentation of the soggy nest material. This may prevent chilling of the eggs and account for the birds being able to leave them unattended for long periods. Copulation usually takes place on the nest when the female is sitting on it. Eggs, 4 or 5, sometimes 3 or 6, rather pointed at both ends, chalky white, becoming stained dirty brownish during incubation by contact with the sodden nest. Average size c. 36 x 25 mm. The birds cover up the eggs with loose nest material every time they leave the nest. Both sexes incubate, and tend the young. Incubation period recorded as 19-20 days. Two (or more?) broods are raised in succession. When the female is incubating the second clutch, the care of the first brood of downy young devolves entirely on the male.

The downy striped and spotted hatchlings can swim almost as soon as hatched, but dive when a day (?) old clumsily with a splash, remaining submerged only for a short time. When first venturing forth from the nest they hold on with the bill to the parent's flank feathers at the rear and are thus towed along. On scenting danger the parent gives the tittering alarm note, at the same time partly raising its wings and dipping its posterior. The chicks clamber up the incline and ensconce themselves between the scapulars and are carried away to safety.

MUSEUM DIAGNOSIS. For details of plumages of the nominate race *ruficollis* see Witherby 1940, 4: 109-11. Our race *capensis* differs from it in having white bases to the primaries and more white on the secondaries.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	94-109	18-22	30-35 (Baker)	c. 23-33 mm. (SA)

COLOURS OF BARE PARTS. Iris reddish brown or deep red, or orange yellow, with a circle of fine brown spots round pupil. Bill in adult black, the extreme tip pale and the base and gape (swollen) yellow or greenish yellow; in downy young cherry red. Legs and feet greenish black or black.

Order PROCELLARIIFORMES

- Dark all over with white rump, pale wing-bar, square tail, and yellow webs of toes (c. 19 cm. = 7½ in.) *Oceanites oceanicus oceanicus* 17

Family PROCELLARIIDAE: Petrels, Shearwaters

Sea birds of very diverse sizes and coloration, almost from goose to myna, and white, grey, brown, or black plumage or combinations of these. Bill short and stout to lengthy and slender, covered with horny plates, hooked at tip. Nostrils tubular. Wings narrow, long, and pointed with first primary longest, and secondaries short. Tarsus short to medium, slender, laterally compressed, reticulated. Feet webbed, with strong hindclaw. Tail short, rounded. Sexes alike.

Genus DAPTION Stephens

Daption Stephens, 1826, in Shaw's Gen. Zool. 13(1): 239. Type, by original designation, *Procellaria capensis* Linnaeus

Bill short, stout, gonys angulate near the end, and the extremity inclined upward. Nostrils divided within the tube but terminating in a single orifice. Wings long: 1st quill (as.) longest; secondaries short. Tail of 14 feathers rather short, slightly rounded at end. Tarsus slender, reticulated, somewhat compressed and shorter than the middle or outer toe; hindclaw stout. Contains only a single species.

PETRELS, SHEARWATERS

11

7. Whitefronted or Streaked Shearwater. *Procellaria leucomelana* Temminck

Procellaria leucomelas Temminck, 1835, Planch. Col. d'Ois. livr. 99: 597
(Seas of Japan and Nagasaki Bay)
Baker, FBI No. 2199, Vol. 6: 306

SIZE. Brownheaded Gull ±; length c. 48 cm. (c. 19 in.).

FIELD CHARACTERS. Pelagic. Recognized by its white face streaked with black.

Adult. Above, dark brown with black wings and tail. Below, white, including under surface of wings. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. North Pacific Ocean from Korea and Japan south in winter to Philippine Is., Borneo, Moluccas and New Guinea. Breeds in colonies on small offshore islands, e.g. in Japan, in burrows excavated in earthen hillsides.

Only one record for our area — a specimen taken at Mt Lavinia, Ceylon, in 1884. (Skin in British Mus.)

MUSEUM DIAGNOSIS. For details of plumage, breeding etc. see Hachisuka 1932: 252; breeding biology Austin and Kuroda 1953: 304.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	305-339	48-53	46-54	131-150 mm. (Baker)

COLOURS OF BARE PARTS. Iris dark brown. Bill dark horn-colour. Legs and feet flesh-colour, the outer toe darker (Baker).

8. Pinkfooted Shearwater. *Procellaria carneipes* (Gould)

Puffinus carneipes Gould, 1844, Ann. & Mag. Nat. Hist. 13: 365
(small islands off Cape Leeuwin, West Australia)
Baker, FBI No. 2193, Vol. 6: 305
Plate 2, fig. 8

SIZE. Brownheaded Gull ±; length c. 50 cm. (c. 20 in.).

FIELD CHARACTERS. Pelagic.

Adult. Above and below dark sooty brown or chocolate-black; sides of head and neck paler greyish brown. Pale fleshy bill and feet. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Indian and Pacific oceans from the Australian seas north in the (southern) winter to Ceylon, Japan, California.... (Alexander 1955: 23-4). Breeds on islands off southwestern Australia and northern New Zealand, and at Lord Howe Island. Within our area two specimens taken in Ceylon, one in 1879 (Wait 1931: 413), the other in 1945 (Osman Hill 1945, JBNHS 45: 239-40). More recently small numbers observed in the Maldivé Islands in July (Phillips 1958, JBNHS 55: 216).

MUSEUM DIAGNOSIS. For description of plumage, biology, etc. see Murphy 1936: 658.

10

PROCELLARIIFORMES

6. Cape Petrel. *Daption capensis* (Linnaeus)

Procellaria capensis Linnaeus, 1758, Syst. Nat., ed. 10, 1: 32 (Cape of Good Hope)
Baker, FBI No. 2201, Vol. 6: 307
Plate 2, fig. 12

OTHER NAME. Cape Pigeon.

SIZE. Pigeon; length c. 36 cm. (c. 14 in.).

FIELD CHARACTERS. A black and white pelagic petrel with a dark head, conspicuously chequered back, and two large roundish white patches on upper surface of each wing.

× c. 1/10

MUSEUM DIAGNOSIS. For description of plumage, measurements, moults and biology, see Murphy 1936: 601-10.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	240-268	29-32	42-46	92-108 mm.

COLOURS OF BARE PARTS. Iris brown. Bill black, the skin between the rami red. Legs and feet black.

Genus PROCELLARIA Linnaeus

Procellaria Linnaeus, 1758, Syst. Nat., ed. 10, 1: 131. Type, by subsequent designation, *Procellaria aequinoctialis* Linnaeus (Gray, 1840, cf. *Ibis*, 1949: 512)

Cf. Phillips, W.W.A. 1951, *Spolia Zeylanica* 26(2): 151-3.

Bill long, slender, compressed, much hooked at the point and with both mandibles turning down at tip. Nostrils tubular ending in two distinct oblique orifices ('double-barrelled') directed forward and upward, with a broad division between them. Wings long and pointed: 1st primary (as.) longest. Tail of 12 feathers, rather long and graduated. Tarsus reticulated, compressed and sharp in front; shorter than the middle and outer toes which are subequal. A small hindclaw.

Oceanic birds of moderate size.

12

PROCELLARIIFORMES

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	299-316	41-46	c. 52-56	137-148 mm.

COLOURS OF BARE PARTS. Iris brown. Bill, feet and legs flesh colour, the tip of both mandibles dusky and darker (Baker).

9. Wedgetailed Shearwater. *Procellaria pacifica chlororhyncha* (Lesson)

Puffinus chlororhynchus Lesson, 1831, Traité d'Orn., Livr. 8: 613
(Sharks Bay, Western Australia)

Baker, FBI No. 2196, Vol. 6: 303 (= *Puffinus pacificus hamiltoni* Mathews)
Plate 2, fig. 7

SIZE. Brownheaded Gull ±; length c. 48 cm. (c. 19 in.).

FIELD CHARACTERS. Pelagic. Above, dark chocolate-brown, primaries and wedge-shaped tail black. Face and throat dark brownish grey. Below, dimorphic, greyish brown (dark phase), or white (light phase). Sexes alike.

× c. 1

STATUS, DISTRIBUTION AND HABITAT. Warmer parts of the Indian and Pacific oceans. Breeding at Seychelles, Mauritius, Fouquet, and Rodriguez; ranging widely over the western Indian Ocean. From within our area 4 specimens, all taken on the W. coast of Ceylon, are in the Colombo Museum. An old sight record at Trincomalee by Col. Legge (Wait 1931: 412) and another by W. W. A. Phillips at Colombo in 1949 (1950, JBNHS 49: 289). According to the latter this shearwater is probably a regular summer visitor to coastal Ceylon. He found it (presumably this same race, *chlororhyncha*, plentiful in the Maldivé Islands in early July (1958, JBNHS 55: 216). Cumming's record from the Makran Coast of Baluchistan was shown by Ticehurst (1940, JBNHS 32: 89) to be erroneous, but this shearwater may well turn up along the coast of West Pakistan.

BREEDING. For breeding biology see Murphy 1936, and Murphy, Niedrach & Bailey 1954: 30.

MUSEUM DIAGNOSIS. For details of plumage, races, etc. see Murphy 1951: 1-21; Hachisuka 1932: 253.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	274-290	c. 36-39	c. 45-48	149-161 mm.

COLOURS OF BARE PARTS. Iris dark brown. Bill dull fleshy or dusky greenish. Legs and feet fleshy white (Baker).

PETRELS, SHEARWATERS

13

10. Slenderbilled or Short-tailed Shearwater. *Procellaria tenuirostris* Temminck*Procellaria tenuirostris* Temminck, 1835, Pl. Col., livr. 99: text to pl. 587

(Seas north of Japan and shores of Korea = Japan)

Baker, FBI No. 2197, Vol. 6: 304 [= *Puffinus tenuirostris tenuirostris* (Temminck)]

OTHER NAMES. Mutton-bird, Whale-bird.

SIZE. Pigeon; length c. 33 cm. (13 in.).

FIELD CHARACTERS. Pelagic.

Adult. Above, dark sooty brown, crown and primaries nearly black. Below, paler and greyer with grey chin and throat and greyish under wing-coverts.

STATUS, DISTRIBUTION and HABITAT. Once obtained near Ormara on the Makran Coast, Baluchistan, in May 1889 mistakenly reported (JBNHS 12: 767) as *P. chlororhynchus* (cf. above). Another example picked up dead on the south coast of Ceylon in May 1949 (Phillips 1951, SZ 26: 151). Both these doubtless blown in by SW. Monsoon gales. Breeds on islands in the neighbourhood of Tasmania and southeastern Australia. Ranges northward to Korea and Japan, and to Behring Straits and western coasts of North America.

MUSEUM DIAGNOSIS. For description of plumages, biology, etc. see Murphy 1936: 673-6.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	258-280	31-34	49-52	80-85 mm. (Baker)

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, tinged with olive. Legs and feet purplish black, with outer toes and outer side of tarsus black.

11. Mauritius Shearwater. *Procellaria therminieri bailloni* Bonaparte*Procellaria nugax a. bailloni* Bonaparte, 1857, Cons. Av., 2: 205(ex *Insula Franciae* = Mauritius)

Not in Baker, FBI

Plate 2, fig. 13

LOCAL NAME. Hoogula (Maldives).

SIZE. Pigeon —; length c. 30 cm. (12 in.).

FIELD CHARACTERS. Pelagic.

Adult. Above, sooty black with greyish neck, the grey extending to sides of breast. Below, white; under tail-coverts black or black-and-white. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Breeds in the Maldive Islands. Extraliminally also in Mauritius, Réunion, Rodriguez, Seychelles, etc. Ranges in the tropical Indian Ocean, but strangely enough not yet obtained in coastal Ceylon or western India.

MIGRATION. ?

GENERAL HABITS. Like other petrels, spends most of the non-breeding season at sea. Glides swiftly close to the surface skimming over the waves

PETRELS, SHEARWATERS

15

Two specimens (Wing 201 and 212 mm.) have been taken on the Bombay Coast in the SW. monsoon season, doubtless storm-blown, and one in Kerala (JBNHS 16: 14). The racial identity of the last is undetermined.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	185-209	c. 38	31-33	87-103 mm. (Baker)

COLOURS OF BARE PARTS. Iris brown. Bill dusky brown, bluish at the base and most of lower mandible. Legs and feet pinkish white; outer part of tarsus and outer toe including web black, variable in extent.

Genus BULWERIA Bonaparte

Bulweria Bonaparte, 1843 (1842), Nouv. Ann. Sci. Nat. Bologna 8: 426.Type, by monotypy, *Procellaria bulwerii* Jardine & SelbyVery closely allied to *Procellaria* but considerably smaller and of a more or less uniformly slate colour. Feet weaker; tail comparatively longer. Nostrils on top of culmen forming two quite separate round holes, this portion somewhat soft.13. Mascarene Black Petrel. *Bulweria aterrima* (Bonaparte)*Procellaria aterrima* 'Verr.' = Bonaparte, 1857, Cons. Av., 2: 191(ex *Insula Borbonica*, Afr. occ. = Réunion)

Not in Baker, FBI

OTHER NAMES. Réunion Petrel, Mascarene Gadfly Petrel.

SIZE. Pigeon +; length c. 36 cm. (c. 14 in.).

FIELD CHARACTERS. Pelagic.

Adult. Above and below dark grey-brown or sooty black, with wedge-shaped tail. Bill short, stout, black. Feet dark reddish flesh colour; outer toe and webs black (Alexander 1955). Dimorphic: dark and light colour phases. Has been likened to a huge swift flying low and fast over the surface of the sea.

STATUS, DISTRIBUTION and HABITAT. Indian Ocean from the Mascarene Islands north to the Gulf of Aden. Doubtfully breeding on Réunion Island c. 21°0'S., 55°30'E.

A live specimen (storm-blown?) taken by fishermen at Bombay, 15 June 1940, identified at Colombo Museum (JBNHS 42: 193). Unfortunately the skin cannot be traced for rechecking; therefore the record must stand unconfirmed till fresh specimens come to hand.

13a. Jouanin's Gadfly Petrel. *Bulweria fallax* Jouanin*Bulweria fallax* Jouanin, 1955, L'Oiseau 27: 160

(at sea, approximately 12°30'N., 55°E.)

Not in Baker, FBI

Plate 2, fig. 6

OTHER NAME. Jouanin's Black Petrel.

14

PROCELLARIIFORMES

in a wandering course on extended motionless wings interrupted by a few rapid strokes, often lowering legs and paddling or 'walking' along the water. Turns and twists from side to side in flight flashing the white breast intermittently, like sand plovers in a flock. Ranges widely over vast expanses of ocean, returning at the appointed season to its specific breeding islands.

FOOD. Small fish, squids, and other surface-floating animals; refuse thrown overboard, etc.

VOICE and CALLS. Unrecorded in India.

BREEDING. Gregarious. Season, in Maldives apparently between October and January, or later; said by the islanders to continue throughout the year. Burrows were found to contain eggs and young on 29 December (Gadow in Gardiner 1903); also between 26 and 31 January (1958, Phillips & Sims, JBNHS 55: 201). Nest, a burrow excavated in sand beneath roots of scrub, within six metres of the shore; particularly numerous on small uninhabited islets. The birds visited the burrows only at night, between midnight and 4 a.m. Eggs, white; one measured 49 x 35 mm. Clutch size? Incubation period? (Both the incubation and nestling periods are inordinately protracted in shearwaters and petrels.) Presumably, as in other petrels, both sexes incubate.

MUSEUM DIAGNOSIS. For description of plumages etc. of nominate race *therminieri* see Murphy 1936: 684-7. *Bailloni* differs from it only in details. It differs from the more northerly occurring race *persica* (see below) in being somewhat smaller with a shorter bill, and in the greyish of the neck extending to sides of breast. (See also Palmer 1962, 1: 198.)MEASUREMENTS. Specimens from Maldives, Seychelles, Réunion measure: 7 ♂ ♀ Wing 181-198 (av. 191.7); bill (nostril to tip) 21-23 (av. 21.6) mm. Specimens collected at Aden, and on the Makran and western India coasts (*P. l. persica*) measure: 4 ♂ ♀ Wing 199-210 (av. 204.5); 5 ♂ ♀ bill (nostril to tip) 25-27 (av. 25.6) mm.

COLOURS OF BARE PARTS. Iris dark brown. Bill slate, ridge of culmen and tip black. Legs and feet slate-blue (livid flesh in juv.), back of tarsus and outer toe black, middle of webs and joints dusky (Witherby).

12. Persian Shearwater. *Procellaria therminieri persica* (Hume)*Puffinus persicus* Hume, 1873, Stray Feathers, 1: 5

(at sea between Gwadar and Muscat)

Baker, FBI No. 2200, Vol. 6: 306

SIZE. Pigeon —; length c. 31 cm. (12 in.).

FIELD CHARACTERS. Similar to *P. l. bailloni* but somewhat larger and with a longer bill. Less grey on neck and with a narrow white ring round eye and a white streak behind it. Difficult to distinguish unless in the hand. (See measurements under *P. l. bailloni*.)

STATUS, DISTRIBUTION and HABITAT. Arabian Sea coasts between Aden and Karachi. Common and abundant in the Persian Gulf and the Gulf of Oman, and on the Makran Coast. Breeding stations unknown; may lie off the Makran Coast or the Straits of Hormuz as suggested by Meinertzhagen (1954: 441).

16

PROCELLARIIFORMES

SIZE. Pigeon —; length c. 29-30 cm. (12 in.).

FIELD CHARACTERS. Pelagic.

Adult. Above and below brownish black with long wedge-shaped tail and a short, thick bill. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Probably breeds in burrows on islands such as Kuria Muria off eastern Aden, Socotra, or Abd-el-Kuri. Found commonly in the Arabian Sea and the Gulf of Aden throughout the year. Bailey and Bourne (1963, JBNHS 60: 258) report that they handled several examples of this species that came aboard an aircraft carrier at 16°49'N., 55°15'E. and 18°50'N., 57°50'E. on 14 February 1960, and 11°24'N., 57°05'E. on 25 May in the central Arabian Sea off the mouth of the Gulf of Aden.

GENERAL HABITS. Unknown, but has been observed feeding alone far from land.

FOOD. One of the birds handled by Bailey (Bailey & Bourne, loc. cit.) vomited a small squid.

BREEDING. Unknown, but probably some time between October and March.

MUSEUM DIAGNOSIS

MEASUREMENTS

Wing	Bill	Tarsus	Tail	Wingspan
240	29	32	125	790 mm.

COLOURS OF BARE PARTS. Bill black. Feet flesh-coloured with black outer edges to the legs and toes.

13b. Bulwer's Gadfly Petrel. *Bulweria bulwerii* (Jardine & Selby)*Procellaria bulwerii* Jardine & Selby, 1828, Ill. Orn., 2. pl. 65 (Maddira)

Not in Baker, FBI

Plate 2, fig. 5

OTHER NAMES. Bulwer's Petrel, Bulwer's Black Petrel.

SIZE. Pigeon —; length c. 26-5-28 cm. (10½-11 in.).

FIELD CHARACTERS. A small brownish black gadfly petrel, rather paler on chin and edges of greater wing-coverts, with a short, slim bill, short legs, and a long, wedge-shaped tail.

PETRELS, SHEARWATERS

17

STATUS, DISTRIBUTION and HABITAT. Pelagic. Breeds on islands off the coast of China; the Bonin Islands, Vulcan Islands, the western Hawaiians and Marquesas Islands in the Pacific Ocean. Also breeds on Madeira, the Salvages, Canary and Cape Verde Islands in the Atlantic. Phillips (1959, Bull. BOC, 79: 100-101) has reported upon the occurrence of this species in the Indian Ocean, having secured a specimen in the Maldives in August, 1958.

FOOD. Probably squid, small fish, and zooplankton.

BREEDING. Eggs are known from May to July.

Bill of *Bulweria bulwerii*, $\times c. 1$

MUSEUM DIAGNOSIS

MEASUREMENTS

Wing	Bill	Tarsus	Tail
200	21	27	110 mm.

COLOURS OF BARE PARTS. Bill black. Legs mainly pink; feet flesh-colour, outer toes and webs black.

Family HYDROBATIDAE: Storm Petrels

The smallest sea birds, closely related to Shearwaters, up to about Myna size (c. 25 cm. or 10 in.), of blackish or greyish plumage, mostly with a white rump. Wings long; tail medium to long; neck short. Bill slender, of medium length, grooved, hooked at tip. Nostrils tubular with a single orifice. Legs slender, medium to long; feet webbed, mostly black. Webs black or particoloured. Sexes alike.

Genus OCEANITES Keyserling & Blasius

Oceanites Keyserling and Blasius, 1840, Wirbelth. Eur. 1: xciii, 131, 238. Type, by subsequent designation, *Procellaria wilsonii* Bonaparte = *Procellaria oceanica* Kuhl. Exc. small. Bill slight, and shorter than head: the orifice of the combined nostrils single. Wings very long and narrow: 2nd primary (as.) longest. Tail moderate, slightly forked. Tibia partly naked; tarsi smooth, much longer than toes. Hind toe only represented by a minute claw. Basal phalanx of middle toe not flattened; shorter than the other phalanges plus claw. Claws sharp, spatulate, but little flattened.

The genus ranges through the southern oceans and into the North Temperate zone.

14. Wilson's Storm Petrel. *Oceanites oceanicus oceanicus* (Kuhl)

Procellaria oceanica Kuhl, 1820, Beitr. Zool. Abth., 1: 136 pl. 10, .1.

(No type locality. South Georgia designated by Murphy,

1918, Bull. Am. Mus. Nat. Hist., 38: 128)

Baker, FBI No. 2194, Vol. 6: 300

Plate 2, fig. 1

OTHER NAMES. Mother Carey's Chicken, Yellow-webbed Storm Petrel.

SIZE. Bulbul; length c. 19 cm. (7½ in.).

PETRELS, SHEARWATERS

19

STATUS, DISTRIBUTION and HABITAT. Claimed to be one of the most numerous bird species in the world, and is certainly the most wide-ranging of the storm petrels. Breeds on Antarctic and subantarctic islands wandering north in the Atlantic, Pacific and Indian oceans in summer, to Europe, Arabia, India, New Guinea, Japan, California, etc. Not uncommon along the coasts of the Persian Gulf, Makran and Sind. Also visits coastal Ceylon chiefly during the SW. Monsoon, and has been taken at Kanyakumari (Kerala). Sinclair (1888, JBNHS) mentions it as 'known but rare' on the Konkan coast (W. India). A specimen¹ was collected within two miles of Bombay docks on 22.10.1947 when also a number of scattered birds were observed

in coastal waters a few miles southward (Abdulali, JBNHS 47: 550). This is possibly a regular seasonal occurrence but curiously enough unrecorded. H. G. Alexander noted it about 150 miles out of Bombay towards Aden on 10 September (*Ibis*, 1929: 43). Not recorded from northern parts of the Bay of Bengal, but several from the neighbourhood of Malaya.

MIGRATION. The meagre authentic records for the Indian Ocean suggest that probably the main body of birds from the Antarctic breeding grounds reaches north to Socotra and the Arabian coast in May-June, returning by way of the waters off Ceylon between September and November (Gibson-Hill 1948, JBNHS 47: 445).

GENERAL HABITS. Keeps in scattered ones and twos or small parties — sometimes large gatherings of 200 or more. Often met far out at sea flying swift-like (alternate glides and fluttering) close over the water even in a choppy sea, or riding buoyantly on the wave crests. Picks up floating animalcules from the comparatively calm troughs between the waves, getting hidden now and again behind the swell. Feeds by 'walking' or 'hopping' on the water with wings fluttering and held slightly above line of back — strangely reminiscent of a flock of jungle babblers hopping in active search of food — long legs dangling, feet paddling, head bent low and bill touching the surface.

FOOD. Mainly zooplankton.

BREEDING. In the south polar and subpolar zones in the southern summer, November to January. Nests in crevices in cliffs, under and amongst stones of screes, etc.

MUSEUM DIAGNOSIS. For details of plumage etc. see Murphy 1936, 2: 749; Baker 1929, 6: 300.

MEASUREMENTS

Wing	Bill	Tarsus	Tail
	(from feathers)		
♂ ♀	12-14	32-36	72-84 mm.
			(Baker)

COLOURS OF BARE PARTS. Iris blackish. Bill dull black. Legs and feet black, with a conspicuous pale yellow patch in the centre of each web.

¹Dr. C. A. Gibson-Hill who examined this specimen suggested that it might be of the Kerguelen breeding race *parvus*. But the differences between the races are so slight and the overlap in the measurements so considerable that he could not be definite. The bird measured: Wing 145; bill 18.5; tarsus 35; tail 59 mm.

18

PROCELLARIIFORMES

FIELD CHARACTERS. Pelagic. A small sooty black storm petrel with a conspicuous white patch above tail (coverts) and a pale wing-bar. Longish slender black legs with distinctive lemon-yellow webbed toes which characteristically project behind the short square tail in flight. Sexes alike.

Foot, $\times 1$

Dark coloration and white rump, as well as flight, superficially reminiscent of house swift. The only storm petrel with white rump and dark underparts occurring regularly in the Indian Ocean.

$\times c. 1$

20

PROCELLARIIFORMES

Genus FREGETTA Bonaparte

Fregetta Bonaparte, 1855, Comp. Rend. Acad. Sci. Paris 41: 1113. Type, by original designation, *Thalassidroma leucogaster* Gould

Very close to *Oceanites*. Differs from it in having the first phalanx of the middle toe greatly flattened and longer than the other phalanges plus claw. Claws flattened, broad, spade-shaped and pointed at end.

The genus is chiefly found in the southern oceans.

15. Duskyvented Storm Petrel. *Fregetta tropica melanogaster* (Gould)

Thalassidroma melanogaster Gould, 1844, Ann. & Mag. Nat. Hist., 13: 367

(Southern Indian Ocean)

Baker, FBI No. 2195, Vol. 6: 302

Plate 2, fig. 4

OTHER NAMES. Gould's Storm Petrel; Mother Carey's Chicken.

SIZE. Bulbul \pm ; length c. 20 cm. (8 in.).

FIELD CHARACTERS. Pelagic. Like Wilson's Storm Petrel sooty black above with white rump, but with underside including middle of under wings white. A black band along middle of belly through under tail-coverts. Legs shorter, all black, including webs of toes. The longitudinal dark band on the belly, with conspicuous white areas on either side, distinguish this storm petrel from its congeners. It is, however, surprisingly difficult to differentiate in life as it follows a ship or dances upon the ocean' (Murphy 1936, 2: 764). Flight weaker, more fluttering and bat-like; otherwise habits more or less the same as last.

STATUS, DISTRIBUTION and HABITAT. Accidental straggler. Breeds in colonies on islands in the Antarctic and subantarctic zone, e.g. Kerguelen and South Orkney. Only a single old record from our area — a specimen collected in the Bay of Bengal (c. 1895) by or for the Marquis of Tweeddale, now in the British Museum. The bird ranges in the seas south of Australia, but has apparently not been seen elsewhere in the Indian Ocean.

Jerdon 1864 (3: 827), mentioned that a storm petrel was not of unfrequent occurrence near the mouths of the Ganges in stormy weather, as well as in the Bay of Bengal. The species was not established, and no recent authentic identification is available.

MUSEUM DIAGNOSIS. For description of plumages, also biology, see Murphy 1936, 2: 764-7.

MEASUREMENTS

Wing	Bill	Tarsus	Tail
	(from feathers)		
♂ ♀	14-15	c. 40-43	73-81 mm.
			(Baker)

COLOURS OF BARE PARTS. Iris brown. Bill, legs and toes (including webs) black.

Genus OCEANODROMA Reichenbach

Oceanodroma Reichenbach, 1853 (1852), Av. Syst. Nat.: iv. Type, by original designation, *Procellaria furcata* Gmelin

Cf. Austin, O. L., Jr., 1952, Bull. Mus. Comp. Zool., Harvard, 107: 399-401

PETRELS, SHEARWATERS

21

Rather close to *Fregetta* and *Oceanites* but with deeply forked tail of 12 feathers. Tarsus about equal to middle toe plus claw. 1st primary (as.) concealed, minute and pointed; 3rd primary longest.

16. Forktailed Storm Petrel. *Oceanodroma leucorhoa monorhis* (Swinhoe)

Thalassidroma monorhis Swinhoe, 1867, Ibis: 386 (Amoy, China)
Not in Baker, FBI
Plate 2, fig. 2

OTHER NAME. Leach's Storm Petrel.
SIZE. Bulbul ±; length c. 17-19 cm. (c. 7-7½ in.).
FIELD CHARACTERS. Pelagic. Similar in size to Wilson's but appearing a fairly uniform sooty brown, including underwing. Slightly greyer on neck and underparts, and with dark rump instead of white. Differs also in its distinctly forked tail, and shorter black legs and black feet. Flight similarly swallow-like but stronger than in whiterumped species described. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Rare vagrant. Breeds on islets from Korea and coastal Japan south to Quelpart Island, and islets off Formosa. Winters south to Singapore. In our area only a single specimen obtained in Ceylon — an exhausted storm-driven male at Mutwal near Colombo, 3 July 1927. This was apparently misidentified by Stuart Baker as of the Californian race *socorroensis*. Also a fairly reliable identification (H. H. Tomlinson) of one that came on board ship a little west of Colombo, 10 June 1923, and was examined in the hand (Gibson-Hill 1948, JBNHS 47: 447-8).

MUSEUM DIAGNOSIS. For description of plumage, measurements and other details, see Austin, 1952.

COLOURS OF BARE PARTS. Iris brownish. Bill, legs, and feet black (Palmer 1962, 1: 226).

Bill of *Oceanodroma leucorhoa*, x c. 1

Order PELECANIFORMES

Family PHAETHONTIDAE: Tropic-Birds

Wide-ranging tropical sea birds similar in size and superficial appearance to terns but morphologically closer to cormorants and frigate birds. Plumage in adults chiefly white and black. Head large; neck short; bill yellow or orange-red, longish, stout, slightly decurved, pointed. Wings long and pointed. Tail wedge-shaped with the middle pair of feathers in adults narrow, ribbonlike, much elongated as in the Paradise Flycatcher (*Terpsiphone*). Legs extremely short; feet webbed (connecting all 4 toes). Sexes alike. Young hatch from the egg with down. Eggs curiously like those of the raptors especially the Scavenger Vulture (*Neophron*). (For details of anatomy etc. see Baker 1929, 6: 290.)

TROPIC-BIRDS

23

FIELD CHARACTERS. Pelagic. A predominantly white tern-like sea bird with two greatly elongated ribbons in the wedge-shaped tail as in the Paradise Flycatcher's.

x c. ½

horizontal patch on posterior flanks. Bright coral red bill diagnostic. Sexes alike.

Young (immature). Black-spotted crown and nape, heavier black barring on back, and no ribbons in tail.

STATUS, DISTRIBUTION and HABITAT. Northern parts of Indian Ocean. Breeds on islands off the Somali coast, and in the Straits of Bab-el-Mandeb and the Persian Gulf. Ranges widely over the ocean in the off season. Recorded at sea off the Makran coast (February), between Karachi and Gulf of Kutch (March), Bombay (February, May and July — Navarro, Rauf Ali, JBNHS 59: 649; 63: 437); also from the Laccadive Islands. A specimen secured on 3 February 1956 west of southern Ceylon (7°52' N., 77°26' E.) is apparently the first authentic record in Ceylon waters, and also the southernmost in our area (Phillips 1958, SZ 28: 184). Recorded again in July 1972 (A. E. Butler, CBCN).

GENERAL HABITS. Flight tern-like but stronger and more direct with steady powerful flapping of the long, pointed wings, each flap perceptibly raising and lowering the bird in the air. Resembling the flight of a pigeon and punctuated with bouts of gliding. Usually unafraid, flying inquisitively quite close around ships far out at sea. The birds hover over a promising spot as if to take aim, and plunge headlong from a height of 30 or 40 metres on their prey, like the sea terns and boobies.

FOOD. Mainly fish and squids. Flying fish have often been taken from crops of specimens.

VOICE and CALLS. Loud, monosyllabic, rather finch-like (Phillips); 'incessant screams while circling around ship' (E. H. Aitken).

BREEDING. Season. March/April recorded in the Persian Gulf. A single egg laid under shelter of a ledge of rock or in a crevice. Often nests gregariously. Incubation period c. 28 days.

For breeding biology of the species see Stonehouse 1962: 124-61.

MUSEUM DIAGNOSIS. For details of plumage etc. see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail (including streamers)
♂ ♀	281-301	55-60	25-28	215-301 mm.

COLOURS OF BARE PARTS. Iris dark brown. Bill orange-red to dusky red, the tip, edge of commissure and narial groove blackish. Legs and feet yellow or yellowish white, the anterior toes and webs between them black (Baker).

Adult. Above, white finely barred with black. A black upright crescentic band in front of and through eye on each side of head. A black wing-bar conspicuous in flight. Outer primaries largely black. Below, including underside of wing, white with a black

horizontal patch on posterior flanks. Bright coral red bill diagnostic. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Breeds on islands off the Somali coast, and in the Straits of Bab-el-Mandeb and the Persian Gulf. Ranges widely over the ocean in the off season. Recorded at sea off the Makran coast (February), between Karachi and Gulf of Kutch (March), Bombay (February, May and July — Navarro, Rauf Ali, JBNHS 59: 649; 63: 437); also from the Laccadive Islands. A specimen secured on 3 February 1956 west of southern Ceylon (7°52' N., 77°26' E.) is apparently the first authentic record in Ceylon waters, and also the southernmost in our area (Phillips 1958, SZ 28: 184). Recorded again in July 1972 (A. E. Butler, CBCN).

18. Redtailed Tropic-bird. *Phaethon rubricauda rubricauda* Boddaert

Phaethon rubricauda Boddaert, 1783, Table Pl. enlum.: 57 (Mauritius)

Baker, FBI No. 2189, Vol. 6: 292

Plate 5, fig. 1

SIZE. Blackheaded Gull ± or large tern; length c. 36 cm. (14 in.) + tail with streamers c. 48 cm. (19 in.).

FIELD CHARACTERS. Pelagic. A tern-like sea bird, predominantly silky white, with black streak through eye, black shafts to wing and tail feathers, and two long, somewhat stiff narrow bright red streamers in wedge-shaped tail which project spike-like rather than trail ribbon-like in flight. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Breeds on Mauritius, Assumption, and the Aldabra group of islands. Ranges widely in the tropical western Indian Ocean. Vagrants reported from the Bay of Bengal several times, but not collected and determined racially. May belong to the Christmas Island and Cocos-Keeling breeding population *westralis* Mathews.

GENERAL HABITS. Like other tropic-birds, usually met far out at sea, singly or in pairs — not gregariously. Does not follow ships for scraps, but often circles round close above them inquisitively and unafraid, and then moves on. Flight more buoyant than of the Short-tailed species. For feeding ecology see Ashmole & Ashmole, 1967, Peabody Mus. Bull. 24: 19

MUSEUM DIAGNOSIS. For details of plumages etc. see Baker, loc. cit.; Mathews and Iredale 1921: 80.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail (including streamers)
♂ ♀	330-339	66-69	30-33	360-428 mm. (Baker)

COLOURS OF BARE PARTS. Iris dark brown; eyelids black. Bill bright orange-red, paler or slightly brownish at the base, with a small black bar on the plane of the nostril. Legs and proximal one-third of the toes pale mauve or bluish white, with the distal two-thirds of the web black' (Gibson-Hill 1950).

19. White Tropic-bird. *Phaethon lepturus lepturus* Daudin

Phaethon lepturus Daudin, 1802, Buffon Hist. Nat., ed. Didot, Quadr. 14: 319

(Mauritius)

Baker, FBI No. 2190, Vol. 6: 293

Plate 5, fig. 4

OTHER NAME. Yellowbilled Tropic-bird.

SIZE. Blackheaded Gull ± or large tern; length c. 38 cm. (c. 15 in.) + tail with streamers c. 45 cm. (18 in.).

FIELD CHARACTERS. Pelagic. A white tern-like sea bird with orange-yellow bill and upright crescentic black spot in front of eye continued behind as a black streak through it to nape. In flight, a broad black band from shoulder to shoulder across upper surface of wings conspicuous, interrupted in the middle by the white back. Black wing tips. Two very long white streamers (central tail-feathers) broader and more pliant (ribbon-like) than in the red-tailed species. At close range adult distinguishable from adult *indicus* by unbarred back. Sexes alike.

PELICANS

25

STATUS, DISTRIBUTION and HABITAT. The typical race breeds in the Mascarene, Seychelles, Maldiva, Andaman, and Cocos-Keeling islands. Sight records for seas off Ceylon; 4 specimens taken on the island's west coast in Colombo Museum (Phillips 1953, Checklist: 3). Ranges over the tropical Atlantic, Pacific, and Indian oceans in several races.

GENERAL HABITS. Like other tropic-birds usually met with singly on the high seas. Has the same pigeon-like flight. Only seldom settles on water. For an excellent account of its biology see Murphy 1936: 802-7.

BREEDING. Season, in the Red Sea and Persian Gulf islands (?) May, June, and July (Baker); in the Maldiva Islands apparently the cool months November to January (adult, nestling, and eggs collected on Mahlosmadulu Atoll in November, and full-fledged juveniles on Tuladu Island in January — Phillips & Sims 1958, JBNHS 55 (2): 202).

For breeding biology see Stonehouse 1962: 124-61.

MUSEUM DIAGNOSIS. For description of plumages etc. see Murphy 1936: 802-3.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	252-282	44-51	21-23	Central feathers up to 575, generally c. 450 mm. (Baker)

COLOURS OF BARE PARTS. '♂ ♀ Iris dark brown; eyelids black. Bill yellowish grey, almost grey at the base with a dark grey line through the nostril. Legs and feet jet black, except for the inner toe and a small patch in the inner web which are a very light blue-grey, almost white;' (Gibson-Hill 1950).

Family PELECANIDAE: Pelicans

LOCAL NAMES (for all species): *Hārdil* (Hindi); *Bellua*, *Birwa* or *Bherwa* (Bihar); *Ganggya*, *Gaganter*, *Gorapolo* or *Gorapullo* (Bengal); *Chinkabatu* (Telugu); *Dhakias*, *Dhara*, *Bhela* (Assam); *Uphong* (Manipur); *Pas boruwa*, *Parbara* (Sinhala); *Kūlkāda* (Tamil, Ceylon); *Pen* (Sind; Kutch); *Kotumpannam* (Malayalam).

Large gregarious clumsy-looking birds with short stout legs and large fully webbed feet. Tarsus compressed, reticulate in front. 2nd longest, heavy, the upper mandible flattened and hooked at tip, the lower consisting of two narrow flexible arches, underhung throughout its length by a capacious gular pouch of loose naked skin. Nostrils obsolete, concealed in grooves running the whole length along either side of culmen. Wings large and broad, 2nd primary (as.) longest. Tail short, square, soft. The extensible pouch serves as a dip- or landing net for scooping up fish, and when nesting on the ground or in trees in the hot sun as a cooling device for dissipating moisture and promoting evaporation by constant pulsation. The skeleton of hollow bones is particularly light weighing less than a kilogram to the total body weight of about 12 kilograms. Thus in spite of some little effort in the initial take-off from the surface, particularly in a following wind, the birds can fly strongly and for long distances to and from their fishing grounds, and when migrating. They fly with the neck bent back in a flat S, head drawn in between the shoulders, the large broad wings beating the air powerfully and steadily with a whistling sound. The flat-keeled underside of the body is beautifully streamlined for buoyant flight and is reminiscent of the float of a flying boat. When alighting on the water the birds

20. White or Rosy Pelican. *Pelecanus onocrotalus* Linnaeus

Pelecanus onocrotalus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 132. (Africa, Asia)
Baker, FBI No. 2176, Vol. 6: 270

Plate 3, fig. 2

LOCAL NAMES. See under Family.

SIZE. Vulture ±; length c. 183 cm. (72 in.).

FIELD CHARACTERS.

'Adult. Plumage mostly white, tinged with rose colour, with a tuft of yellowish feathers on the breast; primaries and some of the secondaries black; slight crest on the back of the head; feathers of the forehead ending in a point above the bill. Sexes alike; female smaller.

Feathers of forehead of (A) *P. onocrotalus* and (B) *P. philippensis* × c. 1/18

'Young (immature). Pale buffish brown above, somewhat mottled; primaries brown; underparts white with no rosy tinge' (Alexander 1955: 174).

STATUS, DISTRIBUTION and HABITAT. Resident, at least in part; first discovered breeding in the Great Rann of Kutch in 1960 (Sālim Ali 1960, JBNHS 57: 414). Mainly winter visitor to W. Pakistan (Baluchistan, Sind) and N. India from the Punjab to Assam (U.P., Rajasthan, Kutch, Saurashtra N. Gujarat). Andhra (Visakhapatnam?), and 'Madras' (?). Often vast congregations on large jheels and lagoons.

Extrolimital. Breeding from Hungary to the lakes of central Asia, south to Iraq and the Persian Gulf (Bubiyan Island off Fao). Wintering in N. Africa, Asia and through Burma, Malaysia to E. China.

BREEDING. Season. February to April in the Great Rann of Kutch where several hundred pairs were first found in 1960 nesting among old worn-down flamingo nests on the periphery of the occupied 'City'. Nest, a skimpy to fairly substantial bed of large white feathers (the birds' own, and flamingos') close together, about one nest per square metre. On 21 March most nests contained two eggs or young each (some 3 or 4), from naked newly hatched chicks to hefty squabs in down, a fortnight or more old. Eggs, ivory white with a smooth gloss, not chalky-textured like flamingo eggs, about the same size but slightly broader. Average of 25 Kutch eggs

26

PELECANIFORMES

make full use of their wings and tail to check momentum, at the same time throwing out their broadly webbed feet well forward to act as friction brakes against the water. Pelicans fly either in the characteristic V-shaped echelons of geese, or in long straggly ribbons with a wide front. The birds are much given to soaring on thermals, and flocks may commonly be seen in the middle of a hot day sailing on outspread motionless wings with upturned tips, in graceful circles high up in the blue, by themselves or in company with storks and vultures.

The birds frequent large freshwater lakes and jheels, and brackish lagoons. Their food consists almost exclusively of fish, some of considerable size being taken. A single bird is estimated to consume as much as 2 kg. per day. While the greater part of the fish perhaps consist of species of small economic worth, which are always in the majority, pelicans occasionally do some damage to commercial fisheries also. The method of fishing is by cooperative effort, a flotilla of birds swimming in a semicircle, or from bank to bank across an arm of a lake, vigorously splashing on the water with their large wings to drive a school of fish into the shallows. They do not dive for their prey like cormorants, but merely sail or rush into the shoal with bills open and lower mandible trailing in the water, or head completely submerged, the enormous skin bag acting as a landing net for the quarry which is swallowed by an upward jerk of the bill. Only the American Brown Pelican normally plunges from the air on fish like the sea terns or gannets. When satiated the birds waddle on to the shore to rest and preen and digest, before resuming the hunt.

The oil obtained from pelicans' fat is highly valued in Indian medicine as an embrocation for rheumatism and similar ailments.

DISTRIBUTION. Temperate and tropical America, Africa, Asia, Europe, Australia. Some species migratory.

VOICE. Syringeal muscles responsible for true voice-production, lacking. Adults usually silent; rarely uttering throaty grunts or croaks likened to the grunt of a buffalo. Young have a variety of groans, yelps and chattering.

Genus PELECANUS Linnaeus

28

PELECANIFORMES

95.56 × 61.65 mm.; of 14 from Persian Gulf, *sic* Baker, 88.3 × 57.5 mm. Chicks when newly hatched, naked glossy-skinned, dark flesh-coloured, changing to blackish in 3 or 4 (?) days. Turn blacker when feather papillae appear and the down and quills sprout. Bill, bill-pouch, and legs funereal black. Down of the larger squabs dull sooty black in striking contrast with the snowy white of the tree-nesting *P. philippensis* (q.v.). The larger squabs are enormously fat and ugly; when approached they herd together and waddle off with an ungainly, unsteady gait. On fright the Kutch chicks disgorged an astonishing quantity of fish (mainly *Cyprinodon dispar*) some fully 25 cm. long and weighing 500 to 600 gm. each.

Pelecanus onocrotalus

■ Breeding range

to c. 1.25 cm. (½ in.) near tip. Similar tapering lateral bands on either side of culmen and lower mandible for c. 25 cm. (10 in.) from gape; tip of bill (nail) pale cherry-red paling to a yellowish horn point. Pouch lemon-yellow. Legs and feet pale creamy grey. Pouch held c. 4 kg. of fish, some 25 cm. long.]

21. Spottedbilled or Grey Pelican. *Pelecanus philippensis philippensis* Gmelin

Pelecanus philippensis Gmelin, 1789, Syst. Nat. 1(2): 571 (Philippines = Manila, vide Stresemann 1952, Ibis 94: 514)

Pelecanus roseus Gmelin, 1789, Syst. Nat. 1(2): 570. (Manila, P.I.)
Baker, FBI No. 2179, Vol. 6: 274

Plate 3, fig. 1

LOCAL NAMES. See under Family.

SIZE. Vulture +; slightly smaller than White Pelican. Length c. 152 cm. (60 in.).

FIELD CHARACTERS. Without black in wings.

Adult. Head, neck, and upperparts grey; underparts greyish white, the under tail-coverts mottled with brown; under wing-coverts and under tail-coverts tinged with vinaceous in summer; lower back, rump, and flanks tinged vinaceous in winter; a crest on the back of the head, composed of elongated brown feathers tipped with white; bill flesh-coloured with blue spots on the upper mandible; pouch dull purple with bluish black markings; feet dark brown. Sexes alike.

'The grey colouring which includes wings and tail, at once distinguishes this species' (Alexander 1955: 176).

Young (immature), pale brown above, white below.

STATUS, DISTRIBUTION and HABITAT. Resident and locally migratory, in well watered tracts in both Pakistans, all India, and Ceylon. Breeds in Ceylon, Madras (Tirunelveli and Chingleput districts), Andhra (West Godavari district), Assam (Kaziranga Wildlife Sanctuary) and doubtless elsewhere in suitable localities. Nicobar Is. (accidental. Abdulali, JBNHS 61: 500).

GENERAL HABITS, etc. See under Family.

BREEDING. Gregarious, often in traditional sites in mixed colonies with egrets, cormorants, etc. Season, in Ceylon December to March/April, at Aredu-Sarepalle, a few miles from Kolleru Lake in Andhra—the largest pelicanry known in India—chiefly October to March. Nest, a massive structure 60–75 cm. across, roughly circular, 30 cm. or more thick, on branches of *Pithecellobium*, mango, and other large trees, or on palmyra (*Borassus*) and coconut (*Cocos*) palms. On a thick foundation of twigs are bedded large quantities of rice straw from nearby newly harvested fields making the finished nest appear as though entirely made of that material. Sodden decaying water weeds and reed stems also used along with or instead of straw. Nests on palms built at base of the more or less horizontal stems of lowest leaves, the nests touching one another in a continuous untidy ring platform. Pilfering of material from neighbouring nests common. Nests constantly added to most of the time. Eggs, 3 or 4, chalky white becoming

BOOBIES

31

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	720–800	400–450	116–122	220–230 mm. (Baker)
♀♀	680–720	360–380		

COLORS OF BARE PARTS. Iris white or yellowish white. Bill plumbeous grey, the nail and edges of both mandibles yellow over the apical half. Cheeks, orbital skin, and pouch, pale yellowish or creamy flesh-colour, the last deepening into orange-red in the breeding season. Legs and feet pale bluish grey or plumbeous.

MISCELLANEOUS. In Sind the Mohanas or inland fishermen use captive tethered pelicans as decoys. They also use the skin stretched over a frame as a helmet for stealthily approaching ducks and coots in water with bodies submerged, and capturing them by pulling them under by their legs one by one.

Family SULIDAE: Boobies

Sea birds of the size of large ducks, e.g. Brahminy, to larger than geese. Body stout, neck of moderate length, wings long and pointed, tail rather long and wedge-shaped. Bill stout, conical, pointed, and slightly downcurved at tip, but not hooked. Nostrils obsolete. Legs short and stout, feet large and fully webbed. Plumage typically white in adults with the primaries or entire wing black; also the tail in some species. Bill, and bare facial and gular skin, brightly coloured. Sexes alike or nearly so.

The majority of species live in the tropical seas. Boobies can be readily identified in the distance by their characteristic habit, shared with tropic-birds and sea terns, of plunging headlong into the water from a height of 8 to 17 metres in the air for fish. The large size and absence of streamers in the tail distinguishes them from both the others. That they are capable of very deep dives in pursuit of fish is shown by the fact that a booby was found entangled in a fishing net set 27 metres below the surface. They breed on oceanic islands, on the ground or in stick nests in trees.

For further details see Murphy 1936: 827–9; Witherby 1940, 4: 14; Palmer 1962, 1: 280.

Genus SULA Brisson

Sula Brisson, 1760, Orn. 1: 60; 6: 494. Type, by tautonymy, *Sula* Brisson = *Pelecanus piscator* Linnaeus

Characters as of the Family.

Key to the Indian forms

PELECANIFORMES

stained and dirty in course of incubation; long to moderate oval, nearly equal at both ends. Average size of 50 eggs 78.8 × 53.4 mm. (Baker). Both sexes incubate and also feed the young. In contrast with the White Pelican, the chicks when a few days old are covered with snow-white down. A great deal of noise prevails in a colony with groaning and yelping by the hungry chicks and throaty grunts and bill-clapping by the adults. Chicks feed by thrusting complete head into capacious bill-pouch of parent, flapping their wings ecstatically. Incubation period c. 30 days (Lamba 1963, Part 1: 110–19). Period from laying of egg to flying of young about five months. (For an excellent account of the Aredu-Sarepalle pelicanry in Andhra see K. K. Neelakantan 1949, JBNHS 48 (4): 656–66, and for photos E. P. Gee 1960, *ibid.* 57: 245–51.)

MUSEUM DIAGNOSIS. See Baker, loc. cit.; Robinson and Chasen 1936: 239.
MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	530–607	324–355	86–98	168–196 mm.
♀♀	525–550	285–308	75–86	

COLORS OF BARE PARTS. Iris white to pale yellow, clouded with brown. Bill pinkish flesh or yellowish flesh with a row of bluish black spots on each side near the edge; the nail and terminal half of both mandibles orange, the lower mandible with bluish blotches near the centre. Pouch dull purple blotched with bluish black. Naked (facial) skin orange-yellow, livid in front of the eye. Legs and feet very dark brown or blackish (Baker).

Weight 1 ♂? imm. 5 kg. (BNHS).

22. Dalmatian Pelican. *Pelecanus philippensis crispus* Bruch

Pelecanus crispus Bruch, 1832, Isis, Col. 1109 (Dalmatia)

Baker, FBI No. 2179, Vol. 6: 273

Plate 3, fig. 3

LOCAL NAMES. See under Family.

SIZE. Vulture +; same as White Pelican. Length c. 183 cm. (72 in.).

FIELD CHARACTERS.

Adult. Very similar to White Pelican, also mainly white with black primaries, and difficult to distinguish from it in the distance. Colour of legs and feet dark grey instead of pink; and forehead feathers ending in a *crescent* line instead of a pointed wedge, best diagnostic clues. In flight dusky-white undersurface of wings distinguishes it from White Pelican. Sexes alike.

Young (immature) brownish grey above; white below. Pouch greyish.

STATUS, DISTRIBUTION and HABITAT. Breeds in SE. Europe, Asia Minor, Iran, N. China, SE. Mongolia. Winter visitor to N. Africa and our area: recorded in Baluchistan, Sind, Punjab, Kutch, Rajasthan (?), Saurashtra, N. Gujarat, Oudh, Bihar, Orissa (?), Bengal, Assam. Not in the Deccan, S. India or Ceylon. Flocks on large rivers, jheels, and coastal lagoons.

GENERAL HABITS, etc. See under Family.

MUSEUM DIAGNOSIS. For plumages see Naumann 1905, 11: 24.

23. Masked Booby. *Sula dactylatra melanops* Heuglin

Sula melanops Heuglin, 1859, Isis, 351, pl. 10, f. 2 and 3
(Burda-Rebschi, Somali Coast)

Baker, FBI No. 2187, Vol. 6: 288 (*personata* ?)

Plate 5, fig. 3

OTHER NAMES. Bluefaced Booby; White Booby.

SIZE. Barheaded Goose +; length c. 80 cm. (32 in.).

FIELD CHARACTERS. The largest of the boobies.

Adult. Mainly white: wing quills, greater wing-coverts, and tail-feathers chocolate-brown; bill blue-grey, greenish yellow, yellow, or red; naked skin of face and throat (the mask) blue-black; feet yellow, orange, greenish blue, or slaty blue.

BOOBIES

33

Young (immature). 'Head and neck dark brown; upperparts greyish brown' (Alexander 1955: 182).

STATUS, DISTRIBUTION and HABITAT. Common out at sea off the Sind and Makran coasts, at Ormara Head and elsewhere (Ticehurst, 1923, *Ibis*: 460). Occasionally blown in on the western seaboard during the monsoon gales. Obtained thus at Karachi, Bombay, Cannanore, and Ceylon (Kalutara and Putalam, on west coast). Once as far inland as Nasik, 112 km. NE. of Bombay (Salim Ali 1958, JBNHS 55: 358). The Ceylon specimens have been recorded as of the Australasian race *personata*; but the races are not readily distinguished, especially in brown juvenile plumage, and geographically they are more likely to belong to this, the SW. Indian Ocean population. Sight record from the Maldives Islands (Phillips & Sims, 1958). Breeds on Socotra, Mait, and other islands off the Somali Coast, on Rodriguez and Farquhar islands near Mauritius, and on Seychelles, etc. Perhaps also in the Kuria Muria group off the Oman coast (Arabian Sea).

GENERAL HABITS. The plunging habit needs clear water in which prey can be spotted at some depth, therefore the birds usually avoid the muddy littoral. During the plunge the conspicuous dark tail is fanned out as a rudder. For breeding biology of the species see Dorward 1962: 174-200.

FOOD. Chiefly squids and flying fish.

MUSEUM DIAGNOSIS. See Murphy 1936: 846-7.

MEASUREMENTS. (*personata*)

	Wing	Bill	Tarsus	Tail
♂ ♀	419-452, nearly always over 430	103-114	c. 54-58	c. 180-200 mm. (Baker)

COLOURS OF BARE PARTS. Iris yellow; for rest see Field Characters (above).

24. Redfooted Booby. *Sula sula rubripes* Gould

Sula rubripes Gould, 1838, Syn. Bds. Austr., app. pt. 4: 7
(New South Wales, Raine Island, northern Queensland)
Baker, FBI No. 2185, Vol. 6: 285
Plate 5, fig. 5

OTHER NAME. Redlegged Gannet.

SIZE. Large gull; length c. 41 cm. (26 in.).

FIELD CHARACTERS.

'Adult. Plumage mainly white, tinged with buff; primaries blackish brown; tail pale greyish brown; under wing-coverts mostly grey; bill light blue with brown tip and red base; naked skin of face blue, of throat black; feet red.'

'Young (immature). Plumage generally dull brown. In intermediate plumage, in which the bird often breeds, the head and underparts are lighter brown than the back and wings, whilst the rump, tail, and upper and under tail-coverts are white.' (Alexander 1955: 181-2.) Many other puzzling colour phases besides, not entirely explainable by age.

Adult distinguishable from adult Masked Booby by small size, whitish tail *contra* chocolate-brown, and red feet *contra* slaty.

STATUS, DISTRIBUTION and HABITAT. Breeds on many tropical islands in the Indian Ocean, e.g. Christmas Island, and in the western and central

CORMORANTS

35

in the Bay of Bengal. Recorded in the Arabian Sea off the Oman coast, 19°41'N., 59°38'E. and 23°29'N., 64°44'E. in December (A. O. Gross, 1960, *Audubon Magazine*, Nov.-Dec.). A specimen has been taken on 'the Malabar Coast'. Recorded several times from the west coast of Ceylon during the NE. monsoon. Also on the Maldives and Laccadive islands.

GENERAL HABITS. Usually seen singly or in small groups of up to a dozen birds or so. Rather more solitary in its hunting than the Redfooted Booby. Like others of the family catches its food — mainly flying fish and squids (cephalopods) — by diving from 25 to 35 metres up in the air and subsequent underwater pursuit. Nests on the ground in the open, on sea cliffs etc.

For an excellent account of its bionomics see Gibson-Hill 1947: 109-15.

MUSEUM DIAGNOSIS. For plumages etc. see Murphy 1936: 854 for the nominate race *leucogaster* from which *plotus* differs only in details. Also Gibson-Hill 1947, 1950.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
5 ♂♂	392-398 (av. 395.2)	96-101	41-45	198-210 mm.
4 ♀♀	406-426 (av. 417.5)	102-107	44-45.5	204-227 mm.

COLOURS OF BARE PARTS. Iris (both sexes) grey; eyelids dull blue. Bill: ♂ light greenish grey, ♀ slightly paler with tip almost white. Facial, ramal, and gular skins: ♂ dark purple, ♀ light greenish yellow often with a slightly darker patch in front of and below the eye. Legs and feet: ♂ pale arsenic green, ♀ pale yellowish green (Gibson-Hill 1950: 235).

Family PHALACROCORACIDAE: Cormorants and Darter

Gregarious, fish-eating, colonial-nesting water birds. All our Indian species are characterized by black plumage, whence collectively known in Hindi as *phalacrocorak* or *jil-korra* (water-crow).

Bill laterally compressed, rather long, slender and pointed; hooked at tip in cormorants, stiletto-like in the darter or snake-bird. Nostril obsolete. A gular pouch in cormorants, naked anteriorly. Neck and body long, rather spindle-shaped; wings of moderate length. Tail long and stiff. Legs short; feet large, peleciform, with all four toes united in a web for swimming; claws much curved. Sexes alike. Stance of bird when perched on tree or rock more or less upright.

Plumage less dense or resistant to water than in ducks and many other swimming and diving birds. Becomes permeated by prolonged immersion and requires constant drying out.

Further morphological details in Stressemann 1927-34, Aves: 804, 875; Van Tyne & Berger 1959: 401; Witherby 1940, 4: 1-2.

Within our area found mainly on inland waters — jheels, rivers, irrigation reservoirs, etc. Rarely also on brackish lagoons and tidal creeks. Expert divers. Unlike grebes, swimming under water with use of wings, literally flying beneath the surface, in pursuit of fish. The flight of cormorants, with neck stretched out in front, is powerful, sustained, and rather goose-like in profile as well as head-on, but the birds rise with some difficulty, flapping heavily along the surface to get airborne. When alighting on the water, the long stiff tail is first to break the surface and helps to check momentum.

34

PELECANIFORMES

Pacific. Ranges widely over the warm seas in these areas. Hume identified a flock on the Laccadive Islands (Baker 1929, 6: 287). A specimen (storm-blown?) taken in Ceylon in July (1936) in the neighbourhood of Colombo. According to Jerdon, 1864, occasionally seen in the Bay of Bengal, where Blyth later described it as 'common'. However in the British Museum there is only a single specimen actually collected in the Bay of Bengal.

GENERAL HABITS. The flight resembles that of a large shearwater. The birds hunt in groups of five to fifteen strung out in single file, flying with strong regular wing strokes low over the surface, plunging from the air and chasing the quarry under water. Most fishing done in the evening or early hours of the night. Sometimes gatherings of three or four hundred birds over a large shoal of fish. Unlike other boobies, nests chiefly in bushes and trees.

FOOD. Mainly squids (cephalopods), and fish. For more details of bionomics see Murphy 1936: 861-70; Gibson-Hill 1947: 115-19.

MUSEUM DIAGNOSIS. See Murphy 1936: 861-2.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	403-421	90-97, once 83	c. 40-43	219-228 mm. (Baker)

COLOURS OF BARE PARTS. Iris dark brown; rest as under Field Characters. Further details in Gibson-Hill, 1947: 116.

25. Brown Booby. *Sula leucogaster plotus* (Forster)

Pelecanus plotus Forster, 1844, Descr. Anim., ed. Licht.: 278 (near New Caledonia)
Baker, FBI No. 2184, Vol. 6: 285
Plate 5, fig. 6

OTHER NAMES. Brown Gannet; Common Booby.

SIZE. Large gull; length c. 76 cm. (30 in.).

FIELD CHARACTERS. The commonest booby in most tropical seas.

Adult. Above, dark chocolate-brown; primaries blackish. Below, neck and upper breast chocolate-brown; rest white including undersurface of black-margined wings. Sexes alike; male somewhat smaller.

Young (immature) largely dusky brown; difficult to distinguish from other species in immature plumage.

STATUS, DISTRIBUTION and HABITAT. Breeds on islands in the Indian and Pacific oceans, e.g. Christmas and North Keeling. Occurs uncommonly

36

PELECANIFORMES

BREEDING. In mixed colonies or heronries with storks, egrets, herons, ibises, etc. Nests, skimpily to fairly substantial stick platforms lined with water weeds in trees, rarely on rocks. Eggs, 2 to 6, pale blue or pale green overlaid by a chalky layer. Incubation by both sexes. Young nidicolous, naked at hatching, down-covered later; extraordinarily ugly throughout. Fed by both sexes by regurgitation, the chick inserting its head into the parent's gullet, wrestling vigorously with its wings flapping, and not letting go till the parent breaks off with an effort. Nestlings beg excitedly by shaking and swaying their upraised scrawny necks from side to side and tickling the parent's bill to induce disgorgement.

Adults commute long distances to forage for the voracious insatiable young, flying out and back all together in goose-like V-shaped echelons or wavy diagonal lines — a common sight at heronries in the mornings and evenings.

Cormorants are notorious for their prodigious appetites, and their depredations on local fish populations can be potentially devastating. Nevertheless, the wholesale indiscriminate persecution of the birds on this account, without a proper scientific inquiry, is unjustified. Investigations on the food and feeding habits of these and other piscivorous birds elsewhere have shown that the majority of fishes taken are of low economic worth, or which themselves often constitute a far greater menace to the spawn and fry of valuable food fishes than the birds.

Genus PHALACROCORAX Brisson

Phalacrocorax Brisson, 1760, Orn. 1: 60. Type, by tautonymy, *Phalacrocorax* Brisson = *Pelecanus carbo* Linnaeus

General characters as of the Family. Bill moderately long, rather slender and compressed; culmen rounded and sharply hooked at end, with a narrow groove on each side, bifurcating at the dertrum or nail, the lower branch running down to the commissure. A gular pouch, naked anteriorly. Wing of moderate length: 2nd primary (as.) usually longest. Tail rounded or wedge-shaped, of 12 or 14 very stiff feathers. Tarsus short and compressed; toes flattened; claws much curved.

Genus cosmopolitan; represented within our limits by three species. (See Key, above.)

26. Large Cormorant. *Phalacrocorax carbo sinensis* (Shaw)

Pelecanus sinensis Shaw, 1801, Nat. Misc. 13: p. 1. 529, text (China)

Baker, FBI No. 2180, Vol. 6: 277

Plate 4, fig. 1

LOCAL NAMES. Ghogur, Pân-kowwa, Jâl-kowwa (Hindi); Wādā silli (Sind); Neîâr (Kashmir); Bontakâki (Telugu); Di dao-kwa in Cachar, Pâni kaori—all cormorants—in Nowgong (Assam); Pân-kauri, for cormorants and shag (Bengal).

SIZE. Large duck; length c. 80 cm. (32 in.).

FIELD CHARACTERS. A thick-set duck-like black water bird with a slender bill, hooked at tip, and longish stiff tail. Swims low on water with only the longish neck and a thin slice of the back showing. Settles on rocks, sandbanks, and trees with an upright carriage. Often seen thus with wings and tail spread out to dry.

x c. 1

Adult (breeding). Above and below black with metallic bluish or greenish sheen, with a broad white patch on posterior flanks. Head, crest, and neck.

CORMORANTS

39

central Province), December. Nest. An untidy, comparatively massive deepish platform of twigs about 50 cm. in diameter, lined with water weeds etc. Built colonially, often in mixed heronries cheek by jowl with its own species and other water birds, the nests sometimes touching one another. Usually, however, a tendency to segregation into discrete *mohallas* is noticeable. Normally in trees standing partially submerged, but an unusual colony of hundreds of nests on ledges of rocks flanking the Subansiri river in Assam is described by Baker 1935 (4: 425-8). Eggs, 3 to 5, sometimes 6, long ovals, more or less equal at both ends, pale blue-green in colour, overlaid with a white chalky layer, becoming stained and dirty during incubation. Average size of 100 eggs 60.6 x 39.3 (Baker). Incubation period 23-24 days. Both sexes partake in incubation and feeding the young. As in all cormorants, the hatching is extraordinarily ugly—naked at first, covered with black down a few days later. According to Heinroth five weeks in nest; full fledged at two months. Nestlings demand food from incoming parent by violently worrying and tickling—'attacking'—its yellow throat-patch to the accompaniment of a persistent wheezy *chooe, chooe, chooe*—almost a whistle.

MUSEUM DIAGNOSIS. For details of plumages, moults, etc. of the nominate race see Witherby 1940, 4: 5-7, 10.

In breeding plumage our race *sinensis* differs from the above (of the northern Holarctic Region) by its head and neck being much whiter. In winter plumage the two are indistinguishable in the field.

MEASUREMENTS. Dr C. B. Ticehurst gives for birds from India and Muscat:

	Wing	Bill	Tarsus	Tail
♂ ♀	319-364	57-72 mm.	[62-71	140-155 mm.

(Baker)]

COLOURS OF RARE PARTS. Iris green; eyelids dusky yellow. Bill dark horny brown, the lower mandible except the tip pinkish- or yellowish-white. Skin of pouch black and yellow, patched in varying degree, occasionally all yellow. Legs and feet black.

MISCELLANEOUS. Longevity (*P. c. carbo*), 18+ years (Ring, 33: 148—1962).

27. Indian Shag. *Phalacrocorax fuscicollis* Stephens

Phalacrocorax fuscicollis Stephens, 1826, in Shaw's Gen. Zool. 13 (1): 91 (Bengal)

Baker, FBI No. 2181, Vol. 6: 279

Plate 4, fig. 2

LOCAL NAMES. Same as for the preceding, often with a prefix meaning small.

SIZE. Duck +; length c. 63 cm. (25 in.).

FIELD CHARACTERS. Smaller than the preceding. Distinguished from Little Cormorant (28) by longer, slenderer bill and sloping forehead.

Adult (breeding). Above, glistening bronze-black. Below, shiny jet black. A pure white tuft of feathers on each side of neck behind ear-coverts, and a few white specks on head. On closer view, in good light scalloped or scaly effect on back and wings (produced by darker edging to the feathers) perceptible. In non-breeding plumage distinguished from Large Cormorant chiefly on size; from Little Cormorant by bigger size, yellow gular skin, and white-speckled throat. Sexes alike.

38

PELECANIFORMES

more or less mixed with silky white feathers. Facial skin and throat white; gular pouch bright yellow.

Large size, white sides of face, yellow gular pouch, and white oval thigh patches diagnostic at rest as well as in flight.

In winter (non-breeding) plumage the hoariness of the head and neck, and the white thigh patches disappear; the yellow gular pouch becomes less bright. Then differentiated from our other cormorants chiefly on size.

Young (1st year). Dull brown above; more or less white below, progressively becoming browner and then blacker everywhere. Fully adult breeding plumage apparently attained in the fourth year.

STATUS, DISTRIBUTION AND HABITAT. Resident and locally migratory, practically throughout our area. In Kashmir, Ladakh and Nepal on lakes at considerable elevations (e.g. Satpur in Balistan, 11,300 ft. (c. 3450 m.) Meinertzhagen), and on the rivers debouching into the plains, and far up their gorges. Right across the Gangetic Plain to eastern Assam, south through the Peninsula, and in Ceylon. Ticehurst's observations at Karachi (*Ibis* 1923: 458) suggest that there may be a regular seasonal influx of extralimital migrants in winter, augmenting the resident population.

Frequents large inland waters—Himalayan torrents and lakes, and lowland rivers, jheels, irrigation reservoirs, etc. Also tidal lagoons and salt pans.

Extralimital. From Holland through central and southern Europe to central Asia; Burma, Thailand, Indochina and Malaysia to China. The species, in several geographical races, is found in North America, Europe, Asia, northern Africa, and Australia.

GENERAL HABITS. Usually met with in ones and twos, or small flocks of up to 8 to 10; seldom bigger. But very large congregations collect to breed at traditional heronries such as Keoladeo Ghana in Bharatpur (Rajasthan). Hunts fish by diving and underwater pursuit. From the surface, where the bird swims low down on the water, only the neck showing and the body almost completely submerged, it takes a little upward leap before plunging to dive, often remaining below for many seconds at a time. Sometimes joins in the concerted community hunts of its smaller relatives. When satiated, has been observed to dive and catch a catfish about 15 cm. long and play with it as a cat does with a mouse. The bird swam ashore with the fish, dropped it struggling on the bank, picked it up again and carried it back into the water, released it and dived after it, caught it again and brought it ashore, then leisurely repeated the whole performance several times before swallowing it. Normally silent in the non-breeding season. See also under Family.

For courtship display and general bionomics see Witherby 1940, 4: 2-10. FOOD. Almost exclusively fish.

BREEDING. Gregoriously in many localities throughout the country, the larger heronries becoming traditional and resorted to year after year. Season, mainly between September and February dependent on the monsoons, the filling up of jheels, and the availability of fish supply for the young. Recorded as follows: Sind (Eastern Narra dist.), November; N. India (Bharatpur), September-December; Madras (Vedanthangal), January-February; Assam (Subansiri river), December; Ceylon (North-

40

PELECANIFORMES.

Young (immature). Above, scaly bronze-brown, tail and primaries blacker. Below, chiefly white, with the flanks mottled brown and white.

The three species are difficult to distinguish in the field in non-breeding plumage, without size comparison, and sometimes liable to be confused *inter se*.

STATUS, DISTRIBUTION AND HABITAT. Resident, moving locally with conditions of water and fish supply, throughout the subcontinent from Sind in W. Pakistan to eastern Assam, south through the Peninsula, and in Ceylon. Not in the Himalayas except in the foothills where the larger rivers debouch into the plains. May occur in the peninsular and South Indian hills on the newly constructed dammed reservoirs among the Small Cormorants usually present there.

Frequents jheels, rivers, irrigation tanks, tidal estuaries, etc. by itself or in company with either or both the other cormorants. Abundant in Karachi harbour at certain times of the year.

Extralimital. Burma south to Tenasserim.

FOOD. Mainly fish.

GENERAL HABITS. As of the Family (q.v.). More gregarious than the Large Cormorant, oftener seen in flocks of large size and in association with its smaller relative, the two species frequently hunting together. The communal hunt, or battue, consists of a party of the birds hemming in a shoal of fish, or intercepting it as it gushes from the sluice gate of an irrigation reservoir, diving feverishly with little upward leaps and chasing the fish under water. Great havoc is wrought amongst the quarry as one bird after another plunges after them with energy, each to reappear presently with a struggling silvery form held crosswise in the bill. This is quickly shifted into position and swallowed head foremost with an upward jerk of the bill; presently the bird dives once more. The manoeuvre is repeated again and again till the birds are sated, when they will sit about on a sandbank or on rocks or trees in the characteristic upright posture, wings and tail spread open to dry, preening themselves and waiting for appetite to return.

BREEDING. Season, overall July to February; as in the preceding and in allied water birds generally, depending on early or late monsoon rainfall and local water conditions. Usually August to October in northern India; November to February in the south and in Ceylon. Nest, an untidy platform of twigs, rather like a crow's nest, sometimes scantily lined with grass roots and water weeds. Built in trees either in small colonies of its own or—as in Keoladeo Ghana (Rajasthan)—in enormous mixed heronries or 'rookeries' covering an extensive area of swamp with the partially submerged trees loaded down with thousands of nests and hundreds of thousands of water birds of numerous species—all three cormorants, darters, storks, herons, etc. There are often 30 to 50 nests of cormorants and other species in a single moderate-sized tree, closely packed and tier upon tier, the lower ones soon getting fouled and caked with the rain of excreta from above. Eggs, 3 to 5 or 6, pale bluish green with a chalky surface, smaller replicas of the Large Cormorant's. Average size of 100 eggs 51.3 x 33.2 mm. (Baker). Both sexes incubate. Incubation period not recorded. Chicks naked at hatching, soon becoming clothed in sooty black down.

MUSEUM DIAGNOSIS. See Key (above) and Baker, loc. cit.

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	257-276	50-61 generally 54-58*	c. 47-52	132-144 mm.

Weight 5 ♂ ♀ 600-790 g. (av. 706) — BNHS.

COLOURS OF BARE PARTS. Iris green or blue-green. Bill dark brown, base of lower mandible reddish horny, gular skin yellow; naked skin of face black-purplish in the breeding season, yellowish at other times. Legs and feet black (Baker).

28. Little Cormorant. *Phalacrocorax niger* (Vieillot)

Hydrocorax niger Vieillot, 1817, Nouv. Dict. Hist. Nat. 8: 88 (East Indies=Bengal)
Baker, FBI No. 2182, Vol. 6: 280
Plate 4, fig. 3

LOCAL NAMES. *Pān kaurica*, *jagrābi* (Hindi); *Pān kauri* also for shag (Bengal); *Narikāki* (Telugu); *Kādāl kāgām*, *Nēr kāgām* (Tamil); *Diya kara* (Sinhala); *Kādiādrācu* (Malayalam).

SIZE. Jungle Crow +; length c. 51 cm. (20 in.).

FIELD CHARACTERS. Smaller size, comparatively shorter, stouter bill, domed forehead, longer tail, and absence of yellow on gular skin distinguish it from the Shag. Size difference perceptible only when the two seen together.

Adult (breeding). Black overall with a bluish or greenish sheen. Upper back and wing-coverts dark silvery grey, scalloped with black. A short crest on occiput and nape and a few scattered silky white feathers and plumes on forehead and sides of head. In non-breeding plumage crest and white feathers in head disappear, and throat becomes white. Sexes alike.

Young (immature). Above, brown, the back with paler scalloping. Below, paler, with throat and centre of abdomen white.

Chick (c. one week old). Head bald shiny livid red, with naked scrawny neck. Body covered with dingy black down.

STATUS, DISTRIBUTION and HABITAT. Resident, with local movements depending on water conditions. Found through the subcontinent and in Ceylon. Absent in the Himalayas and northern West Pakistan. Affects jheels, rivers, irrigation reservoirs and canals, village tanks, tidal estuaries, etc.

Extralimital. Burma, Thailand, Indochina, Malaysia, Indonesia east to the Greater Sunda Islands.

GENERAL HABITS. As of the Family (q.v.) and very similar to the preceding, with which it commonly associates and is frequently confused. Solitary birds, or twos and threes on village tanks and tidal estuaries, to great flocks on the larger inland waters, and enormous congregations at the traditional rookeries, e.g. Keoladeo Ghana in Rajasthan and Vedanthangal in Madras State. When not on water, usually seen perched upright on trees, stakes, or rocks, sunning themselves, wings and tail spread open. In the feverish jostling during the communal hunts, in which densely packed rabbits participate, the birds often leap-frog over their fellows in their eagerness to plunge after a shoal of fish—manoeuvres reminiscent of starlings at a swarm of grasshopper nymphs.

DARTER

43

STATUS, DISTRIBUTION and HABITAT. Rare vagrant (?) to West Pakistan. A single specimen in the BNHS collection (o? 3. ix. 1917, Gujar, Mashki, 165 m. SSW. of Kalat, Baluchistan—J. E. B. Hotson) is the only record for our area (JBNS 62(3): 553).

Extralimital. SE. Europe, Black and Caspian Seas, Middle East, Afghanistan, Russian Turkestan, Algeria, Tunisia.

GENERAL HABITS. Similar to Little Cormorant.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. As for Little Cormorant, but feathers of scapulars and upper wing-coverts graphite grey, fringed or scalloped with black. Winter, glistening black with white throat and rusty brownish breast. Summer (breeding), head dark rusty brown.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	200-207	28-31	c. 36	140-117 mm.

Outer toe with claw c. 53-56 mm.

(Hartert)

COLOURS OF BARE PARTS. Iris dark brown (not green), sometimes almost blue-black. Legs and feet black.

Genus ANHINGA Brisson¹

Anhinga Brisson, 1760, Orn. 1: 60, 6: 476. Type, by tautonymy and monotypy
Anhinga Brisson = *Plotos anhinga* Linnaeus

Bill slender, straight, very sharp-pointed with both margins of commisure toothed near tip. No lateral groove; nostrils small, basal and linear. Neck very slender with a bend or kink at the 8th and 9th vertebrae. Wing pointed: 3rd primary (as.) longest. Scapulars elongate and lanceolate. Tail long, cuneate in shape, of 12 stiff feathers.

29. Darter or Snake-bird. *Anhinga rufa melanogaster* Pennant

Anhinga melanogaster Pennant, 1769, Indian Zool.: 13, p. 12 (Ceylon and Java)
Baker, FBI No. 2183, Vol. 6: 282
Plate 4, fig. 5

LOCAL NAMES. *Pānca*, *Pān dāhi* (Hindi); *Silli* (Sind); *Goyār* (Bengal); *Pānābātā* (Telugu); *Chakari* (Southern Gonds); *Pānābittāra* (Tamil, Ceylon); *Diya kara*, *Belli kara* (Sinhala); *Maniori*, *Begigir* (Assam).

SIZE. Duck +; length c. 90 cm. (36 in.).

FIELD CHARACTERS. A black water bird like the cormorant, with longer, slenderer snake-like neck, narrow head, and straight, pointed stiletto-shaped bill. Tail long, stiff, fan-shaped.

Adult. Above black, the back and wings longitudinally streaked and speckled with silver-grey; head and neck velvety chocolate-brown

¹ Treated by some authors under a separate family, Anhingidae, by others in a subfamily of Phalacrocoracidae (Anhinginae), or merely a genus as here.

PELECANIFORMES

42

FOOD. Mainly fish; to a lesser extent also tadpoles, frogs, and crustaceans.

BREEDING. Season, chiefly July to September in W. Pakistan and N. India; November to February in the south; December to May in Ceylon. Nest, an untidy stick platform about 25 cm. in diameter indistinguishable from that of the Shag, as also are the eggs though somewhat smaller. Average size of 100 eggs 44.8 × 29.0 mm. (Baker). Normal clutch 3 to 5. The nest is too small to contain the full complement of young when fairly grown. When an observer approaches a nest-tree these crowded youngsters, as well as brooding birds from adjoining nests, tumble plumb down into the water beneath, scraping through the thorny branches. The adults dive, or flap and patter along the surface to take off with the usual effort. The young soon manage to clamber back into the nest-tree using their pliant feet with the sharp hooked claws, the chin, and the stumpy wings to support and pull themselves up the branches. In addition to nesting in enormous mixed colonies at swamps, sometimes in multitudes dense enough to blacken acres of denuded trees, the Little Cormorant also nests singly and in smaller numbers on trees standing high and dry in the midst, or on the outskirts, of inhabited villages at considerable distances from water, in the usual company of Cattle and White egrets. Baker found an exceptional breeding colony in a swampy reed-bed in Assam. Here the nests were placed about 1.5 metres above the water on masses of broken-down elephant grass, the colony being completely screened from view by the tall growth. Both sexes partake in nest-building, incubation and care of the young. Incubation period not recorded. The marked disparity in growth of chicks of the same brood suggests that the eggs are laid at longer intervals than 24 hours and that incubation commences with the first egg. Brooding from the first egg must also serve to protect the clutch from nest marauders like the House Crow which is a very serious menace at heronries all over the country.

MUSEUM DIAGNOSIS. For plumages see Baker, loc. cit.; Robinson and Chasen 1936, 3: 246.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	181-205 (once 212)	29-34	35-40	133-146 mm.

Weight 5 oo? 360-525 g. (av. 427) — BNHS.

COLOURS OF BARE PARTS. Iris green. Bill horny brown, blackish at tip, livid purple at base. Gular and orbital skin black (non-breeding), purple (breeding). Legs and feet blackish, tinged with purple flesh colour when breeding (Baker).

28a. Pygmy Cormorant. *Phalacrocorax pygmaeus* (Pallas)

Pelecanus pygmaeus Pallas, 1773, Reise versch. Prov. Russ. Reich, 2: 712, pl. G
(Caspian Sea)
Not in Baker, FBI
Plate 4, fig. 4

LOCAL NAMES. None recorded.

SIZE. Little Cormorant ±.

FIELD CHARACTERS. In winter doubtfully distinguishable from Little Cormorant, see Museum Diagnosis.

PELECANIFORMES

44

with white chin, throat, and a narrow white line from behind eye halfway down each side of neck. Below, shiny black. Sexes alike.

Young (immature). Above, dark brown, head and neck paler (whitish), mantle narrowly and dully streaked with rufous and silver-grey. Below, brown; tail tipped paler.

STATUS, DISTRIBUTION and HABITAT. Resident, with local movements depending on water conditions. Found throughout the subcontinent from W. Pakistan to E. Assam (from c. 300 m. in the Himalayas), southward through the Peninsula, and in Ceylon.

Frequents inland waters—swamps, jheels, rivers, irrigation reservoirs, village ponds, etc.

Extralimital. Burma, Thailand, Indochina, Malaysia, Celebes (Sulawesi). Other races in Africa, Madagascar, Middle East.

GENERAL HABITS. Keeps singly, in scattered twos and threes, or large congregations, depending on living conditions. More individualistic than cormorants, and does not hunt in cooperative bands. Swims with body submerged, only the snake-like head and neck showing above the surface, constantly turning from side to side. An expert diver and underwater swimmer using the feet to propel itself in pursuit of prey, wings held half open. Unlike cormorants (and grebes) does not leap upward before plunging to dive; merely stretches neck horizontally and quietly vanishes below surface leaving hardly a ripple. When chasing fish under water, sways neck back and forth like a javelin-thrower poised to throw. A special structure in the vertebrae of the neck enables the sharp bill to be shot out as by a powerful spring. The quarry is transfixed on the stiletto-like mandibles. It is jerked off smartly when the bird surfaces, shaken into position, and swallowed head foremost. Though needing some initial effort in the take-off, flies strongly with quick flaps punctuated with sailing, tail spread fanwise, and slender neck with the characteristic kink in the middle stretched in front. When satiated perches upright on a tree-top or snag like cormorants, sunning itself with outspread wings and tail. As in cormorants, and strangely enough for such specialized aquatic birds, the plumage is permeable to water and needs constant drying. Occasionally spirals up on a thermal to lofty heights and circles on motionless wings along with storks and pelicans, obviously for fun.

When a tree on which darters are resting is approached, the birds hurl themselves into the water below, dragging through the intervening tangle of thorny branches as if shot dead. They go right under, but presently the snake-like necks reappear one by one in the distance. It is possible that some of such birds may be moulting their wing quills and temporarily flightless (see Moulting).

VOICE. Seldom heard except when nesting, a loud disyllabic *chigi*, *chigi*, *chigi*, etc. recalling the beginning of a guinea-fowl's cackle: and various grunts and croaks besides. Nestlings also very noisy when begging food.

FOOD. Almost exclusively fish, including some seemingly much too large for the bird's slender bill and gullet.

BREEDING. Season. June/July to December in W. Pakistan and N. India; November to February in the south; January to March in Ceylon. Nest, a largish twig platform built on trees standing in or near water, often

gregariously, among large mixed heronries, e.g. Keoladeo Ghana, Rajasthan, the nests almost touching one another on the overcrowded trees. Eggs, 3 to 6, elongated, spindle shaped, pale greenish blue with a whitish chalky coating, becoming soiled and dirty during incubation. Average size of 80 eggs 52.9 × 33.5 mm. (Baker). Both sexes partake in incubation and feeding the young. Incubation period unrecorded. As in the Little Cormorant, there is great disparity between nestlings in the same brood. Incubation commencing with the first egg is of survival value against nest-robbers like House Crows, and also against the fierce midday sun. Chicks blind and naked when hatched, except for some straggly down on head. White down acquired in a few days, persists on head, neck, and underparts even after wing and tail quills sufficiently grown for chicks to fly. Feeding by regurgitation, the bill and head of chick being thrust violently into parent's gullet.

On arrival of foraging parent at nest, the chicks jostle for food, upstretching neck, vigorously shaking and swaying it in a kind of St Vitus's dance, and tickling the parent's throat. Parent lowers and opens bill wide, allowing chick to thrust its entire head into the elastic gullet. The irritation within apparently induces a retching effect, helping parent to bring up food. The swaying and tugging extraction process lasts for several seconds, the parent having to back away forcibly from the importunate young. Several visits by both parents needed to satisfy the voracious brood. Nest young also require frequent quenching of thirst. Water is squirted in jets from parent's bill into gullet of chick, sometimes spilling outside in the process. On fright chicks, even when quite small, disgorge the food they have eaten into the water below like hailstones, sometimes even hurling themselves bodily as well. Many of the smaller chicks perish through inability to swim and to clamber back to the nest. Adolescents usually manage to do so, using their pliant feet and sharp-hooked claws, chin and neck, and the stumpy forelimbs to haul themselves up the trunk and branches, becoming gory in the process if the nest tree happens to be a thorny one such as babool or *Prosopis*.

At the Keoladeo heronry in Rajasthan heavy predation of nestlings is caused by Pallas's Eagle (*Haliaeetus leucorhynchus*), a few pairs of which are permanently established there. They appear to specialize in darter squabs particularly when half to three-quarters grown.

MUSEUM DIAGNOSIS. See Baker, loc. cit.; Van Tyne & Berger 1959: 402; Stresemann 1927-34, Aves (morphology).

MOULT. Like most Anseriformes and some other groups, the Darter moults all its wing quills simultaneously after breeding and is flightless for some weeks till these have been replaced by new feathers.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	331-357	74-90	42-47	202-240 mm. (Baker)

Weight 400? 1160-1500 gm. (av. 1340) — BNHS.

COLOURS OF BARE PARTS. Iris, inner ring white, outer yellow. Bill dark horny brown; terminal half black, lower mandible yellowish. Legs and feet black.

MISCELLANEOUS. Darters are regularly employed by local wandering tribes in parts of Assam and Bengal for catching fish in swamps and small

FRIGATE BIRDS

47

Genus *FREGATA* Lacépède

Fregata Lacépède, 1799, Tabl. Ois.: 15. Type, by subsequent designation, *Pelecanus aquilus* Linnaeus

Characters as of the Family.

30. Christmas Island Frigate Bird. *Fregata andrewsi* Mathews

Fregata andrewsi Mathews, 1914, Austr. Av. Rec., 2: 120
(Christmas Island, Indian Ocean)
Baker, FBI No. 2191, Vol. 6: 295

SIZE. Kite +; length ♂ c. 97 cm. (38 in.); ♀ c. 102 cm. (40 in.).

FIELD CHARACTERS.

Male (adult, breeding). Above, glossy metallic black. Below, throat and breast black, only the belly white.

Female (adult). Larger than male. Above, same as ♂. Below, only throat black, rest of underparts white, the white spreading up as a collar on sides of neck (to clavicular region), not across hindneck.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Vagrant; possibly storm-driven. Breeds on Christmas Island (Indian Ocean) south of Java, c. 11°S. The record from Kerala (Prater, JBNHS 33: 446, and *Synopsis*: 11) proves on a re-examination of the specimen to relate not to this species but to *Fregata minor* (Abdulali, JBNHS 57: 667-8). Similarly the only Ceylon specimen in the Colombo Museum, hitherto recorded as *F. andrewsi*, has been shown to be *F. minor aldbarensis* (Phillips 1953). Therefore it must be emphasized that so far no authentic record of *Fregata andrewsi* in Indian waters exists.

MUSEUM DIAGNOSIS**MEASUREMENTS**

Wing ♂ 600-625; ♀ 635-643 mm. (Baker). Average of wing of 10 mature specimens ♂ 610; ♀ 650 mm. (Gibson-Hill 1947).
(For an excellent and complete biography of this species see C. A. Gibson-Hill 1947.)

31. Lesser Frigate Bird. *Fregata minor aldbarensis* Mathews

Fregata minor aldbarensis Mathews, 1914, Austr. Av. Rec., 2: 199 (Aldabra Island)
Baker, FBI No. 2192, Vol. 6: 297

Plate 3, fig. 5

OTHER NAME. Great Frigate Bird (!).

lakes (Stonor, JBNHS 47: 746). The practice is not widespread and far dying out.

Family *FREGATIDAE*: Frigate Birds or Mart-of-war Hawks

Rather large, gregarious, dark coloured or black-and-white oceanic birds with long, pointed, streamlined wings, deeply forked tails, and flight resembling that of raptors. Bill long and strongly hooked, rounded in cross-section, the culmen convex. Nostrils obsolete. Throat bare; bright coloured gular pouch occasionally inflated like a balloon to ridiculous proportions by courting male, even in flight. Tarsus very short, stout, feathered. Feet small, all four toes united by a web near their base; claws long, strong, much curved; middle claw pectinate as in tropic-birds and cormorants.

Sexes dimorphic; female larger than male. For anatomical details see Baker 1929, 6: 295; Palmer 1962, 1: 365-6.

RANGE. Pan-tropical. Oceanic islands and adjacent seas. Non-migratory.

GENERAL HABITS and FOOD. Chiefly fish and squids (cephalopods) neatly picked up from surface shoals with an inward flick of the strongly hooked bill while hovering close above the water. Sometimes flying fish chased and captured in the air. More usually food procured by pirating — attacking and chasing boobies, tropic-birds, etc. and forcing them to give up what they have caught. The booty is swooped off in mid-air before it reaches the water, or scooped up from the surface as it falls. They also swoop and carry off the young of colonial-nesting birds such as terns.

Frigate birds are magnificent fliers and capable of soaring and sailing for hours at a stretch high up in the heavens. Owing to their short legs and long wings they cannot take off from a flat surface, therefore they hardly ever alight on a calm sea, spending almost all day on the wing. They roost at night on trees and bushes, and also build their stick nests in similar situations, and on rocks. Eggs, usually 1 (or 2), chalky white. Incubated by both sexes. Incubation period about 6 weeks. Chick blind and naked at hatching; covered with white down later.

48

PELECANIFORMES

SIZE. Kite +; length c. 87-102 cm. (34-40 in.).

FIELD CHARACTERS.

Male (adult). Above, glossy black with a brown band on wings across the median wing-coverts and innermost secondaries. Below, brownish black.

Female (adult). Larger than male. Above, including head and neck, black with a brown hind collar and light brown band on wings. Below, throat and foreneck greyish white (or mottled brown and white); lower neck, breast and sides white; flanks and abdomen black. 'The female is the only frigate bird with white underparts and whitish throat' (Alexander 1955).

STATUS, DISTRIBUTION and HABITAT. Rare straggler (storm-driven) in the monsoon. Breeds on Seychelles and Aldabra Islands (Indian Ocean) lying between the equator and 15°S., and 45° to 60°E.

The only Indian specimen (♂, BNHS Coll.) is a storm-blown example, entangled in a fishing net in a rough sea at the onset of the SW. monsoon near Quilon (Kerala), originally misidentified as *F. andrewsi* (q.v.). But there are three independent SW. monsoon sight records from Bombay by reliable observers (Taylor, JBNHS 51: 939) and two specimens from Ceylon, both females — one in the Colombo Museum (also recorded as *F. andrewsi* but since corrected), the other from the Tweeddale Collection in the British Museum. Phillips's sight record (JBNHS 55: 203) of large all-black frigate birds in the Maldives Islands in December and January presumably also relates to this form.

HABITS, FOOD, etc. See under Family.

MUSEUM DIAGNOSIS**MEASUREMENTS**

	Wing	Bill (from feathers)	Middle toe	Tail
♂ ♂	585-603	116-130	48-57	392-410 mm.
♀ ♀	605-621	130-150		395-430 mm. (Baker)

COLOURS OF BARE PARTS (in nominate *minor* of Christmas Is. etc.) Iris (♂ ♀) dark brown; a white spot on lower lid. Eyelids: ♂ black; ♀ crimson or madder pink. Bill (♂ ♀) variable slaty, steel, or blue grey, often darker or brownish at tip; usually a pinkish area at base of lower mandible in ♀. Internasal and throat skin: ♂ pale scarlet, ♀ dull crimson. Gular pouch in ♂ light scarlet (non-breeding) to crimson-scarlet (breeding). Feet: ♂ dark, or reddish brown with pale pinkish white soles; ♀ flesh white (Gibson-Hill 1947).

FRIGATE BIRDS

49

32. Least Frigate Bird. *Fregata ariel* *iredaldi* Mathews

Fregata ariel iredaldi Mathews, 1914, Austr. Av. Rec., 2: 121 (Aldabra Island)
Baker, FBI No. 2193, Vol. 6: 298
Plate 3, fig. 4

OTHER NAME. Mascarene Frigate Bird.

SIZE. Kite +; length c. 80 cm. (32 in.).

FIELD CHARACTERS. The smallest frigate bird. 'Adults are distinguished from all other species by the conspicuous white patch on the side under the wing' (Alexander 1955).

Male (adult). Above, glossy metallic black. Below, browner with a white patch on each side of abdomen (lower flank).

Female (adult). Larger than male. Above, mainly glossy black with a chestnut collar on hindneck and a brownish patch on the wing-coverts. Below, throat and abdomen black; breast buffy white. Young (immature). Upperparts brownish black; head, neck, breast and abdomen white streaked with rusty, the head sometimes brown (Alexander).

STATUS, DISTRIBUTION and HABITAT. Occasional straggler, doubtless often storm-blown in the monsoon. Breeds on Aldabra Island, near Madagascar, 9°30'S., 46°30'E. Reportedly also on the more northerly atolls in the Maldives c. 4°N., 72°E. (Phillips & Sims, JBNHS 55: 203, 1958). Apart from sight records there are at least six examples taken on the west coast of Ceylon, in June, July, August, September, and one near Jaffna, Northern Province, in April. A storm-driven male on 23 June (1955) near Colombo was in fresh plumage with 'testes enlarged' (Phillips 1953, 1956). Only two records from India: a young bird taken near Trivandrum (Kerala) in c. 1904 (Ferguson, JBNHS 16: 13) — specimen not now available — and 1 (♂) at Bombay in July 1960 (Abdulali, JBNHS 57: 668). A young bird ringed as pullus on Aldabra I., Indian Ocean, 9°22'S., 46°28'E., 18.iv.1969, found storm-blown on Malad beach, Bombay, c. 18°55'N., 72°50'E., 4.vi.1970 — c. 4500 km NE.

GENERAL HABITS, FOOD, etc. See under Family.

MUSEUM DIAGNOSIS

MEASUREMENTS. Gibson-Hill (1950) gives for adults from Cocos-Keeling Is. (subspecies?) as follows:

	Wing	Bill	Tarsus	Tail
4♂♂	518-550 (533.5)	79-85 (82.2)	22-23.5 (22.75)	307-331 mm. (316.5)
5♀♀	534-562 (547.0)	86-93 (89.4)	24-25.5 (24.9)	314-324 mm. (318.4)

A ♂ from Ceylon measures: Wing 520; bill 81; tarsus 21; tail 304 mm. (Phillips 1958); and the Bombay ♂ measures Wing 520; bill (from skull) 82; tail 325 mm. (SA).

COLOURS OF BARE PARTS. ♂ Bill grey, gular pouch red; feet black or reddish brown. ♀ Bill bluish; skin of throat red; feet red (Alexander, 1955).

Order CICONIIFORMES

Family ARDEIDAE: Herons, Egrets, Bitterns

Cf. Curry-Lindahl, K., 1971, *Ostrich*, suppl. No. 9: 52-70

Long-legged, lanky wading birds, from body size of village hen to vulture, with long slender flexible necks in most species. A kink in the middle (as in the Darter) enables the neck to be retracted into a flat S in flight as is characteristic of the family.

HERONS, EGRETS

51

Throat glistening white, crest of two long feathers (63 cm. = 25 in.)

Page

D Small- to medium-sized. Plumage mainly various shades of greenish- or bluish-black, white, and grey.

74

4 Plumage generally white and grey, with greenish black crest and mantle, wings paler than back (58 cm. = 23 in.).

78

Nyticorax nycticorax (adult)

Smaller (46 cm. = 18 in.). Plumage generally grey with greenish-black crest, mantle streaked with pale greenish grey, wings darker than back

59-62

Butorides striatus (adult)

E Wings and upperparts dark sooty brown glossed with metallic green, wing-coverts spotted with white, sides of neck and underparts streaked with slaty brown.

5

5 Crown and crest brown (58 cm. = 23 in.).

78

Nyticorax nycticorax (juvenile)

Crown and crest black (46 cm. = 18 in.).

59-62

Butorides striatus (juvenile)

F Small- to medium-sized. Wings, tail, and underparts white; head, neck, breast, and back variable.

63, 65

6 Head, neck, and breast pale ochre. Back dark rusty or maroon-brown (46 cm. = 18 in.).

63, 65

Ardeola grayii (breeding)

Head dark rusty brown, breast purplish, back deep blue-black (52 cm. = 21 in.).

65

Ardeola bacchus (breeding)

Head, neck, and breast pale ochre heavily streaked with dark brown, back pale ashy brown.

63, 65

Ardeola grayii (non-breeding)

Similar to above but back darker.

65

Ardeola bacchus (non-breeding)

G Medium-sized. Plumage generally light buff or rich chestnut.

7

7 Top of head black, sides of head, neck, and upperparts rich chestnut-brown, back finely vermiculated with black, underparts pale buffy white streaked with black and chestnut. Under wing-coverts white barred with black, primaries black tipped with chestnut and white. Bill short and stout (51 cm. = 20 in.).

80, 82

Gorsachius melanolephus

Top of head and mustache black, rest of plumage pale yellowish buff, upperparts heavily streaked with blackish, underparts streaked with chestnut, primaries black barred with pinkish brown (71 cm. = 28 in.).

89

Botaurus stellaris

H Generally small-sized with underparts predominantly brown, buff, or chestnut

8

8 Colour and pattern of upperparts sharply differentiated on crown, back of neck, and mantle

a

Colour and pattern of upperparts less sharply differentiated on crown, back of neck, and mantle

b

Colour of upperparts with no sharp differentiation of crown, back of neck, or mantle

c

a Top of head, upperparts and primaries black; large greyish buff patch on wing; underparts pale buff with dark lanceolate feathers across upper breast (36 cm. = 14 in.).

83

Ixobrychus minutus (male)

b Crown black, back of neck pale chestnut, mantle dark brown (in value, almost as dark as primaries). Buffy patch on wing (36 cm.

50

CICONIIFORMES

Bill long, straight, sharp-pointed, dagger-like. Nostrils oval, close to the base. Tarsi very long; toes long and slender, the middle and outer toes united by a small web at their base. Claw of middle toe pectinate or comb-like. Hind-toe well developed; on same plane as the other toes.

Middle toe and claw of adult

Grey Heron showing pectinations, X c. 1

Most species have curious powder-down patches on each side of rump and breast providing a sort of dry shampoo for degreasing soiled feathers. Plumage soft and loose-textured, usually white, grey, purple, or brown; in some species speckled, barred, or streaked above and/or below. Sexes alike or nearly so. In many species filamentous ornamental plumes acquired during the breeding season, for the trade in which (as 'aigrettes') the birds were greatly persecuted and in some places nearly exterminated (see Little Egret).

DISTRIBUTION and HABITAT. Throughout the tropical and temperate zones, except on some oceanic islands. Marshes, jheels, rivers, tidal estuaries.

FOOD. Fish, frogs, insects, molluscs, rodents, young birds.

BREEDING. Colonial; usually in mixed heronries of several species in association. Nests, shallow stick platforms normally on trees. Eggs, normally 3 to 6, bluish white or pale greenish blue; unmarked in Indian species. Young, nidicolous.

ANATOMICAL DETAILS. Witherby 1939, 3: 125. Stresemann 1927-1934, Aves: 810.

Key to the Indian forms

Page

- A Large-sized. Plumage grey above, varied below.....1
- 1 Crown and crest vinous-chestnut, neck rufous-cinnamon (length 142-152 cm. = 56-60 in.).....*Ardea goliath* (adult) 53
- Crown and neck dull rufous, foreneck streaked with black (slightly smaller than above).....*Ardea goliath* (juvenile) 53
- Crown black, crest grey-tipped (127 cm. = 50 in.).....*Ardea insignis* (adult) 53
- Crown white, occipital crest black, neck smoky white (98 cm. = 39 in.).....*Ardea cinerea* (adult) 54, 55
- Crown grey, crest black, neck grey (slightly smaller than above).....*Ardea cinerea* (juvenile) 54, 55
- Crown black, neck ferruginous striped with black and buff (97 cm. = 38 in.).....*Ardea purpurea* (adult) 57
- B Large-sized. Plumage dark brown to cinnamon brown above, head and neck rufous.....2
- 2 Dark brown above, head and neck pale rufous-brown streaked with white (127 cm. = 50 in.).....*Ardea insignis* (juvenile) 53
- Head and neck rufous-brown. Lower foreneck streaked with black, rest of plumage uniform cinnamon-brown in distance as result of broad cinnamon-brown edges masking the purplish slaty feathers (97 cm. = 38 in.).....*Ardea purpurea* (juvenile) 57
- C Medium-sized. Plumage mainly dark slaty blue above and below.....3
- 3 Throat and breast streaked with chestnut and white (58 cm. = 23 in.).....*Ixobrychus flavicollis* (adult) 88
- Throat glistening white, bushy nuchal crest (58 cm. = 23 in.).....*Egretta sacra* (breeding — dark phase) 77

66

Genus ARDEA Linnaeus

Ardea Linnaeus, 1758, Syst. Nat., ed. 10, 1: 141. Type, by subsequent designation, *Ardea cinerea* Linnaeus (Gray, 1840)

Bill long, compressed, and pointed; culmen straight, edges of both mandibles slightly serrated at commissure. Upper mandible grooved on either side; nostrils rather long, situated near base. Sides of head to behind eye naked. Tibia partially naked; tarsus long, scutellated in front. Wings ample and rounded; tail short, nearly square-cut. Head crested; lower plumage very lax and soft; feathers at base of neck below and on scapulars long and attenuated forming ornamental plumes. Genus cosmopolitan.

HERONS, EGRETS

53

33. Great Whitebellied Heron. *Ardea insignis* Hume

Ardea insignis Hume, 1870, *Stray Feathers*, 6: 470 (Sikkim Terai, Bhutan Duars)
Ardea imperialis Baker, 1928, *Bull. Brit. Orn. Cl.* 49: 40 (Sikkim terai, Bhutan duars)
 Baker, FBI No. 2220, Vol. 6: 342
 Plate 6, fig. 3.

LOCAL NAMES. None recorded.

SIZE. Considerably larger than Grey Heron; length c. 127 cm. (50 in.).

FIELD CHARACTERS

Adult. Above, like the Grey Heron (q.v.). Crown slaty black (contra white), the longest crest feathers tipped grey. Tail and primaries slaty black. Below, lower breast, abdomen, flanks, axillaries, under tail-coverts pure white. Thigh-coverts white in front, grey behind. Sexes alike.

'Except for the whitish chin and throat, and the shiny white belly, under wing- and under tail-coverts, the bird appears dull grey all over' (H. C. Smith, MS.).

STATUS, DISTRIBUTION and HABITAT. Resident, but apparently rare, in Nepal and Sikkim terai, Bihar (north of Ganges river), Bhutan duars to NE. Assam. East Pakistan, Arakan, and N. Burma where the upper reaches of the Irrawaddy river mentioned as one of its strongholds. Affects inland swamps, marshes, and stretches of rivers through forest. Not on sea coast. Singly or in small parties of four or five.

GENERAL HABITS. As of the Family. Nothing specifically recorded.

BREEDING. Unrecorded in our area; only once in Arakan, Burma (April) — a huge stick nest in a lofty tree, containing four eggs like those of Grey Heron but larger, c. 70 × 50 mm.

MUSEUM DIAGNOSIS. See A. O. Hume 1878, *Stray Feathers*, 6: 470-1.

MEASUREMENTS. A male collected by H. C. Smith in Burma had wing 530 mm. Baker gives for

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	546-572	152-176	171-216	199-211 mm.

COLOURS OF BARE PARTS. 'Iris ochraceous yellow. Bill and legs blackish' (H. C. Smith). 'Loral skin, orbital skin, and base of lower mandible greenish; upper mandible and inner margin of lower mandible blackish slaty; tip of lower mandible underneath greenish ochre, remaining portion mussel-grey. Tarsus black with horny patches. Claws black' (Stevens).

34. Giant Heron. *Ardea goliath* Cretzschmar

Ardea goliath Cretzschmar, 1826, in Rüppell's *Atlas*, Vögel : 39, pl. 26
 (White Nile, Bahbar Abiad)
 Baker, FBI No. 2221, Vol. 6: 343
 Plate 6, fig. 2

LOCAL NAMES. None recorded.

SIZE. Considerably larger than Grey Heron; length c. 142-152 cm. (56-60 in.). Standing almost the height of a man.

FIELD CHARACTERS. Like a gigantic Purple Heron.

For reversion of name from *imperialis* Baker see Biswas, 1963, JBNHS 60(3): 680.

HERONS, EGRETS

55

Grey Heron (q.v.), from which it differs in being a darker grey above. Sexes alike; female smaller.

STATUS, DISTRIBUTION and HABITAT. Casual winter visitor, recorded from Baluchistan, Sind, Kutch, and Nepal (Rand & Fleming), but possibly commoner and more widespread than hitherto believed. Shows great diversity of status within a single population, some individuals (or local populations) sedentary, others — specially juveniles — tending to wander and even migrate long distances. Thus, a ringed example from Kazakhstan (40°48'N., c. 70°E.). USSR was recently recovered in South Kanara, Mysore (JBNHS 59: 650). Breeds in the Palaearctic and Ethiopian regions — Europe, N. Africa to Asia Minor, NW. Siberia.

MUSEUM DIAGNOSIS. See Withersby 1939, 3: 131-3.

MEASUREMENTS, COLOURS OF BARE PARTS etc. See under No. 36 below.

36. Eastern Grey Heron. *Ardea cinerea rectirostris* Gould

Ardea rectirostris Gould, 1843, *Proc. Zool. Soc. London* : 22 (New South Wales ' = India? ', Stone, 1913, *Austral. Av. Rec.*, 1: 142 restricted by Ripley 1961, *Synopsis*: 12 to India)
Ardea leucophaea Gould, 1848, *Proc. Zool. Soc. London* : 58 (India)
Ardea cinerea jayyi Clark, 1907, *Proc. U.S. Nat. Mus.*, 32: 468 (Seoul, Korea)
 Baker, FBI No. 2218, Vol. 6: 340
 Cf. Baker, E. C. S., 1928, *Bull. Brit. Orn. Cl.* 49: 30-40
 Abdulali, H., 1968, JBNHS 65: 191-2
 Plate 6, fig. 4

LOCAL NAMES. *Nāri*, *Sain*, *Kūbūd*, *Ānjān* (Hindi); *Khyra* (Bihar); *Sada kāk* or *Kāk*, *Anjan* (Bengal); *Saa* (Sind); *Brāg* (Kashmir); *Natayana pachchi* (Telugu); *Nārai*, *Sambal nārai* (Tamil); *Chārimūnti* (Malayalam); *Kalapua karawal koka*, *Indura koka* (Sinhala); *Kūddil* (Kolís of Maharashtra).

SIZE. Same as No. 35. Standing c. 75 cm. high.

FIELD CHARACTERS. A long-legged, long-necked marsh bird.

Male (adult). Above, ashy grey with white crown and neck, and long black occipital crest. Below, a conspicuous black-dotted line down middle of foreneck. Elongated black-streaked white feathers on breast. Rest of underparts greyish white.

Female similar but smaller; crest and pectoral plumes less developed.

STATUS, DISTRIBUTION and HABITAT. Resident. All India, both Pakistans, Nepal, Ceylon, Maldives Islands, Andamans, and Nicobars (?). From plains level to about 900 m. in Nepal, and between c. 3500-4000 m. in Ladakh. Breeds up to c. 1750 m. — Vale of Kashmir. Affects inland water — jheels, marshes, rivers; also tidal creeks, estuaries, mangrove swamps, coastal backwaters, and rocky offshore islets.

EXTRALIMITAL. The Middle East, Burma, Thailand, Indochina, Malaysia, E. Siberia, E. China, Japan, Formosa, Hainan.

GENERAL HABITS. Usually solitary, occasionally small parties; gregarious when nesting. Largely crepuscular, hunting chiefly in the early morning twilight and into the dusk. Still-hunts by standing motionless at the water's edge head sunk between the shoulders, or wades into the shallows neck arched and partly stretched forward, peering intently for any fish or frog

54

CICONIIFORMES

Adult. Above, crown and crest deep vinous chestnut; neck rufous-cinnamon. Upperparts, wings and tail slaty grey. Below, chin, cheeks, and throat, white; elongate breast plumes streaked white and slaty black. Lower parts, including wing-lining, deep chestnut or maroon. Sexes alike.

Young (immature). Above, head and neck duller and paler rufous. Upperparts grey with rufous edging. Below, white streaked with brown.

STATUS, DISTRIBUTION and HABITAT. Rare vagrant. Essentially an African species, breeding on islands off the African and Arabian coasts of the Red Sea, and in Iraq, etc. Appearances in India sporadic, rare, and somewhat mysterious. Blyth got some live examples in the Calcutta market in 1845 and 1846, presumably from the Salt Lakes where he shot one bird each in 1878 and 1879; a third seen in 1880. In c. 1873 Hume saw six gigantic herons on the river near Multan (W. Pakistan) above the confluence of the Chenab and Sutlej, with a great deal of rufous about the neck, which were probably this species (SF, 1: 105). Blanford observed one example each near Nagpur (Madhya Pradesh) and in Baluchistan; Stuart Baker saw five on the Meghna river near Dacca in 1910. After that no record till December 1925 when one was shot by L. R. Fawcett in the Khulna Sunderbans, now in East Pakistan (JBNHS 31: 523). Described by the collector as 'not uncommon'; Peter Jackson, 1974 (JBNHS 71(3): 608), observed several in the same locality. Two specimens collected in Ceylon, also in 1878 and 1879, and another seen on a later occasion; also a solo quite recently (T. W. Hoffmann, CBCN, Feb. 1975: 6).

GENERAL HABITS. As of the Family. In its endemic area frequents tidal creeks, mangrove swamps, estuaries, and inland lakes. Usually solitary and very shy. Has a seemingly slow and ponderous flight. Archer 1937 (1: 47) points out that for the bird's size its pale blue eggs are remarkably small (c. 71 × 52 mm.); being nearly equal to those of the Crab Plover (*Dromas ardeola*), which is one-third its size, or less, but lays large eggs.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	570-589	184-196	225-252	212-237 mm.
♀ ♀	592-662	180-196		

COLOURS OF BARE PARTS. Iris yellow, with an outer rim of red. Bill dark horny-slate, the lower mandible, gape, and commissure paler and yellowish. Legs and feet dark slaty black (Baker).

35. European Grey Heron. *Ardea cinerea cinerea* Linnaeus

Ardea cinerea Linnaeus, 1758, *Syst. Nat.*, ed. 10, 1: 143 (Europe, restricted to Sweden)
 Baker, FBI No. 2217, Vol. 6: 339

LOCAL NAMES. As under No. 36.

SIZE. Length c. 98 cm. (39 in.) including neck and legs. Standing about 75 cm. high.

FIELD CHARACTERS. A lanky, long-legged, long-necked grey marsh bird. Indistinguishable in the field with certainty from the resident Eastern

56

CICONIIFORMES

that may blunder within striking range of the formidable poised bill. When prey is sighted the bird cranes its flexible neck forward and freezes, waiting for a favourable opportunity to strike. Presently the rapier bill is shot out with lightning speed and the unsuspecting victim impaled or firmly secured in the mandibles. With an upward jerk it is manoeuvred into position and swallowed head foremost. Sometimes the bird will stalk its prey stealthily or shift to a new vantage point, lifting up and putting down each foot noiselessly and with studied deliberation. Single birds observed perched all day long on snags—the remnants of submerged forest trees under the waterspread of dammed irrigation reservoirs (e.g. Periyar Lake in Kerala), almost flush with the surface. They procure their food in such deep water by jabbing at prey as it swims or floats past or by short forays from the base, bellyflopping momentarily on the surface to seize a fish. When disturbed, the bird rises with a harsh *quaark* which is also uttered from time to time on the wing. The initial take-off from the perch is clumsy and accompanied by an awkward stretching of the long neck, vigorous laboured flapping of the wings, and by much swaying and balancing with the long loosely dangling legs. The launching is preceded by a slow swinging, or wagging, of the tail up and down, as if to assist in the process. The bird then flexes its legs and springs upward. Once in the air it flies strongly with steady flaps of the broad wings, neck characteristically folded back in a flat S, head drawn in between the shoulders, legs tucked under the tail and trailing behind. It roosts at night on trees and mangroves, and also settles on them in daytime when sated.

FOOD. Fish, frogs, molluscs, crustaceans, aquatic insects, small rodents, and young birds. In Kashmir alleged to do considerable damage to the trout fisheries. However, a proper scientific investigation of the food and feeding habits may reveal, as elsewhere, that by preying largely on predatory fishes the birds actually do more good than harm to the trout. Drinks water in the usual manner of birds, repeatedly dipping bill into the liquid and raising head to swallow.

VOICE and CALLS. In addition to the resonant *quaark* uttered in flight, a variety of harsh croaks and, at the heronry, a goose-like *honk*.

BREEDING. Season. Various. Mainly March to June in Kashmir; July to October in northern India; November to March in S. India and Ceylon. Nests gregariously, sometimes in pure colonies but usually in mixed heronries of egrets, storks, cormorants, night herons, etc. Two best-known of such heronries are Keoladeo Ghana in Rajasthan, and Vedanthangal in Madras, but smaller and less-known ones widely scattered over the country. In Kashmir Valley the largest chenar trees (*Platanus orientalis*), often over 35 m., are selected for the nests; in Keoladeo Ghana large *Kili-kaddim* (*Stephgyne parviflora*), and babool (*Acacia arabica*) and kandi (*Prosopis spicigera*) are the most favoured, while at Vedanthangal the substrate is provided by partially submerged *Barringtonia racemosa* trees. The selected trees are usually standing in water or in its close proximity. In tidal forest nests are normally built on mangroves, *Avicennia*, *Rhizophora*, and other species. Rarely tall dense reed-beds are used. Nest, a platform of twigs with a central depression scantily lined with leaves, straw, and water-weeds. Often many nests in a single tree, cheek by jowl with those of other tenants of the heronry. Egg,

HERONS, EGRETS

57

normally 3 or 4 occasionally 5, broad to moderately long ovals, pale sea green or green-blue, variable in shade. Average size of 100 eggs 58.6 × 43.5 mm. (Baker).

Both sexes share in building the nest, incubation, and feeding the young. Incubation period 25–26 days. Incubation, as with most other occupants of heronries, begins with the first egg as a protection from the fierce sun and from nest-robbers like crows. Thus a marked disparity is noticeable among chicks of the same brood. Chick in down grey above whitish below; the down on the crown very long and erect with bristly tips giving a crested appearance. Young fed by regurgitation. On arrival of parent at nest its bill is seized by an importunate youngster in its own mandibles and vigorously twisted and wrestled with till the parent disgorges the half digested food. This either taken by small chicks directly from parent's bill or gobbled up from nest floor when older.

For details of courtship, nest relief and other behaviour see Witherby 1939, 3: 126–9.

MUSEUM DIAGNOSIS. For plumages of nominate race, from which *retirostris* differs only in minor details, see *ibid.*: 131–3.

MEASUREMENTS. Baker gives for Indian and Chinese examples of *retirostris*:

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	422–475 (once 481)	109–135	140–162	165–180 mm.

There is no significant difference in size between the two races.

Weight 4 oo? 1500–2250 (av. 1757) gm. (BNHS).

COLOURS OF BARE PARTS. Iris golden yellow. Bill (breeding) bright orange-yellow with a brown line down middle of culmen; (non-breeding) dark horny brown. Legs and feet (breeding) bright orange-yellow sometimes with a pink tinge; (non-breeding) greenish brown, marked with yellowish on the joints and back of tarsi (SA).

MISCELLANEOUS. Longevity, *A. c. cinerea* (from ringing data) = 24 + years (Ring, 1962, 33: 148).

37. Eastern Purple Heron. *Ardea purpurea manilensis* Meyen

Ardea purpurea var. *manilensis* Meyen, 1834, Nova Acta Acad. Caes. Leop. Carol. 16, suppl.: 102–103 (Philippines)

Baker, FBI No. 2216, Vol. 6: 337

Plate 6, fig. 5

LOCAL NAMES. *Nāri*, *Lāl sain*, *Lālānjān* (Hindi); *Khyra* (Bihar); *Lāl kānk* (Bengal); *Lāl kol* (Assam); *Yerra nārāyānā pākshi* (Telugu); *Chēmārai* (Tamil); *Chēyāmūti* (Malayalam); *Karawala kokka*, *Barendi kokka* (Sinhala).

SIZE. Smaller and slighter than Grey Heron; length c. 97 cm. (38 in.) including long neck and legs. Standing c. 70 cm. high.

FIELD CHARACTERS. A lanky marsh bird like the last. In direct sunlight upperparts, including dorsal surface of wings, bright purple, a shade darker than the Purple Moorhen.

Adult. Above, purplish blue or purplish slaty; blackish on wing and tail. Crown and crest slaty black, rest of head and long thin neck ferruginous boldly striped with black. Below, chin and throat white; long drooping plumes on upper breast buffy white with black and chestnut streaks. Rest of

58

CICONIIFORMES

underparts slaty black and rich chestnut; under wing chiefly ferruginous. Sexes alike; female with crest and pectoral plumes less developed.

Young (immature). Uniform cinnamon brown in distance, effect of broad cinnamon-brown edges masking the purplish slaty feathers.

STATUS, DISTRIBUTION and HABITAT. Resident and local migrant. Throughout the plains of India east to Assam and Manipur, both Pakistan, Nepal (lowlands), Ceylon, Andamans and Nicobars. Possibly as in Grey Heron, augmented in winter by influx of extralimital migrants. The nominate race, with more black streaks on foreneck, has been obtained by Meinertzhagen (JBNHS 32:91) in Baluchistan (Quetta, Nushki), where it occurs sporadically (Christison, *ibid.* 43:486). Frequents jheels, reedy swamps, lakes, and rivers.

Extralimital. Burma, Thailand, the Indochinese countries, China south of the Yangtze and Ryukyu Islands, south to the Philippines, Greater Sunda Island and Celebes (Sulawesi). Other races in Europe, Madagascar, and USSRiland.

GENERAL HABITS. Largely crepuscular. Solitary. Similar to those of Eastern Grey Heron (q.v.). Perhaps shyer and more secretive, keeping to dense reed cover, where it may be easily overlooked on account of the bittern-like way it freezes on suspicion — thin neck and bill upstretched — camouflaging it among the reeds. The bird flushes out with a fluster and harsh croaking when suddenly come upon, and settles on a low tree in the open until the covert is quiet again.

FOOD and VOICE. Similar to the Grey Heron.

BREEDING. Season. Various; June to September–October in N. India; November to March in S. India and Ceylon. Usually nests in small colonies of its own. When in mixed heronries with other species, shows a tendency to segregation into its own *mohallas*. Nest, a platform of sticks and branches, or rush stems, built in trees, dense reed beds, or screw pine (*Pandanus*) tangles standing in fairly deep water, from a few centimetres to two or three metres above the surface. The rushes or *Pandanus* leaves are beaten down to form a platform for the nest. Eggs, 3 to 5, rarely 6, pale sea green or greenish blue. Broad to moderately long ovals, close and smooth textured; very similar to eggs of Grey Heron. Average size of 100 eggs 54.6 × 39.7 mm. (Baker). Both sexes share nest-building, incubation, and care of the young. Incubation period about 24–26 days. Eggs laid at longer intervals than 24 hours; incubation commences from the first egg, hence the very marked disparity in young of the same brood. Half-grown chicks clamber about freely among branches of nest-tree, but promptly return to nest on arrival of foraging parent. The parent's bill is seized and violently stroked and drawn down to induce regurgitation. The food is gobbled up from the nest floor, or as it issues from the parent's throat.

MUSEUM DIAGNOSIS. For plumages of nominate race, from which *manilensis* differs only in details and is hardly distinguishable, see Witherby 1939, 3: 136–7.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	327–387	115–144	121–145	120–142 mm. (Baker)

HERONS, EGRETS

59

Males are appreciably larger than females.

COLOURS OF BARE PARTS. Iris yellow; orbital skin dull greenish or yellowish green. Bill dark yellow, culmen and tip horny brown. Legs and feet reddish brown, soles and hinder edge of tarsus paler and more yellow. In breeding birds bill and legs much brighter orangey.

MISCELLANEOUS. Both this and Grey Heron highly prized as food by certain classes, e.g. the mohanas or inland fishermen of Sind. The birds are kept tethered by a leg, perched on floating bits of log or on the prow of the mohanas' houseboats to fatten for slaughter or use as decoys.

Longevity, *A. p. purpurea*: 16 + years (Ring, 1962, 33: 148).

37a. Western Purple Heron. *Ardea purpurea purpurea* Linnaeus. See Appendix. The genus *Ardea* also includes Nos. 45 and 46.

Genus BUTORIDES Blyth

Butorides Blyth, 1852 (1849), Cat. Bds. Mus. Asiat. Soc.: 281. Type, by monotypy, *Ardea javanica* Horsfield

Unlike Pond Heron (*Ardeola*) has no nuptial plumage. Tibia feathered nearly to the joint. Tarsus comparatively much shorter than in *Egretta* or *Ardeola*. Feet smaller and slenderer; middle toe with claw about equal to tarsus in length, but much shorter than bill. Head crested. Scapulars and interscapulars long and lanceolate but not disintegrated as in *Egretta* or *Ardeola*. Tail of twelve feathers as in *Ardeola*.

38. Little Green Heron. *Butorides striatus javanicus* (Horsfield)¹

Ardea chloriceps 'Hodgs.' = Bonaparte, 1857, Consp. Gen. Av., 2: 129 Nepal. (Restricted to Hitaura, Chisapani Garhi dist. by Biswas, 1959, Curr. Sci., 28: 288)

Baker, FBI No. 2231, Vol 6: 357

Plate 6, fig. 1

LOCAL NAMES. *Kancha bāglā* (Hindi); *Kāna bāk* or *Kuro bāk* (Bengal); *Kona moochree* (Assam); *Dori konga* (Telugu); *Dorhi kokku* (Tamil); *Podi kokka* (Sinhala); *China kokku* (Malayalam).

SIZE. Pond Heron; length c. 46 cm. (18 in.).

FIELD CHARACTERS. Smaller than Pond Heron, chiefly black, grey, and metallic dark green, but otherwise like it in general effect.

Adult. Above, forehead, crown, and long occipital crest glossy greenish black; cheeks white; head and neck grey. Upperparts, with lengthened scapulars, slaty grey glossed with dark green and bronze-green. Wing-coverts dark glossy green. Wing quills green-glossed black with grey and white tips and edges. Below, chin and centre of throat white. Lower parts ashy grey; under tail-coverts white with blackish tips or edges. Sexes alike.

Young (immature). Above, brownish without the lengthened scapulars. Crown and short crest streaked with buff. Wing feathers edged with buff, and with apical white spots. Below, buffy white, heavily streaked with dark brown.

STATUS, DISTRIBUTION and HABITAT. Resident. Generally, but thinly

¹ Revival of name *chloriceps* (Bonaparte) as in the earlier edition is unnecessary. See Ripley, S. D., 1969, *Ibis* 111: 102.

60

CICONIIFORMES

distributed throughout the subcontinent from Sind (in W. Pakistan) to eastern Assam and Manipur. Also Ceylon and Laccadive Islands. Chiefly plains and up to at least c. 1000 m. in the Nepal bhabar and duns, and up to c. 1500 m. in the peninsular hills (Mahabeshwar). Affects streams, lakes, ponds, etc., with dense marginal shrubby growth. Also coastal backwaters, mangrove swamps, and tidal creeks.

Extralimital. Burma, Thailand, Malaysia, Indochina, Indonesia, Philippines, Sunda Islands, Celebes (Sulawesi). Numerous other races occur in S. America, Africa, Indian Ocean islands, and eastern Asia south to Australia and S. Pacific islands.

x.c. 1

GENERAL HABITS. Solitary; shy and retiring; silent. Crepuscular and nocturnal, but also active during daytime, particularly in cloudy overcast weather. Partial to shady nullahs and secluded rock pools in jungle streams bordered or overgrown with jamun (*Eugenia jambolana*) seedlings, *Phyllanthus lawii*, and similar bushes. Flushes when suddenly come upon, flying with deliberate wing flaps, the thick and heavy-looking neck stretched forward (not telescoped like heron's), and dropping into the shrubbery or alighting on an overhanging branch a hundred metres or so farther. Normally keeps during daytime to shady watercourses under the welter of tangled brushwood, uprooted trees and other debris brought down by monsoon torrents, perched rather sluggishly on some snag or projecting root a few inches above water, constantly flicking its tail up and down like a kingfisher. Very parochial; occupies the same secluded spot day after day. Here sits patiently craning down its neck now and again to jab at anything eatable that floats or swims past. Or it stealthily creeps along the water's edge and lunges at prey within range. On suspicion, surreptitiously clambers up into the seclusion of a thicket, descending immediately it is reassured.

FOOD. Fish, shrimps, frogs, crabs, water beetles, etc. Mudfish or *neota* (*Periophthalmus*) and *Belone strongylura* (16.50–20.25 cm. long) specifically recorded among stomach contents of specimens.

VOICE. Normally very silent. When flushed and flying off utters an alarm note *K'you*, *K'you* or *K'yek*, *K'yek* (y as in 'yes') (G. M. Henry). 'Teem-teem-teem like redshank' (H. Abdulali). Other notes not described.

BREEDING. Evidently double brooded. Season, over the greater part of the subcontinent March to September, varying locally with water conditions; in Ceylon March to July. Nest, a small platform of twigs with an unlined depression for the eggs. Built singly, but colonially or in mixed

HERONS, EGRETS

61

heronries, though exceptionally several nests may be found in a circumscribed area. Normally 3 to 4.5 metres up in a small tree in a mangrove swamp, or in one concealed among bushes on the edge of the stream or pond; occasionally near a village, the bird's silent and secretive behaviour preventing discovery. Eggs, 3 to 5, smooth, fine textured, light sea green, very like those of Pond Heron (q.v.) but curiously enough averaging larger. Average size of 40 eggs 39.5×29.7 mm. (Baker).

Both sexes incubate and feed the young by regurgitation, the chicks seizing the adult's bill and vigorously twisting and stroking it to make it disgorge (cf. Purple Heron). Incubation period unrecorded. Courtship display and behaviour undescribed. Incubation commences with first egg, resulting in considerable disparity in growth of nestlings in the same brood.

MUSEUM DIAGNOSIS. Indian birds, *chloriceps*, are paler than those from W. Java (*javanicus*), with longer moustachial streaks and longer wings. Wing 18 ♂ 174-184; 6 ♀ 177-182 mm. v. 3 ♂ 165-174; 2 ♀ 166-174 mm. in *javanicus* (Biswas, loc. cit.).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	174-203	56-70	47-51	54-69 mm. (Baker)

Weight 1 ♂ 220 gm. (BNHS).

COLOURS OF BARE PARTS. Iris bright lemon-yellow. Bill, upper mandible dark horny brown, lower sage green; blacker in breeding birds. Eyelids and bare patch in front of eyes bright yellowish leaf-green. Legs and feet yellowish leaf-green, yellower on hind tarsus and soles; claws dusky.

39. Andaman Little Green Heron. *Butorides striatus spodiogaster* Sharpe

Butorides spodiogaster Sharpe, 1894, Bull. Brit. Orn. Cl., 3: xvii
(Andamans and Nicobars)
Baker, FBI No. 2232, Vol. 6: 359

LOCAL NAMES. Unrecorded.

SIZE. As last.

FIELD CHARACTERS. Similar to *chloriceps* but darker, especially on the underparts. (See Museum Diagnosis.)

STATUS, DISTRIBUTION and HABITAT. Resident. Andaman and Nicobar islands. Affects mangrove forest along the shores.

GENERAL HABITS, FOOD, VOICE, etc. As in the last.

BREEDING. No difference except that the nesting sites are chiefly in mangrove trees in tidal swamps. Eggs averaging slightly smaller — 38.2×28.2 mm. (Baker).

MUSEUM DIAGNOSIS. Differs from *chloriceps* in being darker grey, especially on neck, breast, and abdomen which are dark slaty grey. Sides of the head deeper grey with less white.

MEASUREMENTS. Slightly smaller:

	Wing	Bill	Tarsus	Tail
♂ ♀	167-171	57-60	41-44	58-62 mm.

COLOURS OF BARE PARTS. As in last.

HERONS, EGRETS

63

42. Indian Pond Heron or Paddybird. *Ardeola grayii grayii* (Sykes)

Ardea Grayii Sykes, 1832, Proc. Zool. Soc. London: 158 (Dukhun)
Baker, FBI No. 2229, Vol. 6: 354
Plate 4, fig. 9 and Plate 6, fig. 8

LOCAL NAMES. *Bāglā*, *Āndhā bāglā*, *Chama bāglā*, *Khūnch bāglā* (Hindi); *Koneh bāk* (Bengal); *Bāgli* (Mirbhikars, Bihar); *Ral puchake* (Gond); *Kūlāthū kokkū*, *Kūrūthū kokkū*, *Mādū kālān*, *Mādāyān* (Tamil); *Gūddi konga* (Telugu); *Kana kokka*, *Podi kokka* (Sinhala); *Brūku* (Kashmir); *Kūlāmūnī* (Malayalam).

SIZE. Country hen +; length c. 46 cm. (18 in.).

FIELD CHARACTERS. An egret-like waterside bird largely snow-white and prominent when in flight, effectively camouflaged earthy brown when at rest.

Adult (non-breeding). Drab. Above, head and neck dark brown streaked with yellowish buff. Back, scapulars, and tertiaries, ashy brown with pale yellowish shaft-stripes on the scapulars. Below, chin and throat white; upper breast white, streaked with brown. Rest of plumage, including tail, white.

Adult (breeding). Very handsome. Above, head and neck light yellowish brown; crown browner. Long recumbent white or buff occipital crest of lanceolate plumes. Back deep maroon with very long decomposed feathers extending over the tail. Below, chin and throat white; upper breast ashy brown, the feathers long and somewhat disintegrated. Rest of body, wings, and tail white; tips of first primaries tinged brownish. Sexes alike in breeding and non-breeding plumages.

STATUS, DISTRIBUTION and HABITAT. Resident; shifting locally with drought and flood conditions. Throughout the subcontinent, and Ceylon. Also Andaman, Nicobar, and Laccadive islands. In the plains and seaboard; up to c. 1200 m. in the peninsular hills (to 2150 m. in the Nilgiris), and c. 1500 m. in the Kashmir and Nepal valleys. Affects streams, jheels, marshes, inundated paddyfields, village tanks, stagnant roadside ditches, borrow-pits and puddles, even kutchas wells, and tidal mudflats.

Extralimital. From the Persian Gulf to Burma and Malaysia.

GENERAL HABITS. Usually solitary when feeding, or in small loose parties. Gregarious at roost; colonial when nesting. Its method of hunting is typically heron-like, either standing hunched up and motionless but fully alert on the water's edge or amidst a squelchy puddle, or stalking stealthily, lifting each foot clear of the water and putting it down circumspectly, neck craned forward and bill poised in readiness to jab at the quarry. Observed catching fish by bellyflopping on the water from overhanging stone slab c. 1 metre above (Muir, JBNHS 24: 366). Large numbers collect at drying-up village ponds after the monsoon to feast on the concentrating refugee frogs and fish. Rises with a flash of the white wings and flies with deliberate rather lazy flapping, neck partly extended as in the Little Green Heron, not folded back as in the Grey Heron.

FOOD. Frogs, fish, crustaceans, water beetles, and other insects. Mud-skippers or *Periophthalmus* from tidal swamps, and *Oryzias* crabs from between tidemarks on the sandy seashore specifically recorded. Also among insect food the following identified: *Brachytrypes achatinus*, *Atractomorpha crenulata*, *Oxya* sp., *Crocotemis serrillia*, *Pelagonus marginatus*, *Trithemis*

62

CICONIIFORMES

40. Paler Maldivian Green Heron. *Butorides striatus didii* Phillips & Sims

Butorides striatus didii Phillips & Sims, 1958, Bull. Brit. Orn. Cl., 78: 51 (Malé Island, North Malé Atoll, Maldive archipelago)
Not in Baker, FBI

LOCAL NAME. *Rabonds* (Maldives).

SIZE. As *B. s. chloriceps*.

FIELD CHARACTERS. Similar to *chloriceps* but much paler even than the next form.

STATUS, DISTRIBUTION and HABITAT. Resident. Common in the central and northern atolls of the Maldive archipelago. Affects mangrove swamps and the neighbourhood of beaches.

GENERAL HABITS. Not different from *chloriceps*. At ebb tide sits on the knobs of coral on the beaches, darting out at small fishes and crabs nearby. Flies inland as tide rises to perch on tops of palm trees or stand on the sea walls and exposed coral outcrops, apparently asleep. Not shy.

41. Darker Maldivian Green Heron. *Butorides striatus albidulus* Bangs

Butorides albidulus Bangs, 1913, Proc. Biol. Soc. Washington, 26: 93 (Suadiva Atoll, Maldive Islands)
Not in Baker, FBI

LOCAL NAMES. *Rabonds* or *Rabulli* (Maldives).

SIZE. As *B. s. chloriceps*.

FIELD CHARACTERS. Similar to *chloriceps* but paler.

STATUS, DISTRIBUTION and HABITAT. Resident. Southern Maldive Islands. Mangrove swamps and around beaches.

GENERAL HABITS. As in the paler Maldivian race (q.v.).

MUSEUM DIAGNOSIS. Paler than *chloriceps*. Described from the unique type collected on Suadiva Atoll. Whether both races from within this group of islands can be maintained needs investigating.

MEASUREMENTS and COLOURS OF BARE PARTS. As in the other races.

Genus ARDEOLA Boie

Ardeola Boie, 1822, Isis von Oken, col. 559. Type, by monotypy, *Ardeola limicola* Scopoli

Cf. Bock, W.J., 1956, Amer. Mus. Novit. No. 1779: 35-57

Feathers of head, neck and upper breast elongate. Those of the two latter decomposed during the breeding season, when also a crest of elongate, lanceolate feathers develops. Bill stout and about equal in length to middle toe and claw. Tarsus strong, about same length as bill. Tail of twelve feathers, typically broad. Neck shorter than in *Ardea*. Head, neck and back always coloured, but undergoing a complete change of colour in the breeding season.

64

CICONIIFORMES

palidinnervis, *Platygomphus dolobratus*, *Dysticus* spp., *Chrotopogon* spp., grasshoppers, dragonfly larvae, crickets, ants, etc.

VOICE and CALLS. A harsh croak when suddenly flushed. Birds in a nesting colony constantly utter a conversational wa-koo — very human-like — interlarded with short croaks.

BREEDING. Usually in small groups of its own species, or mixed with night herons, egrets, cormorants, etc. Perhaps less colonial than many others of the family. *Season*, in most parts of the subcontinent May to September; in south India and Ceylon November to February; in Ceylon till August. *Nest*, an untidy structure of twigs, slightly more substantial than a dove's nest. Built in isolated large trees or clumps such as of tamarind or mango, often growing in the midst of a noisy town or village, and not necessarily close to water. Colonies also sited in willows, as in Kashmir, or in babool (*Acacia arabica*) or tamarisk (*Tamarix* sp.) standing in water, the nests between two and four metres above the surface; likewise in mangroves. If undisturbed, the same sites are used year after year and tend to become traditional. Eggs, 3 to 5; smooth, fine-textured, typical broad oval of the family, pale sea green in colour. Average size of one hundred eggs 38.0×28.5 mm. (Baker). Believed to pair for life, but this not proven. Both sexes take part in nest building; apparently the male chiefly responsible for collecting the material which the female puts together. Both sexes incubate and feed the young. Period of incubation 24 days (Lamba, *Pavo* 1(1)-1963). Feeding done by regurgitation as in the Grey and Green Herons (qq.v.), with vigorous bill-seizing and demands by the young.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	199-230	60-67	60-64	73-84 mm. (Baker)

Scheer (loc. cit. *infra*) gives for Indian birds:

	Wing	Bill length	depth at base	Tarsus
♂ ♂	194-230 (210.9)	48-66 (60.6)	12-15 (13.8)	50-63 mm. (56.6)
♀ ♀	182-224 (198.4)	51-66 (58.8)	11-15 (12.9)	49-62 mm. (54.5)

Weight 10 ♂ ♀ 175-310 (av. 215) gm. (BNHS).

COLOURS OF BARE PARTS. Iris lemon yellow. Orbital skin greenish yellow. Bill greenish yellow with blue on base, horny on middle part of culmen, black on top and sides of anterior third. Legs and feet dull green; claws pale horny; pads dingy yellowish white (Biswas).

HERONS, EGRETS

65

In full breeding dress the legs and feet in some individuals become bright salmon pink. In the majority there is merely a brightening of the yellow.

42a. Maldivian Pond Heron. *Ardeola grayii phillipsi* Scheer

Ardeola grayii phillipsi Scheer, 1960, Senck. biol. Frankfurt am Main, 41: 145 (Hitadu, Addu Atoll, Maldives)
Not in Baker, FBI

LOCAL NAME. *Hudu rabulli* (Maldivian).

SIZE. Same as 42.

FIELD CHARACTERS. Same as for 42. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Race peculiar to the Maldivian Is. Found on the southernmost atolls — Addu and Suadiva. Affects freshwater ponds and rain puddles; also tidal mudflats.

GENERAL HABITS, FOOD, VOICE and CALLS. Similar to 42. Recorded as eating frogs, skinks, small fish, shrimps and insects. Has been observed jabbing at large land crabs with the heavy bill.

BREEDING. No information.

MUSEUM DIAGNOSIS. Differs from the nominate form in having a more massive bill in the male, and shorter tarsus in the female. Outermost primaries in adult pure white instead of dusky.

MEASUREMENTS

	Wing	Bill length	depth at base	Tarsus
♂ ♂	207-220 (211.1)	64-68 (65.8)	14.5-16 (15)	54-67 mm. (57.6)
♀ ♀	186-199 (190.6)	53-58 (56.5)	12.5-14 (13.1)	49-52 mm. (50.1)

COLOURS OF BARE PARTS. Iris golden yellow. Bill yellow. Legs pale yellow-green becoming deeper yellow in ♂ ♂ and more rose in ♀ ♀ during the breeding season. Weight of type specimen 230 gm. (Scheer).

43. Chinese Pond Heron. *Ardeola bacchus* (Bonaparte)

Buphus bacchus Bonaparte, 1855, Cons. Av., 2(1) (Malay Peninsular)
Baker, FBI, No. 2230, Vol. 6: 355
Plate 6, fig. 7.

LOCAL NAMES. *Lampra* (Manipur).

SIZE. Indian Pond Heron +; length c. 52 cm. (21 in.).

FIELD CHARACTERS. Slightly larger than Indian Pond Heron and very similar to it in non-breeding plumage.

Adult (breeding). Above, head and neck, with long lanceolate nuchal crest, dark maroon-chestnut. Back and some scapulars blackish slaty. Below, chin and throat white; elongate breast plumes dark maroon-chestnut, blackish towards ends. Rest of body including wings and tail white; the outer two or three primaries brownish at tip. Sexes alike.

HERONS, EGRETS

67

SIZE. Village hen; length c. 51 cm. (20 in.).

FIELD CHARACTERS. In non-breeding plumage a lanky snow-white bird very similar to Little Egret, usually seen in attendance on grazing cattle, not necessarily near water. Always identified from Little Egret by yellow bill contra black. In breeding plumage unmistakable: golden buff on head, neck, and back, the feathers disintegrated and hair-like. Sexes alike.

× c. 1

STATUS, DISTRIBUTION and HABITAT. Resident, but in the Himalayas migrating to lower elevations in winter. Throughout the subcontinent, Ceylon, and the Andaman, Nicobar, Laccadive, and Maldivian islands. Plains, and cultivated Himalayan duns and valleys up to at least 1500 m. altitude (Nepal), and to c. 1200 m. (possibly higher) in the peninsular hills and plateaux (e.g. Sahyadris, Nilgiris), often as a daily commuter from lower levels. Almost invariably in attendance on grazing animals, domestic or wild. In recent years the species has spread to and colonized widely in S. America and the U.S.A.

Extraliminally the race *coromandus* occurs in Burma, the Indochinese countries, Malaysia, S. China, Korea, S. Japan, Formosa, Hainan, Philippines, Sunda islands, Celebes (Sulawesi), and Ceram as resident, migrant, or on passage.

GENERAL HABITS. Gregarious. Usually seen in attendance on grazing village cattle on damp grassy margins of tanks as well as dry fallows and forest glades far removed from water. Also with grazing herds of wild buffaloes, or rhinoceros wallowing in swamps and *bheels* in Assam. The birds stand around amongst or on the backs of the animals fearlessly, or stalk alongside running energetically in and out between their legs and pouncing on grasshoppers and other insects disturbed by the animals' progress. Every now and again the long flexible neck and pointed bill lunges out at the fleeing quarry. Sometimes a bird will complacently settle on and walk along the body of a wallowing animal to explore the inside of its ear or some less accessible part. Blood-sucking flies, ticks and other parasitic insects are picked off the sides and bellies of the grazing animals by the birds springing up for them as they scurry alongside, or from other parts while riding upon the animals' heads or backs. To capture bluebottle flies (*Musca comitoria*) off the low herbage, the bird poises its bill, cranes forward and sways its neck comically from side to side as if taking aim, and jabs at the insect.

Besides attending on cattle they sometimes collect in large gatherings (of up to several hundred strong) at inundated ploughed fields where the freshly turned up soil provides ample feeding. They consort freely with vultures at slaughter-houses and animal carcase dumps on the outskirts of towns, for the flies and maggots these unsavoury places provide. Cattle

66

CICONIIFORMES

STATUS, DISTRIBUTION and HABITAT. Resident; shifting locally. Eastern Assam, Manipur, East Pakistan, Andaman islands. Affects marshes, and every sort of inland and tidal waters, as the Indian bird (q.v.).

Winter plumage, × c. 1

Extralimital. China from Kansu and the Tsinling Mts south to Burma, Thailand, Malaysia, Hainan and Borneo. Wanderer to Japan (non-breeding).

BREEDING. Breeds in the eastern Brahmaputra Valley in Assam (Lakhimpur), westward to about Tezpur, in small mixed heronries together with Indian Pond Herons and the usual associates. Season, chiefly May to July-August. Nest and eggs not different from those of the Indian bird, the latter 3 to 5 pale sea green. Average size of 50 eggs 37.7 × 28.4 mm. (Baker).

MUSEUM DIAGNOSIS. Non-breeding plumage differs from *A. grayii* only in being somewhat more brown and buff on the head and neck, and rather deeper brown on back and scapulars.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	195-238	61-69	60-64	72-90 mm. (Baker)

COLOURS OF BARE PARTS. Iris deep golden yellow. Orbital skin greenish yellow. Bill yellow, blackish on terminal quarter, bluish at base. Legs and feet yellowish green, the soles still paler; possibly as in *A. grayii* salmon pink in some breeding individuals, but not recorded.

Genus *BUBULCUS* Bonaparte

Bubulcus Bonaparte, 1855, Comp. Rend. Acad. Sci. Paris, 40: 722. Type, by tautonymy, *Ardea ibis* Linnaeus = *Ardea bubulcus* Audouin

Included by some authors in *Ardeola*. Differs from *Egretta* by its shorter bill and feet. Naked portion of tibia shorter than inner toe without claw. Breeding plumage very distinctive, consisting of golden buff hair-like plumes on head and back.

Only a single species inhabiting the warmer parts of Europe and Asia, and all Africa. Has spread to America within recent years.

44. Cattle Egret. *Bubulcus ibis coromandus* (Boddaert)

Cancerma coromanda Boddaert, 1783, Table Pl. enlum.: 54 (Coromandel)
Baker, FBI No. 2226, Vol. 6: 349
Plate 7, fig. 5

LOCAL NAMES. *Sirkhia-bāglā*, *Badāmi-bāglā*, *Doria bāglā*, *Gāi bāglā* (Hindi); *Go bāk*, *Gāi bāk* (Bengal); *Samti konga* (Telugu); *Unni kokku* (Tamil, Ceylon); *Harakkakka* (Sinhala); *Jobogali* (Assam); *Gochāndi khāo* (Marathi); *Kunk pakki* (Sind); *San-dung-il* (= 'following after cattle' — Manipur); *Kāliminti* (Malayalam).

68

CICONIIFORMES

egrets have favourite roost trees, shared with crows, mynas, and other birds, to which they resort every evening flying in a more or less disorderly rabble in the characteristic heron style — neck folded back, head hunched between the shoulders, and legs tucked under the tail, projecting behind like a rudder.

FOOD. Chiefly insects. From stomach contents the following have been identified: Sarcophagidae, *Agrotis* sp. larvae, *Chrologonus* spp., *Acridium aeruginosum* and other grasshoppers, carabid beetles, earth-worms, and flies (Muscidae). To a minor extent tadpoles, frogs and lizards.

VOICE and CALLS. A low croak uttered when one bird is supplanting another, especially at nest colony. Normally very silent.

BREEDING. Season, mainly June to August in N. India; November to February in the south; February to July in Ceylon. In small to medium sized colonies of its own, but more usually mixed with cormorants, night herons, egrets, etc., in large trees such as mango, tamarind, or peepul, often standing in the midst of a noisy bazaar — even within populous cities like Bombay, Madras, and Calcutta — not necessarily close to water. Eggs, 3 to 5, broad ovals, very pale sea green, almost white or skim-milk blue. Average size of 80 eggs 44.1 × 36.5 mm. (Baker). Both sexes share in nest building, incubation, and feeding the young by regurgitation as in Purple Heron (q.v.). Incubation period undetermined.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	240-260	50-66	82-92	83-96 mm.

Males average a little larger than females.
Weight 2 oo? 450, 475 gm. (BNHS).

COLOURS OF BARE PARTS. Iris golden yellow. Bill yellow; orbital and facial skin greenish yellow. Legs and feet black, the upper parts of the tibia, and soles, yellow or greenish yellow (Baker)

Genus *EGRETTA* Forster

Egretta T. Forster, 1817, Syn. Cat. Brit. Eds.: 59. Type, by monotypy, *Ardea garzetta* Linnaeus

Contains those egrets which in the breeding season develop ornamental plumes on the back as well as, in some cases, on the breast and head. All are white at all seasons with the exception of *E. guloris* and *E. sacra* which are dimorphic with also slaty phase. Smaller than birds of the genus *Ardea* and with much slenderer bills and thinner necks. In winter plumage the species can be distinguished chiefly by size.

See Key, p. 50.

45. Large Egret or Great White Heron. *Ardea alba alba* Linnaeus¹

Ardea alba Linnaeus, 1758, Syst. Nat., ed. 10, 1: 144 (in Europe = Sweden)
Baker, FBI No. 2222, Vol. 6: 345

LOCAL NAMES. Same as next.

SIZE. Grey Heron ±; length c. 96 cm. (38 in.); standing c. 75 cm. to top of head.

¹*Egretta alba* has been transferred to genus *Ardea*.

FIELD CHARACTERS. A large lanky snow-white heron-like marsh bird with bare blackish legs, long slender neck and head, and pointed black-and-yellow or yellow bill. In the breeding season a bunch of ornamental filamentous plumes (aigrettes) develops on the back, falling over beyond the tail. Sexes alike. Solitary.

STATUS, DISTRIBUTION and HABITAT. Rare winter straggler into West Pakistan and Uttar Pradesh. Affects jheels and marshes.

Extralimital. Breeds in SE. Europe, W. and N. Asia to SE. Siberia, N. China, N. Japan.

GENERAL HABITS. See next.

MUSEUM DIAGNOSIS. For plumages etc. see Withersby 1939, 3: 139.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	410-465	110-135	170-215	140-185 mm.

♀♀	400-450	110-132	—	—
----	---------	---------	---	---

COLOURS OF BARE PARTS. Iris yellow. Bill black, base yellow (ad. summer), all yellow (ad. winter & juv.); lores and round eyes green; legs and feet black-brown, sides yellowish, toes greenish black (Withersby).

46. Eastern Large Egret. *Ardea alba modesta* J. E. Gray

Ardea modesta J. E. Gray, 1831, Zool. Misc.: 19 (India)

Baker, FBI No. 2223, Vol. 6: 346

Plate 7, fig. 1

LOCAL NAMES. *Māldng bāglā*, *Tūrā bāglā* (?), *Tar bāglā*, *Bādā bāglā* (Hindi); *Dhār bāk*, *Bādā bāk* (Bengal); *Bōr bōg* (Assamese in Nowgong); *Loklenba* (= 'standing in streams' — Manipur); *Peddā tellā konga* (Telugu); *Mala konga* (Gond); *Peria vellāi kokku* (Tamil, Ceylon); *Loku sudu kokka*, *Badadel kokka* (Sinhala); *Bāglo āchho* (Sind); *Perūmūnti* (Malayalam).

SIZE. Grey Heron —; length c. 91 cm. (36 in.).

FIELD CHARACTERS. Slightly smaller, otherwise identical with the foregoing and indistinguishable from it. Size variable and deceptive; thus in non-breeding plumage confusion between some individuals and the Smaller Egret easily possible. In breeding season, especially during various nest ceremonies, the diaphanous lacelike plumes of the back are often erected and spread out in 'showers' — a halo of mist! No crest. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident and nomadic, shifting locally with water conditions. Throughout the subcontinent and Ceylon, Nepal Valley (?) and lowlands, and Maldiv Islands in winter. Not recorded in Andaman or Laccadive is.; possible sight record in Nicobars (JBNHS 61: 502). Low country — at jheels and marshes, rivers, tidal estuaries, etc.

Extralimital. Burma, eastward through the Indo-Chinese countries and Malaysia to S. and C. China, S. and C. Japan, south and east to Australia.

GENERAL HABITS. Usually solitary, and seldom more than two or three separated individuals amongst feeding groups of the two smaller species. More gregarious when nesting, but everywhere less abundant, more widely scattered, and less communal than the other egrets. Behaviour and feeding

HERONS, EGRETS

71

Baker gives the range of *modesta* ♂♀ as Wing 354-391; bill (from feathers) 104-116 mm. and says 'Bill much more slender than in *E. a. alba*'

COLOURS OF BARE PARTS. Breeding: Iris bright lemon-yellow. Bill black, yellow at base. Orbital skin and lores bright verdigris green. Legs: tibia bright rose-pink; tarsus and feet pinkish brown or black. Non-breeding: Bill orange-yellow. Orbital and facial skin greenish yellow. Legs, feet, and claws, black.

MISCELLANEOUS. Longevity, *A. a. alba*: c. 10 years (Ring, 1962, 33: 148).

47, 48. Smaller or Median Egret. *Egretta intermedia intermedia* (Wagler)

Ardea intermedia Wagler, 1829, Isis von Oken, col. 659 (Java)

Egretta intermedia palluca Deignan, 1947, Proc. Biol. Soc. Washington 60(1): 97 (Muang Chiang Rai, Siam)

Baker, FBI No. 2224, vol. 6: 347

Plate 7, fig. 2

LOCAL NAMES. *Pātāngkhā bāglā*, *Pātōkhā bāglā*, *Kārchā bāglā* (Hindi); *Korehā bāk* (Bengal); *Bāglo āchho* (Sind); *Lāng khong sāng* (Manipur); *Vellāi kokku* (Tamil); *Sudu kokka* (Sinhala); *Tellā konga* (Telugu).

SIZE. Length c. 45 cm. (26 in.).

FIELD CHARACTERS. Slightly smaller, otherwise very like Eastern Large Egret; non-breeding birds often indistinguishable from it. In breeding plumage presence of decomposed filamentous plumes on back as well as breast diagnostic. No crest. Sexes alike. Less solitary than Large, less gregarious than Little Egret.

STATUS, DISTRIBUTION and HABITAT. Resident and nomadic, shifting locally with water conditions. Throughout the subcontinent, Ceylon, Andaman and Nicobar islands. Low country and plateaux; to about 1400 m. altitude in Nepal Valley. Affects jheels, marshes, inundations; also coastal backwaters, tidal estuaries, and mangrove swamps.

Extralimital. Burma, Thailand, Indo-Chinese countries, Malaysia, east to China and Japan, south to Greater Sunda Is. and the Philippines. Resident in some of the areas, migratory in others.

GENERAL HABITS. Not different from Large Egret except that it is somewhat more social even in the non-breeding season, occasionally seen in small flocks.

BREEDING. Colonial, in mixed heronries with the usual associates. Season, nest, and nest sites as in the previous species. In Sind inundated tamarisk forest, and in Kutch and other coastal areas tidal mangrove forests are commonly resorted to for nesting. Eggs, 3 or 4, sometimes 5, pale sea green, smooth-surfaced broad ovals. Average size of 60 eggs 47.6 × 35.8 mm. (Baker). As in other egrets, both sexes share all domestic chores. Incubation period undetermined, but believed to be about 21 days.

MUSEUM DIAGNOSIS. For distinguishing this from *E. a. modesta* see remarks under that species.

Egretta intermedia palluca Deignan is based on the mistaken premise that eastern birds retain a yellow bill at all seasons. La Touche (1931-4, 2: 447), and Smythies (1953: 529) both describe the bill as black in the breeding season, and the former as 'yellow, pointed with black in winter', therefore exactly as in typical *intermedia* from western India. There seems no justification for retaining this race.

70

CICONIIFORMES

habits very similar to the Grey Heron's (q.v.). Flight with rather slow deliberate flapping of the broad wings, typically heron-like — neck telescoped, head pulled in between the shoulders, legs trailing behind. When disturbed and suddenly taking off, and also during short foraging hops the long slender neck is fully extended, and twisted this way and that, seemingly to counterbalance the swaying legs and produce an even keel.

FOOD. Fish, frogs, crustaceans, water insects, etc.

VOICE and CALLS. Except for an occasional throaty croak when one bird is supplanting a rival, very silent.

BREEDING. Colonial, in mixed heronries of storks, darters, cormorants, Smaller and Little Egrets; etc. Season, July to September in Sind and N. India; November to February in the south; December to May in Ceylon. Nest, a flimsy twig platform, c. 25-35 cm. in diameter, seemingly too small for the bird. Built in trees of medium to large size standing by themselves or in a grove or copse, either partially submerged or on raised ground away from water. In the latter case it may be a large peepul or tamarind tree in the midst of a noisy town or overhanging a public highway, with as many as 40 to 50 nests of this species in addition to others'. Babool (*Acacia arabica*) and kandi (*Prosopis spiciroga*) trees in the Keoladeo Ghana Sanctuary of Rajasthan, and tamarisks in the riverain and canal areas of Sind, are commonly patronized. The nests here are scattered amongst those of other species in the heronry without any suggestion of segregation. Eggs, 3 or 4, smaller but otherwise identical with those of the Grey Heron. Average size of 60 eggs 54.0 × 38.6 mm. (Baker). Both sexes build the nest, incubate, and feed the young by regurgitation, as described. Incubation period unrecorded; in the nominate race (*alba*) it is said to be 'probably 25-26 days'.

MUSEUM DIAGNOSIS. For description of plumages etc. see Withersby 1939, 3: 139 for the nominate race, from which *modesta* differs only in being smaller. Generally distinguishable from *Egretta i. intermedia* (next species) by its wing length of c. 350 mm. and tarsus over 160 mm. *contra* wing under 350 and tarsus under 150 mm. But females are smaller, and furthermore there is considerable individual variation in size, sometimes producing an overlap or near-overlap in these measurements. Therefore, identifying individual examples in non-breeding plumage is not always satisfactory, and in some cases even impossible.

MEASUREMENTS

		Wing	Bill (from feathers)	Tarsus	Tail
China specimens (Foochow)	5 ♂♂	360-370	109-111	173.5-175 (one 163)	139-150 mm.
	4 ♀♀	345-361	95-104	152-157	130-143 mm.

Breeding males have the train of dorsal ornamental plumes projecting from about 92 to 165 mm. beyond tip of tail; females about 38 to 90 mm. (La Touche 1931-4, 2: 446).

		Wing	Bill (from skull)	Tarsus	Tail
Indian specimens (Gujarat & Ceylon)	6 ♂♂	355-375	103-117	146-165	125.5-143 mm.
	6 ♀♀	337-365	97-100.5	136-160	120-138 mm. (SA, HW)

72

CICONIIFORMES

MEASUREMENTS. Baker gives as follows:

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	304-333 (once 354)	73-97 (twice 68, once 118)	122-148 (once 114)	116-135 mm.

Three specimens from Travancore, Ceylon and Rajasthan measure: 2 ♂♂ wing 302, 316; bill (1) 94 (from skull), (1) 77.5 (from feather); tarsus 111.5, 120; tail 121.5, 124 mm. 1 ♀ wing 294; bill (from feathers) 69; tarsus 102 tail 117 mm.

Weight 1 ♂? 900 gm. (BNHS).

COLOURS OF BARE PARTS. Iris lemon-yellow. Bill black, yellow at base (breeding) lemon-yellow, dusky at tip browner at base (non-breeding). Naked lores and infra-orbital skin yellowish green (breeding); yellowish (non-breeding). Legs and feet dusky black, greenish on the joints and tibia. Rose-pink or salmon-pink in leg of breeding birds unrecorded in this species.

49. Little Egret. *Egretta garzetta garzetta* (Linnaeus)

Ardea Garzetta Linnaeus, 1766, Syst. Nat., ed. 12, 1: 237

('Oriente' = northeast Italy)

Baker, FBI No. 2225, Vol. 6: 348

Plate 4, fig. 7 and Plate 7, fig. 3

LOCAL NAMES. *Kilchia* or *Kārchā bāglā* (Hindi); *Bādrō* (Sind); *Chhotā korhā bāk* (Bengal); *Teleri bog* (Assamese in Nowgong); *Crimd tellā konga* (Telugu); *Chin vellāi kokku* (Tamil, Ceylon); *Sudu kokka* (Sinhala); *Chinnamūnti* (Malayalam).

SIZE. Village hen ±, with longer neck and legs; length c. 63 cm. (25 in.).

FIELD CHARACTERS. A lanky snow-white waterside bird — small replica of the Large and Median Egrets. Similar also to non-breeding Cattle Egret but distinguished from it at all seasons by black v. yellow bill, partly coloured legs and feet (black and yellow), and also usually by habitat. In breeding season develops a drooping nuchal crest of two long narrow plumes in addition to filamentous ornamental feathers on both back (scapulars) and breast; the latter less decomposed. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident, shifting locally with water conditions. Throughout the subcontinent, chiefly lowlands and plateaux; to about 1400 m. altitude in the Himalayas (Nepal Valley) and at least 900 m. in the peninsular hills. Also Ceylon, Andaman, Nicobar, Laccadive (?), and Maldiv Islands. Affects inland waters — marshes, jheels, inundated paddyfields, etc. Rarely tidal estuaries, mudflats and backwaters; hardly ever the seashore.

HERONS, EGRETS

73

Extralimital. S. and E. Europe, N. and E. Africa, Middle East, Iran, Afghanistan, Burma, Malaysia, east to China, Hainan, and Japan. Partly migratory.

GENERAL HABITS. More gregarious than the two larger white egrets, usually in flocks on the edge of water or wading in the shallows. Still-hunts or stalks prey in the characteristic heron manner, lunging out with its flexible neck and dagger bill to seize the quarry. Flies with steady but leisurely flaps of the broad rounded wings, head and neck drawn in when commuting or on long flights. Roosts on favourite trees ('rookeries') in association with other species.

FOOD. Fish, frogs, crustaceans, water insects, etc.

BREEDING. Colonial, in mixed heronries. *Season*, July to September in Sind and N. India; November to February in the south; December to May in Ceylon — dependent on water conditions. *Nest*, the typical flimsy cupped structure of twigs — only slightly more substantial than a dove's — placed 2 to 6 metres up in a tree, single or one of a grove standing in a tank or jheel, or on dry land; sometimes away from water and in the midst of a village or town. The nests are often close together, even touching others of the same or different species. Inundated tamarisk forests in Sind, and partially submerged babool and kandi jungle in monsoon-flooded semi-desert areas in NW. India (Kutch, Rajasthan, etc.) are favourite nesting sites. Similarly situated *Barringtonia racemosa* groves and *Pandanus* thickets in South India (Vedanthangal in Madras; Srirangapatnam in Mysore), and mangroves in the Bengal Sunderbans are also regularly patronized. But smaller heronries are scattered all over the country. *Eggs*, 3 to 5, typically heron, pale blue-green broad ovals with a smooth texture. Average size of 60 eggs 44.4 × 31.7 mm. (Baker). As in the family, both sexes share all the domestic chores. Feeding of young etc. as in the species described. Incubation period 21–25 days.

MUSEUM DIAGNOSIS. For details of plumages etc. see Witherby 1939, 3: 141.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	257–289	79–91	99–110	92–108 mm. (Baker)
		(from skull)		
♂ ♂	260–295	85–92	100–110	90–110 mm.
♀ ♀	(240) 250–282	78–90		— (Witherby)

Weight 5 oo? 320–420 (av. 390.6) gm. (BNHS).

COLOURS OF BARE PARTS. (Breeding and non-breeding) Iris yellow. Facial skin greenish yellow. Bill black, the gape and base of lower mandible yellowish. Tarsus and tibia black; feet yellow, greenish yellow, or mixed black and yellow; soles almost all yellow. In a female in breeding condition from Nepal, 'Ocular skin bluish purple. Bill black, base of upper mandible bluish purple, lower mandible with a small basal area of bluish purple. Legs black, feet orange-yellow' (Ripley).

MISCELLANEOUS. *Egret Farming.* Some years ago this species used to be extensively and lucratively farmed by the *mirbahars* or *mohanas* (inland

HERONS, EGRETS

75

FIELD CHARACTERS. General effect as of Little Egret, but dimorphic. Adult in two colour phases: (1) pure white, (2) slaty grey to slaty blue-black, with glistening white throat and upper foreneck. Some examples intermediate, partly white partly slaty. In breeding plumage a nuchal crest of two elongated narrow plumes and same sort of filamentous plumes on back and breast as in Little Egret. White phase indistinguishable from Little Egret except by more solitary habit and seacoast habitat. Sexes alike in both colour phases.

Sub-adult (dark phase?). *Above*, pale ashy grey. *Below*, chin and throat white; upper foreneck grey; lower foreneck, breast and underparts including under tail-coverts and inner thighs, white.

STATUS, DISTRIBUTION AND HABITAT. Resident, nomadic, and local migrant (see Breeding). Northern shores of the Arabian Sea and seaboard of West Pakistan (where very common); shores of western India south to Kanyakumari, and of northwest Ceylon; Laccadive Is. Rare on the eastern coast, only recently recorded as resident and breeding from east of Nellore and in the neighbourhood of Pulicat lagoon (Kirkpatrick, JBNHS 58: 275). Affects sandy and rocky seashores, tidal lagoons and mudflats, and mangrove swamps. Once far inland, Hyderabad, A.P. (Neavoll, 1967, JBNHS 65: 216).

Extralimital. Coasts of Red Sea, Gulf of Aden, and Persian Gulf.

GENERAL HABITS. Solitary and somewhat crepuscular. Occasional separated twos and threes, both colour phases together. Gregarious at nest colonies. Wades stealthily into shallow surf on tidal mud, or among rock pools left by receding tide, and secures prey by jabbing at it with the pointed bill and flexible neck. Often seen sitting hunched up on a partly submerged rock or fishing stake patiently waiting for the tide to ebb to resume hunting. While stalking in the shallow surf, sometimes suddenly raises unopened wings at the armpits, level with the back, crouching forward furtively on flexed legs (as in a bird about to settle on eggs), wading deeper almost to belly, peering intently into the water, neck craned out and bill poised in readiness. From time to time also suddenly flicks the wings open and shut, quite obviously to stampede lurking or 'frozen' prey by the sudden movement. Flight and general behaviour not different to Little Egret's, though usually more mobile and active when hunting.

FOOD. Fish, crabs, molluscs, etc. The mudskipper (*Periophthalmus*), procured in tidal mud, is a regular food item of adults and nestlings.

VOICE AND CALLS. Very silent. A short throaty croak sometimes heard when one bird is supplanting a rival.

BREEDING. Colonial, usually in segregated heronries of own species, but also mixed with other egrets and pond and night herons. *Season*, between

74

CICONIIFORMES

fisherfolk) of Sind on many of the local dhands (jheels) for their valuable ornamental plumes known to the trade as 'aigrettes' or 'ospreys'. The birds were pinioned and housed in spacious pens of reed matting — 50 or 60 couples to a pen — where they moved about freely and became quite tame. They were well fed and cared for, and between March and September they paired off, built their own nests from twigs provided by the owners, laid from 3 to 5 eggs, and incubated them. After hatching the chicks were left with the parents for about a week, then removed and hand reared. They attained maturity in about 12 months. The parents commenced laying a second clutch almost immediately after the removal of the brood, and soon brought up another family. In this way they sometimes produced 4 and even 5 successive clutches during the season. The dorsal plumes were extracted in a humane manner without injury to the birds. There were four pluckings — one every three months — and each bird seldom produced less than a *tola* (11.66 gm.) in the year. Round about the year 1914, the feathers fetched from Rs. 10 to Rs. 15 per *tola* in the Indian market (even '10 to 28 times their weight in silver'), but as much as £15 per oz. (28.35 gm.) when smuggled to Europe, a trade which was apparently practised on a large scale by specialists in the business! The lack of official encouragement to this profitable cottage industry by a controlled relaxation of the ban on export of wild birds' plumage in favour of genuinely farm-produced feathers — but even more the change in women's fashions in clothing — has virtually put an end to the egret-farming industry. But to our knowledge some small egret farms existed in Sind up to 1930, and some may possibly survive to this day. While the farming concerned the Little Egret almost exclusively, before statutory protection was given enormous numbers of egrets of all species were slaughtered by gangs of professional hunters, armed with snares and muzzle-loading guns, who scoured the countryside visiting one breeding heronry after another and systematically slaying the adults, often leaving the nestlings, to starve and perish. In the more accessible areas this vandalism had reduced the egret population to the verge of extinction. The species that suffered most were the three white egrets — *E. alba*, *E. intermedia* and *E. garzetta*, but to a lesser degree also the Cattle Egret (*Bubulcus ibis*) and the Reef Heron (*Egretta gularis*). (For detailed accounts see articles on 'Egret Farming in Sind', JBNHS 23: 161; 27: 944; 28: 748, 751.)

50. Indian Reef Heron. *Egretta gularis schistacea* (Hemprich & Ehrenberg)

Ardea (Leptorodas) schistacea Hemprich & Ehrenberg, 1832, Symb. Phys. Aves, (p. 12), pl. 6 (Red Sea)

Ardea Asha Sykes, 1832, Proc. Zool. Soc. London: 157 (Dukhun)

Baker, FBI No. 2228. Vol 6: 353

Plate 7. fig. 4

LOCAL NAMES. *Kālā bāglā* (Hindi); *Thirāmūti* (Malayalam); *Therāpū konga* (Telugu); *Kārāi kokke*, *Kārpū kūllāyāyin* (Tamil).

SIZE. Same as Little Egret; length c. 63 cm. (25 in.).

76

CICONIIFORMES

April and August in Sind (Karachi city and harbour) and Kutch (Gul of Kutch); end of May in Ceylon (Chilaw; rare). No record elsewhere in between, therefore possibly migrates locally to special areas. *Nest*, the usual untidy structure of twigs, occasionally plucked green and with leaves still attached. In large trees such as peepul (*Ficus religiosa*), jamun (*Eugenia jambolana*), Rain Tree (*Pithecellobium dulce*) and others standing on dry ground, with the colony overflowing on to adjacent trees. But the normal site is coastal mangrove swamps subject to inundation at high tide, the nests being placed in trees and bushes of *Rhizophora*, *Avicennia*, and *Sonneratia*, etc. Both the dark and pale phases breed together in the same colony, but white mated to white and slaty to slaty only; no evidence here of slaty and white birds paired together as in Africa. *Eggs*, 3 or 4, exactly like those of the Little Egret in colour, shape, and texture of shell. Average size of 50 eggs 44.9 × 34.3 mm. (Baker). Both sexes share all the domestic chores. As in most herons the male collects the twigs and fetches them to the nest where the female puts them together. Incubation commences with the first egg, accounting for marked disparity in growth of young in the same brood. Nest-feeding done by regurgitation as described. Period of incubation undetermined. The nests contain either all white or all grey chicks each. Only a single case observed of 2 white, 1 grey (one of the parents was white, the other not seen). None of the white chicks are snow-white, all being more or less dappled with grey, thus different from Little Egrets'. No adult white bird retains the grey dappling, but adult slaty birds frequently show small asymmetrical white patches on the wings.

MUSEUM DIAGNOSIS. In skins extremely difficult to distinguish *E. garzetta garzetta* from white phase of *E. gularis schistacea*. Proportions and colours of legs and toes (particoloured) the same in both. Plumages both breeding and non-breeding also identical, including the ornamental plumes. The only constant difference is: bill black in the always white *E. garzetta garzetta* against horny brown or even yellowish in *E. gularis schistacea*, whether in the dark or the white phase. It has been suggested that the dimorphic *E. g. schistacea* may only be ecological populations of *E. g. garzetta* adapted to a marine habitat. Contrary to experience in India, dark and white birds often found paired together in the same colonies in Africa, and dark and white chicks in the same nest. Furthermore, in East Africa *E. g. garzetta* has several colour phases — pale lavender grey, sooty grey, dark sooty grey, and blackish slate, with intermediates. The problem of these colour phases is not properly understood. The different coloration does not depend on age or sex.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	267–301	94–101	97–102	102–112 mm. (Baker)

Weight 5 oo? 355–460 (av. 421) gm. (BNHS).

COLOURS OF BARE PARTS. Variable. Adult: Iris yellow. Bill horny brown above, yellowish at base and on lower mandible; or largely bright yellow (in slaty phase). Legs and feet particoloured as in *E. garzetta*: tarsus greenish black; toes yellowish brown (dark phase), largely yellow or greenish yellow (white phase).

In small nestlings, naked skin between feather buds, and apteria, yellowish grey-green. Legs and feet yellowish green and brown.

Iris greenish grey in very young; lighter grey (almost whitish) in older nestlings.

HERONS, EGRETS

77

51. Eastern Reef Heron. *Egretta sacra* (Gmelin)

Ardea sacra Gmelin, 1789, Syst. Nat. 1(2): 640 (Tahiti)

Baker, FBI No. 2227, Vol. 6: 351

LOCAL NAMES. Unrecorded.

SIZE. Length c. 58 cm. (23 in.).

FIELD CHARACTERS. Slightly smaller than the last, otherwise of same general effect and maritime habitat.

Adult. Also dimorphic like No. 50: (1) pure white, (2) dark slaty grey or slaty black, with a white streak down middle of chin and throat. In breeding plumage both phases distinguishable from *E. g. schistacea* by a bushy nuchal crest, *contra* crest of two lanceolated plumes in the latter. Feathers of lower foreneck long, lanceolate, overhanging breast. Long lanceolate plumes on back (scapulars and interscapulars) reaching to middle of tail, ending in paler slaty grey than rest of plumage. Sexes alike.

Sub-adult. Pied or mottled, in intermediate colour stages.

STATUS, DISTRIBUTION AND HABITAT. Resident in the Andaman and Nicobar islands. Affects rocky portions of the coasts.

Extralimital. From the eastern coasts of the Bay of Bengal eastward — Burma, Malaysia, to the coasts of southern China Sea, S. Korea, S. Japan, Philippines, Sunda Islands, Moluccas, Celebes, New Guinea, South Pacific islands, N. Australia, New Zealand.

GENERAL HABITS. Very similar to the last. Solitary. Keeps to the rocky sea coast and squelchy tidal mud exposed at low water, or sits hunched up on a partially submerged rock or mangrove tree waiting for the ebb.

FOOD. Fish, especially the mudskipper (*Periophthalmus*), crabs, and occasionally insects, such as grasshoppers, obtained on bare ground above tide level.

VOICE. An occasional 'grunted croak or *ork* when feeding, presumably to signalize the acquisition of an unduly tasty morsel'. Also a longer harsher, *ark* when alarmed (Gibson-Hill). Normally silent.

BREEDING. Colonial. Season, May to July and up to September. Nest, the usual rough untidy stick platform. Placed on rocks in hollows and crevices, in stunted *Ficus* trees, low thorny bushes up to a metre from the ground, or more commonly among mangrove trees in creeks, sometimes just above high-water mark (B. B. Osmaston). Eggs, 3 or 4, pale sea green, typical of the herons. Average size of 50 eggs 44.8 × 33.3 mm. (Baker).

MUSEUM DIAGNOSIS. For details of plumages, and a very full discussion of the colour phases etc., see A. O. Hume 1874, *Stray Feathers*, 2: 304-9.

	MEASUREMENTS			
	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	250-293	70-86	72-77	93-98 mm. (Baker)

COLOURS OF BARE PARTS. Variable. Iris yellow. Bill horny brown above, yellowish at base and on lower mandible; often yellow all over in white birds. Legs varying from pale yellowish green (in white birds) to deep dull greenish or nearly black (in dark individuals).

HERONS, EGRETS

79

Not recorded from the Laccadives or Maldives. Affects jheels, tanks, streams, and ponds, as well as estuaries, tidal creeks, coastal lagoons and backwaters.

Extralimital. Central and southern Europe, south to Africa. Middle East, Burma, Thailand, Malaysia, the Indochinese countries to China and Japan.

GENERAL HABITS. Gregarious, crepuscular and nocturnal except in breeding season. Colonies from a dozen to several hundred birds spend the daytime roosting in the seclusion of dense *Pandanus*, mangrove or other bushes bordering or overhanging water, or covering a little islet in a river. A grove of large leafy trees or a bamboo copse on dry ground, maybe in the vicinity of a village — lofty chenars in Kashmir — do equally well. Here the birds sit sluggishly in their characteristic hunched posture, neck drawn into the body, shoulders and back rounded, and blood-red eye staring unblinkingly. Owing to their silent and secretive habits such daytime roosts, even large and populous ones, are liable to be overlooked unless some disturbance causes the birds to fly out, when they will mill around like a rabble of flying foxes before resettling. At dusk they bestir themselves, flying out singly or in small parties in different directions to their accustomed feeding grounds by some jheel or creek. Except when foraging for nest-young, feeding is chiefly done in the morning and evening twilight, and during the night. The birds are active in the quest for food and seldom still-hunt in the manner of true herons. The flight is strong and direct, with quick flaps of the rounded wings — reminiscent in the distance, and in silhouette, of a flying fox. The thick-set neck is pulled in and shortened, but not folded in as in the Grey Heron. At the communal roosts and heronries emotion of any kind between individual birds is expressed by a momentary raising of the crest and fluffing out of feathers of the neck, breast and back, followed occasionally by a jab of the bill at a neighbour.

VOICE AND CALLS. A single unmistakable raucous *wook* or *kwaark* is uttered from time to time while flighting to and from the feeding grounds. Partially fledged chicks in the nest or when out clambering among the adjacent branches keep up an incessant clamour, *click, click, click*, etc. for being fed.

FOOD. Fish, frogs, aquatic insects, dragonfly larvae, etc.

BREEDING. Colonial. Often in pure colonies of its own, or in segregated *mohallas* in mixed heronries, or even individually in uneasy proximity of nests of cormorants, egrets, and pond herons. Season, April-May in the Vale of Kashmir; June-July to September in N. India generally; December to February in S. India; December to September in Ceylon. Nest, a rough untidy platform of twigs, sometimes flimsy enough for the eggs to be seen from below. Placed in the same sort of sites as used for daytime roosts — trees, *Pandanus* or tamarisk bushes standing in or near water, or groves of trees (often lofty, as chenars in Kashmir) on dry land. Eggs, 3 or 4, rarely 5, typical of the family, pale blue green, longish ovals. Average size of 50 eggs 49.0 × 35.1 mm. (Baker). Both sexes take part in all the domestic chores. The nest material is evidently collected chiefly by the male. Incubation period not ascertained; given as 21 days for European birds. Great disparity in chicks of same brood owing to the eggs being laid at about 48-hour intervals and incubation commencing with the first egg. Chicks fed by

78

CICONIIFORMES

Genus NYCTICORAX T. Forster

Nycticorax T. Forster, 1817, Syn. Cat. Brit. Bds.: 59. Type, by tautonymy and monotypy, *Nycticorax infansatus* Forster = *Ardea nycticorax* Linnaeus

Bill very stout and deep, much compressed, with culmen distinctly curved; upper mandible notched close to tip. Head short and comparatively thick with nuchal crest of a few narrow feathers. Wings rounded: 3rd primary (as.) longest. Tail short, of 12 feathers. Only upper part of tibia feathered. Tarsus long and stout, about equal to culmen in length; scutellated in front, reticulated behind. Genus practically cosmopolitan.

52. Night Heron. *Nycticorax nycticorax nycticorax* (Linnaeus)

Ardea Nycticorax Linnaeus, 1758, Syst. Nat., ed. 10, 1: 142 (Southern Europe)

Baker, FBI No. 2233, Vol. 6: 659

Plate 4, fig. 16 and Plate 6, fig. 14

LOCAL NAMES. *Waak*, *Kwaak*, *Tār bāglā*, *Kōkrāi* (Hindi); *Bār* (Kashmir); *Bachka* (Bengal); *Chongkhū* (Manipur); *Raat bāggūl*, *Raat kōkkā*, *Rāj kōk* (Marathi); *Awaak*, *Waaak* (Gujarat); *Gadri* (Sind); *Chinta wākha* (Telugu); *Vākka* (Tamil); *Toppi kōkkū* (Malayalam); *Re kāna kōkkā* (Sinhala).

SIZE. Pond Heron; length c. 58 cm. (23 in.).

FIELD CHARACTERS. A stocky grey, white and black marsh bird of the same general effect as the Pond Heron, with a markedly stouter bill.

Adult. Above, ashy grey with metallic greenish black back and scapulars. Forehead and a streak over eye white; crown, nape, and drooping occipital crest black, the last with a few long narrow white plumes. Below, white; sides of body ashy grey. Sexes alike.

Young (immature). Brown, streaked and speckled with rufous, buff, and dark brown — rather similar looking, when at rest, to Pond Heron in non-breeding plumage.

STATUS, DISTRIBUTION AND HABITAT. Resident. Patchily distributed, and shifting locally with water conditions. Throughout the subcontinent, up to c. 1900 m. in the Kashmir and Nepal valleys in spring and summer; most moving southward in winter. Ceylon, Andaman and Nicobar islands.

80

CICONIIFORMES

regurgitation, as in the family, the parent's bill being seized and violently pulled down into the nest to induce disgorgement. Courtship display described in Witherby 1939, 3: 148-9.

MUSEUM DIAGNOSIS. For details of plumages etc. see Witherby 1939, 3: 150-2.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	265-300	65-80	65-75	95-110 mm.
♀ ♀	270-285	66-75	—	— (Witherby)

Weight 1 ♂ 275 gm. (BNHS)

COLOURS OF BARE PARTS. Iris blood-red. Bill black, greenish yellow at base and on most of lower mandible. Naked lores and orbital skin yellowish green. Legs and feet dull green. In breeding season bill blacker; legs and feet lemon-yellow, orange-red, or pinkish red.

MISCELLANEOUS. Longevity (in captivity): 18+ years (PZS, 125: 535).

Genus GORSACHIUS Bonaparte

Gorsachius Bonaparte, 1855, Cons. Av., 2: 138. Type, by monotypy, *Nycticorax goisagi* Temminck

Plumage variable. Bill as stout as in *Nycticorax* but much shorter. Culmen shorter than tarsus. Nostrils large, linear, open. Tarsus short, stout, reticulated throughout. Feet small, the toes bordered by a narrow membrane. Tail short, of twelve feathers. Head crested; neck short and thick. Wing rounded: 2nd, 3rd and 4th primaries (as.) subequal, the 3rd usually slightly the longest.

53. Malay or Tiger Bittern. *Gorsachius melanolophus melanolophus* (Raffles)

Ardea melanolophus Raffles, 1822, Trans. Linn. Soc. London, 13(2): 326 (Western Sumatra)

Baker, FBI No. 2234, Vol. 6: 361

Plate 4, fig. 8 and Plate 6, fig. 15

LOCAL NAMES. *Rāj bāg* (Assam); *Thāvitū kōkkū* (Malayalam); *Re kōkkā* (Sinhala).

SIZE. Pond Heron +; length c. 51 cm. (20 in.).

FIELD CHARACTERS. An unmistakable relation of the Pond and Night Herons. Reminiscent also of a large Chestnut Bittern (q.v.).

Adult. Above, crown and long bushy nuchal crest ashy black. Back and rest of upperparts largely chestnut-cinnamon, closely and finely barred with black (hence sometimes called Tiger Bittern). Primaries and secondaries greyish black with chestnut and white tips. Tail black, rufescent at tip. Below, chin and throat white; foreneck and upper breast sandy-rufous streaked with black. Rest of underparts white, blotched and spotted with black and rufous on lower breast and abdomen. Sexes alike.

Young (immature). Above, head almost black; nape and long crest feathers streaked with white. Rest of upper plumage dark brown spotted with white, the wings and scapulars with wavy buff barring. Below, chin and throat white with a central dark brown streak. Rest of underparts white to buff, spotted and barred with dark brown, densely on breast lightly on abdomen and flanks.

BITTERNs

81

STATUS, DISTRIBUTION and HABITAT. One of the peculiar discontinuously distributed Indo-Malayan species of evergreen biotope. Resident in the heavy rainfall areas of the southern Western Ghats — Kerala, W. Mysore (including Nilgiris) north to about Belgaum (c. 15° 50' N. × 74° 31' E.); Assam, Manipur. Winter visitor to Ceylon. Foothills and up to at least 800 m. altitude in SW. India; up to c. 1800 m. in Ceylon. Frequents streams and marshy patches in thick forest.

× c. 1

Extralimital. Burma, Thailand, Malaysia, Indochina, S. China, Formosa, Borneo, Sumatra, Java.

MIGRATION. Very little known. Regular winter visitor to Ceylon arriving on the west coast in October and November. At Jatinga in the Haflong district (c. 25° N. × 93° E.) and in certain other valleys of Assam, birds of this species, along with several others usually considered non-migratory, are regularly attracted in large numbers to lights displayed by the villagers. Jatinga lies on a spur flanking the valley at an altitude of about 600 m., and the appearance of the birds on dark cloudy overcast monsoon nights between August and October, flying in a north-south direction, is clearly suggestive of some sort of migratory passage. Further investigation is desirable. (For a fuller account see Sálím Ali, 1962, JBNHS 59 (1): 128-30.)

GENERAL HABITS. In many respects similar to those of the Night Heron; largely nocturnal. Excessively shy and difficult to approach or observe, but perhaps less rare than generally believed. When disturbed feeding at a water-hole in dense forest, it flies off noiselessly with a rapid flapping of wings, alighting a short distance away in a thick tree, whence it moves on again before it can be approached.

VOICE and CALLS. On the whole very silent. Besides a short croak and hisses uttered by an incubating bird when closely approached, nothing recorded. When hungry, captive birds uttered 'a rasping *arh arh arh* (a as in "hat")' — G. M. Henry.

FOOD. Fish, frogs, lizards, molluscs, insects, etc.

BREEDING. *Season*, in Assam chiefly May and June; in SW. India end May to August, during the heaviest rains. *Nest*, a flimsy structure of twigs like the Pond Heron's, sometimes with a lining of reeds etc. Usually placed between 5 and 8 m. up in a small tree overhanging a stream in thick forest. Not concealed, but easily overlooked. Rarely in reed beds. *Eggs*, 3 to 5, white

BITTERNs

83

55. Little Bittern. *Ixobrychus minutus minutus* (Linnaeus)

Ardea minuta Linnaeus, 1766, Syst. Nat., ed. 12, 1:240 (Switzerland)
Baker, FBI No. 2236, Vol. 6:364
Plate 6, fig. 11

LOCAL NAME. *Goi* (Kashmir).

SIZE. Pond Heron —; length c. 36 cm. (14 in.).

FIELD CHARACTERS. A 'hunchbacked' waterside bird, similar in general effect to the Pond Heron. In flight whitish shoulder patch contrasting with blackish wings, suggestive of identity.

Male (adult). *Above*, black, including crown, nape, crest, back, scapulars, rump, tail, and innermost secondaries. A large lavender-grey to whitish patch on closed wing (coverts) almost masking the blackish brown flight feathers while bird at rest. Sides of head and neck greyish pink or vinous. *Below*, throat and neck white to buff. Upper breast ochre, of lanceolate feathers; lower breast blackish maroon. Rest of underparts white, the flanks ochre with faint dark shaft-lines.

Female. *Above*, chestnut-brown largely replacing black. A chestnut-brown shoulder patch. *Below*, chiefly chestnut and rufous, streaked with rufous-buff.

Young (immature). *Above*, dark brown with rufous scalloping or streaking. *Below*, chiefly white and buff, streaked with chestnut and buff.

STATUS, DISTRIBUTION and HABITAT. Resident: local, and apparently also locally migratory. West Pakistan (Sind), and northern India (Nepal, Uttar Pradesh), east to Assam (Cachar — Baker). Normally in the lowlands; in the vale of Kashmir up to c. 1500 to 1800 m. altitude. Frequents jheels and marshes with thick reed-beds and other cover.

Extralimital. Central and southern Europe to W. Siberia and Transcaucasia. Asia Minor, Israel, Iran, Turkestan, Afghanistan. N. Africa, wintering south to Cape Colony. Other races in tropical Africa, Australia, New Zealand.

GENERAL HABITS. Non-gregarious; usually keeping singly, rarely two or three together. Largely crepuscular. Skulks in thick reed-beds during daytime, clambering amongst the stems, and seldom shows itself except when flushed from its retreat. Flies with fairly rapid flaps of the rounded wings, head characteristically drawn into the shoulders, close above the water or reed tops to pitch into the growth again a short distance away preceded by a short glide. Sometimes seen standing hunchbacked at the edge of a reed-bed, lunging out with its bill now and again at some insect or other morsel. When suddenly come upon, especially when on nest, the bird 'freezes', stretching the flexible neck to its full length upwards, bill thrust stiffly into the sky. In this attitude the long slender neck blends so perfectly with the surrounding reeds, particularly in the case of the streaked female, that the bird becomes astonishingly invisible even at close range as long as it remains still.

VOICE and CALLS. An occasional frog-like *urk* is recorded in Kashmir. In Europe the male has been described as uttering 'a rather low croaking *kéé*' repeated often for long stretches with remarkable regularity at rate of approximately 25 to a minute' (A. Voigt in Witherby 1939).

82

GICONIIFORMES

with a bluish tinge; broad ovals occasionally slightly pointed at the small end. Average of 40 eggs 46.2 × 37.2 mm. (Baker). Though ordinarily so shy, the bird is a close sitter, hissing and croaking at the intruder and refusing to leave its nest till almost touched. Share of the sexes in nest building, incubation and feeding the young unrecorded. Period of incubation unknown.

MUSEUM DIAGNOSIS
MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	255-281	43-49	c. 67-79	96-112 mm. (Baker)

COLOURS OF BARE PARTS. Iris golden yellow. Bill fleshy yellow, the culmen and tip horny brown. Orbital skin greenish slate, suffused with red in the breeding season. Legs and feet dull green, brownish in front.

54. Nicobar Tiger Bittern. *Gorsachius melanolophus minor* Hachisuka

Gorsachius melanolophus minor Hachisuka, 1926, Ibis: 592
(Katchel Island, Nicobar Is.)
Baker, FBI No. 2235, Vol. 6:363

LOCAL NAMES. Unrecorded.

SIZE. Slightly smaller than the foregoing.

FIELD CHARACTERS. As in No. 53.

STATUS, DISTRIBUTION and HABITAT. Apparently resident, but rare. Nicobar Islands (obtained at Katchel, Tillangchong, False Harbour, etc.). Frequents streams and swampy patches in thick forest.

GENERAL HABITS. As described under No. 53.

BREEDING. Not recorded.

MUSEUM DIAGNOSIS. As No. 53, but smaller. Plumage very variable.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	224-234	40-42 (once 44)	c. 61-67	80-88 mm. (Baker)

COLOURS OF BARE PARTS. As in the nominate race (No. 53).

Genus *IXOBRYCHUS* Billberg

Ixobrychus Billberg, 1828, Syn. Faun. Scand., 1(2): 166. Type, by subsequent designation, *Ardea minuta* Linnaeus. (Stone, 1907, *Auk*, 24: 192.)

Bill straight and slender; culmen flat at base with a broad shallow groove on each side of upper mandible. Tarsus rather short, equal to about two-thirds of the culmen. Back of neck almost denuded of feathers, though this concealed by feathers of side of neck. Head crested. Feathers of upper breast very soft and lax; no dorsal or scapular plumes. Tail short, often of ten feathers only.

Genus almost cosmopolitan except in the northern Holarctic Region.

84

GICONIIFORMES

FOOD. Fish, frogs, molluscs, crustaceans, and largely insects.

BREEDING. Has been recorded in the Eastern Nara district of Sind (Doig and Butler) in May; in Kohat (Whitehead) in July; in Cachar (Baker — once) month not stated. Breeds commonly and abundantly in the Kashmir Valley from May to July; singly, not in colonies. *Nest*, a pad of rushes built partly by bending down a number of reeds and then adding other pieces of reed flags to form a shallow platform; from a few centimetres to a metre or so above the water. Normally in dense reed-beds and liable to be swamped by rise of water level in a flood. Sometimes the nests are made of fine twigs and provided with a depression for the eggs. *Eggs*, 4 to 6 or 7, white, often with a pale bluish tinge; regular ovals about equal at both ends, smooth but glossless. Average size of 80 eggs 34.1 × 26.0 mm. (Baker). Both sexes share in building the nest, incubation, and feeding the young. The eggs are laid at two-day intervals. Incubation period 16-17 days. Incubation commences with the first egg, resulting in marked disparity in the development of chicks of the same brood. The nestling is clothed in loose cinnamon-coloured down with longer bottlebrush-like bristles sticking out from its crown. The older chicks clamber about among the surrounding reeds till a parent returns with food, whereupon they scramble back to the nest where the characteristic tussle ensues to induce it to regurgitate.

MUSEUM DIAGNOSIS. For details of plumages etc. see Witherby 1939, 3: 154-5.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	142-155	45-52	42-47	45-52 mm.
♀ ♀	137-150 (once 157)	45-52		

(Witherby)

Weight 2 oo? 105. 108 gm. (BNHS).

COLOURS OF BARE PARTS. Iris pale yellow to orange-yellow. Bill yellow, creamy yellow or purplish yellow, the culmen darker and browner. Orbital skin pale livid green. Legs and feet greenish yellow, dull greenish plumbeous or greenish horny (Baker).

56. Chestnut Bittern. *Ixobrychus cinnamomeus* (Gmelin)

Ardea cinnamomea Gmelin, 1789, Syst. Nat., 1(2): 643 (China)
Baker, FBI No. 2238, Vol. 6:367
Plate 6, fig. 9

LOCAL NAMES. *Lāl bāglā* (Hindi); *Khyri bāk* or *Lāl bāk* (Bengal); *Meti kakkā* (Sinhala); *Kūrūtta kakkū* (Tamil); *Sārdiyya kakkū* (Malayalam).

SIZE. Pond Heron —; length c. 38 cm. (15 in.).

FIELD CHARACTERS. Smaller and lankier than Pond Heron, but an unmistakable cousin.

Male (adult). *Above*, including crown and bushy crest, chestnut-cinnamon. Wing quills chestnut. *Below*, chin and throat whitish with a dark median stripe down foreneck. A patch of black and chestnut buff-edged feathers on each side of upper breast largely concealed by the elongated

BITTERNS

85

breast feathers; rest of underparts pale chestnut. Underside of wings (in flight) still paler chestnut with a pinkish tinge.

Female (adult). *Above*, chestnut-brown. Crown blackish. Scapulars and wing-coverts with black-bordered buff spots. *Below*, buffy rufous with a heavy brown streak down middle of foreneck and breast, flanked by parallel broken lines on either side, like 'coarse stitching with brown thread'. Rest of underparts streaked with dark brown. Underwing rufous-buff.

× c. 1

Young (immature). Like female but less chestnut more brown above, and more distinctly barred and spotted. *Below*, more heavily streaked with dark brown.

STATUS, DISTRIBUTION and HABITAT. Resident — subject to local movements dependent on water conditions; possibly also migratory to some extent. Throughout the subcontinent, Ceylon, Andaman, Nicobar and Maldivian islands. The Indus Valley is approximately the western limit of distribution of both this and Yellow Bittern; eastward to Assam and beyond. Lowlands from the Nepal duns and Himalayan terai southward in the Peninsula and Ceylon. Up to at least 900 m. elevation in the peninsular hills; to over 1800 m. in Ceylon. Affects reed-beds in inland jheels and swamps, inundated standing paddyfields, etc. Rarely also coastal backwaters and tidal mangroves, e.g. in Kerala; frequently side by side with the Yellow Bittern.

Extralimital. Burma, Thailand, Malaysia, Philippines, Sunda Islands, Celebes (Sulawesi). China from Manchuria to Hainan; Ryukyu Islands.

GENERAL HABITS. Non-gregarious and largely crepuscular. Normally seen during daytime only when flushed out of long grass, as when snipe-shooting, but commonly flying about from one reed patch to another during the breeding season and in overcast rainy weather. Flight (rather quick flaps of the rounded wings with neck drawn in) and other habits and behaviour very like Pond Heron and Yellow Bittern.

FOOD. Fish, frogs, molluscs, insects, etc. in astonishing quantity. One bird had swallowed a fish 12.70 cm. long, c. 5 cm. in circumference, with a skull c. 2 cm. across, 1 eel c. 13 cm. long, and 2 of c. 9 cm. each (Butler — Andamans).

VOICE and CALLS. Normally silent. Very noisy in spring, constantly uttering a loud *kok-kok* (La Touche). In courtship 'the male flew slowly before the female with slow, stiff wing beats, calling *ek-ek-ek*, then perched at the top of a low tree and sang *gook-gook-gook-gook-gook-gook-gook* with each of the first five notes louder than the one before it, and the last three pitched three or four tones lower' (H. G. Deignan). J. K. Stanford also describes this display in identical terms, minus the accompanying calls, and

BITTERNS

87

Female. More or less similar except for a buff mesial line down the throat and foreneck, sometimes obsolete.

Young (immature). *Above*, rufous-brown with broad buff fringes to the feathers (scalloping). *Below*, more heavily streaked; buff mesial line down centre of foreneck more pronounced.

STATUS, DISTRIBUTION and HABITAT. Resident, moving locally with water conditions; possibly also migratory to some extent. Throughout the subcontinent from the Indus Valley eastward to Assam and beyond, and from Nepal (duns) southward to Kerala. Also Ceylon, Andamans, and Nicobars. Lowlands, and up to c. 900 m. in the peninsular hills; to c. 1200 m. elevation in Ceylon. Affects reed-beds, and scrubby growth in inland swamps as well as coastal mangroves and backwaters, and inundated standing paddy crops, etc., frequently side by side with Chestnut Bittern.

Extralimital. Burma, Thailand, Malaya east to China and Japan, south to New Guinea and the Caroline Is. The numerous subspecies described are ill defined and their validity, according to Hartert (1910-22, 2: 1260) and later authorities, is questionable.

GENERAL HABITS. Like the Little Bittern (q.v.) largely crepuscular and nocturnal, but quite active in daytime in cloudy, overcast weather. When come upon suddenly, especially on nest, it also assumes the characteristic posture of the tribe aptly termed 'On Guard'. The slender neck is thrust vertically upward, bill pointing to the sky, while the bird freezes, taking full advantage of its streaked underside to become astonishingly inconspicuous amongst the reedy surroundings. In other respects also very similar to both the Little and the Chestnut Bitterns.

FOOD. Fish, frogs, molluscs, insects, etc. One described sitting on its heels catching flies 'which it did with incredibly rapid lunges of its head and bill without moving its body at all' (Vaughan & Jones — E. China).

VOICE and CALLS. Very silent. *Kaka-kakak* (Mayr — SW. Pacific).

BREEDING. Season, as in Chestnut Bittern, between June and September, as soon as the monsoon has properly set in, filling the depressions and swamps. *Nest*, and site, not different from the last — a pad of reed flags etc. placed on bent-down reeds in a swamp, or in shrubbery on the edge of a pond, from a few centimetres to a metre or so above the water or mud. *Eggs*, 4 to 6, fine-textured but glossless, pale skim-milk blue or green-blue. Inner membrane pale blue *contra* white or pale yellowish white in *Ixobrychus minutus*. Average size of 60 eggs 31.2 × 23.9 mm. (Baker). Both sexes take part in all the domestic chores. The eggs are laid on consecutive days and incubation begins from the first egg. Period of incubation undetermined.

MUSEUM DIAGNOSIS. For fuller description of plumage see Baker, loc. cit. Tibia feathered down to the tibio-tarsal joint. Culmen longer than mid-toe and claw. Rest as for the genus.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	129-136 (once 143)	52-57 (once 49)	44-51	41-47 mm. (Baker)

COLOURS OF BARE PARTS. Iris orange-yellow or bright golden-yellow. Bill: culmen horny brown, commissure and lower mandible pale yellowish flesh; mouth

86

CICONIIFORMES

says it reminded him of the nuptial flight of a long-eared owl or a greenfinch (*sic* Smythies).

BREEDING. Season, between June and September, commencing as soon as the monsoon rains have well set in; most general in July-August. *Nest*, a small pad of leaves, bits of reed stem, etc. built on bent-down matted reeds, or in a cane brake in a swamp, a metre or so above the water or mud. *Eggs*, 4 or 5, sometimes 6, white with occasionally a bluish tint; short to long ovals, generally almost cylindrical. Average size of 50 eggs 36.5 × 26.4 mm. (Baker). Both sexes take part in building the nest, incubation, and feeding the young, which is done by regurgitation, as described under No. 36. Period of incubation undetermined.

MUSEUM DIAGNOSIS. Tibia naked for c. 10 mm. above tibio-tarsal joint; otherwise as for the genus (cf. *I. minutus*).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	138-149 (once 156)	43-51	45-50	41-45 mm. (Baker)

Recent specimens from Nepal measure:

	Wing	Bill (from posterior edge of nostril)	Tail
3 ♂♂	151, 152, 154	45, 46, 47	44, 46, 48 mm.
1 ♀	145	45	45 mm. (Biswas)

COLOURS OF BARE PARTS. Iris yellow, orange, or pinky red. Bill greenish yellow or light orange-yellow, the culmen blackish, and base of the mandibles rosy red. Naked orbital and loreal skin deep rosy red or reddish purple in male; yellowish in female. Legs and feet yellowish green; soles paler, more yellow.

57. Yellow Bittern. *Ixobrychus sinensis* (Gmelin)

Ardea sinensis Gmelin, 1789, Syst. Nat. 1(2): 642 (China)

Baker, FBI No. 2237, Vol. 6: 365

Plate 6, fig. 10

LOCAL NAMES. *Jūn bāglā* (Hindi); *Kat bāk* (Bengal); *Meti kokka* (Sinhala); *Māndī nārāi* (Tamil); *Manja kokku* (Malayalam).

SIZE. Same as Chestnut Bittern; length c. 38 cm. (15 in.).

FIELD CHARACTERS. Like the Chestnut Bittern, small and lanky, and an unmistakable cousin of the Pond Heron; predominantly yellow, brown, rufous, and chestnut. In flight yellowish fawn body contrasting with black wings suggestive of identity.

Male (adult). *Above*, crown and bushy crest black; sides of head vinous-pink. Back chiefly light brown or yellowish brown. Rump dark ashy; tail slaty black. Wing quills blackish. *Below*, chin, throat, and foreneck pale yellowish; upper breast blackish with buff streaks; rest of underparts pale yellowish buff.

88

CICONIIFORMES

pink. Naked facial skin pale greenish yellow. Legs and feet yellow or greenish yellow; claws horny brown.

58. Black Bittern. *Ixobrychus flavicollis flavicollis* (Latham)

Ardea flavicollis Latham, 1790, Index Orn., 2: 701 (India)

Baker, FBI No. 2239, Vol. 6: 368

Plate 6, fig. 12

LOCAL NAMES. *Kālā bāglā* (Hindi); *Kālo bāk* (Bengal); *Ay jan* (Assam); *Khaira bōg* (Assam, Nowgong); *Kalu kākka* (Sinhala); *Kāruppu nārāi* (Tamil); *Kāruṭha kākku* (Malayalam).

SIZE. Pond Heron +; length c. 58 cm. (23 in.).

FIELD CHARACTERS. General effect as of Pond Heron; largely black and rufous-buff with a conspicuous buff-and-white cheek patch.

Male (adult). *Above*, crown, sides of head, and upperparts including wings and tail, slaty grey to almost black. A band of bright ochre-yellow on either side of neck. *Below*, chin and throat white with a rufous dotted line down the middle. Foreneck mixed slaty black, chestnut, and buff. Upper breast dark slate with buffy white margins to the feathers (scalloping). Rest of underparts slaty grey to brownish black with a few white-edged feathers on abdomen.

Female (adult). *Above*, more brown less slaty grey. *Below*, breast feathers streaked with white and rufous markings. Abdomen lighter brown with more white in centre.

Young (immature). *Above*, crown slaty black; rest of upper plumage including wings, dark brown scalloped light rufous. *Below*, upper breast brownish rufous, scalloped paler and with darker shaft-streaks.

STATUS, DISTRIBUTION and HABITAT. Resident, shifting locally with water conditions. Also partly migratory. Thinly and patchily distributed throughout the better watered parts of the subcontinent, from Sind in West Pakistan (E. Nara district) and the Gangetic Plain including Bengal and East Pakistan, to Assam, Manipur and beyond. Fairly common in the heavy rainfall zone of south-west India (Mysore, Kerala), and Ceylon. Not recorded from the Andaman and Nicobar islands. Affects reedy inland swamps and overgrown seepage nullahs in jungle, mostly in the low country, but also suitable marshes up to c. 1200 metres in the hills. Apparently not found in tidal mangroves.

Extralimital. Burma, Thailand, Malaysia, Indochina, central and southern China, Greater Sunda Is., Celebes (Sulawesi). Other races extend the species to Australia.

MIGRATION. A bird ringed in Malaya (Selangor, 3°12'N., 101°04'E.) 11.xii.1964 recovered in Manipur (Tadubi, 25°34'N., 94°04'E.) 1.xi.1965 (*Malayan Nature Jour.* 21(1): 36).

BITTERNS

89

GENERAL HABITS. Non-gregarious; largely crepuscular and nocturnal. On the whole very similar to those of the genus *Ixobrychus*. Skulks in swampy reed-beds and thickets once the sun is up, and only seen in daytime when beaten out of its retreat; more active at dawn and dusk, and in overcast rainy weather. Flight characteristic of the little herons as described. When suddenly come upon, adults as well as flightless clambering young assume the 'On Guard' posture and freeze, effectively camouflaging themselves among the reed stems.

FOOD. Fish, frogs, molluscs, insects, etc. (One fish c. 115 cm. taken from stomach.)

VOICE AND CALLS. Unrecorded, except for a loud booming in the breeding season.

BREEDING. *Season*, mainly June to September during the SW. monsoon, varying locally with incidence of rainfall and filling up of jheels and swamps. *Nest*, a pad of twigs or matted water-weeds with a slight central depression. Placed on bent-down reeds in a swamp, or in a cane brake or bamboo clump, a metre or so above the surface. *Eggs*, normally 4, broad ovals more or less equal at both ends, white with a faint tinge of bluish or sea green. Average size of 40 eggs 41.6 × 31.4 mm. (Baker). Both sexes share all the domestic chores. Incubation starts with the first egg. Incubation period undetermined. Chicks fed by regurgitation as characteristic of the family.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	197-215	69-82	61-70	63-74 mm.
♀♀	195-204			

COLOURS OF BARE PARTS. Iris golden brown to red. Bill reddish horny, paler and yellowish at tip and terminal half of lower mandible; bare facial skin purple, the eyelids bluer. Legs and feet dark brown (Baker).

Genus *BOTAURUS* Stephens

Botaurus Stephens, 1819, in Shaw, Gen. Zool. 11(2): 592. Type, by subsequent designation, *Ardea stellaris* Linnaeus

Plumage long and lax forming decorative plumes down foreneck and breast. Bill, short, deep at base, much compressed. Culmen shorter than tarsus. Nasal groove broad and deep with the linear nostril near base. Tarsus stout and short, shorter than middle toe and claw. Tibia partly naked above joint. Tail of ten feathers.

Genus chiefly confined to Palaearctic, Oriental and Australian regions, one species being found in India.

59. Bittern. *Botaurus stellaris stellaris* (Linnaeus)

Ardea stellaris Linnaeus, 1758, Syst. Nat., ed. 10, 1: 144

(Europe, restricted to Sweden)

Baker, FBI No. 2240, Vol. 6: 370

Plate 4, fig. 6 and Plate 6, fig. 13

LOCAL NAMES. *Nir goug*, *Bāz* (Hindi).

STORKS

91

or more. It is not particularly loud but of great carrying power and audible over a mile away.

BREEDING. Not proven but may possibly breed in thick reed-beds in Anchar Lake in the Kashmir Valley as asserted by local shikaris. According to Bates & Lowther 1952 (p. 355) it may occasionally be heard booming there in June, which is suggestive circumstantial evidence. *Nest* and site similar to those of the smaller bitterns. *Eggs*, 4 to 6, light olive-brown with a few specks and spots of darker brown at the broad end. Average size of 80 eggs 52.5 × 38.3 (Baker).

MUSEUM DIAGNOSIS. For description of plumages etc. see Witherby 1939, 3: 159-60.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	320-350	60-75	90-100	95-116 mm.
♀♀	300-356	65-75	—	—

(Witherby)

COLOURS OF BARE PARTS. Iris yellow. Bill greenish yellow, ridge of upper mandible brown at base, black-brown at tip. Lores and round eyes green to 'livid blue'. Legs and feet pale green, yellowish at tarsal joint and back of tarsus; soles yellow (Witherby).

MISCELLANEOUS. Longevity 8+ years (Ring, 1962, 33: 148).

Family GICONIIDAE. Storks

Large, long-legged, diurnal birds chiefly terrestrial and marsh-haunting. Colour pattern mainly white and black with a metallic sheen. Bill long, massive, pointed, straight or nearly so, ungrooved. Wings long and broad. Tail short; under tail-coverts lax and greatly developed in some species. Legs very long, the tibiae partly naked. Toes of moderate length, webbed at base. Claws blunt, that of middle toe not pectinated as in herons. No powder-down 'shampoo' patches. Tracheo-bronchial muscles to the syrinx or 'sound box' absent, therefore lacking voice and calls. Most species produce low grunting and hissing noises, and a loud castanet-like clattering or snapping of the mandibles.

Unlike herons, storks fly with neck and legs fully outstretched like cranes, ibises and spoonbills, by a series of wing flaps interspersed with sailing.

RANGE. Temperate and tropical zones of the Old and New Worlds. Seventeen species in all, the northern ones migratory.

FOOD. Mainly small animals—mammals, birds, reptiles, amphibians, fish, crustaceans, insects, etc.

BREEDING. *Nests*, large stick platforms in trees, or on cliffs and buildings. *Eggs*, 3-6 white. Incubation and nest feeding by both sexes. Chicks nidicolous; naked at first, downy later. Food regurgitated by parent into nest, whence guzzled by nestlings.

For structural and morphological details see Baker 1929, 6: 320; Witherby et al. 1939, 3: 112; Stresemann 1927-34, Aves: 807-9. Cf. Kahl, P., 1971, *Living Bird* (Cornell Univ.) 10: 151-70; 1970 JBNHS 67: 453-71.

Key to the Indian forms

- A Mandibles with edges not touching, leaving open gap near centre of bill

1

90

GICONIIFORMES

SIZE. Pond Heron +; length c. 71 cm. (28 in.).

FIELD CHARACTERS. Considerably larger than the Pond Heron, but of the same general hunchbacked effect, with neck retracted, both at rest and in flight. Overall tawny buff or straw colour, closely barred and mottled with blackish. Short, stout, pointed bill, and large feet.

Adult. *Above*, crown, nape and upper back black; bushy drooping crest partly tipped and edged with buff. Sides of head ochre, faintly stippled with black. Lower back, rump, and tail yellowish buff, profusely barred and mottled with black. *Below*, chin and throat white with a conspicuous buff and black median line continued down elongated overhanging yellowish buff breast plumes. Rest of underparts yellowish buff, streaked with brown and buff. Sides of breast narrowly barred with brown and dark buff. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, found in small numbers from Sind in West Pakistan (common) across Rajasthan and the Gangetic Plain to Assam, straggling south through Gujarat, Madhya Pradesh, Orissa, Andhra Pradesh, Maharashtra, Madras and Mysore (Nanjangud, 160 km. south of Bangalore, being the southernmost record in India). Not recorded in Kerala or Ceylon. Affects dense reed-beds and bulrushes in inland jheels and swamps.

Extralimital. Breeds in the temperate Palaearctic region throughout Europe and Asia from Great Britain to Japan. A second breeding race in South Africa.

MIGRATION. No precise information.

GENERAL HABITS. Similar to its smaller cousins described. Solitary, secretive, crepuscular and nocturnal. Seldom seen in daytime except when put up from partly submerged reed-beds, e.g. while snipe-shooting is in progress. Flaps leisurely and noiselessly above the reeds on its broad rounded wings and pitches into cover again a short distance away. When nesting, has the characteristic habit of freezing on alarm, neck and bill stretched vertically upward. In its winter quarters this 'On Guard' posture is only seen when e.g. a wounded bird is trying to evade capture.

FOOD. Fish, frogs, molluscs, insects, etc. Elsewhere small birds and rodents also recorded.

VOICE AND CALLS. Silent in winter. In breeding season the male utters a deep, resonant, rather ventriloquial boom, commonly repeated 3 to 6 times

92

	Neck brown.....	<i>Mycteria leucocephala</i> (juvenile)	93

Genus MYCTERIA Linnaeus

Mycteria Linnaeus, 1758, Syst. Nat., ed. 10, 1: 140

Type, by monotypy, *Mycteria orientalis* Linnaeus

Bill long, and very slightly compressed, broad at the base. Culmen rounded throughout; slightly turned downwards throughout its length; lower mandible concave beneath. Both mandibles subcylindrical anteriorly. Nostrils oval, placed near base of culmen. Head and throat naked; nape and neck feathered. Legs long with tibia half naked; toes long. Under tail-coverts very long, extending beyond tail. Represented in our area by only one species.

60. Painted Stork. *Mycteria leucocephala* (Pennant)*Tantalus leucocephalus* Pennant, 1769, Indian Zool.: 11, pl. 10 (Ceylon)

Baker, FBI No. 2214, Vol. 6: 331

Plate 8, fig. 2.

LOCAL NAMES. *Jānghil*, *Dhāk* (Hindi); *Kānkāri* (Mirshikars, Bihar); *Jānghil*, *Rām jāhākar*, *Soma jāngha* (Bengal); *Lamjang*, *Lungduk* (Sind); *Chitrōda* (Kutch); *Teru kāla konga* (Telugu); *Chingā nārāi* (Tamil); *Sāngudāi nārāi* (Tamil, Ceylon); *Das tuduwa* (Sinhala).

SIZE. Vulture \pm ; standing c. 93 cm. (3½ ft.).

FIELD CHARACTERS. A long-legged, long-necked, egret-like marsh bird with long, heavy yellow bill slightly decurved at tip, and unfeathered waxy yellow face. Plumage white, closely barred with metallic greenish black above, with a black band across breast. Delicate rose-pink near the tail (closed inner secondaries). Wing- and tail-quills black. Sexes alike.

Flight silhouette somewhat hunchbacked, neck outstretched (head lower than line of back) and long legs trailing straight behind.

Young (immature). Pale brown with dark scale-like edges to the neck feathers. No pectoral band.

STATUS, DISTRIBUTION AND HABITAT. Resident, shifting locally with water conditions. Throughout the plains of the Indian Union, both Pakistans, Nepal terai, Ceylon (low country dry zone). Not recorded in the Andaman Is. Affects inland marshes, jheels, inundated fields, and occasionally river banks.

Extralimital. Burma, Thailand, N. Malaya (vagrant), Indochina, SW. China.

GENERAL HABITS. Normally met with in pairs or small parties. In the breeding season enormous congregations of up to several thousand strong may collect at favourite heronries, e.g. Keoladeo Ghana in Rajasthan. Such heronries tend to become traditional if left unmolested. The birds feed gregariously where food is abundant, such as when large quantities of fish are washed down by monsoon floods. Usually they hunt individually, wading into shallow water with neck bent down, mandibles open like an enormous pair of forceps and partly immersed, probing the bottom mud. The bird saunters about slowly ploughing the water thus. From time to time one leg is partly flexed and deliberately wagged back and forth in a raking motion, occasionally supplemented by a sudden flicking open of the wing on the same side. This manoeuvre is obviously intended for stampeding 'frozen' quarry towards the open mandibles. Its success is evident from the snapping and swallowing action that frequently follows. When sated, the birds spend their time standing about hunchbacked on the bank, or soaring on thermals for hours on end, circling aloft on motionless wings in company with pelicans and other stork-like birds. Normal flight typical of the family (q.v.), accompanied by a rhythmical slight opening and closing of bill as if gasping for breath.

FOOD. Mainly fish. Also reptiles, frogs, crustaceans, and insects.

VOICE AND CALLS. Silent except for the characteristic clattering of the mandibles of the family. During greeting ceremony at nest a low moan

STORKS

95

bills into the parent's gullet and tugging at the fish to speed it on its way. Possibly the delay in delivery is due to the necessity of predigesting the food for the young.

MUSEUM DIAGNOSIS. Chick (in down). Sullied white with naked black face and black bill tipped with pale greenish yellow or sulphur yellow, more extensively on upper mandible. Also yellow on short thick (naked) eyebrow, at anterior end of eye and along naked hindneck.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	490-510	252-278	240-250	150-172 mm. (Baker)

Weight 2 oo? 2020, 3500 gnn. (BNHS).

COLOURS OF BARE PARTS. Iris straw yellow; grey-brown in immature. Bill orange-yellow, darker and plumbeous at base; naked skin of face orange-yellow. Legs and feet brown or fleshy brown, sometimes nearly red.

Genus *ANASTOMUS* Bonnaterré

Anastomus Bonnaterré, 1791, Tabl. Encyc. Méth. Orn., 1: xciii. Type, by subsequent designation, *Ardea oscitans* Boddaert

Bill stout and strong; gonys considerably upcurved; an open space between the mandibles for about two-thirds their length in the middle. Anterior half of upper mandible furnished with lamellae. Face, chin, and throat naked in adults; feathered all but the lores and throat in juveniles. Tarsus about equal to culmen in length; reticulated throughout. Toes and claws longer than in other genera of Ciconiidae.

61. Openbill Stork. *Anastomus oscitans* (Boddaert)*Ardea oscitans* Boddaert, 1783, Table Pl. enlum.: 55 (Pondicherry)

Baker, FBI No. 2215, Vol. 6: 333

Plate 8, fig. 5

LOCAL NAMES. *Gūnglā*, *Ghāngil*, *Ghōnghila* (Hindi); *Dokar* (Bihar); *Thonte bhānga*, *Shāmukh bhānga*, *Shāmukh khol* (Bengal); *Pouna konga* (Southern Gonds); *Galu konga* (Telugu); *Naththai kuththi nārāi* (Tamil); *Gombelle kōkka*, *Bellan kōkka*, *Beli kava* (Sinhala); *Sāmik bhānga* ('snail breaker'. Assamese, Nowgong); *Cherakokkan* (Malayalam).

SIZE. Large duck; length c. 81 cm. (32 in.). Standing c. 68 cm. (2½ ft.) to top of head.

FIELD CHARACTERS. A small stork, chiefly white with glistening purplish black or greenish black mantle (scapulars), wings, and tail. The peculiar-shaped bill with arching mandibles, leaving a narrow open gap between them, is diagnostic. Casually mistakable in the distance for White Stork, *Ciconia ciconia* (q.v.). Sexes alike.

In non-breeding plumage white upper parts replaced by dull smoky grey.

Young (immature). Darker smoky brown-grey with blackish brown mantle.

STATUS, DISTRIBUTION AND HABITAT. Resident, shifting locally with water conditions. Possibly regular local migrant in parts (?). Throughout

produced by both (?) sexes. A continuous harsh grating or scraping noise by half-grown nestlings when begging food.

BREEDING. Colonial, sometimes several thousand pairs together in mixed heronries. Season, variable, dependent on monsoon conditions. Normally August to October in N. India; November to March in the south; March-April in Ceylon. In drought years breeding may be skipped altogether. Nest, a large stick platform with a shallow central depression sparsely lined with leaves, straw, and waterweeds; added to desultorily throughout occupation with leafy twigs or green water vines (e.g. *Ipomoea*). Built in large or medium sized trees standing in water, such as babool (*Acacia arabica*), kāndi (*Prosopis spiciroga*), kelikādāmb (*Stephegyne parviflora*) and *Barringtonia racemosa*, often twenty nests or more on a single tree crowded cheek by jowl in disorderly tiers, in amicable association with cormorants, darters, open-bill storks, and others. Not uncommonly also on single large peepul (*Ficus religiosa*) or suchlike trees overhanging a pond within a populated town. Eggs, 2 to 5—most commonly 3 or 4—dull sullied white, sometimes sparsely spotted and streaked with brown. Average size of 50 eggs 69.5 × 49.0 mm. (Baker). Both sexes share all the domestic chores. Period of incubation undetermined. Adult, on arrival at nest, greets incubating mate by craning forward and stiffly arching neck (as in aggressive vulture at a carcass), with bill partly open as if about to be sick! This gesture reciprocated by mate in the same way; both (?) birds uttering a low moan during the ceremony, sometimes crossing the stiffly arched necks the while. In nest relief the incoming bird is greeted by its incubating mate standing up on the edge of the nest, both birds ruffling their long, lax, under tail-coverts, bending their heads together down into the nest, shifting from one foot to the other, and making as if to adjust the twigs in the structure before the newcomer takes over. While one bird is brooding its mate often flies out, maybe half a kilometre or more, to fetch tender leafy babool branches to add to the nest. Twigs wrenched off topmost branches with much effort, and sections of floating *Ipomoea* vine collected from the water—sometimes absurdly large bushy branches, at others ridiculously tiny or scraggy leafless twigs or rush-blades. Twigs broken off tops of only certain individual trees to which many birds from the neighbourhood may resort, several tugging at the same time. When the forager returns with material, the sitting bird greets him (or her) with clattering of mandibles, bill-touching and tail-spreading.

In the pre-clambering stage, small nestlings very intolerant of hot sun; constantly shielded by parent standing on edge of nest with partly open, drooping wings. On fright they disgorge all undigested food and feign death in a realistic manner, crumpling up pathetically on the floor of the nest. Three-quarter-grown chicks clamber about the neighbouring branches. On return of foraging parent they quickly scramble back to the nest and beg with open bills and partly open flapping wings, bobbing or 'pumping' head up and down with a continuous rasping or scraping cry, rather as of vultures in copulation. Sometimes incoming parent sits inert for long periods beside the nest (in one case 45 minutes) before stepping on to the edge and disgorging 6 to 8 large fish, along with much slimy matter. The chicks gobble these up from the nest floor, the more impatient ones poking their

CICONIIFORMES

96

the Indian Union, both Pakistans, Nepal (terai), and Ceylon. Affects inland waters—jheels, marshes, etc.; rarely river banks, and tidal mud flats.

Extralimital. Burma, Thailand, east through the Indochinese subregion.

MIGRATION. Apart from local shifts directly influenced by water conditions, performs some sort of regular migratory movement, as yet little understood. Birds are constantly reported dashing themselves against the dome of the lantern at various coastal lighthouses, e.g. Point Calimere (Tanjavur dist., Madras) and Sacramento (E. Godavari dist., Andhra).

× c. 1

This occurs only during the later monsoon months (August-September) on particular nights in the dark period of the moon, in overcast weather with low clouds, poor visibility and heavy wind. The falls occur before midnight or in the very early dark hours of morning, when a sedentary diurnal bird as this should normally have no business to be about!

Nestlings ringed at Bharatpur (Rajasthan) have been recovered a few months later up to 800 km. due east, suggesting definite seasonal movement. Further evidence of long migration provided by a bird ringed in Thailand (Wat Phailom, 14°06' N., 100°33' E.) on 5.ii.1965, recovered in East Pakistan (Jessore 23°20' N., 89°20' E.) on 26.vi.1966—a straight line distance of c. 1500 km. It is possible that after leaving the nest the young of this stork also disperse and wander far and wide, as young Grey Herons are well known to do.

GENERAL HABITS. Our smallest and commonest stork, with a wide local distribution. Met with singly or in small parties and flocks; large congregations when nesting. Like others of the family, regularly soars on thermals on a sunny day, circling for hours high up in the heavens in company with pelicans, ibises, and vultures, etc. The descent from aloft is a spectacular performance. With erect neck, head held high (cocked), wings half pulled in, the dangling legs partly flexed and straddled to balance—sometimes worked back and forth as in running—the bird hurtles steeply through space, banking, side-slipping, and gyrating violently, till within a few short seconds, from a mere speck in the sky, it has swished down, to alight buoyantly on a tree-top in the colony, preceded by a vigorous braking with the wings.

The significance and function of the peculiar gap in the bill is obscure. It is not meant for crushing snail shells as sometimes suggested. However, it is obviously an adaptation to facilitate extraction of the soft body and viscera of molluscs from the shell, particularly of the large *Pila globosa* snails on which the bird commonly feeds. The precise mechanics of the process have not been observed. In captivity Ierdon (1862-4) records that even blinded Openbills secured the shell with their feet and after some manipulation 'succeeded in cutting off the operculum as cleanly as if it had been done by a razor', but so rapidly that he was unable to follow the details. After removing the operculum the bird inserted the tip of its

STORKS

97

mandibles and 'pulled out the entire shell fish almost to its utmost tip'. Examination of *Pila* shells immediately after they had been emptied by Openbills showed that pressure exerted by the mandibles on the thin and brittle rim of the mouth had cracked off a section of it, allowing the bill tip to be inserted below the operculum to prise it up. How the soft parts are extracted so cleanly and rapidly remains a puzzle. The shells are often tackled under water with the mandibles of the bird partly open and submerged to above the eyes. The rapidity with which the bill is raised again and again to swallow the morsels is quite amazing. Before withdrawing, the head is shaken from side to side in the water as if to wash off the mud from the food.

FOOD. Chiefly molluscs. From the bill and gullet of a specimen eight complete bodies and viscera of large *Pila globosa* snails have been taken. Also eats crabs, frogs, and other small animals found on its accustomed feeding marshes. For details of food in the Sunderbans see Mukherjee, A. K., 1974, JBNHS 71(2): 188-91.

VOICE and CALLS. Very silent except for occasional deep moans and clattering of mandibles during greeting ceremony at nest. During copulation ♂ clatters his bill against that of ♀ (M. P. Kahl).

BREEDING. Colonial; in large mixed heronries sometimes several thousand pairs (e.g. at Keoladeo Ghana, Rajasthan). *Season*, mainly July to September in north India; November to March in the south; December to April in Ceylon; dependent on monsoon and water conditions. In drought years breeding may be skipped altogether. *Nest*, a rough circular pad of twigs with a central depression lined with leaves, etc. Built in trees such as *Acacia*, *Prosopis*, or *Barringtonia*, standing partially submerged in a jheel or monsoon-filled depression. Occasionally on the edge of a tank, in or close to a village. Many nests (up to 30 or more) on a single tree, in crowded association with darters, cormorants, and egrets with a tendency to segregation. Nests in such crowded situations become thickly caked with chalky white excreta from the jostling occupants of adjacent nests. *Eggs*, 2 to 4, rarely 5, sullied white, broad to moderate ovals, with a close texture. Average size of 100 eggs 57.9 × 41.2 mm. (Baker). Both sexes partake in all the domestic chores. Period of incubation believed to be 24-5 days; not confirmed. Chicks clothed in pale fawn-coloured down. Intolerant of the hot sun, and constantly shielded by parents standing on edge of nest with open drooping wings.

Fed by regurgitation by parent on to floor of nest, almost exclusively on soft bodies and viscera of large snails. Importunate chicks often short-circuit the food from the parent's open bill during the disgorgement process. On fright they throw up large boluses of it (once c. 58 gm.).

Till young flies from nest, bill of normal shape with close fitting mandibles; subsequent development of gap needs study. For further notes see Kahl, M. P., 1970, JBNHS 67(3): 454-6.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	392-408	153-162	c. 140-150	163-217 mm. (Baker)

STORKS

99

Extralimital. Burma. Other races in Africa and SE. Asia.

GENERAL HABITS. Met with as a solitary, in pairs, or small parties — a flock of fifteen being the largest ever recorded by us (SA). Stalks about and feeds on dry or marshy land, seldom wading in water or immersing bill. Roosts at night in tall trees. Has the common habit of soaring on thermals on a sunny day and gliding in circles high up in the sky in company with related birds, and with vultures. For further notes see Kahl, M. P., 1970, JBNHS 67(3): 456-7.

FOOD. Frogs, reptiles, crabs, molluscs, and large insects. Fish only when stranded high and dry by receding flood, or from drying up water-holes in forest streams, etc. Has been observed to pick winged termites emerging from the ground and also in the air, flying back and forth through a rising swarm and snapping up the insects in the bill (Ball 1874, SF2: 433).

VOICE and CALLS. Silent except for a clattering of the mandibles with neck bent over backwards and crown resting between the shoulders.

BREEDING. Individual; not in colonies. *Season*, variable; mostly July to September in northern India; December to March in the south; January to April in Ceylon. *Nest*, a massive structure of twigs, c. 1 metre in diameter, with a considerable central depression lined with straw, almost deep enough to hide the bird when sitting close. Usually built in a lofty tree such as *Salmalia* some 20 to 30 metres from the ground. Sometimes also lower down in medium sized trees. The same site may be used in subsequent years if the birds are left undisturbed. *Eggs*, broad to pointed ovals, 3 or 4, rarely 5, white, but becoming stained brown during incubation through contact with the bird's muddy feet. Very variable in size and shape. Average size of 100 eggs 62.9 × 47.4 mm. (Baker). Both sexes take part in building the nest and feeding the young; presumably also in incubation (unconfirmed). Period of incubation unrecorded. Young fed by regurgitation of predigested food by parent into nest, as in other storks.

MUSEUM DIAGNOSIS. Forehead, sides of head to behind the eye naked. Tail (black) short and deeply forked. Under tail-coverts (white), longer than tail and with stiff shafts, giving the impression of being the true tail.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	444-497	145-168	c. 152-180	199-255 mm. (Baker)

Two males collected by SA recently have wings 515-519 mm., showing the wide diversity in the range.

COLOURS OF BARE PARTS. Iris brown. Bill black, red on culmen, gony, along the commissure, and at tips of both mandibles. Naked skin of face, chin, and throat slaty black. Legs and feet red lake.

63. White Stork. *Ciconia ciconia ciconia* (Linnaeus)

Ardea Ciconia Linnaeus, 1758, Syst. Nat., ed. 10, 1: 142 (Sweden)

Baker FBI No. 2207, Vol. 6: 321

Plate 8, fig. 3

LOCAL NAMES. *Lāglāg*, *Hāji lāglāg*, *Ujti*, *Dhak*, *Gyār*, *Bāda ritarā* (Hindi); *Wādumi konga* (Telugu); *Lēklāk* (Sind).

98

CICONIIFORMES

COLOURS OF BARE PARTS. Adult. Iris almost white, grey, or pale brown. Bill dull greenish horny, redder beneath; or dusky red. Orbital skin and naked lores black. Legs and feet dull fleshy. Grown nestling. Iris greyish brown. Bill dark brown; gular skin bright purple. Legs and feet greyish- or pinkish brown.

Genus *CICONIA* Brisson

Ciconia Brisson, 1760, Orn., 1: 48, 5: 361. Type, by tautonymy, *Ciconia* = *Ardea Ciconia* Linnaeus

Bill long, stout, tapering, and pointed, the lower mandible slightly inclined upwards anteriorly. Nostrils almost linear, basal, and pervious. Part of lores, and chin, naked. Lower half of tibia naked. Tarsi long and reticulated. Feet short with broad toes; claws very short, broad, and depressed. Feathers of lower neck elongated, partly overhanging breast. For further structural details see Witherby 1939, 3: 115.

62. Whitenecked Stork. *Ciconia episcopus episcopus* (Boddaert)

Ardea episcopus Boddaert, 1783, Table Pl. enlum.: 54 (Coromandel Coast)

Baker, FBI No. 2210, Vol. 6: 342

Plate 8, fig. 6

LOCAL NAMES. *Mānī jor* (Bengal); *Lāglāg* (Hindi); *Bāgūla*, *Kārdāk*, *Kandana*, *Kourou* (Marathi); *Kāli tūl* (Gujarat); *Vānnāthi nārū* (Tamil); *Kamua* (Assam); *Kārim kōkku* (Malayalam); *Padili kōkka* (Sinhala).

SIZE. Goose ±; standing c. 106 cm. (3½ ft.) to top of head.

FIELD CHARACTERS. A red-legged black and white stork with conspicuous white neck and black crown (like a padre's skull-cap). Rest of plumage including short tail black glossed with purple or greenish blue, except elongated under tail-coverts which are white. Sexes alike.

× c. 3

Young (immature). The glossy black replaced by dull dark brown, but sometimes as in adult. Feathers of neck longer and more fluffy. (For description of nestling c. 1 week old, see Whistler JBNHS 25: 746.)

STATUS, DISTRIBUTION and HABITAT. Resident. Sparsely distributed throughout the well watered parts of India, both Pakistan, Nepal (to c. 1250 m. elevation), Ceylon. Locally not uncommon. Low country, plateaux, and up to at least c. 650 m. in the peninsular hills in suitable biotope. Affects flooded grassland and fallows, irrigated ploughed fields, rain-filled puddles and depressions, banks of streams, seepage marshes, etc. Often deep in forest where marshes occur. Rarely on tidal creeks, and only far up from the sea.

100

CICONIIFORMES

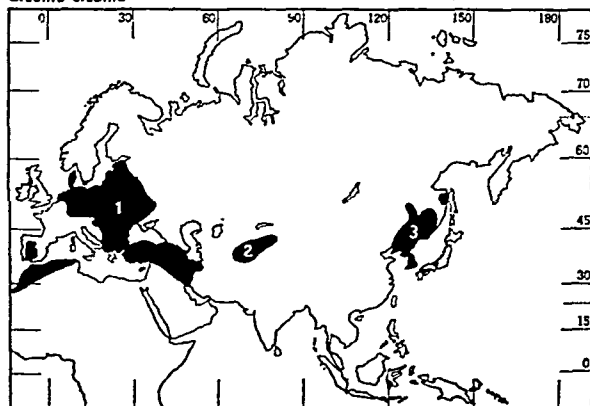

SIZE. Goose ±; standing c. 106 cm. (3½ ft.) to top of head.

FIELD CHARACTERS. A long-legged, long-necked, egret-like bird, all white except for the longer scapulars and wing quills which are black. Legs and heavy pointed bill red. Feathers of head, neck, and breast long and lanceolate. Sexes alike.

Young (immature). Like adult, but the black parts are brown or tinged brown, and some of the shorter scapulars have brown centres.

Nestling (in down), snow white, with blackish bill and grey legs and feet.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, arriving September/October, all gone by March/April. Fairly common in West Pakistan, northwestern India, Nepal terai. In smaller numbers east and south in the Gangetic Plain (Uttar Pradesh, Bihar, Orissa, W. Bengal), Assam, East Pakistan, Madhya Pradesh, Gujarat, Rajasthan, Maharashtra. Decreasingly south through the Deccan (Andhra, Madras, Mysore). The records from the eastern side of the subcontinent — Bengal, E. Pakistan, Assam, etc. — probably relate to the next subspecies (*boyceana*).

Ciconia ciconia

■ Breeding range 1 *C. c. ciconia*; 2 *C. c. asiatica*; 3 *C. c. boyceana*

There is a single sight record from Ceylon where it is evidently a rare straggler. Also a very doubtful and incredible one of a pair nesting in the NW. Province of the island in 1880 (Wait 1931: 419).

Parties or small flocks by jheels and in marshy fields, etc.

Extralimital. Breeds in Europe north to 60° N. lat., N. Africa, Western Asia (Asia Minor, Iraq, Iran, Turkestan).

GENERAL HABITS. Stalks along sedately in search of food on marshy grassland, freshly drained fallows or moist fields ploughed for winter crops. Though almost domesticated and enjoying protection by popular sentiment as a harbinger of good luck in most countries where it nests, the bird is

STORKS

101

usually wary and difficult to approach in its Indian winter quarters. Flight — a few flaps followed by a glide — appears leisurely, but is fast and strong. Royal Air Force pilots in Mesopotamia during World War I clocked the speed of migrating storks at about 48 miles (77 km.) per hour. Has the common habit of soaring on thermals and gliding in circles high up in the heavens for many hours at a stretch in company with its allies — other stork species, pelicans, etc. Often roosts at night in bare tree-tops.

FOOD. Frogs, reptiles, crustaceans, young rodents, occasionally fish, but very largely orthopterous insects, of which seasonally locusts in all stages — from egg to adult — form a considerable proportion. For this reason it enjoys additional protection in many countries both in its breeding and wintering areas.

VOICE. Poorly developed. Adults practically silent but for the characteristic bill-clattering of the family — a form of 'percussion music'. In this the head is thrown backward till the crown and culmen nearly touch the back. The mandibles are clattered rapidly, producing a castanet-like rattling, variable in volume and tempo. The puffed-out gular pouch functions as a resonator. While thus clattering, the head is slowly returned to the normal position and continued in an arc, till the bill nearly rests on the ground. Frequently both birds of a pair (especially in courtship) indulge in a bill-clattering duet, standing breast to breast.

MIGRATION. Little precise data available for India, but southward passage (autumn) observed through NW. Pakistan, across the Great Rann of Kutch, and Rajasthan. Northward passage (spring) recorded in Kurram Valley, April to end May (Whitehead, JBNHS 20: 976). A nestling ringed in Braunschweig, Germany (c. 52°N., 10°E.) and recovered a few months later in Bikaner, Rajasthan (c. 28°N., 73°E.), was our first positive evidence that some at least of our winter visitors may derive from Europe. This is confirmed by a nestling ringed at Molkenberg, Germany (52°42'N., 12°12'E.) 3.vii.1971, recovered at Tirunelveli, Tamil Nadu (c. 8°44'N., 77°41'E.) January 1973 — c. 7600 km. ESE.

BREEDING. Extralimital. *Season*, March to May. *Nest*, a large stick platform placed on buildings, chimney stacks, cliffs or tall trees near human habitations. In the Middle East old mosques are commonly resorted to, whence the bird's claim to veneration by the Muslim populace. Known in Iran as *Hāji Lāglāg* from its habit of settling on mosques and the popular belief that it migrates annually for pilgrimage to Mecca! *Eggs*, 3 to 5, pure white. Average size of 120 eggs 73.2 × 58.8 mm. (Baker). Incubation period about 30 days.

MUSEUM DIAGNOSIS

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	530—635	c. 150—220	c. 180—230	215—240 mm.
♀♀	530—590	c. 140—175		

COLOURS OF BARE PARTS. Iris brown or greyish brown. Bill bright red. Bare loral and orbital skin, and chin, black. Legs and feet bright red.

The Turkistan race *asiatica*, supposedly larger and with a larger bill, is not sufficiently differentiated and of dubious validity.

STORKS

103

Extralimital. Breeds in Denmark, Sweden, and Germany, east through Russia and Asia to N. China. Winters also in Africa.

GENERAL HABITS. Not appreciably different from those of the White Stork except that perhaps it usually keeps more to marshy ground and the neighbourhood of rivers and inland waters, and is even more shy and wary. Seen in pairs, small parties of 10 or 12, or large herds — an exceptional one of 'not less than 500' recorded by Hume near the Chenab river, Punjab (SF 1: 106). Its association with the Whiteneked Stork has been repeatedly remarked.

Ciconia nigra

Breeding range

FOOD. Animal matter — frogs, fish, crustacea, insects, and occasionally young or disabled rodents, birds, etc.

VOICE. Seldom heard in India, but in breeding season said to be more vocal than White Stork, adults producing a variety of guttural notes (reported by several observers as 'melodious'), and nestlings a heron-like chatter. Bill-clattering is rare.

BREEDING. *Season*, in central Europe April/May. *Nest*, a large stick platform built in a lofty pine, oak, or other tree, 10 to 25 metres from the ground; never on buildings. *Eggs*, 3 to 5, blunt oval, white. Average size of 100 eggs 65.3 × 48.7 mm. (Baker).

(For a full account of breeding, courtship, etc. see Witherby *et al.* 1939, 3: 116—18, mostly culled from the excellent observations of Horst Siwert in Germany, recorded in his book *Storche*, 1932.)

MUSEUM DIAGNOSIS. For full description of plumages etc. see Witherby 1939, 3: 117—18.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	520—605	160—190	c. 180—200	190—240 mm. (Baker)

CICONIIFORMES

64. Eastern White Stork. *Ciconia ciconia boyciana* Swinhoe

Ciconia boyciana Swinhoe, 1873, Proc. Zool. Soc. London : 513 (Yokohama)

Ciconia alba asiatica Severtzov, 1873, Bull. Imp. Soc. Friends Nat. Sci. Anthr. and Ethnogr. Moscow 8(2): 145 (Turkestan)

Baker, FBI No. 2209, Vol. 6: 322

LOCAL NAMES. As for 63.

SIZE. Slightly larger than the preceding, but difference hardly perceptible in the field.

FIELD CHARACTERS. Differs from No. 63 chiefly in having a larger and black (contra red) bill.

STATUS, DISTRIBUTION AND HABITAT. Uncommon winter visitor to Assam, Manipur, and E. Pakistan, where Stuart Baker saw a pair ('with conspicuous black bills') in Khulna.

Extralimital. Breeds from Lower Ussuri and Amur rivers to Korea and Japan.

GENERAL HABITS. Same as in the nominate race. Nothing specifically recorded in its Indian winter quarters.

MUSEUM DIAGNOSIS. Black bill and larger measurements: ♂♀

Wing 620—70; bill (from feathers) 195—222 (Baker), (from skull) 200—60 mm. (Hartert).

COLOURS OF BARE PARTS. 'Iris rosy pink with an outer ring of black' (David & Oustalet). Bill black in breeding season, tinged purplish at base. Other parts as in nominate race (Baker). 'Naked skin round eye red; skin of [throat] pouch red; bill blackish; legs and feet red' (La Touche).

65. Black Stork. *Ciconia nigra* (Linnaeus)

Ardea nigra Linnaeus, 1758, Syst. Nat., ed. 10, 1: 142 (Sweden)

Baker, FBI No. 2209, Vol. 6: 323

Plate 8, fig. 4

LOCAL NAME. *Surnal* (Hindi).

SIZE. White Stork ±; standing c. 106 cm. (3½ ft.) to top of head.

FIELD CHARACTERS. A black stork with white underparts.

Adult. *Above*, including head and neck, black highly glossed with green, bronze and purple. *Below*, lower breast, belly, flanks and under tail-coverts white. Sexes alike.

Young (immature). Head, neck and upper breast dark brown, each feather tipped paler. Mantle dull brownish black. Underparts white.

Nestling (in down). Snow-white with lemon-yellow bill and bright rosy legs which later turn almost white.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to West Pakistan and northern India, from Baluchistan, Sind, NWF. Province, and the Punjab through the Nepal lowlands (to c. 900 m. alt.) and the Gangetic Plain to eastern Assam; south through Rajasthan normally to about Kutch and northern Gujarat. Rare in the Deccan, south to c. 18°N. lat. (Sholapur dist.). Has not been recorded in South India, and only once in Ceylon (Phillips, *Ibis* 1940: 333—4). Occurs on spring passage in Kashmir (Ward, JBNHS 17: 947), and in both spring and autumn in Gilgit (Scully, SF 10: 143).

104

CICONIIFORMES

Weight of an adult male recorded by Scully, 7 lb. (= c. 3.17 kg.).

COLOURS OF BARE PARTS. Iris brown or black. Bill red, pale at tip. Bare facial skin deep red. Legs and feet coral or scarlet-red.

MISCELLANEOUS. Longevity: 14 years (Ring, 1962, 33: 148).

Genus *EPHIPPIORHYNCHUS* Bonaparte

Ephippiorhynchus Bonaparte, 1885, Consp. Av. 2: 106. Type, by monotypy, *Mycteria senegalensis* Shaw

Bill very long, and curved slightly upwards at the tip. Tarsus very long. Head and neck completely feathered.

66. Blacknecked Stork. *Ephippiorhynchus asiaticus asiaticus* (Latham)

Mycteria asiatica Latham, 1790, Index Orn., 2: 670 (India)

Baker, FBI No. 2211, Vol. 6: 326

Plate 8, fig. 1

LOCAL NAMES. *Banaras*, *Lohāṛjāṅg*, *Lohā sarang* (Hindi); *Lohāṛ jāṅgh* or *Lohā jāṅgh* (Bengal); *Telia hāreng* (Assam); *Periya nārdi* (Tamil); *Peddā nāllā kōṅga* (Telugu); *Ali kokka* (Sinhala).

SIZE. Painted Stork +; standing c. 135 cm. (4½ ft.) to top of head.

FIELD CHARACTERS. A handsome black-and-white stork with massive black bill and long coral-red legs. In overhead flight large size, black neck and bill, pure white underparts (including all wing quills) with a broad black diagonal band across each wing diagnostic.

Adult. *Above*, head, neck, scapulars, and tail black, brilliantly glossed with green-blue, purple, and bronze. Back (interscapulars to upper tail-coverts) pure white. *Below*, from upper breast to under tail-coverts, pure white. Sexes alike except for colour of eyes; brown in male, conspicuous bright lemon-yellow in female.

Young (immature). Rather like a large washed-out example of Black Stork: the glossy black parts replaced by dull brown; white parts less pure and dusky.

Nestling (in down). Completely snow-white at first, head and neck changing to greyish black later.

STATUS, DISTRIBUTION AND HABITAT. Resident. Widespread but sporadic and nowhere abundant. All India (rare in the south), both Pakistan, Nepal, Ceylon (low country dry zone). Affects lowland marshes, jheels, and large rivers. Occasionally tidal mangrove swamps.

Extralimital. Burma, Malaysia, Thailand, Indochinese countries. The race *australis* extends the species to Australia.

GENERAL HABITS. Keeps solitary or in widely separated pairs apparently with recognized feeding territories; after the breeding season in small parties consisting of adults and young. Usually seen wading in shallow water or stalking sedately on a squelchy marsh in search of food, or squatted on its tarsi on dry ground at the edge. Has the characteristic stork habit of soaring and circling aloft in the heat of the day. Normally shy and suspicious.

FOOD. Chiefly fish, but also frogs, reptiles, crabs, and any other small animals that can be come by. Observed capturing live coots, once in skimming flight, and swallowing them entire (Panday, J. D., 1974, JBNHS 71(1): 141).

STORKS

105

VOICE. Of adults unrecorded. When disturbed on nest, or otherwise agitated, e.g. a wounded bird about to be captured, the bill is clattered aggressively. Downy nestlings being hand-reared produced 'a sort of *chack* followed by *wee-wee-wee* repeated two or three times'. They also stretched up their necks and clattered their bills when suddenly disturbed, and then produced the above sounds (McCann, JBNHS 34: 581).

DISPLAY. Since Hume's vivid but fragmentary account in *Nests and Eggs of Indian Birds* (1890, 3: 266) nothing new has been added to warrant a reinterpretation of the antics described. Hume wrote: 'A pair will gravely stalk up to each other, and when about a yard or two feet apart will stand face to face, extend their long black and white wings, and while they flutter these very rapidly, so that the points of the wings of the one flap against the points of the other's wings, advance their heads till they nearly meet, and both simultaneously clatter their bills like a couple of watchmen's rattles.' See also Kahl, M. P., 1970, JBNHS 67(3): 457-8.

BREEDING. Season, overall September to December varying locally with the early or late cessation of the rains. Nest, an enormous platform of sticks, often thorny, 1 to 2 metres in diameter, with the central portion lined with straw, leaves, bits of rag, etc. Placed singly 20 to 25 metres up near the top of a large peepul (*Ficus religiosa*) or similar tree standing solitary in the midst of cultivation, not necessarily close to water. Eggs, 3 or 4, rarely 5, typical broad blunt smooth-textured ovals, white in colour with the inner membrane dull green. Average size of 75 eggs 72.1 × 53.4 mm. (Baker).

Both sexes build the nest and feed the young by regurgitation on to the nest floor. Share of the sexes in incubation, and incubation period, unrecorded.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	565-645	298-324	c. 300-333	257-281 mm. (Baker)

COLOURS OF BARE PARTS. Iris ♂ dark brown; ♀ lemon-yellow. Bill black. Naked skin of gular pouch and eyelids dull purple. Legs and feet coral-red.

Genus *LEPTOPTILOUS* Lesson

Leptoptilos Lesson, 1831, *Traité d'Orn.*, livr. 8: 583. Type, by subsequent designation, *Ardea dubia* Gmelin

Cf. Kahl, P., 1972, *Ardea* 60: 97-111.

Bill very large, high at base, tapering gradually to tip. Culmen and commissure almost straight, the former about as long as, or a little longer than, tarsus. Nostrils small, narrow, placed near culmen. Head and neck naked except for sparse scattered hair-like feathers. Crown bald.

67. Adjutant Stork. *Leptoptilos dubius* (Gmelin)

Ardea dubia Gmelin, 1789, *Syst. Nat.*, 1(2): 624 (India)

Baker, FBI No. 2212, Vol. 6: 327

Plate 8, fig. 10.

LOCAL NAMES. *Hārgila*, *Gārūr*, *Peḍa dhauk* (Hindi); *Dhānk* (Mirshikars, Bihar); *Dusta* (Hindi in Deccan); *Hārgila* (Bengal); *Peemigāla konga* (Telugu).

STORKS

107

from her calf' (Oates), and 'a loud grunting croak not unlike the low of a buffalo'. How these sounds are produced is not known since the bird is devoid of true voice muscles.

DISPLAY. Only incompletely recorded. Courtship dance described as similar to that of the Blacknecked Stork (q.v.), but copulation only observed in a tree and not following the dance on the ground (Baker).

BREEDING. Season, overall October to January, varying locally with early or late cessation of the rains. The only specific record for India is an old one (January 1883) of Baker's in the Khulna Sunderbans where about 40 or 50 pairs nested for many years on lofty trees in dense forest on the edge of a vast area of swamp and lake. The breeding grounds *par excellence*, however, seem to lie in S. Burma where incredible numbers congregate to breed on the pinnacles of the limestone rocks and in lofty trees along the Ataran river in Pegu district. It has been suggested that Indian Adjutants probably all migrate to this area to nest. (For a full account of the remarkable colony see Hume & Oates 1890, 2: 260-4.) According to Smythies 1953: 523, no recent information is available about this colony.

Nest, an enormous platform of coarse sticks 1 to 2 metres in diameter and up to a metre deep, placed far out on a near-horizontal branch of a lofty tree such as *Salmalia*. Eggs, 3 or 4 — sometimes 2, but never 5 — white, usually badly soiled. Broad ovals, more or less equal at both ends; fine-textured and smooth-surfaced with the inner membrane very dark green. Average size of 50 eggs 77.3 × 57.5 mm. (Baker). Both sexes share in nest building and incubation; presumably also in feeding the young (not recorded). Incubation period unknown.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	800-820	320-345	320-330	310-335 mm. (Baker)

COLOURS OF BARE PARTS. Iris white or yellowish white (adult); blue-brown (young). Bill pale yellowish or greenish fleshy, more red near base in breeding season. Bare skin of head dull reddish brown, turning to brick-red on hindneck and blackish on forehead. Pouch and neck yellow; more pink on pouch and fleshy pink on the end, where it is moreover spotted with black. Legs and feet pale greyish white to pale horny brown.

'The pouch can be extended to a great size, looking like a child's pink balloon with smeary black spots' (Baker).

MISCELLANEOUS. The popular folk belief, recorded by the Mogul Emperor Baber in his Memoirs, still persists that if you spit the head of an Adjutant before death you may extract from it the fabulous *Zohar-mohra* or 'snake-stone', allegedly a potent antidote against snake- and all other kinds of poison.

68. Lesser or Haircrested Adjutant. *Leptoptilos javanicus* (Horsfield)

Ciconia javanica Horsfield, 1821, *Trans. Linn. Soc. London*, 13(1): 188 (Java)

Baker, FBI No. 2213, Vol. 6: 329

Plate 8, fig. 12

LOCAL NAMES. *Chinjōrā*, *Chandana*, *Chandari*, *Beng ger*, *Chhota gārūr* (Hindi); *Maddāshūr*, *Medertāk* (Bengal); *Tekla moora* (= 'bald head', Assam); *Ber*

106

CICONIIFORMES

SIZE. Vulture +, standing 120-150 cm. (4 to 5 ft.) to top of head.

FIELD CHARACTERS. The largest and ugliest of our storks; black, grey and dirty white with naked reddish and yellow head and neck and a huge four-sided wedge-shaped bill. A naked pinkish gular pouch 25-35 cm. long, hanging from base of neck, distinguishes it from the Smaller Adjutant (next species).

In overhead flight the broad black wings with a whitish band along the middle are distinctive.

Adult (breeding). Above, including wings and tail, blackish slaty grey slightly glossed with green. Innermost secondaries and greater wing-coverts silvery grey forming a broad band on wing. A ruff of fluffy white feathers round base of neck. Below, white, including soft flimsy under tail-coverts.

Adult (non-breeding) lacks the silvery grey wing-band. Sexes alike.

Young (immature). Scantly feathered on the naked parts. Inner secondaries and coverts dark brown. Nestling (in down). Pure white.

STATUS, DISTRIBUTION AND HABITAT. Uncertain. Largely nomadic and local migrant. Breeding principally, and abundantly, in Burma, but only sporadically in Assam, Orissa, and the Sunderbans. Not uncommon in northern India — chiefly during the rains — from Sind through Kutch, N. Gujarat, Rajasthan, Nepal terai, and the Gangetic Plain to Assam and E. Pakistan. Rare in the Deccan. Not recorded in the southern Peninsula, Andamans, or Ceylon. At jheels and marshes, and on outskirts of habitations.

Extralimital. Burma, Thailand, Malaysia, Indochinese countries, Sumatra, Java, Borneo.

GENERAL HABITS. Keeps singly or in small parties, stalking about with a martial gait (whence its English name) on marshland and jheels, particularly where the water is drying and concentrating the fish life in shallow puddles. When not actively feeding it spends the time standing hunched up, or squatting on its shanks head ludicrously drawn in between the shoulders, and often with the mandibles agape. The birds consort freely with kites and vultures to feast on animal carcasses dumped on the countryside or on village outskirts. In the last century, when municipal sanitation was more primitive than now, large numbers of Adjutants haunted the city of Calcutta, perching boldly on rooftops etc. for the offal and refuse, and rendered valuable service as scavengers. The flight, attained by running a few steps for the take-off with noisy flapping of the huge wings, is the acme of grace and buoyancy once the bird is fairly launched, and its effortless sailing in circles high up in the heavens in company with vultures and other storks is a sight that never fails to impress. The precise significance and function of the pendent sac at the base of the neck is obscure. It communicates with the nasal cavity and is unconnected with the gullet. Therefore it cannot receive or store food as is popularly believed. In greeting display bill pointed vertically upward and clattered loudly (*contra* downward in African Marabou — Kahl).

FOOD. Fishes, frogs, reptiles (*Vipera russelli*, *Uromastix hardwickii* taken from stomachs), crustaceans, and almost any manageable living thing it can come by. Also largely carrion. Observed walking down, capturing and swallowing maimed wild ducks (Panday, J. D., 1974, JBNHS 71(1): 141).

VOICE. Besides the characteristic bill-clattering of the family it is described as emitting a sound like 'the lowing of a cow when separated

108

CICONIIFORMES

tekola (Nowgong, Assam); *Dodal konga*, *Dodal gatti gadu* (Telugu); *Mera kokku* (Tamil, Ceylon); *Māna* (Sinhala); *Vayalanatticken* (Malayalam).

SIZE. Vulture +; standing 110-120 cm. (3½ to 4 ft.) to top of head.

FIELD CHARACTERS. A large stork with massive dirty yellowish wedge-shaped bill. Chiefly glossy metallic black above, white below, with sparse hair-like feathers on almost naked reddish yellow head and neck. Very similar to the Adjutant, but somewhat smaller size, less erect carriage, black instead of slaty upperparts, and absence of neck-pouch diagnostic. Sexes alike.

In non-breeding plumage lacks the copper spots near the tips of the larger secondary coverts.

Young (immature). Upper plumage less glossy; head and neck more feathered.

STATUS, DISTRIBUTION AND HABITAT. Resident, nomadic (especially in the rains), and locally migratory. Assam, Bengal, East Pakistan, Bihar, Orissa, Kerala, Ceylon. Recorded also from Andhra, Uttar Pradesh (Lucknow Division), Delhi, Nepal terai, Kutch and Rajasthan, but uncommon in continental India. Affects well watered tracts — swamps and pools in forest, jheels, flooded land, etc.

Extralimital. Burma, Malaysia, Borneo, Java, Sumatra, S. China.

GENERAL HABITS. Usually solitary; not different from the Adjutant's except that it is less of a scavenger, does not haunt the neighbourhood of human habitations, and is much more shy and retiring. At close quarters the noise made by its wings in flight has been likened to the humming of telegraph wires in a wind. See also Kahl, M. P., 1970, JBNHS 67(3): 459-60.

FOOD. Fish, frogs, reptiles, crustaceans, and locusts recorded.

VOICE. 'Heard making same guttural noise as *Ciconia episcopus*' (Inglis, JBNHS 15: 75). No other data.

DISPLAY. Beyond that 'the nuptial dance consists of the same fantastic steps and gestures as those assumed by the Large Adjutant', and that both sexes take an equal part in the display, nothing recorded.

BREEDING. Baker, 1935, (4: 448-9): 'Nesting in Ceylon, Travancore, parts of the Malabar coast, Madras Presidency, E. Bengal, and Assam.' For some of these areas, e.g. Kerala, only circumstantial evidence is so far available. Within our limits Assam is probably where the largest number of nests is to be found. Season, November to January. Nest, a huge stick platform c. 120 to 150 cm. in diameter and 30 to 120 cm. deep depending upon for how long annually renovated. Placed in lofty trees such as *Salmalia* standing in forest, 12 to 30 metres from the ground. Eggs, indistinguishable from those of the larger Adjutant even in size. Average of 50 eggs 76.4 × 55.3 mm. (Baker). A curious habit, apparently fairly general, is reported by Baker of the birds jabbing their eggs with their bills when agitated, as by a collector climbing up to the nest. Share of the sexes in the domestic chores, as well as incubation period, unrecorded.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	580-600	260-305	228-268	230-253 mm.

COLOURS OF BARE PARTS. Iris white. Bill dull yellow, the tip whitish and base tinged red in the breeding season. Bare skin of crown greenish brown. Face and neck yellow, tinged with brick-red in the breeding season. Legs and feet greenish brown to almost black (Baker).

In a freshly killed non-breeding adult ♂ noted as follows: Iris slaty grey. Bald crown greyish biscuit-colour. Bill pinkish biscuit colour. Sides of head and extreme base of neck pale pink; rest of neck bright turmeric yellow. Legs, feet and claws slaty black.

Family THRESKIORNITHIDAE. Ibises, Spoonbill

Comparatively long and bare-legged gregarious waterside or marsh birds related to and resembling storks, herons, and egrets, with whom they normally associate. Plumage in Indian representatives chiefly white, or black, or chestnut with metallic gloss. Bill long, slender, grooved and decurved (ibises), or extremely flattened and spatulate at tip (spoonbill). Nostril placed at base of a long, narrow groove on each side of culmen. Face and throat, or whole head and neck, bare in some species. Neck slender, longish, outstretched in flight. Wings long; tail short. Legs and toes moderately long; tibiae partly bare; toes webbed at base. Sexes alike or nearly so.

RANGE. N. and S. America, Africa (including Madagascar), the southern Palearctic Region, Australia. Some species migratory.

TECHNICAL DIAGNOSIS. Witherby 1939, 3: 118; Stresemann, 1927-34 Aves: 806 (under Plegadidae).

CLASSIFICATION. Ripley 1961, Synopsis: 22-23.

Key to the Indian forms

	Page
A Bill long, curved downward, generally dark coloured, plumage white, glossy black, or chestnut.....	1
1 Naked skin of head and neck black; plumage nearly all white, elongated inner secondaries forming slaty grey ornamental plumes (75 cm. = 30 in.).....	
..... <i>Threskiornis melanocephala</i> (adult, breeding)	110
Similar to above but plumes lacking.....	
..... <i>Threskiornis melanocephala</i> (adult, non-breeding)	110
Similar to non-breeding adult but neck and most of head feathered, primaries tipped with black.....	
..... <i>Threskiornis melanocephala</i> (juvenile)	110
Head black, naked, covered with red warts, neck feathered; plumage mostly glossy black with white patch on shoulder (68 cm. = 27 in.).....	
..... <i>Pseudibis papillosa</i> (adult)	112
Resembling above but lacking red warts, and plumage overall dull glossless brown.....	
..... <i>Pseudibis papillosa</i> (juvenile)	112
Smaller (52 cm. = 25 in.). Plumage of head, neck, and underparts rich chestnut-brown, wings and tail glossed with metallic greenish purple.....	
..... <i>Plegadis falcinellus</i> (adult, breeding)	114
Similar to above but head and neck brown, streaked with white.....	
..... <i>Plegadis falcinellus</i> (adult, non-breeding)	114
Like non-breeding adult but overall plumage dull ashy brown instead of chestnut.....	
..... <i>Plegadis falcinellus</i> (juvenile)	114

Extralimital. Burma, sporadically to China and Japan.

GENERAL HABITS. Gregarious. Normally parties and moderate to large flocks, often associated with storks, spoonbills, and such other marsh-frequenting birds. Saunters actively on squelchy mud or in shallow water probing with partly open mandibles into the bottom ooze, often with head almost completely submerged. Morsels of food are forcepied out and swallowed with an upward jerk of the bill. Flight strong and direct attained by steady rapid wing-strokes punctuated by short glides, the head and neck outstretched, either in V-formation or in evenly-spaced single file. Roosts and nests in trees.

FOOD. Almost entirely animal — fish, frogs, molluscs, insects, worms, etc. — but some vegetable matter (algae ?) also taken. Stomachs of small downy nestlings contained pulpy olive-brown and green vegetable matter, and elytra of tiny blackish beetles, c. 5 mm. long (SA).

VOICE. Normally silent. In the breeding season 'a remarkably loud booming call' (Doig); not confirmed by other observers. In breeding colony 'a series of peculiar grunts, not loud but vibrant', likened to the mumble of many people talking together (Bates). Subdued nasal grunts by adults on the nest tree (SA).

BREEDING. Colonially, in association with storks, herons, cormorants, and other marsh birds, with a tendency to segregation into discrete *mohallas*.

Season, in N. India June/July to October, varying with early or late monsoon and filling of tanks and jheels; in S. India and Ceylon November to February/March. Nest, a smallish platform of sticks c. 25 to 30 cm. across, usually unlined, built in moderate-sized trees (*Acacia*, *Prosopis*, *Barringtonia*, etc.) standing in or near water, or on the tops of partially submerged shrubs (*Zizyphus*, *Copparis horrida*, etc.); sometimes on the outskirts of a village. Eggs, 2 to 4, smooth-surfaced long ovals, chalky white with a faint bluish tinge. Immaculate or sparingly marked with small spots and blotches of light or dark brown, more densely at the broad end. Average size of 150 eggs 63.5 x 43.1 mm. (Baker). Both sexes take part in nest-building and all the domestic chores. Incubation period estimated at 23-25 days (unconfirmed). In the heat of the day, while incubating or standing about on the nest tree, the bill is partly open, the throat pulsating incessantly. Nest-feeding by regurgitation, the nestling wrestling with the parent's bill to receive food directly from gullet. Not picked up from nest floor as in storks. Nestlings commonly predated on by Pallas's and Spotted eagles (*Haliaeetus leucorhynchus* and *Aquila clanga*) and other raptors. On onslaught by eagle the parents fluff out plumage menacingly, erect rump and under tail-coverts, lower head and bill and open out wings, biting the neighbouring twigs in rage and lunging out at the marauder viciously but usually ineffectively. The eggs and hatchlings (as of other birds in heronries) suffer heavy depredation from House Crows (*Corvus splendens*), which habitually infest such places.

MUSEUM DIAGNOSIS. Chick (in down) snow-white with forehead, crown (to below ear coverts), and nape, velvety black. Chin, ventral side of neck, down centre of abdomen, and underside of wings naked or almost naked, the skin pale vinous pink. Egg tooth persists at tip of short waxy bill till third or fourth day.

B Bill long, straight, spatula-shaped at end, coloured black with terminal half bright yellow; plumage including bushy nuchal crest white (standing c. 60 cm. = 25 in.).....	<i>Platalea leucorodia</i> (adult, breeding)	116
Similar to above but lacking nuchal crest.....	<i>Platalea leucorodia</i> (adult, non-breeding)	116
Like non-breeding adult but primaries tipped with black.....	<i>Platalea leucorodia</i> (juvenile)	116

Genus THRESKIORNIS G. R. Gray

Threskiornis G. R. Gray, 1842, App. to List Gen. Bds.: 13. Type, by original designation, *Tantalus aethiopicus* Latham

Head and neck naked in adult. Bill deeply downcurved, stout, blunt. Nostril linear. Tibia feathered only on upper half; tarsus reticulated. Toes long, webbed between the bases, bordered by a membrane to the claws. Tail of twelve feathers. In breeding season inner secondaries longer than primaries, disintegrated, forming ornamental plumes.

The genus ranges from Africa through India and the SE. Asian countries and islands to Australia.

69. White Ibis. *Threskiornis aethiopica melanocephala* (Latham)

Tantalus melanocephalus Latham, 1790, Index Orn., 2: 709 (India)

Baker FBI No. 2203 Vol. 6: 314

Plate 8, fig. 11

LOCAL NAMES. *Munda*, *Safid bāza*, *Didhar* (Hindi); *Kachator* (Purnea, Bihar); *Mündukh* (Mirshikars, Bihar); *Kastechara*, *Sada dochara* (Bengal); *Boga akoki bog* (Assam); *Tattu kokka*, *Dahākatti kokka* (Sinhala); *Thālakāthi chondan* (Tamil); *Kūshānti kokku* (Malayalam).

SIZE. Large domestic hen ±; length c. 75 cm. (30 in.).

FIELD CHARACTERS. A largish snow-white marsh bird with naked black head and neck, and long black downcurved curlew-like bill.

In flight bare blood-red patches on flanks and under wing conspicuous.

Adult (breeding), with some slaty grey in scapulars and in the elongated disintegrated inner secondaries. Long ornamental plumes overhanging base of neck. In non-breeding plumage the slaty grey scapulars, ornamental secondaries and neck plumes are replaced by ordinary feathers. Sexes alike.

Young (immature) has only face and round the eye bare; rest of head and neck feathered. In newly fledged (flying) juvenile, head and hind neck well clothed with black or slaty down. Front of neck covered with short white disintegrated feathers. Bare skin under wing black, not blood-red as in adult.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, nomadic (and/or locally migratory), depending on water conditions. All India, both Pakistans, Nepal terai, Ceylon. Plains and plateau country.

Affects rivers, jheels, marshes, inundated ploughed land and fallows; occasionally tidal mudflats and brackish lagoons.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	343-370	139-170	c. 99-115	133-145 mm. (Baker)

[A freshly killed ad. ♂ (Gujarat) measured Wing 381; bill (from skull) 185; tarsus 119; tail 129 mm. (SA)]

COLOURS OF BARE PARTS. Iris red-brown or red. Bill black. Naked skin of head and neck bluish black. Bare skin of flanks and under wing blood-red. Legs and feet glossy black.

Genus PSEUDIBIS Hodgson

Pseudibis Hodgson, 1844, in Gray's Zool. Misc.: 86. Type, by monotypy,

Ibis papillosa Temminck

Only the head and nape naked in adults *contra* *Threskiornis* which has also the neck bare. Bill slenderer, legs and feet shorter than in *Threskiornis*. Plumage principally black. Inner secondaries of normal shape in breeding season (not lengthened or disintegrated), and no long ornamental plumes at base of neck.

70. Indian Black Ibis. *Pseudibis papillosa papillosa* (Temminck)

Ibis papillosa Temminck, 1824, Pl. Col., livr. 51, pl. 304 (India)

Baker, FBI No. 2204, Vol. 6: 316

Plate 8, fig. 7

LOCAL NAMES. *Bāzā*, *Kālā bāzā*, *Kārān kāl* (Hindi); *Kālo dochara* (Bengal); *Kālo akoki bēg* (Assam); *Nella kānkāndam* (Telugu).

SIZE. Domestic hen ±; White Ibis —. Length c. 68 cm. (27 in.).

FIELD CHARACTERS. A distinctive glossy black marsh bird with slender downcurved curlew-like bill, a small but conspicuous white patch near shoulder of wing, and brick-red legs. A triangular patch of brilliant red warts covering top of naked black head. Sexes alike.

x c. 1

Young (immature). Overall dull glossless brown including feathered crown, head, and throat.

STATUS, DISTRIBUTION and HABITAT. Resident. West Pakistan (Sind), Gujarat, Rajasthan, and throughout the Gangetic Plain and peninsular India south to Mysore. Sparingly in Nepal (terai and dun), Bengal, and

IBISES

113

Assam. Not recorded from the West Coast, Kerala, Ceylon, or the Andamans. Affects dry plains and cultivated country.

Extralimital. Recorded as having occurred in Arakan, though the race normally found in Burma, Thailand, and the Indochinese countries is *davisoni* in which the red warty patch on head is obsolete.

GENERAL HABITS. Keeps in small parties of 3 or 4 or flocks of 8 to 10 individuals; sometimes up to 50 or more. Less dependent on water than White Ibis, preferring to forage on the drier margins of jheels, river banks, and in stubble fields; only occasionally wading into puddles. Flight and behaviour similar to that of White Ibis.

FOOD. Among the stomach contents of specimens, Mason & Lefroy (1912) identified frogs, small fish, earthworms, beetles and other insects (including *Brachytrypes achatinus* adults, and larvae of *Cyrtister confusus*, *Agrotis* sp., and *Hydrophilus* sp.). In addition, lizards, small snakes, scorpions, crustaceans, and a quantity of grain have also been recorded.

VOICE. On the whole silent. A loud nasal screaming cry of two or three notes reminiscent of the Brahminy Duck (*Tadorna ferruginea*), uttered chiefly on the wing (SA).

BREEDING. Not in mixed heronries. Usually individual nests by themselves; rarely small colonies of 3 to 5 pairs in same tree. *Season*, variable: between March and October in N. India; later in Gujarat, Deccan, and the south. *Nest*, a large stick platform c. 35 to 60 cm. in diameter, 10 to 15 cm. deep, loosely and untidily lined with straw. Built in a large tree such as banyan or peepul, or among the bases of leaf stalks in a palmyra (*Borassus*) palm, 6 to 12 metres up. Old nests of kites and vultures frequently utilized. Fresh material added to the nests even when incubation well advanced. *Eggs*, 2 to 4, pale bluish green, some spotless but the majority sparsely flecked and blotched with pale reddish; broad to moderately long ovals with a smooth surface. Average size of 59 eggs 63.0 × 43.8 mm. (Baker). Both sexes incubate. Period of incubation, and other details, unrecorded.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	365-400	138-158	c. 75-85	165-194 mm. (Baker)

COLOURS OF BARE PARTS. Iris brownish yellow to bright orange-red. Bill plumbeous green to dull blackish green. Naked skin of head black; crown and nape bright coral-red or brick-red. Legs and feet brick-red.

Genus PLEGADIS Kaup

Plegadis Kaup, 1829, Skizz. Entw.-Gesch.: 82. Type, by monotypy, *Tantalus falcinellus* Linnaeus

Head feathered except on lores and a small area in front of eyes. Tarsi long, scutellated in front, reticulated behind. Toes long and slender; claw of middle toe pectinated. Bill long, curved, more slender even than in *Pseudibis*.

IBISES

115

Extralimital. S. Europe, the Mediterranean and Middle East countries, Baluchistan, Afghanistan, Turkestan, Burma. Also Africa, Madagascar, and parts of southern North America. The race *peregrinus* inhabits the Philippines and Indonesia to Australia.

MIGRATION. A juvenile ringed in the Volga Delta, USSR, c. 45°55' N., 47°45' E. (9.vii.1931) was recovered at Deolali, Nasik dist., c. 20°N., 74°E. (14.iii.1934). Another juvenile ringed in the same locality, 12.vii.1941, recovered in Malda district, West Bengal, c. 25°N., 88°30'E. (c. 15.iv.1942). These constitute our first positive proof that the resident population is augmented in winter by northern migrants.

GENERAL HABITS. Gregarious; usually tame and confiding. Small parties or flocks of up to 40 or 50. Feeds like White Ibis on marshland or in shallow water, sometimes wading in up to the belly and submerging head completely. Flight—a series of rapid wing-beats followed by a glide—and other habits similar to White and Black Ibises (q.v.). Flocks fly in V-formation or in diagonal wavy ribbons. Perches and roosts on trees.

FOOD. Molluscs, crustaceans, worms and insects. Possibly also tadpoles and small frogs as recorded elsewhere.

VOICE. Normally silent. In breeding season adults utter a peculiar bleating reminiscent of a sheep (Heinroth). Another call described as 'a decidedly corvine prolonged guttural croak' (Lillford).

BREEDING. Colonial; in mixed heronries. Sporadic. Recorded in Sind, Oudh, Orissa, Assam, Manipur. *Season*, mainly May to July. *Nest* smallish, of sticks, c. 30 cm. across and c. 12 cm. deep, on moderate-sized trees such as kandi (*Prosopis spiciopera*) standing in clumps in or near water. *Eggs*, 2 or 3 (in Europe up to 5), deep unspotted blue-green, smooth-textured long ovals, more or less pointed at both ends, somewhat more at the small end. Average size of 100 eggs 52.18 × 36.9 mm. (Baker). Both sexes share incubation. Period 21 days (Heinroth). No details recorded in India; for Europe see Witherby 1939, 3: 123.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	248-298	99-144	c. 85-100	94-106 mm. (Baker)

Female smaller than male: for European birds Wing ♂ 290-306; ♀ 264-277 mm. Weight c. 750 gm. (Heinroth).

COLOURS OF BARE PARTS. Iris grey, brown, or mottled grey and brown. Bill dark livid, olive-grey or plumbeous brown; ('bare skin at base lead-blue'—Ticehurst). Naked skin of face and round eye livid. Legs and feet bronze-brown, bluish ('greenish'—Ticehurst) above 'knee'.

MISCELLANEOUS. Longevity (from ringing data) c. 20 years (Ring, 1962, 33: 148).

Genus PLATALEA Linnaeus

Platalea Linnaeus, 1758, Syst. Nat., ed. 10, 1: 139. Type, by subsequent designation, *Platalea leucorodia* Linnaeus

Both mandibles greatly flattened, becoming broader and spoon-shaped at the tip, where they are slightly decurved. Face and throat naked. Legs long; tibia feathered; tarsus reticulated in front and behind. Toes long, bordered by a membrane, webbed at base.

114

CICONIIFORMES

71. Glossy Ibis. *Plegadis falcinellus falcinellus* (Linnaeus)

Tantalus falcinellus Linnaeus, 1766, Syst. Nat., ed. 12, 2: 241 (Austria and Italy)
Baker, FBI No. 2206, Vol. 6: 318
Plate 8, fig. 9

LOCAL NAMES. *Kowari*, *Kowar*, *Chhōta bāza* (Hindi); *Kachia tora* (Bengal); *Thāi kākānām* (Telugu); *Kārāppu kottan* (Tamil, Ceylon); *Ratu dōe tuduwa* (Sinhala).

SIZE. Domestic hen ±; Black Ibis —. Length c. 52 cm. (25 in.).

FIELD CHARACTERS. A small blackish ibis with feathered head and characteristic slender downcurved bill.

Adult (breeding). Above, rich dark chestnut or maroon-brown, heavily glossed with green and purple on head, neck, chin, throat, lower back, and rump. Tail black glossed with green and purple. Below, chestnut. Under tail-coverts and axillaries deep purple. Sexes alike.

Adult (non-breeding). Head and neck brown, streaked with white. Scapulars and innermost wing-coverts glossy green-blue.

Young (immature). Like adult in winter, but dull (unglossed) ashy brown instead of chestnut.

Plegadis falcinellus

Breeding range

Nestling, clothed in black down. Bill rose-coloured, with a black band at middle and tip which disappear with fledging of chick (Heinroth).

STATUS, DISTRIBUTION AND HABITAT. Partly resident and nomadic, partly winter visitor. West Pakistan (Sind), Uttar Pradesh, Nepal (plains and terai), Gangetic Plain, Madhya Pradesh, Deccan, Rajasthan, Kutch, Gujarat, Orissa, W. Bengal, E. Pakistan (Sylhet, Faridpur), Assam, Manipur. Very rare in Ceylon and Maldives Is., recorded only six times, August to January, between 1960 and 1973 (CBCN).

CICONIIFORMES

116

72. Spoonbill. *Platalea leucorodia major* Temminck & Schlegel

Platalea major Temminck & Schlegel, 1849, in Siebold, Fauna Jap., Aves: 119, pl. 73 (Japan)
Baker FBI No. 2202, Vol. 6: 311
Plate 8, fig. 8

LOCAL NAMES. *Chāmēch bāzā*, *Chāmēch* (Hindi); *Chinta*, *Khuntā bāk* (Bengal); *Khantiya bōg* (Assam); *Gentā miki konga* (Telugu); *Kārāndi mūkh nārī* (Tamil, T.N.); *Chāppāi chondan* (Tamil, Ceylon); *Handi alaiwā* (Sinhala).

SIZE. Domestic duck +; standing c. 60 cm. (24 in.) to top of head.

FIELD CHARACTERS. A long-legged, long-necked, snow-white marsh bird with a distinctive long, flat, black-and-yellow spatula-shaped bill. A cinnamon-yellow patch at base of foreneck, naked yellow throat, and long, bare, black legs. Sexes alike. In breeding season with a long white bushy nuchal crest, erected in display or to express anger or other emotions.

× c. 1

Young (immature), has the primary wing-coverts tipped with black. All primaries black-shafted, the first three largely blotched and mottled with black, 4th and 5th with black tips.

Nestling, covered with white down. Bill at hatching of normal shape, short, pink, and fleshy, gradually thickening and becoming bulbous at tip with slight decurvation. Assumes characteristic 'spoon' shape when chick full-fledged.

STATUS, DISTRIBUTION AND HABITAT. Partly resident and nomadic, partly winter visitor. West Pakistan (Baluchistan, Sind), East Pakistan, practically all India, Nepal (terai), and Ceylon. Plains and plateau country. Affects marshes, jheels, rivers; occasionally tidal creeks and mangrove swamps.

Extralimital. 'Central Asia from China, southern Transbaikalia, Ussuri-land and Japan south to Syria; Egypt, India, and Formosa. Migratory in northern part of its range' (Peters).

MIGRATION. From older observations of vast flocks arriving in Uttar Pradesh in October (Reid 1887, SF 10: 77), and of flocks of many thousand birds each on the Chenab and Sutlej rivers near Multan in December including one estimated to contain ten thousand individuals (Hume 1873, SF 1: 106), the Spoonbill was well known to be, in part, an abundant winter migrant from extralimital areas. Direct evidence has since been provided by the recovery in India of four Spoonbills ringed as nestlings in the Caspian region of USSR (between c. 40° and 50°N. and 45° and 55°E.) in June-July, as follows: Kolhapur district, Maharashtra, (c. 17°N., 75°E.); Monghyr district, Bihar (c. 25°N., 86°E.); Tonk, Rajasthan (c. 26°N., 76°E.); Mandasaur district, Madhya Pradesh (c. 24°N.,

75°E.). Three of these were recovered between October and January; one curiously enough in July, almost exactly two years after ringing and more-over at the time when our local population here should be breeding. A fifth juvenile ringed near Yeysk, Sea of Azov (46°41'N., 38°15'E.) on 10.vi.1961 was recovered — again almost exactly two years later, in June 1963 — near Hyderabad in W. Pakistan (25°35'N., 68°25'E.).

GENERAL HABITS. Gregarious and sociable. Keeps in small parties and flocks of up to fifty or more, either by themselves or in association with egrets, ibises, and other marsh birds. Feeds more actively in mornings and evenings than during daytime, and is partly nocturnal. Wades into the shallows on the edge of a jheel or swamp and with outstretched obliquely poised, partly open bill sweeps from side to side in the water with a semi-circular scything action, raking the bottom ooze with the tip of the lower mandible as it moves forward. Where food is plentiful a compact, eager, jostling herd will advance almost at a run, working methodically back and forth over a particularly rewarding patch. Bouts of intense feeding activity alternate with pauses of quiescence when the entire herd will stand about listlessly with no apparent interest in food. Flight seemingly rather slow, with deliberate wing flaps — neck and legs extended. Flocks fly in diagonal wavy ribbons, each bird evenly spaced behind and to one side of the one in front.

FOOD. Small fish, tadpoles, frogs, molluscs, crustaceans, aquatic insects. Also some vegetable matter.

VOICE. Normally very silent; in breeding colony occasional short low grunts and bill-clattering.

BREEDING. Colonial. Usually in mixed heronries — sometimes very large ones, e.g. Keoladeo in Bharatpur (Rajasthan) — but with a tendency to segregation. *Season*, variable, depending on early or late monsoon and filling of tanks and jheels; normally July to October in N. India, November to January in S. India, December to April in Ceylon. *Nest*, a variable platform of sticks, sometimes a flimsy pad and at others a fairly substantial structure, lined in varying degree with grass or leaves. Built in clumps of moderate-sized trees (*Acacia arabica*, *Prosopis spicijera*, *Barringtonia racemosa*, etc.) standing partially submerged in a jheel. Rarely in reed-beds. Often many nests in the same tree almost touching one another. *Eggs*, 3 or 4, rarely 5, long ovals slightly pointed at one end, smooth surfaced. Chalky white in colour, sparsely marked with small blotches and spots of light to dark brown, sometimes with faint secondary markings of pale grey-brown or pinkish grey. Average size of 40 eggs 65.6 × 44.2 mm. (Baker). Both sexes take part in nest-building and incubation. Incubation period unrecorded in India; estimated as about 21 days.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	350-395	180-228	130-165	108-122 mm.
		(from feathers)		(Baker)

Weight 2 oo? 1770, 1785 gm. (BNHS).

COLOURS OF BARE PARTS. Iris dark brown to brownish crimson. Bill, upper mandible black; terminal half of 'spoon' bright yellow; lower mandible slaty grey.

sharply downcurved ('broken') from about half its length. Sexes alike, but female somewhat smaller and paler.

In flight the large size, long slender outstretched legs and neck, and black-and-scarlet underwing diagnostic.

Young (immature). Overall greyish brown, with brownish bill and dark slaty brown legs. Older birds have more greyish body with dark brown head and bill. Under wing-coverts and axillaries pale pink.

Chick (newly hatched to 2 or 3 days old). Nidifugous; covered with French grey powder-puff down, with soft pale pink bill and short salmon or orange-red legs; both changing to bluish grey in a few days. Very precocious and lively, slithering down from nest mound on alarm and scuttling off unsteadily, balancing itself with stumpy wings, frequently stumbling and rolling over.

STATUS, DISTRIBUTION AND HABITAT. Resident, nomadic, and locally migratory. Also extralimital migrant in part. Not uncommon, but capricious and sporadic, in W. Pakistan (Sind) and throughout the Indian Union (rare in Bengal and Assam), East Pakistan (rare) and Ceylon. Not recorded from Nepal. Affects large jheels, brackish lakes and lagoons, salt pans, estuaries, and tidal mudflats on the sea coast.

Extralimital. S. France, S. Spain, parts of N. and E. Africa, the Middle East and Caspian region to W. Siberia, south through Afghanistan.

MIGRATION. Of chicks ringed at the Ashk Island breeding colony in Lake Rezaieyeh, Iran (37°25'N., 45°30'E.) between 1970 and 1972, six recovered in India 3 to 5 months after ringing — in Gujarat, Rajasthan, Delhi, Andhra Pradesh and Orissa. This gives some plausibility to McCann's conjecture of 35 years ago that under stress of hydrographic conditions breeding populations may shuttle between the major nesting sites in Europe, Africa, and Asia.

GENERAL HABITS. Highly gregarious, normally in small or large flocks and vast congregations at favourite feeding and nesting places, often numbering many hundred thousand. Feeds in shallow water — usually brackish and even concentrated brine — with head immersed. Sometimes swimming and 'up-ending' like duck in deeper water. The partly open bill is inverted

Bare skin of face and throat canary or sulphur yellow, sometimes blotched with black on and above lores. Legs and feet black.

NOTE. The European breeding (nominat) race is only slightly smaller with a smaller bill, but the measurements often overlap. Such examples, and borderline cases, are impossible to assign racially with confidence.

Family PHOENICOPTERIDAE: Flamingos

Large, excessively long-legged marsh birds with very long slender necks and peculiar thick lamellate bills sharply downcurved or 'broken' in the middle. Plumage largely pinkish white and crimson, with black remiges or wing-quills. Tibia bare; toes short and webbed. Sexes alike or nearly so.

ANATOMICAL DETAILS in Witherby 1939, 3: 162-3; Baker 1929, FBI 6: 372; Stresemann 1927-34, Aves: 804-5.

LOCAL NAMES. *Bog hāns*, *Rāj hāns* (Hindi); *Kānmunthi*, *Kānthuti* (Bengal); *Chārdj bāggo* (Mirshikar, Bihar); *Pu konga*, *Sāmidrāpū chihuka* (Telugu); *Pān nārāi*, *Urian* (Tamil); *Siyak karaya* (Sinhala); *Lakkā*, *Lakkē jāni* (Sind); *Hānj pākhi* (Kutch).

SIZE. Vulture +; standing c. 140 cm. (4½ ft.) to top of head.

FIELD CHARACTERS. A tall, long-legged, long-necked, stork-like marsh bird; rosy white with bright scarlet-and-black wings and massive pink bill

so that the upper mandible forms a scoop with culmen skimming or scraping the bottom ooze. The fleshy tongue works back and forth like a piston sucking in the water and mud, from which minute organisms are strained out by the lamellae along the edges of the bill. In dense congregations, where individual feeding space is restricted, the bird dabbles around pivoting on itself, the bill action describing a shallow circular trough or moat in the mud around the central 'turntable'. Such feeding circles, c. 60-90 cm. in diameter, almost touching one another, and sometimes many acres in extent, mark the places where flamingos have been feeding. Flight — with fairly rapid wing-strokes, neck fully extended in front and legs trailing well behind — in diagonal wavy ribbons, single file, or in the characteristic V-formation of geese. Rests usually standing on one leg with the long slender neck coiled round, and head tucked in feathers of back.

FOOD. *Chironomus* larvae, small molluscs and crustaceans (e.g. *Artemia salina*), tiny seeds of lacustrine plants (e.g. *Ruppia* spp., *Scirpus*), and organic mud. Possibly also small fish on occasion, e.g. *Cyprinodon dispar* which is very abundant in the bird's haunts in the Rann of Kutch.

VOICE. A single hoarse brassy goose-like honk. A constant babbling while feeding in company.

BREEDING. *Season*, in the Great Rann of Kutch, the only known nesting ground within our limits, variable, depending on hydrographic conditions, September/October to March/April. *Nest*, a truncated conical mound with shallow pan-like depression at top, from a few centimetres to half a metre high, of sun-baked mud scraped up from the vicinity when in semi-liquid condition, and daubed on. Built in hundreds close to one another in a compact, expansive 'city' covering several acres. Sometimes a merely slightly raised bed of mud pellets constitutes the nest. *Eggs*, normally 1 — occasionally 2 — rather like huge eggs of cormorants, from skim-milk to pale blue in colour overlaid with calcium deposit. Average size of 100 eggs, measured by Jourdain, 88.8 × 54.5 mm. (Baker). Three eggs from the Rann of Kutch measured 83 × 50, 83 × 53, 93 × 58 mm. (SA), falling within the maxima and minima of the above.

Both sexes take part in incubation. Period elsewhere stated as 30 to 32 days. Newly hatched, and small chicks, fed by parent on drops of a clear liquid from its bill tip, of unknown origin and composition. (For further accounts of ecology, bionomics etc. consult References under Family.)

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill	Bare tibia	Tarsus	Tail
♂ ♂	393-444	c. 139-164	c. 220-250	c. 311-327	152-189 mm.
♀ ♀	375-405	c. 120-143	—	—	—
		(from feathers)			(Baker)

A Kutch ad. ♂ (measured in the flesh) Wing 464; bill (from skull) 134; tarsus 324; tail 167 mm. (SA).

Weight 3 oo? 2020-3100 (av. 2481) gm. (BNHS).

COLOURS OF BARE PARTS. Iris lemon-yellow. Bill, facial and gular skin pale pink to rich strawberry-ice colour, the first with black tip. Legs and feet variable pink, like bill.

FLAMINGOS

121

Genus PHOENICONAIAS Gray

Phoeniconaias Gray, 1869, Isis: 440. Type, by monotypy, *Phoenicopterus minor* Geoffroy. Upper mandible not overlapping lower; throat well feathered.

74. Lesser Flamingo. *Phoeniconaias minor* (Geoffroy)

Phoenicopterus minor Geoffroy, 1798, Bull. Soc. Phil. Paris, 1: 98 (East Africa)
Baker, FBI No. 2242, Vol. 6: 375

Plate 3, fig. 6

LOCAL NAME. *Chhōta rājāns* (Hindi).

SIZE. Large duck; standing c. 90–105 cm. (3–3½ ft.) to top of head.

FIELD CHARACTERS. Smaller size, deeper rose-pink plumage, and dark coloured bill with crimson feathers around its base, distinguish it from its larger relative. Sexes more or less alike; female somewhat smaller and paler without crimson on back or breast.

In flight, crimson and black underwing, comparatively thicker neck, shorter trailing legs, and goose-like flight are leading pointers.

Young (immature). Overall greyish brown as in the larger flamingo with shorter, darker bill.

Chick. Pale grey natal down replaced by coarser growth in a few days. Colour of bill and legs at hatching pale pink and orange respectively; when slightly older, black.

STATUS, DISTRIBUTION AND HABITAT. Status uncertain. Recorded practically in all months and only recently found breeding within our limits. Largely seasonal (?) visitor with erratic local movements. W. Pakistan and NW. India — Sind, Rajasthan, Gujarat, and the western Gangetic Plain. The Sambhar Salt Lake (Rajasthan) and the Little Rann (Gujarat) are two of its strongholds where vast concentrations, tens of thousand strong, occur irregularly. Stray specimens taken as far south as Bombay (Sálim Ali & Abdullá, JBNHS 40: 649), and Secunderabad, Andhra (Butler, SF 9: 436), and Chilka Lake, Orissa (January 1967) where reported as casual in winter but frequent. More restricted to salt and brackish lakes and tidal lagoons than large flamingo.

MIGRATION. No definite data.

GENERAL HABITS. Gregarious; large concentrations of the two species frequently together. Differs from the large flamingo chiefly in its ecological preference for heavily saturated brine and its feeding technique consequent upon the bill structure being specially adapted for filtering microscopic organisms (see Jenkin, loc. cit.). Usually walks along, or swims, in 30 to 45 cm. depth of still water swinging head from side to side in a scything motion, sucking in the algae from the surface layer (Brown, loc. cit.). However, in shallow brine only a few centimetres deep, e.g. in salt pans and in the Little Rann of Kutch, the bird feeds in the same way as its larger relative, partly or entirely submerging the head and inverting the bill. The difference in the size of food for which the bills are respectively adapted doubtless enables the two species to co-exist side by side without competing.

FOOD. Almost exclusively algae and diatoms. Occasionally insect larvae and copepods. Regularly drinks fresh water.

BREEDING. Long suspected in Little Rann of Kutch from presence of vast numbers of immature birds in brown plumage accompanying adults. Actual

122

ANSERIFORMES

nesting first discovered only in January 1974 on the periphery of Flamingo City in the Great Rann — an estimated 3–400 nests with eggs and/or chicks. For details see Sálim Ali, 1974, JBNHS 71(1): 141–4. Nests, downy hatchlings and older pulli indistinguishable from those of the larger flamingo. Eggs, similar but averaging smaller, 78.5 × 49.3 mm. (Leslie Brown). Breeds abundantly on the soda lakes in East Africa.

MUSEUM DIAGNOSIS

COLOURS OF BARE PARTS. Iris red. Bill dark lake-red with black tip. Legs and feet red.

Order ANSERIFORMES

Family ANATIDAE: Ducks, Geese, Swans

A group of large, conspicuous water birds perhaps more generally known and recognized than any other, even by persons whose interest in birds does not extend beyond hunting them or purely as items on the menu. By virtue of the regularity of their seasonal appearances and disappearances, their spectacular flights, and their abundance and widespread occurrence in winter on all types of inland waters throughout the country, they perhaps also provide the most tangible example to the popular mind of the phenomenon of bird migration.

Tarsus of Greylag Goose (A) and Mallard (B) to illustrate reticulated tarsus of swans and geese and partially scutellated tarsus of ducks

SIZE. Very diverse, from considerably larger than a Vulture (swan) to about that of a Pigeon (Cotton Teal). Colour from wholly white (swan) to combinations of grey, brown, black, and green with metallic reflections in many attractive patterns. Most ducks with conspicuous metallic 'speculum' or white patch on wing. Bill typically broad, flat, rounded at tip, and with a comb-like fringe or lamellae for straining out food particles from water in which they chiefly feed. Wings in most species rather narrow and pointed, adapted for swift and long-ranging flight. Tail short. Legs short; feet webbed. The majority of our species are migratory, originating from the Palearctic Region (see map, p. xxxvii).

FOOD. Animal and/or vegetable matter. Obtained in water, marshes, or meadows and fields by dabbling, diving, or grazing.

BREEDING. On ground, in holes in ground, or hollows in tree-trunks, etc. Young nidifugous, down-covered.

DUCKS, GEESE, SWANS

Genus BRANTA Scopoli

Branta Scopoli, 1769, Annuus I, Hist. Nat.: 67. Type, by subsequent designation, *Anas bernicla* Linnaeus (Bannister, 1870)

Bill very small with no serrations visible on the edge of the upper mandible as in *Anser* q.v. For further particulars see Delacour, 1: 145.

75. Redbreasted Goose. *Branta ruficollis* (Pallas)

Anser ruficollis Pallas, 1769, Spic. Zool., fasc. 6: 21, pl. 4 (Lower Ob, Southern Russia)
Baker, FBI No. 2259, Vol. 6: 407

Plate 12, fig. 7

LOCAL NAMES. None recorded.

SIZE. Domestic duck ±; length c. 61 cm. (24 in.).

FIELD CHARACTERS. A small brightly coloured goose, largely black and chestnut, strikingly marked with white.

Adult. Above, crown, dorsal side of neck, back and rump black, with two conspicuous grey bars on closed wings. Sides of head and face boldly patterned with white and chestnut. Below, ventral side of neck and upper breast bright chestnut separated from black hindneck and black lower breast by running white bands. Abdomen, vent, and a broad horizontal band on flanks white. Sexes alike.

Young (immature) has the black parts browner and duller and the chestnut parts paler and more cinnamon.

STATUS, DISTRIBUTION AND HABITAT. Rare straggler. Has only been observed thrice within our limits: once in Madhya Pradesh in 1836 (Hume 1880, SF 8: 421) and twice in Assam on the Brahmaputra river (Baker); not more recently than 1907.

Extralimital. Breeds on the Siberian Tundra from the Ob to the Khatanga. Winters in the southern part of the Caspian Sea and the Aral Sea (Peters).

GENERAL HABITS. See Delacour, 1: 181. Nothing recorded in India.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	342-363	23-27	52-58	100-110 mm. (Delacour)

COLOURS OF BARE PARTS. Iris hazel to brown, 'chestnut' (Witherby). Bill and legs black (Baker).

Genus ANSER Brisson

Anser Brisson, 1760, Orn. 1: 58, 6: 261. Type, by tautonymy, *Anser domestica* = *Anas* Linnaeus

Bill short and high at base; nostrils situated half way between base and tip, the latter furnished with a nail-like dertrum. Tarsus fairly long and strong. Wing long and pointed. Tail short and rounded, of sixteen to eighteen feathers.

Wing 405-462 mm., bill 51-66 mm.....	<i>A. f. rossicus</i>

76. Forest Bean Goose. *Anser fabalis middendorffi* Severtzov

Anser middendorffi Severtzov, 1873, Vert. goriz. rospostr. tark. zhiv.: 149 (Sibérie Orientale = Oudskoi Ostrog.). (= *sibiricus* Alphéraky)
Plate 12, fig. 9

77. Tundra Bean Goose. *Anser fabalis rossicus* Buturlin

Anser serrirostris rossicus Buturlin, 1933, Opredelitel promyslovikh pitz. d. h. Best, Buch der jagdbaren Vogel: 60 (West Siberian Tundra. Locality restricted by Dementiev, 1936, Alauda: 190, to Beluchia Guba, Jamal, Taimyr).
Baker, FBI No. 2256, Vol. 6: 403 (= *A. neglectus*)¹

¹ Sushkin's Goose, *A. f. neglectus*, recorded in winter from Assam, is now considered merely a colour phase of the mixed population *A. fabalis-rossicus* (with pink bill and legs) breeding in northern USSR.

DUCKS, GEESE, SWANS

127

SIZE. Greylag Goose —; length c. 68 cm. (27 in.).

FIELD CHARACTERS. Darker and considerably smaller and daintier than the Greylag, with a much shorter (pinkish) bill. A diagnostic white patch on forehead (from base of bill), and irregular coarse black barring on lower breast and flanks. Rump dark greyish brown *contra* grey in Greylag. Legs orange. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Sparse and rare winter visitor to West Pakistan, NW. India (including Kutch and Rajasthan¹, and across the Gangetic Plain (U.P.) to Assam and Manipur). Southernmost record in India from Chilka lake, Orissa, c. 19°40'N. (Craven, JBNHS 48: 365-6).

Anser a. albifrons

Extralimital. Breeds on the Arctic coasts of Europe and Asia, east from the Kanin Peninsula, Kolguev, and southern Novaya Zemlya to the Kolyma river and perhaps beyond. Winters in W. Europe, shores of the Mediterranean, Black, and Caspian seas to China and Japan (Peter Scott). Also in N. Iraq (C. D. W. Savage).

GENERAL HABITS. On the whole very similar to the Greylag. Has a reputation for ability to rise almost vertically from the ground on sudden alarm or disturbance, and to get out of gunshot faster than any other goose. VOICE. Described as a high-pitched musical disyllabic honking, whence known as 'Laughing Goose' in many countries.

MUSEUM DIAGNOSIS. For full description of plumages etc. see Witherby 1939, 3: 183.

¹ The bird shot in Bikaner in December 1948 and recorded (JBNHS 46: 186-7) as *Anser fabalis brachyrhynchus*, proves on re-examination to be an immature of this species.

ANSERIFORMES

126

SIZE. Domestic goose ±; length c. 76 cm. (30 in.).

FIELD CHARACTERS. A large brown goose with an elongate body, long neck, and longish slender bill making somewhat straight line with forehead; black on basal half, yellow or pink on terminal half. Distinguished from the Eastern Greylag, which it resembles, in being less grey more brown, with uniformly dark brown head and neck contrasting with lighter breast and back. Also by longer neck, less tubby body, and slenderer and longer *particoloured* bill *contra* all pink in Greylag.

STATUS, DISTRIBUTION AND HABITAT. Vagrant. Three specimens ('*neglectus*') recorded from Assam by Baker. Possibly both forms occur less rarely in winter, but unidentified.

Extralimital. *A. f. middendorffi* breeds in forests of eastern Siberia from the Khatanga to the Kolyma, south to the Altai. Winters in eastern China, northern Mongolia, and Japan.

A. f. rossicus breeds in Novaya Zemlya and on tundra shores of Arctic Russia and Siberia west of the Taimyr Peninsula. Winters in Europe south to Italy; in Asia to Turkestan and China.

MUSEUM DIAGNOSIS. *A. f. rossicus* differs from *A. f. middendorffi* in being somewhat stockier and less elongate in body, with the bill shorter and higher at base. Lower mandible deep and distinctly curved outward, the nail at tip long, oval, and tapering (*contra* lower mandible straight and nail rounded in *middendorffi*). Normally no narrow band of white feathers around base of bill in either.

MEASUREMENTS

<i>A. f. middendorffi</i> ♂ ♀	Wing 440-562; bill 64-87 mm.; visible depth of lower mandible 7-10 mm.
<i>A. f. rossicus</i> ♂ ♀	Wing 405-462; bill 51-66 mm.; visible depth of lower mandible 7-10 mm.

COLOURS OF BARE PARTS. Iris brown. Terminal half of bill, legs and feet orange-yellow; often pink in *rossicus*.

[*Synopsis* (p. 26) includes the Pinkfooted Goose, *Anser fabalis brachyrhynchus* Baillon, in the Indian avifauna chiefly on the basis of the record of one shot in Bikaner, Rajasthan, in December 1948 (JBNHS 46: 186-7). The identity of the specimen mentioned by Baker (Fauna 6: 403) as taken by his collector in the Surma Valley, Assam, was doubted by Dr C. B. Ticehurst (JBNHS 34: 489) who pointed out that this goose has a limited and distinctly western distribution in winter and not a single record was known even so far east as European Russia. Baker's specimen is apparently non-existent, but the one from Bikaner in the BNHS collection has been re-examined by Mr Humayun Abdulali and one of us (SDR) and proves in fact to be a young Whitefront, *Anser albifrons albifrons*. In the absence of any specimens from India therefore, *Anser f. brachyrhynchus* must be deleted from the Indian list and Baker's record of '*neglectus*' from Assam treated with cautious disbelief !]

79. Whitefronted Goose. *Anser albifrons albifrons* (Scopoli)

Branta albifrons Scopoli, 1789, Annus I, Hist. Nat.: 69 (North Italy)
Baker, FBI No. 2253, Vol. 6: 399
Plate 12, fig. 10

LOCAL NAMES. Unrecorded.

ANSERIFORMES

128

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	392-442	43-52	60-71	114-132 mm.
♀ ♀	380-421	43-47	—	—

Extremes for European birds:

♂ ♀	369-450	40-55 (nail 8-15)	55-80	— mm. (Witherby)
-----	---------	----------------------	-------	---------------------

Weight c. 2-3 kg.

COLOURS OF BARE PARTS. Iris brown. Bill flesh colour or pale orange-yellow to rosy flesh colour, the nail paler and whiter. Legs and feet reddish flesh colour to orange-yellow, the webs paler; claws whitish (Baker).

80. Lesser Whitefronted or Dwarf Goose. *Anser erythropus* (Linnaeus)

Anas erythropus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 123 (North Sweden)
Baker, FBI No. 2254, Vol. 6: 401
Plate 12, fig. 8

LOCAL NAMES. Unrecorded.

SIZE. Duck ±; c. 53 cm. (21 in.).

FIELD CHARACTERS. Like the Whitefronted, *A. albifrons*, but considerably smaller, dark brown, also with blotchy black bars on lower breast and belly, with a round shaped head and proportionately much shorter pink bill. The more extensive white forehead patch, reaching to top of head between the eyes, and the conspicuous swollen ring of yellow skin around

Anser erythropus

■ Breeding ▨ Non-breeding

DUCKS, GEESE, SWANS

129

the eye are diagnostic features which, on a satisfactory view, should settle all doubt. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Rare and sparse winter visitor. Recorded sporadically from West Pakistan (Sind, the former NWFP), Kashmir, Uttar Pradesh, Bengal, Bihar, and Assam. Has strayed as far south as Maharashtra, Poona district (Trevenen, JBNHS 28: 1081).

Extralimital. Breeds largely on mountain tarns from Norwegian Lapland to the Kolyma in Siberia, and perhaps further eastwards. Winters in south-eastern Europe, Black and Caspian seas, Middle East (Iraq, Iran), Seistan, Turkestan, China and Japan.

GENERAL HABITS. Usually congregates in large flocks in its regular winter quarters, e.g. around the Caspian and in northern Iraq. In India recorded only in twos and threes, separately or mixed up with flocks of Greylags.

VOICE. Described as resembling that of *A. albifrons* but much higher pitched and more squeaky.

MUSEUM DIAGNOSIS. In the hand an additional point for differentiation from *albifrons* is that the 'teeth' or serrations are concealed when the bill is shut. For details of plumages etc. see Witherby 1939, 3: 192.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	367-388	28-35	58-62	95-109 mm.

Extremes

	Wing	Bill	
♂♀	340-390	30-45	(J. Berry in Witherby)

COLOURS OF BARE PARTS. Iris brown. Bill pink. Legs orange-yellow (Delacour).

81. Eastern Greylag Goose. *Anser anser rubirostris* Swinhoe

Anser cinereus var. *rubirostris* Swinhoe, 1871, P.Z.S.: 416, ex Gray, 1846, Cat. Bds. Nepal, 144, nom. nud., ex Hodgson, 1844, Zool. Misc.: 86, nom. nud. (Shanghai)

Baker, FBI No. 2252, Vol. 6: 398

Plate 12, fig. 11

LOCAL NAMES. *Sona*, *Karria sona*, *Hāns*, *Rāj hāns* (Hindi); *Rāj hāns* (Bengal); *Kāj* (Bihar); *Kallak*, *Khar hāns* (Bhagalpur); *Mogāla*, *Mogāla bātāk* (Nepal terai); *Kāng ngā* (Manipur); *Rāj hāns*, *Dhitrāj* (Assam); *Gāj* (Kutch); *Hājī* (Sind).

SIZE. Domestic Goose ±; length c. 81 cm. (32 in.).

FIELD CHARACTERS. Very like the normal ashy brown phase of the domestic goose. Pale or French grey rump, white upper tail-coverts, and white nail to pink bill diagnostic.

In flight the comparatively pale head, and pale grey leading-edge of the wing next the body, are additional pointers. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. Common in West Pakistan (Sind, the former NWFP), Kashmir, Punjab, in small numbers in

¹ A white goose shot by Col. H. Nedou and published (JBNHS 49: 311) as the first record in India of the Snow Goose, *Anser carolinensis*, was wrongly identified. It proves to be a partial albino Greylag.

130

ANSERIFORMES

Rajasthan, N. Gujarat, Nepal terai, and across the Gangetic Plain to Assam, Manipur (abundant on Logtak lake), and East Pakistan. Abundant on the Chilka lake, Orissa, in some winters. Rare in Madhya Pradesh; virtually absent in the Deccan and S. India. Only once in Ceylon.

Extralimital. Breeds eastwards from c. 40°E. and south of 60°N., through Asia Minor and central Asia to Kamchatka. In winter to the eastern Mediterranean, Black and Caspian seas, and in Seistan and China (Peter Scott).

MIGRATION. Little precise data. Normally arrives in large skeins (from central Asia?) through the NWFP and Kashmir in October/November, (sometimes as early as first half September) spreading out by December. Has been observed migrating (this and/or Barheaded Goose) at over 4,270 m. (14,000 ft) alt. across the Himalayas in this sector. Practically all have left by mid March. Birds ringed in Bharatpur, 27°14'N., 77°28'E., recovered in Kazakh SSR and Mongolian People's Republic, between c. 48° and 50°N. and 82° and 92°E. For details see JBNHS.

Anser anser

1 *A. a. anser*; 2 *A. a. rubirostris*

GENERAL HABITS. Highly gregarious. Congregates in considerable flocks on the larger jheels particularly in the north-west (e.g. Manchar and Haigam lakes in Sind and Kashmir) wherever abundance of food, comparative freedom from molestation, and extensive cultivation of winter crops in the surroundings supply the essential requirements. Family parties or larger gaggles spend the daytime squatting belly to ground or resting on one leg on mud-spits in jheels and rivers or amidst open fields, or floating listlessly on the water with head tucked in the feathers of the back. But the birds are always uncannily vigilant and alert and can seldom be taken unawares. They

DUCKS, GEESE, SWANS

131

fly out to their accustomed feeding-grounds in the evenings and are active more or less throughout the night — sometimes till well after sunrise. The feeding is done by grazing in wet meadows or newly sown fields; also in the water while swimming by submerging the head and up-ending like ducks. Flight swift and strong with regular wing-beats either in the characteristic V-formation or in trailing wavy ribbons; usually the former in migration. Flocks occasionally indulge in spectacular acrobatics — plunging, side-slipping, turning over on back (the 'Immelmann Turn') and nose-diving high up in the air as if to escape some imaginary devil in pursuit, apparently purely for fun.

FOOD. Almost exclusively vegetarian. Whilst with us, grass and shoots of winter crops such as wheat and gram (to which they may do considerable local damage) and paddy left over in the stubbles after harvesting; also aquatic weeds and tubers etc. *Singhāra* (water-chestnuts = *Trapa*) in the Kashmir lakes form the staple diet in season.

VOCAL. A nasal conversational *gag-gag-gag* while feeding. The far-reaching honking *aahng-urg-ung*, with its variants, uttered in different keys during the morning and evening flighting, is one of the most exhilarating bird sounds for the sportsman and bird lover. These calls are also uttered when migrating, especially during the night.

BREEDING (including display etc.) see Witherby 1939, 3: 182-3 for the Western race.

MUSEUM DIAGNOSIS. Distinguished from the Western (nominative) race, *A. a. anser* by its distinctly lighter and greyer colour, and pink instead of orange bill. No significant size difference.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	445-482	55-72	73-82	129-150 mm.
♀♀	416-470	54-70	52-70	125-145 mm.

(Delacour, for *A. a. anser*)

Weight (100 weighed by Hume) 2-72 kg. (♀) to 3-86 kg. (♂); 5 ♂♂ 2350-3750 (av. 3100), 5 ♀♀ 2450-3060 (av. 2790) gm. (BNHS).

COLOURS OF BARE PARTS. Iris brown. Bill fleshy white to pink; nail paler and whiter. Legs and feet pink.

82. Barheaded Goose. *Anser indicus* (Latham)

Anser indicus Latham, 1790, Index Orn., 2: 839 (Taimyr = India vide Ticehurst 1930, JBNHS 34: 489)

Baker, FBI No. 2258, Vol. 6: 405

Plate 12, fig. 12

LOCAL NAMES. *Hāns*, *Kāryee hāns*, *Rāj hāns*, *Birwa*, *Saxān* (Hindi); *Bādi hāns* (Bengal, Chittagong); *Kārbānch*, *Māgli* (Mirzikhars, Bihar); *Gūwa*, *Paria* (Nepal); *Nāngā* (Ladakh); *Ner teithoo* (Coimbatore); *Bernooria hāns*, *Boga rājādas* (Assam); *Kāng ngā* (Manipur).

SIZE. Greylag Goose —; length c. 75 cm. (30 in.).

FIELD CHARACTERS. A slender, pale grey, brown, and white goose

Adult. Head, face, throat, chin, and a conspicuous stripe down each side of brown neck, white. A black bar across snicuput from eye to eye,

132

ANSERIFORMES

and a shorter second one below it across nape, diagnostic. Bill and legs yellow, nail at bill-tip black. Sexes alike.

In flight white head, pale body and black wing-quills are leading pointers.

Young (immature). Like adult but paler. Head and neck pale grey without markings. Hindcrown, hindneck, and a line through the eyes dusky brown. Bill and feet greenish yellow.

STATUS, DISTRIBUTION AND HABITAT. Breeds in Ladakh; elsewhere winter visitor. Common throughout the northern portions, from West Pakistan and Kashmir eastward through the Punjab, Rajasthan and the Gangetic Plain (including Nepal terai) to Assam and East Pakistan. In some years abundant on the Chilka lake in Orissa. Rare in Gujarat and Deccan, but leap-frogging as far south as Mysore in small numbers fairly regularly. Does not reach Ceylon. Affects large jheels and rivers.

Extralimital. Breeds on high elevation lakes in central Asia from the Tien Shan to Kokonor. Winters sparingly also in Burma.

Anser indicus

■ Breeding ● Non-breeding

MIGRATION. Little known beyond that it normally arrives in northern West Pakistan and NW. India about October/November, is well in by

DUCKS, GEESE, SWANS

133

mid-December, and mostly gone by end March during which month thousands reported migrating northward over lower reaches of Karnali river in Nepal (R. G. M. Willan, *in epist.*). Two birds (1 juvenile, 1 adult), ringed in Kirghiz SSR (c. 40°-42°N., 75°E.) in the breeding season, were recovered in subsequent winters near Gilgit (c. 36°N., 74°E.) and in Dera Ghazi Khan district, W. Pakistan (c. 30°N., 71°E.) respectively. (Details in JBNHS 58: 284, 1961; 59: 964, 1962.) For migration over High Himalayas in NW. sector see under Greylag.

GENERAL HABITS. Gregarious; family parties of 5 or 6 and gaggles of up to a hundred or more. Not appreciably different from the Greylag except that it keeps more to the larger rivers whose expansive sandbars afford safe daytime refuge to vast resting congregations. Also largely a crepuscular and nocturnal feeder, often causing considerable local damage to winter crops. Extremely wary and difficult to approach while in its winter quarters where commonly hunted, but astonishingly tame and confiding where unmolested, e.g. on its breeding grounds in Tibet — at least was (c. 1945) before the Chinese marched in.

VOICE. Similar to the Greylag's but more nasal and musical.

FOOD. Almost exclusively vegetarian: grass, tubers, tender shoots of wheat, gram, and other winter crops. Also paddy in stubbles.

BREEDING. Within our limits only Ladakh, on the high plateau lakes at c. 4300 metres elevation, e.g. Pangong Tso, Tso Moriri, and Tsokr. Season, mainly end May and June. *Nest*, a slight depression in the ground thickly padded with down which is banked up in a parapet around it. On grassy islets in the lakes, or on inaccessible spongy humps in the surrounding bogs — often many nests close to one another. At Tsokr, B. B. Osmaston found them breeding also on cliffs in situations normally used by the Brahminy Duck (q.v.); once in a disused raven's nest padded with down. Eggs, 3 to 6, commonly the latter; thick-shelled, ivory white, becoming soiled during incubation by the owner's muddy feet. Average size of 100 eggs 84.4 × 55.1 mm. (Baker). Incubation by female alone. Period 28-30 days (Delacour). Gender very solicitous about safety of young, the two parents flanking the chicks on either side when leading them on land or on water — the brood occasionally strung out like a furry tail behind flank of swimming parent.

MUSEUM DIAGNOSIS

Chick (in down). *Above*, pale greyish brown with yellow patches on wings. Head and neck yellow, with a grey patch on occiput. *Below*, pale yellow. Bill bluish grey with fleshy nail. Legs greenish grey. [See Delacour 1954, 1: 192 (plate).]

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	450-482	48-63	70-80	140-170 mm.
♀♀	406-460	47-55	63-75	127-160 mm.

Weight 5 ♂♂ 1600-2250 (av. 1975), 1 ♀ 1400 gm. (BNHS).

COLOURS OF BARE PARTS. Iris brown. Bill yellow with black nail and nostrils. Legs and feet deep yellow (Delacour).

[*Synopsis* (p. 27) includes the Lesser Snow Goose or Blue Goose, *Anser caerulescens caerulescens* (Linnaeus) in the Indian avifauna on the strength

DUCKS, GEESE, SWANS

135

(Rajpur). Cf. Abdulali, H., JBNHS 65: 420.

Extralimital. Breeds in N. Russia from the Kanin peninsula and N. Siberia east to the Lena delta. In winter south to the British Isles, N. Europe, Caspian Sea and central Asia.

85. Jankowski's or Eastern Whistling Swan. *Cygnus columbianus jankowskii* Alpheraky

Cygnus bewickii jankowskii Alpheraky, 1904, Priroda i Okhota, Sep.: 10 (Ussuriland). In Russian, cf. Buturlin 1907, Ibis: 651
Baker, FBI No. 2245, Vol. 6: 382 (= *C. minor*)

LOCAL NAMES. Unrecorded.

SIZE. Vulture +; length c. 122 cm. (48 in.) of which neck c. 60 cm.

FIELD CHARACTERS. Large, all-white, goose-like, but with much longer and proportionately slenderer neck. A conspicuous yellow patch of variable extent on base of bill (lores) more or less abruptly truncated behind nostril. Terminal portion of bill black. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Very rare straggler in severe winters. Only three examples appear to have been taken within our limits at irregular intervals during the present century: one each in Baluchistan (Khushdil Khan) and NWFP (Campbellpur, Attock dist.), both in December; the third and latest in Kutch (Bluji) in February (JBNHS 47: 167). However, the eastern and western subspecies intergrade, and the distinctness of *jankowskii* is currently doubted by some authorities.

Cygnus columbianus

1 *C. c. bewickii*; 2 *C. c. jankowskii*

134

ANSERIFORMES

of a record published in the Journal of the Bombay Natural History Society (49: 311-12) of a white goose, then so identified, shot on Haigam jheel, Kashmir, in February 1950 — a single bird with a party of Greylags. On a re-examination of the specimen in the BNHS collection by Mr Humayun Abdulali and one of us (SDR) it proves to be a partial albino of *Anser anser* (JBNHS 63(1): 198). This leaves us without any record of the Snow Goose in our area, and the species must therefore be expunged from the Indian list.]

Genus *CYGNUS* Bechstein

Cygnus Bechstein, 1803, Orn. Taschenb., 2: 404, note. Type, by monotypy, *Anas olor* Gmelin

Characterized by very long neck. Bill of moderate size, raised at the base, of nearly equal breadth throughout. Nostrils elliptical, placed very far back. Wing long; 1st primary (as.) about half length of 2nd; 2nd and 3rd subequal and longest. Tail short, well rounded. For further details see Delacour 1954, 1: 57.

Bill longer (94-99 mm.), broader but less high at the base in comparison. Serrations hardly visible when bill closed.....	<i>C. c. jankowskii</i>

84. Bewick's or Western Whistling Swan. *Cygnus columbianus bewickii* Yarrell

Cygnus bewickii Yarrell, 1850, Trans. Linn. Soc. London, 16: 453 (Yarmouth, England)
Baker, FBI No. 2244, Vol. 6: 381
Plate 3, fig. 10

SIZE. As in 85.

FIELD CHARACTERS. As under 85. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. As in 85. Three records from Pakistan (Mardan, Dera Momin, Kabul River — NWFP) and one from Delhi

136

ANSERIFORMES

C. c. jankowskii breeds from the delta of the Lena to the delta of the Kolyma. In winter south to China and Japan.

GENERAL HABITS. This and other swans have been recorded in India singly, in pairs, or small herds, keeping to the larger rivers and open waters. They swim buoyantly, rather high on the water, and feed mostly on aquatic vegetation, submerging their head and neck in the quest and frequently up-ending like ducks to reach the lower levels. Sometimes dives for food like all other swans. They require effort to take off from the water, running some distance along the surface with powerful flaps of the broad wings, but are fast and graceful once properly airborne, flying considerable distances on migration.

MUSEUM DIAGNOSIS. For plumages and other details see Witherby 1939, 3: 174. The eastern race *C. c. jankowskii* is described as differing from *bewickii* only by its larger bill which is longer (94-99 mm. v. 87-96), broader near the tip (32-36 mm. v. 29-32), and higher near the base. Its yellow loreal patch extends a little further towards the nostril and is not so abruptly truncated. No size or other difference.

MEASUREMENTS (of *C. c. bewickii*)

	Wing	Bill — (from feathers)	Middle toe with claw	Tail
♂♀	480-560	87-96	115-128	140-175 mm. (Hartert)

The Kutch specimen (♂?) measured in the flesh:
(from skull)

552	99	140	161 mm. (SA)
-----	----	-----	-----------------

Tarsus 112 mm.

COLOURS OF BARE PARTS. Iris brown. Bill black and yellow (see Field Characters). Legs and feet black.

86. Whooper Swan. *Cygnus cygnus* (Linnaeus)

Anas cygnus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 122 (Sweden)
Baker, FBI No. 2243, Vol. 6: 380
Plate 3, fig. 8

LOCAL NAMES. Unrecorded.

SIZE. Vulture +; length c. 152 cm. (60 in.) of which neck c. 76 cm.

FIELD CHARACTERS. Very large, pure white, goose-like, but with a markedly straight and upright carriage of long neck when swimming. Bill longer than in other swans, with the upper outline running straight from tip to base of forehead. 'Tip of bill black, base and lores yellow, this colour extending forward laterally to the nostrils' (Delacour). Sexes alike; female slightly smaller.

STATUS, DISTRIBUTION AND HABITAT. Very rare straggler in severe winters. Less than a dozen occurrences recorded within our limits sporadically: one in Nepal in 1829, the others in the present century in NWFP Province (Peshawar dist.), Kashmir, Punjab, Sind and Rajasthan. Latest record of three birds on Chenab river at Timmu (Jhang district, W. Pakistan), December 1953 by Nasiruddin Khan (C. D. W. Savage). On large rivers and open dhands or jheels.

DUCKS, GEESE, SWANS

137

MUSEUM DIAGNOSIS. For plumages and other details see Witherby 1939, 3: 168-72; Delacour 1954, 1: 72-5.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	560-630	100-112	112-120	160-200 mm.
♀♀	550-600	95-103	110-118	155-180 mm. (Delacour)

Weight of adults: ♂ c. 7-12 kg.; ♀ c. 6-10 kg.

COLOURS OF BARE PARTS. Iris brown. Bill: base and lores yellow, tip black (see Field Characters). Legs and feet black.

87. Mute Swan. *Cygnus olor* (Gmelin)

Anas olor Gmelin, 1789, Syst. Nat., 1: 502 (Russia)

Baker, FBI No. 2246, Vol. 6: 383

Plate 3, fig. 9

LOCAL NAMES. Unrecorded.

SIZE. Vulture +; length c. 152 cm. (60 in.) of which neck c. 76 cm.

FIELD CHARACTERS. As large as Whooper Swan, also pure white. Easily identified by a prominent black knob on forehead at base of rather long and pointed pinkish orange bill. Slender neck carried in a graceful S-shaped curve. Sexes alike; female slightly smaller.

In subadult birds, as have mostly occurred in our area, traces of the pale grey-brown juvenile plumage persist. The knob is absent or only slightly developed; the feathers of the forehead prolonged to a point.

STATUS, DISTRIBUTION AND HABITAT. Very rare straggler in severe winters. About a dozen specimens in all have been taken within our limits sporadically during the last hundred years (the last in 1911), chiefly in West Pakistan — N. Baluchistan, Sind, the former NW. Frontier Province, and Punjab. Most records are from the Indus and the Punjab rivers, and from Khushdil Khan lake near Quetta, and the Manchar and other large duck-shooting dhands or jheels in Sind. Sight record of a single bird from as far south as the Bombay Deccan, near Poona (Trevenen 1922, JBNHS 29: 287).

Extralimital. Breeds in E. Europe and western Asia. Winters south to the Mediterranean area and Iran.

GENERAL HABITS, FOOD, etc. See under *C. c. bewickii*. When angry this species assumes the characteristic aggressive posture, commonly depicted in pictures, drawing in the neck and arching the wings over the back.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from knob)	Tarsus	Tail
♂♂	560-625	70-85	100-120	190-200 mm.
♀♀	537-570			(Delacour)

Weight c. 6-11 kg.

COLOURS OF BARE PARTS. Iris dark brown. Lores black. Bill: upper mandible reddish horny, the knob, base, nostrils, margins, and nail black; lower mandible wholly black. Legs and feet dull black.

DUCKS, GEESE, SWANS

139

the surf, or backwater lagoons (in coastal areas), fighting at sunset to forage in nearby paddyfields. A remarkable refuge of this type in the Calcutta area is the open duck pond in Alipore Zoo, where hundreds of wild birds congregate every morning to spend the day throughout the winter months, year after year. Flight feeble, flapping reminiscent of a jaçana's. The birds keep wheeling over a tank long after the better sporting ducks have departed as a result of gunfire. They are poor eating and seldom shot by sportsmen.

It is a good diver and also walks well on marshy land, grazing rather like a goose.

VOICE AND CALLS. A shrill wheezy whistling *seasick*, *seasick* constantly uttered on the wing.

FOOD. Largely vegetarian — aquatic weeds and tender shoots and grain of wild and cultivated rice etc. Also small fish, frogs, snails, worms.

BREEDING. Season overall June to October varying locally with early or late monsoon and resulting water conditions; in Ceylon chiefly December-January and July-August. *Nest*, of twigs and grass placed in natural hollows in ancient tree-trunks, or built at moderate heights in the fork of large branches, sometimes well away from water. Old nests of kites, herons and crows frequently utilized. Some nests built on the ground among reeds and scrub bordering a tank or jheel — fairly substantial pads of leaves, rushes, and grass. Unlined with down, but occasionally with a few odd feathers. *Eggs*, 7 to 12 (maximum recorded 17) — commonly 10, ivory white, smooth, becoming stained brownish during incubation. Average size of 100 eggs 46.9 × 36.8 mm. (Baker). Both sexes said to incubate. Period of incubation 22 to 24 days (Baker); 'probably 30 days' (Delacour).

MUSEUM DIAGNOSIS. Distinguished from *D. fulva* by smaller size and by uniformly chestnut upper tail-coverts *contra* creamy white.

Chick (in down). 'Blackish brown and whitish grey, with large [white] spots on back' (Delacour).

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♀	170-204	38-42	40-50	53-55 mm. (Delacour)

Weight c. 450-600 gm.

COLOURS OF BARE PARTS. Iris dark brown. Bill slaty grey to almost black, the nail still darker. Eyelids bright yellow. Legs and feet plumbeous-grey or plumbeous-blue; webs and claws blackish.

89. Large Whistling Teal. *Dendrocygna bicolor* (Vieillot)

Anas bicolor Vieillot, 1816, Nouv. Dict. Nat. Hist., 5: 136 (Paraguay)

Baker, FBI No. 2261, Vol. 6: 413

Plate 11, fig. 3 and Plate 13, fig. 3

LOCAL NAME. *Biddi shari* (Bengal).

SIZE. Domestic duck —; length c. 51 cm. (20 in.).

FIELD CHARACTERS. Similar to the Lesser Whistling Teal; ferruginous, brownish black, cinnamon, and chestnut. Distinguished from it by somewhat larger size, *creamy white* (*contra* chestnut) upper tail-coverts, a black

138

ANSERIFORMES

Genus *DENDROCYGNA* Swainson

Dendrocygna Swainson, 1837, Classif. Bds., 2: 365. Type, by subsequent designation, *Anas arcuata* Horsfield

Bill of moderate size, raised at base and of nearly equal width throughout. Nail prominent and abruptly bent down. Nostrils situated about one-third length of bill from base. Wings rather broad and rounded. Tarsus long and stout, reticulated on lower portion in front. Legs placed more forward than in most Anatidae. Feet large.

The genus is represented almost throughout the tropical world, two species being found in the Indian subcontinent. (For further details see Delacour, loc. cit., 1: 27-34.)

Key to the Species

Upper tail-coverts uniformly chestnut.....*D. javanica*
Upper tail-coverts whitish, sometimes marked with black...*D. bicolor*

88. Lesser Whistling Teal or Tree Duck. *Dendrocygna javanica* (Horsfield)

Anas javanica Horsfield, 1821, Trans. Linn. Soc. London, 13: 199, pl. 1 (Java)

Baker, FBI No. 2260, Vol. 6: 411

Plate 11, fig. 4 and Plate 13, fig. 4

LOCAL NAMES. *Seelhi*, *Seelkahi* (Hindi); *Sharāl* ♂, *Sharāli* ♀ (Bengal); *Hansrali* (Orissa); *Sorali*, *Horali* (Assam); *Ting* (Manipur); *Bongfang daophlantu* (Cachar); *Teranda* (Malayalam); *Chilli thārā* (Tamil, Ceylon); *Sērūcā*, *Thumba sērūcā* (Sinhala); *Nāni sīvoti* (Gujarat); *Chiku* (Sind); *Chayi* (Kutch).

SIZE. Domestic duck —; length c. 42 cm. (17 in.).

FIELD CHARACTERS. A small pale brown and maroon-chestnut coloured duck, confusable with no other of the same size except the Large Whistling Teal. Uniformly chestnut upper tail-coverts distinguish it from the latter, in which they are creamy white. Feeble, flapping rail-like flight, and the shrill wheezy whistling notes constantly uttered on the wing are leading clues to its identity. Sexes alike.

Young (immature). Duller coloured. Mantle feathers margined with dingy fulvous instead of golden rufous. Lower plumage pale dull fulvous brown.

STATUS, DISTRIBUTION AND HABITAT. Resident; moving about locally with drought and flood. Also partial local migrant. All India, Andaman and Nicobar islands, both Pakistans, Nepal (terai), Ceylon. Affects reedy and vegetation-covered tanks and jheels in plains country.

Extralimital. Burma eastwards to coast of S. China, Malaysia, Thailand, S. Viet Nam, Ryukyu Is., SW. Borneo, Sumatra, Java.

GENERAL HABITS. Sociable. Keeps in small parties of 10 to 15, occasionally fairly large flocks, on and around weedy tanks and inundated paddy-fields. Perches freely in the surrounding trees. Avoids open water and large rivers. Mainly a nocturnal feeder, seeking safety during daytime on undisturbed lotus-covered village tanks, or on the open sea just beyond

140

ANSERIFORMES

line down back of neck, and a broad, diffuse rusty-whitish collar round middle of foreneck. Sexes alike.

Young (immature). Duller; the chestnut portions more brown.

STATUS, DISTRIBUTION AND HABITAT. Resident, nomadic, and possibly also local migrant in part. Scattered widely but sporadically in many areas; everywhere rather scarce and much less common than *D. javanica*. Both Pakistans, N. India south to the Deccan, Assam, Manipur; Ceylon (rare vagrant). Frequents reedy and vegetation-covered jheels and tanks in plains country.

Extralimital. Range very remarkable: far flung, discontinuous and fragmentary, yet producing no geographical variation. S. California, Mexico, northern tropical S. America, Brazil, Peru, south to Paraguay and N. Argentina. East Africa from Lake Chad to Natal; Madagascar. In Asia, besides the Indian subcontinent and Ceylon, only Burma south to Pegu.

Dendrocygna bicolor

Residential range (Also Madagascar and Central & South America)

GENERAL HABITS. Keeps in smaller flocks and to rather more secluded weed-covered tanks, but on the whole very similar to *D. javanica* with which it is often found in association. Wilder and faster on the wing.

VOICE. Also similar, but said to be shriller.

FOOD. Aquatic vegetation taken while swimming and diving.

BREEDING. Apparently more common in Bengal (Nadia dist.) and East Pakistan (Khulna and Jessore districts) than elsewhere in our limits. Season, June to October, chiefly July-August. *Nest*, of sticks roughly put together in hollows in ancient tree-trunks or in forks of large branches, at moderate heights. Very like that of Lesser Whistling Teal; likewise appropriates disused nests of kites and crows. Occasionally built on ground among rank vegetation at edge of a tank. *Eggs*, 6-8, ivory white, smooth, like those of the preceding species only somewhat larger. Average size of 50 eggs

DUCKS, GEESE, SWANS

141

56.6 × 42.9 mm. (Baker). Share of the sexes in incubation unrecorded. Incubation period 30-32 days (Delacour).

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit. Chick (in down). Pale greyish brown; white markings as in *D. javanicus* less contrasty.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	200-235	42-52	56-61	52-58 mm. (Delacour)

Females slightly smaller than males. Weight ♂ c. 650-900 gm., ♀ c. 450-730 gm. COLOURS OF BARE PARTS. Iris light to dark brown. Bill dusky black with bluish slate of varying extent at base. Legs and feet pale dusky plumbeous or bluish slate, to nearly black. Claws black.

Genus TADORNA von Oken

Tadorna Lorenz von Oken, 1817, Isis von Oken 1, col. 1183. Type, by tautonymy, *Anas tadorna* Linnaeus

Casarea Bonaparte, 1838, Geogr. and Comp. List: 56. Type, by monotypy and tautonymy, *Anas rutila* Pallas = *A. ferruginea* Pallas

Goose-like in shape and habits. Bill short, high at base, concave above, flattened and turned up at tip. Nail small and abruptly turned downward and inward; thus bill more or less hooked at tip. Nostrils less than one-third length of bill from base. Tarsus scutellated in front near foot. Wings long and pointed. Tail rounded, of fourteen feathers. Sexes more or less alike.

Two species occur in our limits, formerly placed under separate genera.

Key to the Species

Chestnut-coloured above and below, head paler chestnut, large white patch on bend of wing, bill black.....*T. ferruginea*
Black and white above and below, head black, chestnut girdle around breast and shoulders, bill red.....*T. tadorna*

90. Ruddy Shelduck or Brahminy Duck. *Tadorna ferruginea* (Pallas)

Anas (ferruginea) Pallas, 1764, in Vroeg, Cat. d'Ois., Adumbr.: 5 (Tartary) Baker, FBI No. 2263, Vol. 6: 416

Plate 11, fig. 1 and Plate 13, fig. 1

LOCAL NAMES. *Chākwa* ♂, *Chākui* ♀, *Sūrkhāb*, *Lāl* (Hindi); *Mungh*, *Lālo*, *Kwancha*, *Kathiun* (Sind); *Chākā-chāki* (Bengal); *Rāmkaon*, *Chākoī-chākoua* (Assam); *Kāsār pāndia*, *Pānda hansa* (Orissa); *Sarza*, *Chakravak* (Marathi); *Bāpānā chiluwā* (Telugu); *Thārā* (Tamil); *Loku sēwō* (Sinhala).

SIZE. Large domestic duck; length c. 66 cm. (26 in.).

FIELD CHARACTERS. A large orange-brown or cinnamon-brown duck with paler head and neck, a prominent metallic green speculum on wing with a white patch (wing-coverts) in front of it, and black wings and tail.

DUCKS, GEESE, SWANS

143

GENERAL HABITS. Less gregarious than most other ducks. Usually seen in pairs and small parties, less commonly in flocks of twenty or more. But occasional enormous congregations have been recorded, e.g. on Chilka lake in Orissa, one such estimated by an experienced duck hunter (L. A. Craven) at 'not less than 15,000' (JBNHS 49: 313). Rather aggressive in disposition, and intolerant of feeding competitors of its own and other species. Its flesh is considered rank and fishy, therefore sportsmen usually leave it alone. Nevertheless it is excessively wary and difficult to approach in its winter quarters, flying off and giving the alarm to other ducks long before they have scented danger. Contrary to this, ridiculously tame and confiding on its breeding-grounds, e.g. in Ladakh and Tibet where conditioned to non-molestation from the Buddhist inhabitants, even settling and waddling about on the flat roofs of Tibetan houses and nesting in lumber rooms (Ludlow, JBNHS 33: 79). Walks well and with ease; grazes on dry river banks and grassy lake margins like geese.

FOOD. Omnivorous; takes grain, tender shoots and tubers, crustaceans, molluscs, aquatic insects, reptiles, etc. Alleged to share carrion with vultures occasionally; this needs confirmation.

VOICE AND CALLS. A loud, nasal, clanging *aang-aang* rather like the Greylag's in the distance, uttered on the ground as well as in flight.

BREEDING. Around the high-altitude lakes and swamps above c. 4000 m. in Ladakh, e.g. Pangong, Tsokri, and Tso Moriri. Possibly also in the Khumbu region of Nepal at c. 5000 m. *Season*, chiefly May and June. *Nest*, a thick pad of white down (the duck's own) in a hole or fissure in a cliff, often far from water and maybe several hundred metres above a lake or bog. The ducks flying about the rugged contours or alighting like pigeons on rocky pinnacles high up on a forbidding mountainside present a curiously unrealistic spectacle. *Eggs*, 6 to 10, ivory white, moderately broad ovals, about equal at both ends. Average size of 85 eggs 67.0 × 47.0 mm. (Baker). Incubation mainly by female (?). Incubation period 28-30 days (Delacour). Both parents tend the ducklings, frequently of more than one brood: in one case as many as 34 ducklings accompanying a single pair recorded (Ludlow, *Ibis* 1928: 229). The downy chicks probably shuffle and tumble their way down the rugged slopes to the water. Osmaston suggests their being carried down in the parent's bill. The actual process has not been observed.

For courtship display etc. see Witherby 1939, 3: 228.

MUSEUM DIAGNOSIS. For description of plumage see Baker 1929, loc. cit. Both sexes possess a rudimentary spur on the carpal joint whose significance is not understood.

Chick (in down). Above, dark brown marked with white. Below, white. Very similar to chick of *T. tadorna* but with lores dark brown as on crown, *contra* white (Ticehurst).

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♂	365-387	43-48	60-66	142-146 mm.
♀ ♀	340-355	38-42	55-60	140-142 mm. (Delacour)

142

ANSERIFORMES

In overhead flight orange-brown body, white underside of wings and black quills (remiges) diagnostic.

Male, with narrow black collar or ring round base of neck in breeding season; obsolete in winter.

Female, similar but with head paler and whitish and no black collar.

Young (immature). Like female but with a grey wash on scapulars and tertiaries.

STATUS, DISTRIBUTION and HABITAT. Winter visitor (breeding in our area only in Ladakh). All India (rare or absent in the south), both Pakistan, Nepal (possibly breeding), Ceylon (occasional). Affects large open lakes and rivers with shingle banks and mudspits.

Extralimital. Breeds in S. Spain and from SE. Europe, Near East, Caspian Sea, across Asia to Transbaikalia, south to Himalayas and SW. China. [Also in SE. Iran and Seistan.] Winters in southern half of its breeding range to the Nile Valley; India and S. China. Occasional in Britain (Peter Scott).

MIGRATION. Arrives in N. India c. October/November; most have departed by mid-April. A juvenile ringed in Kirghiz SSR (c. 42°N., 75°E.) in July 1959 was recovered near Lahore (c. 31°30'N., 74°20'E.) in October of the same year (JBNHS 58: 284).

Tadorna ferruginea

144

ANSERIFORMES

Weight ♂ 3 lb. to 4 lb. 4 oz. (c. 1360 to 2140 gm.); ♀ 2 lb. 10 oz. to 3 lb. 5 oz. (c. 940 to 1500 gm.) (Hume); 5 ♂♂ 820-1500 (av. 1034), 3 ♀♀ 950-1100 (av. 1026) gm. (BNHS).

COLOURS OF BARE PARTS. Iris rich brown. Bill, legs, and feet black.

MISCELLANEOUS. As *Chākwa-chākui* (its commonest Hindi name for male and female respectively) the Brahminy Duck has won immortality in popular folklore. Legend describes the birds as a pair of lovers torn apart by unkind fate, ceaselessly calling and answering each other in anguished tones.

91. Common Shelduck. *Tadorna tadorna* (Linnaeus)

Anas Tadorna Linnaeus, 1758, Syst. Nat., ed. 10, 1: 122 (Sweden) Baker, FBI No. 2262, Vol. 6: 414

Plate 11, fig. 2 and Plate 13, fig. 2

LOCAL NAMES. *Shāh chākwa*, *Safed sūrkhāb*, *Rararia* (Hindi); *Shāh chākā* (Bengal); *Thār jo mirgi* (Sind).

SIZE. Domestic duck ±; length c. 61 cm. (24 in.).

FIELD CHARACTERS. A handsome, strikingly coloured duck, chiefly white, black, and chestnut, with a distinctive bright red upturned bill and pink legs.

Male (adult). Above, head and neck glistening greenish black. Rest of upperparts white with two broad black bands along either side of upper back (scapulars). Glistening green wing-speculum bordered above by a chestnut patch. Below, white. A broad chestnut hoop or girdle around upper breast and shoulders. A broad black band from breast to vent and a conspicuous red knob above base of bill.

Female considerably smaller and duller coloured, with the chestnut breast feathers edged with black vermiculations.

Young (immature). Head and neck dull blackish; interscapulars dark brown; no chestnut breast band but sides sometimes suffused with chestnut.

STATUS, DISTRIBUTION and HABITAT. Casual and uncommon winter visitor; fairly plentiful in certain years. Recorded in W. Pakistan (Baluchistan, Sind, the former NWF Province), Punjab, Kashmir, Delhi, Uttar Pradesh (Mainpuri, Banda, Sitapur districts), Bengal (Murshidabad district, Calcutta Salt Lakes), Assam (Brahmaputra river), Manipur (Logtak lake), East Pakistan, Bihar (Monghyr, Darbhanga and Patna districts), Orissa (Chilika lake), Gujarat (Kutch, Saurashtra), Madhya Pradesh (Neemuch), south to the Deccan (Poona), Nepal (Kosi R.). Has occurred regularly in small numbers in recent years in parts of Sind and Punjab (C. D. W. Savage, 1966 in *epist.*). On open lakes and large rivers. Not recorded on sandy and muddy sea coasts and estuaries where chiefly met with in Europe.

Extralimital. Breeds on coasts of W. Europe, including the British Isles; locally about the shores of the Mediterranean, Black, and Caspian seas, east on the saline lakes of central Asia to E. Siberia, Mongolia, and

DUCKS, GEESE, SWANS

145

Tibet. Winters from southern part of its breeding range to N. Africa, Arabia, India, south China and Japan' (Peter Scott).

GENERAL HABITS. Normally more gregarious than the Brahminy. In our area occurs sporadically and irregularly in small parties here and there in the northern parts of the subcontinent. Perhaps more regular on the larger open lakes such as the Manchar and Chilka, and on broad rivers, e.g. the Indus and Brahmaputra, with extensive mudspits and shingle banks. 'Hundreds' recorded on the Chilka in December 1937; practically none the following year! Keeps to mudflats more than water, sauntering about with the facility of geese.

FOOD. Molluscs, crustaceans, insects, and worms. Also algae, seeds, leaves and tubers of aquatic plants, etc.

VOICE AND CALLS. Apparently not heard in India. Recorded elsewhere as a clear whistle (male) and a harsh short quack (female).

BREEDING. The only record in our area is from W. Pakistan — near Khushdil Khan lake, Quetta dist. (Christison, JBNHS 43: 486). Breeds more commonly in neighbouring Seistan (Persian Baluchistan). *Season*, May-June. *Nest*, a bed of down in a natural crevice or hollow in a cliff or bank. *Eggs*, 8 to 16, pearly white. Average size of 100 eggs 65.7 × 47.3 mm. (Baker). (For further details see Witherby 1938, 3: 223.)

MUSEUM DIAGNOSIS

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♂	318-350	52-60	50-57	110-130 mm.
♀♀	290-334	44-54	48-52	100-115 mm.
				(Delacour)

Weight ♂ 2 lb. to 2 lb. 14 oz. (c. 910-1300 gm.); ♀ 2 lb. to 2 lb. 2 oz. (c. 910-960 gm.) (Hume & Marshall).

COLOURS OF BARE PARTS. Iris brown. Bill deep fleshy red to coral-red; nail darker and brownish. Legs and feet fleshy pink to fleshy red; claws black.

Genus ANAS Linnaeus

Anas Linnaeus, 1758, Syst. Nat., ed. 10, 1: 122. Type, by subsequent designation. *Anas boschas* Linnaeus = *Anas platyrhynchos* Linnaeus (Lesson, 1828, Man. d'Orn., 2: 417)

Includes the Dabbling or Surface-feeding ducks, characterized by shorter tail and shorter legs than shelducks (*Tadorna*) set farther back in the body, producing a more waddling gait on land. Tarsus with shields in front. Hind-toe (hallux) with a much narrower inner lobe than in Pochards or the so-called Diving ducks. Also characterized by a common behaviour and display pattern.

Genus cosmopolitan. Represented in India by twelve species many of which were formerly assigned to separate genera. Most species sexually dimorphic. For further details see Delacour 1956, 2: 17-22.

Genus MARMARONETTA Reichenbach

Marmaronetta Reichenbach, 1832, Av. Syst. Nat. p. 9. Type by monotypy, *Anas angustirostris* Ménetriès

Speculum dull blackish, sometimes glossed with green and bordered inwardly by white edges of long pointed tertiaries	<i>A. penelope</i>
Speculum: Outermost secondaries black with narrow white tips, those next to them brilliant metallic green sometimes narrowly tipped with black and white, their coverts tipped rufous	<i>A. crecca</i>
Speculum: Outermost secondaries black with wide white tips, those next to them bronze-green at base, then black tipped with white, their coverts tipped rufous	<i>A. formosa</i>

92. Marbled Teal. *Marmaronetta angustirostris* (Ménetriès)¹

Anas angustirostris Ménetriès, 1832, Cat. Rais. Obj. Zool. Caucase: 58

(Lenkoran, Transcaspiia)

Baker, FBI No. 2277, Vol. 6: 445

Plate 9, fig. 8 and Plate 10, fig. 8

LOCAL NAME. *Chai* (Sind).

SIZE. Domestic duck —; length c. 48 cm. (19 in.).

FIELD CHARACTERS.

Adult. *Above*, overall greyish brown, spotted or marbled with pale greyish buff and blackish. A large brown patch from eye to nape. A slight nuchal crest. Speculum or wing-mirror inconspicuous, dull pale brown. *Below*, sullied white, more or less barred transversely with brown. Sexes alike; female slightly smaller.

× c. 1

Young (immature). Like adult but markings duller and greyer, the large creamy spots on the upperparts lacking. Underparts almost uniform.

STATUS, DISTRIBUTION AND HABITAT. Peripheral breeding range in W. Pakistan (Baluchistan, and possibly also Sind where not uncommon throughout the year, e.g. on the Manchar, and fairly abundant in winter). Chiefly a rare winter visitor to northern parts of the subcontinent. Has occurred frequently but erratically in the former NWF Province (Nowshera), Punjab

Anas angustirostris has been transferred to genus *Marmaronetta*, see p. 145.

ANSERIFORMES

(Bahawalpur), and as a straggler in Uttar Pradesh, Madhya Pradesh, Rajasthan (Bikaner, Bharatpur districts), Gujarat (Kutch, Bhavnagar, Ahmedabad, and Baroda districts), Bengal (Calcutta area), Assam (Sibsagar district), Maharashtra (Ahmednagar, Poona). Affects reedy and matted vegetation-covered jheels. Flooded tamarisk forest, etc., avoiding open water.

Extralimital. Resident (breeds) in Mediterranean Basin from southern Spain to Near East, Persia, Baluchistan, and NW. India (Peter Scott).

Marmaronetta angustirostris

■ Breeding range ▨ Winter extension

GENERAL HABITS. Normally in pairs or small parties; occasionally larger flocks in winter. Habits rather coot-like; dropping into cover after a short flight rather than flying round and round with other ducks when disturbed by gunfire. Feeds chiefly swimming.

FOOD. Almost entirely vegetarian — shoots, tubers, seeds of aquatic plants. Partly also worms, molluscs, aquatic insects and larvae.

VOICE AND CALLS. Silent. Male's calls variously described as a 'weak nasal squeak', 'a whistling croak' and 'a low croaking whistle'. Also a loud and abrupt quack (female?). But apparently insufficiently known and needs accurate recording.

BREEDING. Breeds in West Pakistan (Khushdil Khan lake near Quetta c. 1500 m. altitude; Sonmiani jheel, Las Bela); possibly also on the Manchar in Sind, and in Gujarat as conjectured but not yet substantiated. *Season*, May/June. *Nest*, of rushes and weeds, unlined or sometimes scantily so with down; concealed among weeds and rushes on swampy ground or on an islet in a lake. *Eggs*, 9 to 12, pale creamy, rather long elliptical oval in shape; with a smooth glossy surface. Average size of 122 eggs 46.5 × 34.2 mm. (Baker). Share of the sexes in incubation not recorded. Incubation period 25 days (Delacour).

MUSEUM DIAGNOSIS. Bill long, narrow, high near base, depressed beyond the nostrils, with very short lamellae. The absence of a metallic speculum is a curious departure from the normal condition in its close relatives of the genus *Anas*. Previously placed in a separate genus, *Marmarettia*, considered from structure and habits to bridge *Nettion* with *Anas*, now united (Johnsgaard 1961, Bull. B.O.C., 81: 37-43).

Chick (in down). Like Mallard (q.v.) in pattern, but brownish grey above, pale grey below.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	205-215	43-45	36-38	85-105 mm.
♀♀	198-20	—	—	—

(Delacour)

Weight ♂ 1 lb. 3 oz. to 1 lb. 5 oz. (c. 535-592 gm.); ♀ 1 lb. to 1 lb. 3 oz. (c. 450-535 gm.) (Hume & Marshall).

COLOURS OF BARE PARTS. Iris brown. Bill blackish with a dull grey-green triangle at the base (more pronounced in ♀) and a whitish subterminal line in ♂. Legs and feet olive-brown, the webs blackish.

93. Pintail. *Anas acuta* Linnaeus

Anas acuta Linnaeus, 1758, Syst. Nat., ed. 10, 1: 126 (Sweden)

Baker, FBI No. 2274, vol. 6: 437

Plate 9, fig. 2 and Plate 10, fig. 2

LOCAL NAMES. *Sand*, *Semkh pār* (Hindi); *Kotūāli*, *Drigōsh* (Sind); *Dhrūgūkhō* (Kutch); *Dig hāns*, *Bedā digar*, *Sholanchō* (Bengal); *Dighēnch* (Mirshikars, Bihar); *Digunch* (Nepal); *Nanda*, *Nanja* (Orissa); *Mārkalian* (Tamil); *Nejāl hāns*, *Dighal negi* (Assam); *Daophilantus loubi* (Cachar); *Mehunga* (Manipur).

SIZE. Domestic duck —; length ♂ c. 56-74 cm. (22-29 in.).

FIELD CHARACTERS.

Male (breeding). Elongated body, slender neck, and long pointed pin-like central tail-feathers diagnostic. Black under tail-coverts with a broad buff patch in front, additional pointers. Head, face, and throat chocolate; hindneck black. A white band running down either side of neck, broadening into white of breast and belly. Upper plumage and flanks largely grey, finely vermiculated with black. Conspicuous silver-grey edges to long black pinnae scapulars and upper tail-coverts. Speculum metallic bronze-green.

× c. 1/2

Male (in eclipse). More or less like female, sometimes with the mantle dark ash- or blackish grey coarsely vermiculated with greyish white.

audible from considerable heights. One of the species most sought after by duck hunters both for its sporting qualities and its excellence as a table bird. Seems uncannily aware of this human predilection and is always amongst the first to zoom out of gunshot range when shooting has commenced on a jheel, or to clear right away to other waters while the less prized species are still milling around and paying the toll. Largely a crepuscular and nocturnal feeder, flock after flock flying at sundown from the daytime retreat on some weedy jheel to forage in favourite marshes or squelchy paddyfields, and back again before dawn. This morning and evening 'flying' provides exhilarating sport for duck hunters. Where hunting pressure is not heavy, may continue to feed till the sun is well up, or even during the day, walking about freely and grubbing on marshy tank edges or in wet paddy stubbles. In shallow water the food is procured by the characteristic tipping up or up-ending of the non-diving or surface-feeding ducks. A flock engaged in this way, with merely the tail ends projecting above the surface here and there, presents a singularly comical sight.

FOOD. Chiefly vegetable matter — grass, corns, shoots, and seeds of aquatic plants, and wild and cultivated rice. To a lesser extent also molluscs, worms, water insects and larvae.

VOICE. Very silent. No calls recorded in India.

BREEDING. Entirely extralimital. For particulars of courtship display, nesting, etc. see Withersby 1939, 3: 271-2.

MUSEUM DIAGNOSIS. For description of plumages, moults, etc. ibid.: 273-5.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	254-287	48-59	39-44	172-209 mm
♀♀	242-266	45-50	38-42	—

Weight ♂ 1 lb. 10 oz. to 2 lb. 12 oz. (c. 730-1250 gm.); ♀ 1 lb. 2 oz. to 1 lb. 14 oz. (c. 500-850 gm.) (Hume & Marshall).

COLOURS OF BARE PARTS. Iris dark brown, often tinged with red. Bill light to dark plumbeous, the culmen, lower mandible, and base, darker. Legs and feet dark plumbeous-grey or blackish; webs, claws, and joints blacker.

MISCELLANEOUS. Flight speed, chased c. 104 km./h (Sprunt & Zim). Longevity (from ring recovery) 17 years 10 months (Bear River Refuge, Utah, U.S.A.).

94. Common Teal. *Anas crecca crecca* Linnaeus

Anas crecca Linnaeus, 1758, Syst. Nat., ed. 10, 1: 126 (Sweden)

Baker, FBI No. 2271, Vol. 6: 431

Plate 9, fig. 9 and Plate 10, fig. 9

LOCAL NAMES. *Chāhī mīrghāhī*, *Kerra*, *Lohiya kerra*, *Charter*, *Patāri*, *Souchareka* (Hindi); *Neorib*, *Patāri hāns*, *Tālibitri* (Bengal); *Bajila* (Mirshikars, Bihar); *Bajila* *geini* (Nepal); *Kerds* (Sind); *Chakrag* (Marathi); *Sindri*, *Kūdwai* (Tamil); *Terrada* (Malayalam); *Solari kākki* (Kannada); *Kelivari*, *Chila hāns*, *Patāri hāns* (Assam); *Daophilantus kashiba* (Cachar); *Sirrad* (Sinhala); *Surit* (Manipur).

SIZE. Half-grown domestic duck ±; length c. 38 cm. (15 in.).

FIELD CHARACTERS.

Female (adult). Mottled brown and buff with pointed but pinless tail. Rather like slender female Gadwall but lacking its characteristic white wing-patch and orange bill. Absence of prominent speculum distinguishes her from female Mallard. In overhead flight the peculiar trident-like ending — the two feet with pointed tail projecting between — identifies it.

Anas acuta

■ Breeding ▨ Non-breeding

Young (immature) male has wing coloration of adult male, but with faint light edges to wing-coverts. Rest like female.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. Common, widespread, and locally abundant: all India, both Pakistans, Nepal, Ceylon; probably also Andaman and Nicobar islands whence not yet reported. Affects reedy and vegetation-covered jheels, brackish lagoons, and estuaries.

Extralimital. 'Breeds in the northern parts of Europe, Asia, and N. America, including British Isles. Winters south to N. Africa, the Nile Valley, Ethiopia, the Persian Gulf, India, Ceylon, Burma, Siam, S. China...' (Peter Scott).

MIGRATION. Arrives in W. Pakistan and NW. India in September and October; normally well spread out east and south by middle of November. Mostly gone by end March. Recoveries of Russian-ringed birds in India and vice versa suggest that our migrants originate chiefly from the Caspian region and Siberia, lying between c. 45° and 65°N. lat. and c. 48° and 100°E. long. — at single straight-line distances on the map of up to about 5000 km.

GENERAL HABITS. One of our commonest migratory ducks. Keeps in flocks of 15 or 20 to several hundred strong. Early in the season parties often composed entirely of drakes. Usually wild and wary, swift on the wing, and invariably seeming in tearing haste. The peculiar hissing or whishing sound produced by the rapid wing-beats of a flock overhead is

Male (breeding). Pencilled greyish, with chestnut head and a broad metallic green band running backward from in front of eye to nape, narrowly bordered above and below with whitish. A tricoloured wing bar (speculum) — black, metallic green, buff — particularly conspicuous in flight.

Female (in eclipse). Head as in female, but crown and nape blackish brown, the feathers narrowly edged with buffish cinnamon. Mantle and scapulars edged and marked with rufous-buff.

Female (adult). Mottled dark and light brown, with black and green wing speculum, and pale underparts. May be confused with female Garganey (q.v.), but the prominent speculum is distinctive. At rest, and at close range, speckled brown throat (c. unmarked whitish) is also a pointer.

Young (immature). Belly spotted; secondaries shorter.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. Common, widespread and locally abundant: all India, both Pakistans, Nepal, Ceylon, Andaman, Nicobar, and Maldives islands. Affects tanks, jheels, and marshes, chiefly freshwater.

Extralimital. 'Breeds in Europe and Asia from Iceland to China, Manchuria and Kurile Islands, and Japan. Winters as far south as N. Africa, Nile Valley, Somaliland, Persia, India, to southern China and the Philippines' (Peter Scott).

Anas crecca crecca

■ Breeding ▨ Non-breeding

DUCKS, GEESE, SWANS

153

MIGRATION. Together with the Garganey, one of the earliest ducks to arrive in autumn, numbers being already in W. Pakistan and NW. India by middle or end August, the influx continuing till November, by which time the birds are widely spread out. Many birds moult the remiges after reaching their winter quarters in India, becoming flightless for a time. Mostly gone again by end March; some staying on as late as May. Observed on northward passage in Ladakh, at over 3000 m. altitude in April (Meinertzhagen). Recoveries to date of Russian-ringed Teal in W. Pakistan and India, and Indian rings in the USSR, indicate that our winter visitors are derived from the Caspian region east to Kirghiz SSR and beyond (between c. 50° and 132°E.), and north in Siberia to c. 70°N.

GENERAL HABITS. One of our commonest and most abundant ducks, widely scattered in the plains country on every sort of marsh and inland water, large or small, provided it is shallow, has a muddy bottom, and a plentiful supply of aquatic vegetation. Judged by the qualities that most appeal to the sportsman—abundance, swiftness and versatility on the wing, and palatability—one of our gamiest species. Keeps in small parties and large flocks of up to 200 or more, congregating at times in swarms (together chiefly with the Garganey) that literally blacken acres of marshland and sky, e.g. in the Little Rann of Kutch, before emigration.

On migration, or when commuting to and from distant nocturnal feeding-grounds, the birds fly in a succession of wide Vs or wavy convex lines with a broad front; when disturbed by gunfire on a jheel, usually in close-knit packs which turn and twist in unison with the speed and agility of the smaller waders. They have an uncanny ability to jink in mid-air—braking to a sudden momentary halt in full flight, changing course and rocketing vertically into the sky upon discovering the gunner's ambush or to avoid his forwardly directed shots. Feeding is done by up-ending in shallow water as well as by grazing and grubbing on marshy land.

FOOD. Almost entirely vegetarian: shoots, tubers, and seeds of aquatic plants, and grains of wild and cultivated rice.

VOICE AND CALLS. A low musical far-sounding *krit, krit* by the male; a short sharp quack by the female, usually uttered when suddenly alarmed.

BREEDING. Entirely extralimital. For particulars of courtship display, nesting, etc. see Witherby 1939, 3: 246.

MOULT. Some individuals—presumably our earliest arrivals—leave their breeding grounds even before the post-nuptial (autumn) moult, contrary to the norm in migratory ducks. They shed their wing quills simultaneously after reaching their winter quarters, becoming completely flightless for a time.

MUSEUM DIAGNOSIS. For description of plumages, moults, etc. see Witherby 1939, 3: 248-50.

Chick (in down). Very similar to Mallard (q.v.), blackish brown and yellow, with two dark lines on face.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	175-192	34-38	27-30	62-72 mm.
♀♀	170-180	31-36	—	—

(Delacour)

DUCKS, GEESE, SWANS

155

Anas formosa

■ Breeding ▨ Non-breeding

GENERAL HABITS. Nothing recorded in India except that in one instance in Manipur the birds were in a party of 8 to 10.

VOICE AND CALLS. Described of captive birds as exactly like the loud clucking of a hen.

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. Apart from larger size, female differs from female *crecca* by an appreciably broader bill (150+ mm. v. 140—mm. at widest point near tip). Lower back and rump nearly uniform grey-brown, a little darker on the shafts, v. very dark brown, each feather conspicuously margined greyish or buffish in *crecca*. Wing speculum in both very similar but tip of greater secondary coverts narrower and rufous-buff throughout v. broader and white, only tinged with buff posteriorly in *crecca*. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	203-219	33-38	c. 31-35	86-95 mm.

COLOURS OF BARE PARTS. Iris brown, red-brown, or chestnut-brown. Bill dark bluish to slaty black or black. Legs and feet pale plumbeous or slaty blue (Baker).

96. Grey, Andaman or Oceanic Teal. *Anas gibberifrons albobularis* (Hume)

Mareca albobularis Hume, 1873, *Stray Feathers*, 1: 303 (Andamans)

Baker, FBI No. 2273, Vol. 6: 435

Plate 9, fig. 5 and Plate 10, fig. 5

LOCAL NAMES. Unrecorded.

154

ANSERIFORMES

Weight ♂ ♀ 7-7 oz. to 12 oz. (c. 225-340 gm.).—Hume & Marshall.

COLOURS OF BARE PARTS. Iris brown. Bill black, paler and browner under lower mandible; in female more yellow-brown, sometimes tinged with green. Legs and feet light bluish or olive-grey to deep slaty blue or dark olive-plumbeous.

95. Baikal, Clucking or 'Formosa' Teal. *Anas formosa* Georgi

Anas formosa Georgi, 1775, *Bemerk. Reise Russ. Reich*, 1: 168 (Lake Baikal, Siberia)

Baker, FBI No. 2272, Vol. 6: 433

Plate 9, fig. 7 and Plate 10, fig. 7

LOCAL NAMES. Unrecorded.

SIZE. Common Teal +; length c. 40 cm. (15½ in.).

FIELD CHARACTERS. A remarkably beautiful teal.

Male (breeding). With a distinctive gaudily patterned head. Crown, nape, hindneck, and throat black. Face, sides of upper foreneck, and below the throat buff, narrowly margined with white. A narrow crescentic vertical black band from eye down across the face to the black throat. Crown from in front of and above eye bordered on each side by a narrow white band looping forward down the sides of the black nape into the buff lower throat. A broad crescentic metallic green band from behind eye down sides of head bounded behind by the white loop and in front by the buff facial patch. Mantle slaty grey, pencilled with brown and black. Inner scapulars and tertiaries very long and lanceolate as in the Garganey, velvety black; white and cinnamon. Speculum black and bronze-green, edged with black and white. *Below*, breast vinaceous, spotted with black. Sides slaty. Rest of underparts largely white.

Female (adult). Overall brown, similar to female Common Teal but for somewhat larger size and the distinctive head pattern—crown dark; face light speckled brown with dark lines above the eyes from eye to nape. A round white patch at base of bill (below the brown lores).

Young (immature). Like female but plainer, with no white patch near bill (Delacour).

STATUS, DISTRIBUTION AND HABITAT. Very rare and sporadic winter visitor. Has been recorded at long intervals about a score of times in the last 70 years or so, in Sind, Punjab, Rajasthan, Gujarat, Uttar Pradesh, Bihar, Bengal, Assam, Manipur, the most recent being a sight record on the Jumna near Delhi, 12 May [sic] 1947 (R. S. Symons). Owing to similarity of female with female Teal, possibly some examples go undifferentiated, in spite of larger size.

Extralimital. Breeds in Siberia east from the Yenisey river to the Kolyma delta and Anadyr, south to Lake Baikal, northern Sakhalin and northern Kamchatka. Winters in China and Japan.¹ Recorded from Formosa but derives its name not from that island but from the fact that "formosa" is the Latin for "beautiful" (Peter Scott).

¹ Very abundant winter visitor in southwestern Japan particularly in certain years, flocks numbering 10,000 having been observed. The highest single day's catch of three men operating six throw-nets on a pond was 10,000 Baikal Teal! (Austin & Kuroda 1953).

156

ANSERIFORMES

SIZE. Half grown domestic duck ±; Common Teal +. Length c. 43 cm. (17 in.).

FIELD CHARACTERS.

Male (breeding). Above, dark (almost chocolate) brown, the feathers edged greyish producing a scaly or scalloped effect. Throat, foreneck, and a varying area encircling eye white, this colour sometimes extending to entire face. Wings brown with a green and black speculum bordered in front and behind by whitish bands, the former broad and conspicuous. *Below*, buffy grey spotted with dark brown.

Female differs only in being slightly duller coloured with less distinct centres to the feathers. The green of the speculum more coppery. 'The broad white wing-bar is most conspicuous in flight' (Butler, JBNHS 11: 333).

Young (immature). Like female but dusky markings on lower plumage less distinct, and white eye-ring narrower and more fulvous.

STATUS, DISTRIBUTION AND HABITAT. Endemic in the Andaman group of islands (Landfall, Coco, Great Coco, and others). Nomadic, and on many islands apparently only a winter visitor. Affects outlying freshwater jheels and swamps; also tidal creeks and salt water.

GENERAL HABITS. Less common than the two Whistling Teals. Keeps in flocks of twenty or thirty, feeding chiefly at night by walking about and grubbing in wet paddyfields like Common Teal. Spends much of the day roosting perched up amongst the mangrove trees or on rocks exposed at low tide. The flocks break up into small parties and pairs as the breeding season approaches.

FOOD. Chiefly vegetarian—tender shoots of crops, grain, etc. Probably also insects, worms, crustaceans, etc.

VOICE. A soft whistle. Also described as having a low quacking call-note.

BREEDING. Season, the only dependable record (Osmaston, JBNHS 17: 491) is of a nest containing ten nearly fresh eggs on August 4. *Nest*, in a natural hollow high up in lofty dead tree-trunks, usually inaccessible. *Eggs*, normal clutch? Long, elliptical, cream-coloured ovals. Average size of 10 eggs 49.0 × 36.3 mm. (Baker). Incubation period, share of the sexes in the domestic chores, etc. not recorded.

MUSEUM DIAGNOSIS. The northern Andamans population was hitherto designated as a separate race—*A. g. leucoparva* Fleming—on account of larger extent of white on face and neck. This is now shown to be a case of partial albinism probably caused by too much inbreeding, and the race is currently considered untenable.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	199-205	34-36	35-37	79-81 mm.
♀♀	197-205	34-35	—	—

(Delacour)

Weight c. 425 gm.

COLOURS OF BARE PARTS. Iris reddish brown or red. Bill greenish blue, plumbeous-blue, or plumbeous with the nail black; in some examples lower mandible variously tinged with pink. Legs and feet dark greenish or plumbeous; claws black.

97. Spotbill Duck. *Anas poecilorhyncha poecilorhyncha* J. R. Forster

Anas poecilorhyncha J. R. Forster, 1781, Indian Zool.: 23, pl. 13, f. 1 (Ceylon)

Baker, FBI No. 2265, Vol. 6: 421

Plate 9, fig. 3 and Plate 10, fig. 3

LOCAL NAMES. *Gārm pāi*, *Gugrat* (Hindi); *Hānjār* (Sind); *Lāddim* (Mirshikars, Bihar); *Nāddun* (Nepal terai); *Kara* (Manipur); *Bār māghī hāns* (Assam).

SIZE. Domestic duck; length c. 61 cm. (24 in.).

FIELD CHARACTERS. A large duck of scaly-patterned buffy grey and dark brown plumage. Narrowly black-and-white margined metallic green wing speculum, bordered above (posteriorly) by a broad pure white bar particularly conspicuous in flight. Bright coral-red legs, yellow-tipped dark bill, and two swollen orange-red spots at its base on either side of forehead, are further diagnostic clues.

× c. 1

Female slightly smaller and duller than male; but conclusive sex differentiation possible only on voice (q.v.).

Young (immature). Like adult but paler, less spotted below, and with no red spots at base of bill.

STATUS, DISTRIBUTION AND HABITAT. Resident, nomadic, and occasionally migratory. Common and widely though capriciously distributed, and nowhere really abundant. Throughout the Indian subcontinent, locally up to c. 1200 m. elevation, east of the lower Indus river (occasionally Baluchistan), and Kashmir (to c. 1800 m.) to western Assam. South to Mysore, and occasionally Ceylon. Frequents reedy and vegetation-covered jheels, shallow irrigation tanks, etc. Rarely also on rivers.

A flock of over 200 (subspecies?) reported on Neill Island, Andamans (E. G. Silas, in *epist.*, March 1960), but occurrence there needs confirmation.

MIGRATION. One ringed in Rajasthan (Bharatpur, 27°13'N., 77°33'E.) 5.xii.1969 recovered in USSR (near Novosibirsk, c. 54°06'N., 74°38'E.) August 1970 — c. 2880 km. N. (JBNHS 68(1): 244).

GENERAL HABITS. Very similar to the Mallard, usually seen in pairs, family parties, or moderate sized flocks. A strong flier but less quick in take-off than the Mallard, rising less abruptly and vertically. Prized by sportsmen as much for its sporting qualities as for excellence as a table bird. A non-diving duck, obtaining most of its food by walking about and grubbing on marshland or in wet paddyfields, or by up-ending in shallow water to reach the bottom mud, tail sticking above the surface and legs kicking to maintain the vertical stance. But it can dive very effectively to evade capture when wounded or moulting wing, surfacing only momentarily in a flash, or with just the bill showing. Often it holds on thus to partially submerged vegetation and remains completely hidden from view.

(Shan States)

Baker FBI No. 2267, Vol. 6: 423

LOCAL NAME. *Bār māghī hāns* (Assamese).

SIZE. Same as 97 ±.

FIELD CHARACTERS. 'Similar to the Indian Spotbill, but a little smaller, the underparts more uniform, less spotty; very small or no red dots on the base of the bill' (Delacour). Also with conspicuously white-bordered green speculum.

Young (immature) and Chick (in down) as in the Indian race.

STATUS, DISTRIBUTION AND HABITAT. Resident. Extreme eastern Assam (N. Lakhimpur, Dibrugarh).

Extralimital. Burma, Shan States, Yunnan.

GENERAL HABITS, FOOD, VOICE, etc. Similar to those of the Indian subspecies.

BREEDING. Two nests, similar to those of the Indian race, recorded from Lakhimpur by Baker on 6 February and 13 April respectively. In the Shan States nests have been taken in February, April, June, July, and November. Eggs, 6 and 14, more or less incubated, have been found in nests, but normal clutch-size uncertain. Average size of 27 eggs 52.7 × 39.6 mm. (Baker).

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill
♂♂	245-268	50-57 mm.
♀♀	237-255	— mm. (Delacour)

COLOURS OF BARE PARTS. As in the Indian race.

An intermediate example between this and *zonorhyncha* has been recorded from eastern Assam (1937, JBNHS 39: 638).

99. Eastern Grey Duck. *Anas poecilorhyncha zonorhyncha* Swinhoe

Anas zonorhyncha Swinhoe, 1866, Ibis: 394 (Ningpo, China)

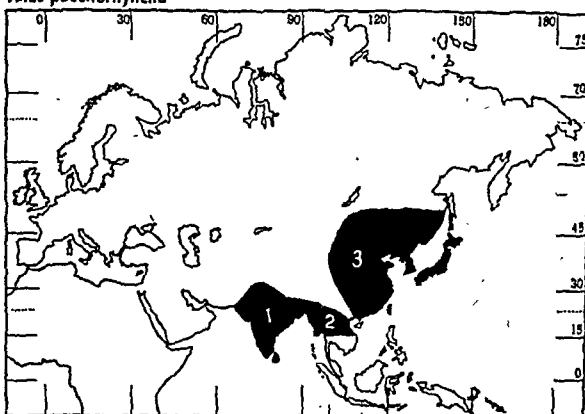

Baker, FBI No. 2266, Vol. 6: 422

SIZE. As No. 97 ±.

158 ANSERIFORMES

FOOD. Chiefly vegetarian — shoots, corms, etc. of aquatic plants, seeds of sedges, grain of wild and cultivated rice, etc. The birds occasionally do considerable damage to rice crops by trampling down a great deal more than they eat. Sometimes also water insects, and their larvae, worms, and molluscs. Among the animal items specifically identified in stomach contents is the water-snail *Vivipara (bengalensis?)*.

Anas poecilorhyncha

Residential range 1 *A. p. poecilorhyncha*; 2 *A. p. haringtoni*; 3 *A. p. zonorhyncha*

VOICE. Almost indistinguishable from the Mallard's — a hoarse wheezy note by the drake, and a loud quack by the duck particularly when suddenly startled. As a rule very silent.

BREEDING. Season, not strictly defined. Depending largely on water conditions, but chiefly July to September/October in north and peninsular India; November/December in the south. Possibly two broods a year. Not Ceylon. Nest, a pad of grass and weeds concealed in herbage on the margins of a tank or swamp; sometimes lined with a small quantity of feathers and down. Eggs, 6 to 12, normally 7 to 9, greyish buff or greenish white, rather broad ovals, smooth and fine textured; very similar to those of the Mallard. Average size of 100 eggs 56.0 × 42.3 mm. (Baker). Incubation, believed to commence with last egg, takes about 24 days. The drake's share in this is unknown, but he assists the duck in guarding and leading the ducklings.

MUSEUM DIAGNOSIS. No eclipse plumage in male. Both sexes undergo a post-nuptial moult when all the wing quills are cast simultaneously, the female sometimes possibly incubating in this condition (Sálim Ali, JBNHS 44: 219).

Chick (in down). Like Mallard, blackish above with yellow back and wing markings and underparts, but the black line through eyes a little broader and blacker (Delacour).

160 ANSERIFORMES

FIELD CHARACTERS. Differs from the Indian Spotbill by duller, less conspicuously marked plumage with darker practically unspotted underparts, and absence of the two red spots at base of culmen. A broad line, heavily speckled with black, from base of bill to ear-coverts. Supercilium, chin, cheeks, and throat more contrastingly whitish. Speculum blue (instead of green) and only narrowly bordered with white. White on secondaries restricted and much less conspicuous. Nail of bill yellow (v. black in *A. p. poecilorhyncha*). Sexes alike; female slightly smaller.

Young (immature) duller than adult.

STATUS, DISTRIBUTION AND HABITAT. Migratory. A frequent straggler in winter to eastern Assam (Sibsagar dist.) and Manipur. Once also procured in Bihar (Darbhanga dist., C. M. Inglis).

Extralimital. Breeds in eastern Siberia, Manchuria, Mongolia, N. China, Korea, S. Sakhalin, the Kurile Is., and Japan. Winters south to S. China and Formosa (Peter Scott).

GENERAL HABITS, FOOD, VOICE, etc. Nothing specifically recorded in India. Elsewhere said to haunt sea coasts as well as inland waters.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)
♂♂	254-276	56-63 mm.
♀♀	243-260	—

(Baker, Delacour)

For a male and female from Chinwangtao, E. China, La Touche (1931-34) gives Wing ♂ 282, ♀ 265 mm.

COLOURS OF BARE PARTS. As in the Indian (nominat) race, but nail of bill yellow and red spots at base lacking.

100. Mallard. *Anas platyrhynchos* Linnaeus

Anas platyrhynchos Linnaeus, 1758, Syst. Nat., ed. 10, 1: 125 (Sweden)

Baker, FBI No. 2264, Vol. 6: 419

Plate 9, fig. 1 and Plate 10, fig. 1

LOCAL NAMES. *Nīlīr*, *Nīr rūgi* (Hindi); *Nīlīr* (Bengal); *Līlēh* (Mirshikars, Bihar); *Līlē* ♂, *Līlēhī* ♀ (Nepal); *Amrolīa hāns*, *Bonaria pāti hāns* (Assam); *Nīrdī*, *Hīrdī* ♂, *Nīrdīdīnī* ♀ (Sind); *Bur*, *Rīje* (Kutch).

SIZE. Domestic duck; length c. 61 cm. (24 in.).

FIELD CHARACTERS.

Male (breeding). Largely grey above and below, finely pencilled and vermiculated with black. Glistening metallic dark green head and neck separated from chestnut breast by narrow white collar. Rump, tail-coverts, and two upcurled central tail-feathers black. Speculum metallic purplish blue bordered in front and behind by narrow black and white bands, conspicuous in flight. Yellowish green bill; orange legs.

Female (and male in eclipse plumage). Brown and buff, streaked and spotted with black. Chin, throat and foreneck plain buff; an irregular dark line through the eye. Orange legs. Distinguished from the very

DUCKS, GEESE, SWANS

161

similar ♀ Shoveller, also orange-legged, by bill shape and purple-blue speculum (v. green).

× c. 1/2

Young (immature). Like female, but duller and less well marked.

STATUS, DISTRIBUTION AND HABITAT. Breeds in small numbers in Kashmir. Mainly winter visitor. Apparently no longer so common in northern W. Pakistan (Bahawalpur) where until c. 1940 at least it often formed 70 to 80 per cent of sportsmen's seasonal bags of duck. Common in lower Sind, decreasingly so eastward through U.P., Nepal, Bihar, Bengal, E. Pakistan to Assam; southward sparingly to rare to about 19°N. in Orissa, Madhya Pradesh, Gujarat and northern Maharashtra. Exceptional if further south; no record. Frequents shallow reedy jheels (or dhands) and marshes; rarely also rivers and ponds.

Extralimital. Throughout the Holarctic Region. In Europe and Asia breeds from the Arctic Circle south to the Mediterranean and roughly

Anas platyrhynchos

■ Breeding ■ Non-breeding

DUCKS, GEESE, SWANS

163

so but quicker repeated. This is uttered as a call-note and can be effectively imitated by hunters to decoy the birds. The female (?) also gives a series of rapid *tuckata-tuckata-tuckata* notes signifying satisfaction on discovering food.

BREEDING. Bates & Lowther (1952), have shown that Major Cock's account in Hume & Oates (1889-90) of 'boatloads' of Mallard eggs from the Kashmir lakes being brought to Srinagar market for sale was a palpable exaggeration. At the present time only very small numbers breed on Hokarsar, Anchar, and other lakes in the Kashmir Valley. *Season*, late April, May and June. *Nest*, a bed of dry grass, rush leaves, and a quantity of the bird's own (blackish) down; sometimes bulky and rimmed with a thick well-felted layer of down, at others without any. Placed on the ground in thick cover of sedges, grass, and bushes on the edge of a lake or some distance from water. *Eggs*, 6 to 10, long ovals, more or less equal at both ends. Normally greenish grey, sometimes pale dull yellowish stone or pale buff; close-textured, smooth-surfaced, with a slight gloss. Average size of 100 Indian eggs 56.6 × 40.3 mm. (Baker). Only the female incubates. Incubation period 26 days (Witherby; q.v. also for courtship display and other details of breeding biology).

MUSEUM DIAGNOSIS. For details of plumages, etc. see Witherby 1939, 3: 236-9. Chick (in down). 'Blackish brown above, with yellow face, underparts, and spots on the back and wings; a dark line through the eyes and shorter ones or spots on the ears; sometimes a small dark streak at the base of the bill' [Delacour 1956, 2: 42; 70 (plate)].

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	266-292	50-57	c. 40-45	80-97 mm.
♀♀	232-276	44-55		(Baker)

Weight ♂ 2 lb. 8 oz. to 4 lb. (c. 1135-1800 gm.); ♀ 1 lb. 10 oz. to 2 lb. 10 oz. (c. 735-1195 gm.). — Hume & Marshall.

COLOURS OF BARE PARTS. Iris brown. Bill dull olive-yellow, or dingy green, the base and gape yellower or orange; nail black. Legs and feet orange-yellow to coral-red; claws black.

MISCELLANEOUS. Flight speeds: cruising 48; chased 64-80 km.p.h. (Sprunt & Zim).

101. Gadwall. *Anas strepera strepera* Linnaeus

FIELD CHARACTERS.

162

ANSERIFORMES

to latitude 30°N. Winters from southern half of breeding range to N. Africa, Nile Valley, India, Burma, S. China and Japan. Several small endemic populations have been described, e.g. from Mexican highlands (*diazi*), Greenland (*conboschas*), Hawaii Is. (*uyvilliana*), Laysan I. (*laysanensis*), but the species is evidently monotypic.

MIGRATION. Mallards ringed in W. Pakistan (Manchar lake, Sind; Jhajja, Bahawalpur) between c. 27° & 30°N. and 68° & 72°E. have been recovered in the Novosibirsk region of USSR, between c. 52° & 56°N. and 67° & 79°E., indicating that a large proportion of our winter visitors are derived from Siberia. The speed of migratory flight has elsewhere been estimated as c. 80 km. per hour.

GENERAL HABITS. A typical surface-feeding or dabbling duck, the ancestor of all our domestic breeds. Gregarious. Keeps in parties and small flocks of seldom more than a dozen or so; sometimes up to 40 or 50. Where persecuted does most of its feeding during the night, fighting at dusk to outlying inundated paddyfields and marshes, and returning to the daytime refuge at dawn. Walks with ease dabbling for food on squelchy ground, or up-ending to rake the bottom mud as it swims in shallow water. The projecting tail is directed backwards to attain the vertical stance, assisted by a constant kicking of the legs. It is a swift and powerful flier, capable of rising almost vertically off the water or land when alarmed. Usually wary and difficult to circumvent, and excellent for the table; therefore combining all the requisites of a coveted sporting bird, and eagerly sought by duck hunters. Though not an underwater feeder, can dive quite effectively to evade capture when wounded.

Foot of Mallard (A) and Common Pochard (B) to show difference in hind toe of surface-feeding and diving ducks

FOOD. Chiefly vegetarian: corms, seeds and shoots of Gramineae and other aquatic plants, wild and cultivated rice, etc. To a lesser extent also molluscs, tadpoles, fish spawn, worms, etc.

VOICE AND CALLS. Of drake a wheezy 'scraping'; of duck a loud rather explosive *quack* when suddenly alarmed and flying off. Also a loud *quack-quack-quack-quack-quack*, the first quack very loud, the others decreasingly

164

ANSERIFORMES

Male (breeding). General effect dark brown and grey, with whitish belly and very black tail end (black upper and under tail-coverts). Dark and light crescentic markings on breast almost forming a pectoral band. A glistening white patch (secondaries) on trailing edge of wing broadly bordered anteriorly with black (middle secondaries), and a chestnut patch (lesser wing-coverts) very conspicuous in flight. At rest the chestnut patch with the black-and-white speculum is a

× c. 1/2

diagnostic pointer.

Male in eclipse. Like female, but greyer and less heavily marked above.

Female (adult). A duller and smaller edition of female Mallard, dark brown mottled with buff, with the chestnut on wing obsolete. Also with orange-yellow legs. Diagnosed in flight by white wing-mirror as in drake; at rest, when this often concealed, by smaller size, slighter build, and absence of Mallard's metallic speculum.

Young (immature). Male similar to drake in eclipse. Female like adult duck but with wings less bright coloured.

STATUS, DISTRIBUTION AND HABITAT. One of our commonest wintering ducks. Both Pakistans, Nepal, all India, lessening progressively southward. Rare in S. India; only a single record in Ceylon. Affects reedy marshes and jheels, large and small, with plenty of cover; open water-spread of dammed reservoirs only occasionally as daytime refuges.

Extralimital. Europe, Asia, and western North America. In Eurasia breeding from Iceland to Kamchatka, south to England, Holland, Germany, central Russia, Caspian, Seistan, Transbaikalia. Wintering south to northern Africa, Ethiopia, S. China.

Anas strepera

■ Breeding ■ Non-breeding

DUCKS, GEESE, SWANS

165

MIGRATION. Gadwall ringed in W. Pakistan, on the Manchar lake, c. 26°N., 68°E., have been recovered in USSR chiefly between 50° and 60°N. lat. and 60° and 80°E. long. in the Omsk region of Novosibirsk, therefore almost due N., at straight-line distances of over 3000 km.

GENERAL HABITS. Very similar to Mallard, and typical of the surface-feeding or dabbling ducks. Gregarious and predominantly vegetarian. Usually keeps in small flocks of 10 to 30 birds or so. Feeds by walking about and dabbling on marshland or in squelchy paddyfields, or by up-ending in shallow water to rake the bottom mud. Sometimes also dives for food, and can do so very effectively when wounded and evading capture. Flight swift, with rapid strokes of the pointed wings producing a low whistling sound. A highly prized sporting bird, ranking with mallard and pintail among the finest for the table. Also one of our most abundant migratory ducks, usually well represented in duck hunters' bags in northern India.

FOOD. Chiefly seeds, shoots, and tubers of marsh plants and aquatic weeds, and grains of wild and cultivated rice. Occasionally insects, worms, molluscs, etc.

VOICE. In both sexes very mallard-like. The quack of the duck is somewhat less loud. 'The male has a soft, breathy call and a raucous, croaking note "oe" often repeated, and followed by a sharp whistle, used in display' (Delacour).

BREEDING. Extralimital. Nest like Mallard's, on ground, near water. Eggs, '7 to 15, usually 8-12, creamy buff like those of the Wigeons, 54 x 36 mm.; incubation 25-26 days' (Delacour).

MUSEUM DIAGNOSIS. For detailed description of plumages see Witherby 1939, 3: 242-4.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	270-285	c. 48-54	c. 36-40	c. 82-98 mm.
♀♀	220-256			
Weight ♂ 1 lb. 8 oz. to 2 lb. 4 oz. (c. 575-1025 gm.); ♀ 1 lb. to 1 lb. 12 oz. (c. 450-800 gm.).				

(Baker)

COLOURS OF BARE PARTS. Iris dark brown. Upper mandible dark slaty brown; lower mandible paler and yellowish or reddish underneath. Legs and feet yellow, brownish yellow to dull orange; claws black.

MISCELLANEOUS. Flight speed: cruising 29 m. (c. 47 km.) p.h. (Sprunt & Zim).

102. Falcated or Bronzecapped Teal. *Anas falcata* Georgi

SIZE. Domestic duck —; Gadwall —; length c. 49 cm. (19 in.).

166

ANSERIFORMES

FIELD CHARACTERS.

Male (breeding) strikingly peculiar and beautiful. Head metallic bronzy green and chestnut-purplish, with a bushy mane-like nuchal crest falling over hindneck, resting on back and giving the impression of a thick neck. Throat and foreneck white with a narrow green collar near base. General aspect of body plumage grey, wavyly pencilled with black and resembling Gadwall's, the markings bolder and more crescentic on breast. Speculum glossy black and green, bordered in front by a grey band (wing-coverts). Inner secondaries very long, sickle-shaped (falcated) — velvety black, white, and grey — covering hind part of body and tail. Upper tail-coverts black, overtopping tail.

Female (adult). Very like female Gadwall, but wing mostly grey with black-and-green (v. white) speculum, a short nuchal crest, and grey (not yellow) legs.

x c. 1

Young (immature). Like the female; males more finely vermiculated. **STATUS, DISTRIBUTION and HABITAT.** Rare but not infrequent winter straggler to Assam (Lakhimpur, Sibsagar, Nowgong, Kamrup, Sylhet districts; Surma Valley), and Manipur. Vagrants recorded in Bihar (Tirhut, Patna, Darbhanga districts), Uttar Pradesh (Lucknow, Roorkee districts), Delhi, Punjab (Jhelum, Karnal districts), West Pakistan (Sind, Bahawalpur), Gujarat (Kutch dist.), Nepal (Kosi R.). Females in hunters' bags sometimes possibly misidentified as Gadwall.

Extralimital. Breeds in N. Asia, south of the Arctic Circle from the upper Yenisey to Kamchatka, south to Lake Baikal, N. Mongolia, the Amur and Ussuriland. Winters in Japan, Korea, E. and S. China to Upper Burma (Peter Scott).

GENERAL HABITS. Nothing specifically recorded in India except that it occurs singly or in pairs on jheels in Assam usually in company with Gadwall (M. J. S. Mackenzie). Once shot from a party of 15 (? mixed species). In flight said to resemble Common Teal with the same swishing sound of wings.

FOOD. Mainly vegetarian.

VOICE. Unrecorded in India. The male's described elsewhere as a loud piercing whistle; also a low chuckling as of Mallard drake when swimming about. The female's as a quack like Gadwall duck's.

BREEDING. Extralimital. Nest. Compactly built of reeds and rushes thickly lined with down. Eggs. 'Six to ten, 56 x 40 mm., creamy white; incubation 24-25 days' (Delacour).

FIELD CHARACTERS.

Male (breeding). General aspect pencilled grey. Head and neck chestnut or bright rusty red with a distinctive cream coloured patch on forecrown.

x c. 1

Male (in eclipse). Above, reddish brown, marked and vermiculated with black; below, chiefly white.

Female (adult). Similar to male in eclipse 'but much duller, less reddish brown, the dark vermiculations less coarse, the lesser wing-coverts grey. There are two colour phases, one redder the other greyer' (Delacour).

Anas penelope

■ Breeding ▨ Non-breeding

Differentiated from rather similar female Gadwall by more rufous plumage and metallic green speculum v. contrasty white and black.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Common in Sind and northern India, where locally very abundant. Less common in peninsular and eastern India generally, but in some years very numerous in W. Bengal, E. Pakistan, Assam, and Manipur, and usually so on Chilka lake (Orissa). Sparse and irregular in Ceylon. Observed in Nepal Valley and central Nepal in winter, and on the high altitude lakes (c. 5030 m. 5330 m.) in eastern Nepal in May and June presumably on northward passage. Frequents shallow reedy jheels and marshes. Small flocks occasionally also on salt-water creeks and mangrove swamps, e.g. on the Sind coast.

DUCKS, GEESE, SWANS

169

Extralimital. 'Europe and Asia, breeding in temperate regions north to the Arctic Circle and beyond, from Iceland and Scotland to Kamchatka. Winters in Britain and south to the Nile Valley. Abyssinia, India, S. China and Japan' (Peter Scott).

MIGRATION. Wigeon ringed during winter in Sind (Manchar lake, c. 26°N., 68°E.) and in central India (Dhar, c. 23°N., 76°E.) have been recovered in summer in Siberia between c. 55° & 58°N. and 66° & 85°E. One of these was a female accompanied by ducklings, and another a male in post-nuptial moult and flightless, indicating that they were on their breeding grounds and thus disclosing the provenance of possibly the majority of our winter migrants.

GENERAL HABITS. Gregarious; sometimes in very large flocks. Like other non-diving ducks feeds by walking about and grazing or grubbing on grassy edges of jheels and in squelchy paddyfields, or by up-ending in shallow water. Swift on the wing, but perhaps less so than Teal, rising abruptly off the water on alarm and quickly climbing well out of gunshot. Flies in compact flocks or irregular lines with a distinctive rustling sound. Provides good sport to the duck hunter and is excellent for the table. Dives effectively to evade capture when only winged.

FOOD. Chiefly vegetarian: corns, seeds, and shoots of marsh and aquatic plants, and wild and cultivated rice. Also water insects and their larvae, molluscs, etc.

VOICE AND CALLS. Of male a distinctive musical piping whistle *whet-oo*, uttered both on the wing and from the ground or water. Of female a short quack, also described as a 'purring growl'.

BREEDING. Extralimital. *Nest*, of matted grass, reeds, etc. with a thick bed of down for the eggs, hidden in undergrowth usually close to water. Eggs, '7 to 12, buffy cream, 54 × 35 mm. on an average; incubation 24 to 25 days' (Delacour).

MUSEUM DIAGNOSIS

DUCKS, GEESE, SWANS

171

Frequents every type of water large and small — jheels, marshes, village tanks, coastal backwaters and lagoons (e.g. in Kerala), the last chiefly as daytime refuges from which to forage in outlying paddyfields during the night.

MIGRATION. Meinertzhagen came across a party of Garganeys on migration at Khardong in Ladakh (4100 m.) as early as 30 July, showing that autumn passage of duck may take place across very high parts of the Himalayas. It is rarely witnessed in daytime unless the birds are forced to the ground by heavy clouds as on this occasion. In NW. India autumn passage is usually in evidence in August, and fair numbers of birds are already in by mid-September, e.g. in Rajasthan (Keoladeo Ghana, Bharatpur). Recoveries of ringed Garganeys in India and the USSR indicate that our visitors are derived from a very extensive northern area, between latitudes 51° & 60°N. and longitudes 30° & 82°E. The most spectacular records so far are of a Bharatpur bird recovered in the Kiev region of the USSR (at 51°19'N., 30°14'E.) and of one ringed in the Leningrad area (60°30'N., 32°50'E.) shot in Maharashtra (Sangli dist., c. 17°N., 75°E.). The straight-line distances on the map between the points of ringing and recovery are c. 5000 and c. 6500 km. respectively, the actual air distance of course being considerably greater. See also Appendix.

GENERAL HABITS. Gregarious; non-diving, though like most surface-feeders can dive very effectively to evade capture when wounded. Feeds by walking about and grubbing in marshland and swampy paddyfields, or by up-ending in shallow water. Largely a nocturnal feeder where persecuted, as this and other duck species invariably are. Enormous mixed congregations of tens of thousands of duck and teal collect in certain daytime refuges in winter, e.g. on the Vembanad backwaters in Kerala, and just before northward emigration in March, e.g. on the extensive marsh at the mouth of the Banas river in the Little Rann of Kutch. Garganeys predominate among these. Flight very swift, with less turning and twisting than the Common Teal, in close-packed flocks. Overhead the wings produce a characteristic swishing hiss by which experienced sportsmen can identify the species even in the dark.

FOOD. Mainly vegetarian; seeds and tender shoots of marsh plants, grasses and sedges, and grains of wild and cultivated rice. Also some animal matter: water insects, larvae, worms, molluscs, etc. Shells of *Planorbis* sp. and *Melania tuberculata* have been identified among stomach contents in India.

VOICE. Usually very silent. Hume mentions a loud strident quack apparently common to both sexes; seldom uttered. A harsh grating *kr-r-r* by male in breeding season; also heard just before emigration, likened to a stick rapidly drawn across wooden palings.

BREEDING. Extralimital. *Nest*, a depression in the ground in wet meadows or grassland, lined with fine grasses and the bird's own down. Well concealed. Eggs, 7 to 16, usually 8 to 12, creamy buff with a distinct gloss. Average size of 108 eggs 45.5 × 32.8 mm. (Baker). Incubation 21-23 days (Delacour).

MUSEUM DIAGNOSIS. For detailed description of plumages see Witherby 1939, 3: 258-60.

170

ANSERIFORMES

SIZE. Domestic duck —; length c. 41 cm. (16 in.).

FIELD CHARACTERS.

Male (breeding). *Above*, head and neck pinky brown streaked with white, and with conspicuous broad white eyebrows. Upperparts blackish brown, scalloped paler. Scapulars long, lanceolate, glossy black, with a broad white median stripe. Wing shoulders (coverts) bluish grey. Speculum green, between two white bands. *Below*, breast light brown, speckled with black. Rest of underparts white, finely waved on sides and spotted near vent (tail-coverts) with black.

× c. 1

Male (in eclipse). Like female, but with fully coloured ♂ wing.

Young male (immature). Like female but darker, with browner underparts, and better defined speculum.

Female (adult). *Above*, head brown with conspicuous whitish eyebrows, white throat, and a distinct dark line from bill through eye to nape. Rest of upperparts dark brown, scalloped paler. Wing shoulders (coverts) greyish brown. Speculum as in male but rather obscure and the green more olive. *Below*, upper breast and near vent brownish with darker spots; rest of underparts white. May be confused with female Common Teal (q.v.), but speculum green and white v. tricoloured black, green and buff, and throat unmarked whitish v. brown-speckled, are diagnostic pointers.

STATUS, DISTRIBUTION and HABITAT. One of our commonest and most widespread migratory ducks. Perhaps the earliest to arrive in its winter quarters, and certainly one of the last to leave, small parties occasionally being seen till well into May. All India, both Pakistans, Nepal, Ceylon.

Anas querquedula

Breeding

ANSERIFORMES

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	187-198	35-40	26-30	62-70 mm.
♀♀	175-194	34-39	—	—
				(Baker)

Weight. ♂ 10 oz. to 1 lb. (c. 283-453 gm.) commonly c. 13 oz. (c. 370 gm.); ♀ 9 to 14.75 oz. (c. 255-425 gm.) commonly c. 12 oz. (c. 340 gm.) — Hume & Marshall.

COLOURS OF BARE PARTS. Both sexes: Iris dark brown. Bill brownish black; nail quite black; margins of commissure and gape paler, often reddish. Legs and feet dark grey.

105. Shoveller. *Anas clypeata* Linnaeus

Anas clypeata Linnaeus, 1758, Syst. Nat., ed. 10, 1: 124 (Sweden)

Baker, FBI No. 2276, Vol. 6: 442

Plate 9, fig. 6 and Plate 10, fig. 6

LOCAL NAMES. *Tidāri*, *Puāna*, *Tokirwēla*, *Ghirah* (Hindi); *Panta mukhi*, *Khante hāns* (Bengal); *Sānkhar* (Mirshikars, Bihar); *Dho baha*, *Sānkhar* ♂, *Khikieria sānkhar* ♀ (Nepal); *Alipāt*, *Gaino*, *Langho* (Sind); *Gaino* (Gujarat, Nal Sarovar); *Phatphaji* (Kutch); *Khantiya hāns*, *Nak dugora* (Assam); *Sirawā* (Sinhala); *Mattimukh cherevi*, *Thārā* (Tamil); *Khāri* (Manipur).

SIZE. Domestic duck —; length c. 51 cm. (20 in.).

FIELD CHARACTERS. Both sexes readily diagnosed by broad, shovel-shaped bill and orange legs.

Male (breeding). Head and neck glossy metallic green (as in Mallard): Pale blue patch on wing-shoulder (coverts) and a white bar between it and metallic green speculum, particularly conspicuous in flight. Breast white; rest of underparts reddish chestnut except two large white patches on posterior flanks.

Male (in eclipse). Like female but somewhat darker, and largely retaining bright coloured wing of breeding male.

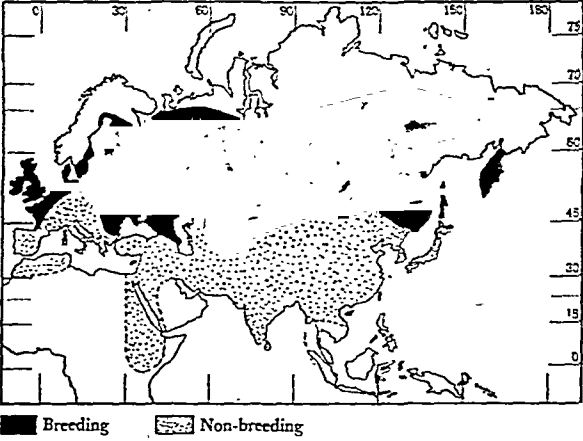

Female (adult). Mottled dark brown and buff, with greyish-blue shoulder patch, faint green speculum bordered above and below with white, and bright orange bill (at base).

Young (immature). Like adult female but with unbarred mantle and narrowly streaked underparts.

STATUS, DISTRIBUTION and HABITAT. Common winter visitor, arriving fairly late (c. October), and also amongst the last to leave (in N. India small numbers present in May and even till mid-June). All India, both Pakistans, and Ceylon. Occurs also in Nepal Valley in winter, but more common on passage in October/November. Affects all types of inland waters: jheels, irrigation reservoirs, flooded ditches, constantly used village tanks, and sometimes rivers.

Extralimital. Breeds in Europe (commonly in Britain), Asia, and N. America, not north of the Arctic Circle nor in E. Canada. Winters as far south as E. Africa, Persian Gulf, Ceylon, Burma, S. China, Japan, Hawaii, Lower California, Mexico, Honduras, Florida (Peter Scott).

Anas clypeata

MIGRATION. A Shoveller ringed in Sind (Manchar lake c. 27°N., 68°E.) was recovered in the Barabinsk district of Siberia, c. 55°N., 76°E., while one ringed in the Kazakh SSR at c. 50°30'N., 69°35'E. was shot near Delhi c. 29°N., 77°E. These recoveries provide a positive clue to the general northerly area whence our winter visitors are derived. Some individuals moult all remiges simultaneously after reaching their winter quarters in India, becoming completely flightless for a time.

GENERAL HABITS. Usually keeps in small parties in association with Common and Garganey teals. When feeding, swims slowly with neck and broad shovel-bill stretched stiffly in front. The lower mandible is fully immersed furrowing the water while the partially exposed upper skims flat along the surface. The bird thus swims into the minute floating organisms which are sifted out from the water by the comb-teeth or lamellae fringing the bill. Sometimes it zigzags along on shallow water, head fully submerged to rake up the bottom mud; or up-ends like other surface-feeding ducks. Flight swift and teal-like, with a distinctive creaking rustle of wings in rising off the water and in the air. But its flesh is usually rank and unpalatable, making the bird unattractive to sportsmen from that point of view.

FOOD. Crustaceans, molluscs, water insects and larvae, fish spawn, worms, etc. Also a quantity of vegetable matter: shoots and corms of aquatic weeds, etc.

VOICE and CALLS. Rather like Mallard's but lower and softer; also a low chuckling quack like Gadwall's.

BREEDING. Extralimital. Nest, a hollow or depression in the ground in a meadow, amongst herbage, lined with grasses and down; occasionally in reed-beds. Eggs, 7 to 16, greenish buff. Average size of 100 eggs 52.2 ×

106. **Pinkheaded Duck.** *Rhodonessa caryophyllacea* (Latham)

Anas caryophyllacea Latham, 1790, Index Orn., 2: 866 (India)
Baker, FBI No. 2249, Vol. 6: 390
Plate 11, fig. 13

LOCAL NAMES. *Gulāb sūr, Lāl sūrā* (Hindi); *Lāl sūr, Saknal* (Bengal); *Damrar, Dimer* (Nepal terai and Tirhut).

SIZE. Domestic duck; length c. 60 cm. (24 in.).

FIELD CHARACTERS. Shape and carriage of head and neck reminiscent of Whistling Teal. Colour pattern unique.

Male (adult). Brownish black above and below, with the partially tufted head, hindneck, and bill bright pink — the colour of new blotting paper. In flight, light pinkish buff speculum and pale shell-pink underwing (contrasting with dark body) prominent.

Female (adult). Overall blackish brown with pale brownish buff speculum. Head merely suffused with pink, the pink area less bright and not sharply demarcated as in male.

Young (immature). 'Head and neck pale rose-whitish colour, with the top of the head, nape, and hindneck brown; the whole plumage lighter brown; the underparts pale dull brown, with the edges of the feathers whitish' (Salvadori).

Chick (in down). Unknown.

STATUS, DISTRIBUTION and HABITAT. Probably extinct. Last authentic sight record (C. M. Inglis) from Darbhanga, Bihar, June 1935. Apparently local and nowhere common even during the 170 years since first described; to some extent locally migratory. Was presumably resident in Assam ('Flocks on several occasions at Nowgong' 1921-3, — Higgins, JBNHS 36: 417), Manipur, Bengal, Bihar, and Orissa, but stragglers recorded in winter sporadically from as far afield as Lucknow (U.P.), Rupar (Ambala dist., Punjab), Delhi, Mhow (M.P.), Jalna (?), Khandala area (?), Ahmednagar (Maharashtra), Nellore (Andhra), and Pulicat Lake (Madras). In its residential range it affected *bhels* in the Himalayan terai (including Nepal) and duars, and swampy lowland grass jungles.

Total of all skins in world museums about 80; collected between 1825 and 1936 (Sälim Ali, Wildfowl Trust Ann. Rep. 1958-9: 55-60).

Extralimital. Burma.

GENERAL HABITS. Little recorded except that the birds were shy and secretive, and seldom seen unless flushed by chance from ponds amongst tall grass jungle as by a line of elephants during tiger hunts. Usually small parties of up to 6 or 8 when not paired for breeding, but flocks of up to 30 and even 40 have been recorded. Feeding behaviour as of surface-feeding

37.0 mm. (Baker). Incubation 23-25 days (Delacour). Layard's breeding record for Ceylon (March), when he is said to have caught most of the twelve ducklings accompanying the female, is incredible. It has been omitted by both Whistler (1944) and Phillips (1953).

Bill of Shoveller from side and above, x c. 1

MUSEUM DIAGNOSIS. For detailed description of plumages, structure, etc. see Witherby 1939, 3: 279-82.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	230-262	61-71	c. 32-38	c. 72-86 mm.
♀♀	217-238	56-64	—	—
				(Baker)

Weight. ♂ 1 lb. 3 oz. to 1 lb. 14 oz. (c. 540-830 gm.); ♀ 1 lb. to 1 lb. 7 oz. (c. 450-650 gm.) — Hume.

COLOURS OF BARE PARTS. Iris ♂ yellow, orange, or orange-red; ♀ brown or orange-brown. Bill ♂ black or plumbeous black; ♀ browner, sometimes tinged with orange. Legs and feet orange, orange-brown; or orange-red.

MISCELLANEOUS. Longevity (from ringing data): c. 20 years. (Ring, 1962, 33: 148). Flight speeds: cruising 40 km.p.h.; chased 80 km.p.h. (Sprunt & Zim).

Genus RHODONESSA Reichenbach

Rhodonessa Reichenbach, 1853 (1852), Av. Syst. Nat. ix. Type, by original designation, *Anas caryophyllacea* Latham

Endemic. Monotypic. Apparently related to *Anas* more closely than to any other duck genus; to some extent maybe also to the Pochards especially the Red-crested, *Netta rufina*, which it resembles both in proportions and in possession of a similar trachea (see Delacour). Superficially, from the longer and thinner neck, high position of the eye, and the very gradual slope of the forehead, Tickell had earlier considered it more allied to the Whistling Teal (*Dendrocygna*) than to *Anas*.

For anatomical details see Humphrey, P. S. and Ripley, S. D., 1962, *Penella*, 61: 1-21, suggesting closer affinity to Aythyinae than Anatinae.

ducks, e.g. Spotbill, but capable of diving like a Pochard on occasion. Sometimes perching on trees.

FOOD. In the gizzard of a specimen were found 'half-digested water weeds and various kinds of small shells' (Shillingford); therefore obviously omnivorous.

VOICE and CALLS (recorded in captivity). Of male a wheezy whistle recalling that of the mallards, but lower and weaker; of female a low quack (Delacour).

Rhodonessa caryophyllacea

Known (former) residential range

BREEDING. An anonymous writer in the defunct *Asian Sporting News* of 17 August 1880 (probably Shillingford) mentions taking its eggs in Purnea (Bihar) in June/July. Nest described as circular, well built of dry grass and a few feathers, without special lining. Diameter c. 9 inches (c. 23 cm.), depth 4-5 inches (c. 10-13 cm.) with wall 3-4 inches thick (c. 7-10 cm.). On ground, well hidden amidst tufts of tall grass, generally not more than c. 500 yards from water. Eggs, 5 to 10, ivory white, spherical, quite unlike those of other ducks in shape. Average size of 8 eggs from two different nests c. 44 × 41 mm. Two very round ones measured c. 43 × 42 mm. Both birds were flushed near a nest, so uncertain whether both sexes, or which, incubates. Shillingford has further described very realistic injury-feigning by a female to draw off intruders from the vicinity of young (or nest?).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	250-282	50-56	c. 40	100-131 mm.
♀♀	246-260	—	—	—

DUCKS, GEESE, SWANS

177

Weight. 1 lb. 12 oz. to 2 lb. 3 oz. (c. 793-990 gm.) — Shillingford. 1 ♂ 3 lb.; 1 ♀ 3 lb. (c. 1,360 gm.) — Inglis.

COLOURS OF BARE PARTS. ♂ Iris light red or orange-red. Eyelids flesh-coloured. Bill dull to bright reddish pink or deep rose-colour, darker on ridge of culmen and gony, brighter and purer pink on nail and at base of both mandibles. Legs and feet reddish black. In ♀ colours same but duller.

MISCELLANEOUS. An inventory recently made of all specimens of the Pinkheaded Duck preserved in the major ornithological collections of Europe, Asia, and N. America revealed that there are probably not more than 80 skins in existence all told, excluding China whence information was unavailable. The oldest of these is dated 1825 (Paris Museum). The paucity of museum skins of this unique and much sought species may be taken as a measure of its rarity even in the last century when no considerations of conscience or conservation could have restrained the collectors' zeal. (Sálim Ali, 1960, *Wildfowl Trust 11th Annual Report*, 1958-9, pp. 55-60.)

Genus *NETTA* Kaup

Netta Kaup, 1829, *Skizz. Entw.-Gesch. Eur. Thierw.* : 102. Type, by monotypy, *Anas rufina* Pallas

Bill long, slightly tapering, very little raised at base; culmen nearly straight. Nostrils placed rather less than one-third length from base. Lamellae broad, prominent, and set rather far apart. Feathering at base of bill ending abruptly in a straight line almost at right angles to commissure. Feet large but less so than in true pochards (*Aythya*); hind toe broadly lobed. Wing comparatively short, pointed, and set far back on the body. Tail of sixteen feathers, short, cuneate. Sexes dimorphic. Male with a full bushy crest.

The species *N. rufina* occurs in temperate Europe, Asia, and N. Africa.

107. Redcrested Pochard. *Netta rufina* (Pallas)

Anas rufina Pallas, 1773, *Reise Russ. Reichs*, 2: 713 (Caspian Sea)

Baker, FBI No. 2278, Vol. 6: 448

Plate 11, fig. 5 and Plate 13, fig. 5

LOCAL NAMES. *Lál chônch*, *Lál sir* (Hindi); *Bādā rūngāmuri*, *Herā hāns* ♂, *Chobra hāns* ♀ (Bengal); *Doommer* (Mirshikars, Bihar); *Dāmār* ♂, *Sānuca* ♀ (Nepal); *Bāthua*, *Rūlābo* (Sind); *Ratoheri* (Gujarat, Nal Sarovar); *Deo hāns* (Assam); *Irupi* (= 'diver' — all pochards, Manipur).

SIZE. Domestic duck —; length c. 54 cm. (21 in.).

FIELD CHARACTERS.

Male (breeding). Head and silky mop-like crest chestnut and golden orange, with bright crimson bill. Above, body light brown, with white patches on shoulders, and white wing-mirror. Below, black, the flanks conspicuously white. In flight, red head and bill, black body, white flanks, white underside of wings with a white bar on the trailing edges are revealing clues.

× c. ½

Has frequently been misidentified as Pinkheaded Duck (both called *Dāmār* in Bihar and Nepal!) but golden orange head (v. bright rose-pink), brownish black underparts with large white patches on flanks (v. all-black) are diagnostic. Furthermore, being largely

178

ANSERIFORMES

a diving duck, is more likely to be seen on deepish open water while Pinkhead on wooded jheels, forest pools and swamps.

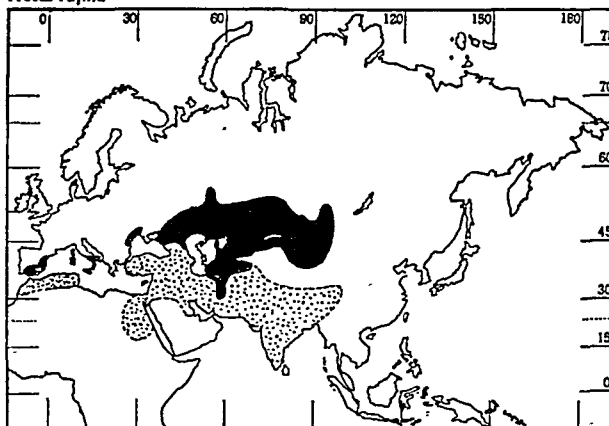

Male (in eclipse). Like female but browner on underparts and retaining bushy crest and bright-coloured eyes, bill, and feet.

Female (adult). Above, dull sooty brown with dark brown (slightly mottled) crown, and nape, sharply demarcated from whitish (pale grey) face and foreneck. Below, excepting breast largely whitish.

Young (immature). Like female, the male browner and darker with dark brown centres to the underparts, and bushier head than in female.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor; arrives about October and mostly gone by mid-March. Common and locally abundant especially in West Pakistan and NW. India (recorded in Nepal Valley) decreasingly so eastward (rare in Assam); south to about the 20th parallel. Less common in the Peninsula, to Madras where fairly plentiful in some years. Not recorded further south in Mysore or Kerala, or for certain in Ceylon. Affects large jheels and reservoirs with plenty of submerged vegetation.

Extralimital. Breeds from southern France, Holland, through lower Danube, S. Russia east across Kirghiz steppes to W. Siberia. Winters in the Mediterranean region; Burma, Shan States to China.

Netta rufina

■ Breeding ● Non-breeding

MIGRATION. Ringing records suggest that our wintering birds are derived from a very widespread northern a.e.a. Two examples ringed in West Pakistan (Larkana district and Bahawalpur) were recovered respectively in Russian Turkestan (at 37°21'N., 66°20'E.) and near Lake Baikal in Siberia (c. 55°N., 105°E.).

GENERAL HABITS. Keeps more to fairly deep open water than to reedy marginal shallows, and obtains its food chiefly by diving, sometimes remaining submerged for many seconds and surfacing again with a peculiar abrupt

DUCKS, GEESE, SWANS

179

spring or pop-up. Often also up-ends in shallow water, like surface-feeding ducks, to reach the bottom mud and weeds. Occasionally walks about and grazes on marshy edges of jheels. Usually shy and wary, quick to take alarm, flying high and keeping well out of gunshot. The palatability of its flesh varies according to the diet on which it has been chiefly subsisting.

FOOD. Largely vegetarian: shoots, buds, rhizomes and seeds of aquatic weeds and grasses, e.g. *Sagittaria*. Also water insects, molluscs, tadpoles, etc. Hume records one that had gorged itself on fish about an inch in length.

VOICE. Very silent in winter. No calls recorded. In breeding male described as a 'hard wheeze, harsher than the Mallard's' (Delacour).

BREEDING. Extralimital. Nest, of reeds, rushes and grass thickly lined with down, placed among herbage at edge of swamps, etc. Eggs, 7 to 12 or 14, pale olive-grey. Average size of 90 eggs 57.8 × 42.4 mm. (Baker).

MUSEUM DIAGNOSIS. For details of plumages etc. see Witherby 1939, 3: 284-5 'When freshly shot the flanks and lesser coverts have a most beautiful salmon-pink tinge which, however, quickly fades' (Ticehurst).

Chick (in down). See Delacour 1959, 3: 49 (description), 140 (plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	256-282	48-54	c. 40-45	c. 60-75 mm.
♀♀	241-279	44-51		(Baker)

Weight. ♂ 1 lb. 12 oz. to 2 lb. 14 oz. (c. 795-1305 gm.); ♀ 1 lb. 10 oz. to 2 lb. 6 oz. (c. 735-1080 gm.) — Hume; 2 ♂♂ 940, 1260, 1 ♀ 970 gm. (BNHS).

COLOURS OF BARE PARTS. ♂ Iris bright red. Bill bright red, the nail paler. [Legs and] feet orange-yellow, more or less tinged with black. ♀ Iris reddish brown, becoming orange-red in spring. Bill greyish black, the edges and tip pale pink. Legs black, more or less tinged with pink (Delacour).

Genus *AYTHYA* Boie

Aythya Boie, 1822 (before May 1), Tagebuch Reise durch Norwegen : 308, 351. Type, by monotypy, *Anas marila* Linnaeus

Nyroca Fleming, 1822, *Philos. Zool.*, 2: 260. Type, by tautonymy, *Anas nyroca* Gùldenstädt

Cf. Sharpe, 1899, *Handlist*, 1: 222-3. (*Aythya*, *Aristonetta*, *Fuligula*) Ibis, 1939: 521-2.

Bill of moderate length, rather more raised at the base than in *Netta*, uniformly broad throughout its length, or slightly broader at tip. Culmen slightly concave. Feathering at base of bill forming a convex line on commissure. Lamellae less prominent than in *Netta*, short, and set much further apart. Nostrils as in *Netta*. Character of wings, tail, and feet as in that genus, but the last much larger and placed farther back on the body.

Represented in India by five species, all migratory.

108. Common Pochard. *Aythya ferina* (Linnaeus)

Anas ferina Linnaeus, 1758, *Syst. Nat.*, ed. 10, 1: 126 (Sweden)

Baker, FBI No. 2279, Vol. 6: 450

Plate 11, fig. 6 and Plate 13, fig. 6

LOCAL NAMES. *Burār nār*, *Lāl sir* (Hindi); *Rangā mūri*, *Lāl mūri* (Bengal); *Chon* (Nepal); *Rangā mūrya* (Assam); *Irūpi* (Manipur); *Torāndio* (Sind); *Tarāndio* (Gujarat, Nal Sarovar); *Dhusanda* (Kutch); *Sengāliān* (Tamil).

SIZE. Domestic duck —; length c. 48 cm. (c. 18½ in.).

FIELD CHARACTERS. A rather squat, tubby duck.

Male (breeding). Head and neck chestnut-red. Upper back and breast black. Rest of upperparts light grey finely vermiculated with black. Rump, upper and under tail-coverts black. Underparts and sides largely greyish white. A dull grey speculum on wing.

Female (in eclipse). Head duller; black of upper back and breast replaced by brown.

Female (adult). Head, neck, upper back and breast rufous brown. Rest of back and scapulars greyish brown, faintly vermiculated. Lower parts mostly greyish brown. Buffy cheeks and throat, a buff mark around base of bill, and pale blue subterminal band on bill are further pointers.

In flight absence of white wing-bar (only inconspicuous dull grey) distinguishes both sexes from other pochards, and the female of this species from females of Scaup and Tufted Pochard (qq.v.).

Bill of adult male from above and side, × c. ½

Young (immature). Like female, the male with head more reddish and paler, and underparts browner.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, arriving in the north fairly late (c. mid-October) and mostly gone by end March. Common and abundant in W. Pakistan and NW. India, and across, more sparsely, to Assam, Manipur, and E. Pakistan. Occurs in Nepal; decreasingly southward in the Peninsula, irregularly to Mysore where not uncommon in some years. Not recorded farther south, or in Ceylon. Frequents the open parts of jheels and irrigation reservoirs with submerged aquatic vegetation.

Extralimital. Breeds in British Isles, S. Scandinavia, and from eastern Russia through W. Siberia to Lake Baikal, south to Holland, Germany, Balkans, Black Sea, Kirghiz steppes and Yarkand. Winters in breeding range and south to Nile Valley; Burma, and S. China (Peter Scott).

MIGRATION. Two Common Pochards ringed in Madhya Pradesh (Dhar) and W. Pakistan (Bahawalpur) respectively, have been recovered in Siberia, between c. 53° & 55°N. and 76° & 84°E., indicating the provenance of at least a part of our wintering population.

Aythya ferina

■ Breeding ■ Non-breeding

GENERAL HABITS. One of our commonest diving ducks; sometimes collecting in flocks and rafts of up to 300 or 400, to very large congregations of several thousand strong, e.g. on Manchar lake, Sind. Feeds chiefly under water; therefore usually seen on open expanses in the middle of tanks and jheels. Largely nocturnal where subjected to disturbance, flighting to its feeding grounds at dusk and returning to the daytime refuge at dawn. Swims strongly rather low on the water; walks clumsily on land. Flight swift with rapid wing-strokes, but take-off rather slow and awkward preceded by some pattering along surface. Ranked normally amongst the finest ducks for the table.

Aythya nyroca

■ Breeding ■ Non-breeding

STATUS, DISTRIBUTION AND HABITAT. Breeds in Kashmir and Ladakh; winter visitor elsewhere. Common in W. Pakistan and N. India, and practically the entire Union; Nepal (Valley chiefly on passage; bhabar winter). Less common to rare in Bengal, Assam, Manipur, E. Pakistan. Sparsely in the Deccan south to Mysore and Kerala (on coastal backwaters and lagoons). No record from eastern side of the Peninsula south of Madras, or Ceylon. Affects weedy and rush-covered jheels as well as more open irrigation tanks, the latter chiefly as daytime refuges and foraging bases.

Extralimital. 'Breeds in S. Europe, Balkans, Poland and W. Siberia to the Ob Valley, south to N. Africa, Persia, Turkestan, Kashmir, the Pamirs, and S. Tibet. Winters, in the Mediterranean region, Nile Valley, Persian Gulf, India, and Burma' (Peter Scott).

MIGRATION. An adult ringed in W. Pakistan (Karachi district) in winter (January) was recovered at 44°34'N., 66°7'E. in the Syr Daria region of Kazakh SSR, three years later. As this was at the end of April it is uncertain whether the bird had already arrived on its breeding-grounds.

GENERAL HABITS. Similar to those of the Common Pochard and others of the genus. In coastal areas, and in the Kerala backwaters, often spends the daytime riding on the sea beyond the surf, safe from disturbance by passing boats, flighting inland at dusk to feed in outlying tanks and paddy-fields and returning to the diurnal refuge at dawn. Is an expert diver and underwater swimmer, procuring most of its food thus, and difficult to retrieve from the water if shot and only winged.

FOOD. Vegetable as well as animal: corals, shoots, leaves, and seeds of aquatic plants; crustaceans, molluscs, water insects and larvae, worms, frogs and small fish.

FOOD. Largely vegetarian: rhizomes, buds, shoots and seeds of aquatic plants. Also crustacea, molluscs, water insects and larvae, worms, and occasionally tadpoles and small fish.

VOICE. Very silent in India. Nothing recorded.

BREEDING. Extralimital. Nest, a cup of flags, rush blades and reeds, thickly lined with down, placed on the ground among high reeds and rushes. Eggs, 6 to 14, dull greyish- or olive-drab. Average size of 160 eggs 60.6 x 42.9 mm. (Baker).

MUSEUM DIAGNOSIS. For details of plumages etc. see Witherby 1939, 3: 283-92. Chick (in down). See Delacour 1959, 3: 140 (plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	210-225	43-50	c. 35-39	c. 54-76 mm.
♀♀	200-213

Weight. ♂ 1 lb. 13 oz. to 2 lb. 5 oz. (c. 822-1052 gm.); ♀ 1 lb. 5 oz. to 2 lb. 4 oz. (c. 595-1025 gm.) — Hume.

COLOURS OF BARE PARTS. Iris yellow or reddish yellow. Bill: base and tip black; middle portion pale plumbeous-blue to dark slaty blue. Legs and feet variable slaty blue; webs and joints darker and blackish.

109. White-eyed Pochard or Ferruginous Duck. *Aythya nyroca* (Güldenstädt)

Anas nyroca Güldenstädt, 1770, Novi Comm. Sci. Petropol., 14: 403 ('... regionibus Tanaicensibus inter gradum 54°-55° ...' = S. Russia)

Baker, FBI No. 2280, Vol. 6: 453 (= *Nyroca nyroca*)

Plate 11, fig. 10 and Plate 13, fig. 8

LOCAL NAMES. *Kurchiya*, *Burur madda* (Hindi); *Lal bigri*, *Bhish hars* (Bengal); *Burru*, *Birino* (Sind); *Tarni* (Gujarat, Nal Sarovar); *Melak* (Nepal terai); *Kili mūri* (Assam); *Iripi* (Manipur).

SIZE. Domestic duck —; length c. 41 cm. (16 in.).

FIELD CHARACTERS.

Male (breeding). Overall aspect of plumage rich rufous-brown and blackish brown, with a large white oval patch on belly, white speculum, and white under tail-coverts. At short range white eye conspicuous.

Male (in eclipse). Head, neck, and breast dull reddish with sandy borders to feathers of lower neck. Mantle brown.

Female (adult). Similar to male but duller — brown rather than chestnut — with the belly less contrasty off-white and not sharply demarcated at the edges. Eye brown.

In flight the chestnut colour, white oval belly-patch, white under tail-coverts, and broad white crescentic band on flight feathers (outer secondaries) diagnostic in both sexes.

Young (immature). Like female but more uniformly brown, with silvery brown underparts and brownish grey eyes.

VOICE. A peculiar harsh *kirr-kerr*, *kirr* uttered both as it flushes from the reeds and when walking about and feeding in a marsh (Hume).

BREEDING. Within our limits only in Kashmir and Ladakh at about 1500 metres altitude on the Hokarsar, Dal, and other lakes. Season, May to June/July. Nest, a pad of rushes c. 25-35 cm. across and 10-12 cm. in depth, thickly lined with finer grasses and down feathers, with a deep depression for the eggs. Built among reed-beds close to the water's edge. Eggs, 6 to 12 — usually 8-10 — pale buff or *café-au-lait*, moderately broad regular ovals, smooth and fine-textured. Average size of 150 eggs 51.7 x 37.9 mm. (Baker). 'Incubation 25-27 days' (Delacour). The account from Hume's time of 'boatloads' of its eggs being brought by Kashmiri fishermen for sale as food in the Srinagar bazaar seems difficult to credit in view of the low numerical status of the breeding population today. As has been suggested, these boatloads possibly comprised a mixed bag of all marsh-birds' eggs including Mallard, coots, moorhens, and others.

MUSEUM DIAGNOSIS. For details of plumages see Witherby 1939, 3: 294-6. For differentiation from the superficially similar Eastern White-eye (*Aythya boschi*) see under that species and Key.

Chick (in down). See Delacour 1959, 3: 71 (description); 140 (plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	174-192	40-43	29-32	48-58 mm.
♀♀	176-185	36-40	—	—

(Witherby)

Weight. ♂ 1 lb. 2 oz. to 1 lb. 9 oz. (c. 510-710 gm.); ♀ 1 lb. 3 oz. to 1 lb. 6 oz. (c. 540-625 gm.) — Hume.

COLOURS OF BARE PARTS. Iris ♂ white, occasionally yellow; ♀ brown. Bill dull slaty or bluish black. Legs and feet dull dark slaty tinged with grey or green, sometimes mottled about the joints.

110. Baer's Pochard or Eastern White-eye. *Aythya boschi* (Radde)

Anas (Fuligula) boschi Radde, 1863, Reise Süd von Ost-Sibirien, 2: 376, pl. 13 (upper Salbatch Plain, middle Amur River, Siberia)

Baker, FBI No. 2281, Vol. 6: 454

Plate 11, fig. 9

LOCAL NAMES. *Bāda bhūti hāns* (Bengal); *Bor kili mūri* (Assam).

SIZE. Domestic duck —; length c. 46 cm. (18 in.).

FIELD CHARACTERS.

Male (breeding). Similar to Ferruginous Duck (No. 109) but whole head and neck black glossed with green, grading into rich rufous-chestnut on breast.

Male (in eclipse). Duller, with head and neck unglossed brownish black like female.

Female (adult). Head and neck dull blackish brown without metallic gloss. A chestnut patch on face near bill. On the whole very like female 109, and if unaccompanied by ♂, doubtfully distinguishable from it in the field.

DUCKS, GEESE, SWANS

185

Young (immature). Like female, but browner.

STATUS, DISTRIBUTION AND HABITAT. Uncommon and erratic winter visitor to Manipur (fairly regular), Assam, W. Bengal, and E. Pakistan. Has occurred also in Bihar. Possibly less rare in these areas than records indicate, but casually overlooked among sportsmen's bags of white-eyes, both species being found together and the females superficially so alike.

Extralimital. Breeds from Transbaikalia to the lower Ussuri and the Amur; Kamchatka (?). Winters in China, Korea, Japan, upper Assam, and Burma (Peter Scott).

MIGRATION. Nothing known.

GENERAL HABITS. Little recorded except that it is stronger and faster on the wing than the Ferruginous Duck.

FOOD AND VOICE. Not specifically described.

BREEDING. Extralimital. Little known.

MUSEUM DIAGNOSIS**MEASUREMENTS**

	Wing	Bill	Tarsus	Tail
♂♂	210-233	48-50	36-38	67-72 mm.
♀♀	186-203	47-48	—	—

(Delacour)

COLOURS OF BARE PARTS. Iris ♂ white or golden yellow; ♀ brown. Bill slaty blue, the basal third, tip, and nail blackish. Legs and feet grey, the joints and webs darker.

111. Tufted Duck. *Aythya fuligula* (Linnaeus)

Anas fuligula Linnaeus, 1758, Syst. Nat., ed. 10, 1: 128 (Sweden)

Baker, FBI No. 2283, Vol. 6: 458

Plate 11, fig. 7 and Plate 13, fig. 7

LOCAL NAMES. *Dūbāru*, *Abīāk*, *Rāhūrā* (Hindi); *Turando*, *Rūhārō* (Sind); *Kālū-lio* (Gujarat, Nal Sarovar); *Malak* (Nepal terai); *Kūringāliān* (Tamil); *Nāllō chiluvu* (Telugu); *Bāmuniya hāns* (Bengal, Assam).

SIZE. Domestic duck —; length c. 43 cm. (17 in.).

FIELD CHARACTERS.

Male (breeding). Plumage boldly contrasting black and white. Jet-black head, neck, breast, back, tail, and vent; pure white flanks and sides of body. White wing-mirror (speculum). A limp occipital tuft (prominent in profile) and yellow eye, additional clues. In flight a broad white band along trailing edge of wings in both sexes conspicuous.

× c. 1

DUCKS, GEESE, SWANS

187

emigration. Affects opener and deeper tanks and irrigation reservoirs than White-eyed Pochard, and expands of open water in the middle of jheels.

Extralimital. Breeds in Europe and Asia from Iceland and the British Isles to the Commander Islands (Pacific), south to central Europe, Balkans, Kirghiz steppes, Lake Baikal, the Amur and Sakhalin. Winters in southern half of breeding range and south to Nile Valley, Persian Gulf, S. China and Philippines (Peter Scott).

MIGRATION. No ringing data.

GENERAL HABITS. Not appreciably different from the Common and White-eyed Pochards (qq.v.), likewise procuring its food chiefly by diving. Rides rather low on water, often with only top of back visible, as in cormorant. Occasionally in very large flocks, or rafts, of several hundred on open tanks.

FOOD. Both animal and vegetable matter as in other pochards.

VOICE. Mostly silent in its winter quarters. A harsh, low *kur-r-r*, *kur-r-r*, uttered in flight.

MUSEUM DIAGNOSIS. For details of plumages etc. see Witherby 1959, 3: 300-2 Chick (in down). See Delacour 1959, 3: 77 (description); 140 (plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	192-208	37-44	33-37	c. 49-58 mm. (Baker)
♀♀	189-202	37-42		

Weight. ♂ 1 lb. 8 oz. to 2 lb. 4 oz. (c. 680-1025 gm.); ♀ 1 lb. 4 oz. to 1 lb. 10 oz. (c. 568-795 gm.). — Hume.

COLOURS OF BARE PARTS. Iris bright yellow. Bill greyish blue or bluish slate to dull dark plumbeous; nail and tip black. Legs and feet same as bill; joints darker, webs almost black.

112. Scaup Duck. *Aythya marila marila* (Linnaeus)

Anas Marila Linnaeus, 1761, Fn. svcc., ed. 2: 39 (Lapland)

Baker, FBI No. 2282, Vol. 6: 456

Plate 11, fig. 8 and Plate 13, fig. 9

LOCAL NAMES. Doubtfully differentiated from 111.

SIZE. Domestic duck —; length c. 46 cm. (c. 18 in.).

FIELD CHARACTERS.

Male (breeding). Very similar to Tufted Duck, the black parts glossed with purple but black back replaced by vermiculated pale grey. Occipital tuft lacking.

Male (in eclipse). Like adult female, but upperparts more heavily vermiculated and pure white facial band absent. Speculum whiter and more pronounced than in female.

Female (adult). Dark brown, closely resembling female Tufted, but always with a sharply defined white band at forehead around base of bill, broader and more prominent than in similar Tufted females.

Eye colour and wing pattern in both sexes same as in Tufted Duck.

186

ANSERIFORMES

Male (in eclipse). Upperparts duller and browner, and dusted with white. Chin and throat mottled with white; lower breast with crescentic white mottling. Sides and flanks pale brown vermiculated whitish.

Bill of adult male from above and side, × c. 1

Female (adult). Dark brown replaces black parts of male. White of lower plumage sootier, less in extent, and diffused at edges (not clear-cut). Tuft rudimentary. Sometimes a white ring of feathers at forehead around base of bill but much narrower than in Scaup (q.v.). Rather variable in details.

Young (immature). Male like adult female, but with mantle feathers more dusted with white, underparts more uniform brown, the belly barred with white. Young female more uniform brown.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor arriving about mid-October and mostly gone by end March. Common in W. Pakistan and N. India (rare in Kashmir; on passage?) including Nepal Valley and lowlands, east to Assam, Manipur, and E. Pakistan, south to about the 20th parallel (Madhya Pradesh, Orissa). Decreasingly in the Deccan and farther south to Mysore (rare). Rare vagrant in Ceylon (1 record), and Maldiv Islands. Has been recorded on high-altitude tarns and lakes (up to c. 5330 m.) in E. Nepal and Sikkim, March through May, presumably on northward

Aythya fuligula

■ Breeding ▨ Non-breeding

188

ANSERIFORMES

Young (immature) male like adult female, but darker and richer brown. Facial band much less in extent, or wanting.

Bill of adult male from above and side, × c. 1

STATUS, DISTRIBUTION AND HABITAT.

Rare vagrant in winter. Has occurred in W. Pakistan (Attock, Karachi?), Salt Range, Kashmir, Kulu, Punjab, Delhi (Gurgaon), Nepal, Uttar Pradesh, Bihar (Monghyr), W. Bengal (Calcutta), E. Pakistan (Chittagong), Assam (Dibrugarh, Lakhimpur), Manipur (near Imphal), Gujarat (Bhavnagar), Maharashtra (Panvel, Ahmednagar). Not south of 19°N. latitude. Some young birds in duck hunters' bags possibly mistaken for other pochards and escape record. Elsewhere largely a sea duck; in India taken on freshwater lakes.

Extralimital. 'Breeds in N. Europe and Asia (eastern limits not yet determined). Winters on coasts of W. Europe (including Britain), eastern Mediterranean, Black Sea, Persian Gulf, NW. India' (Peter Scott).

GENERAL HABITS. Very little recorded in India, and nothing to suggest any appreciable difference from Tufted Duck in habits, food or voice.

BREEDING. Extralimital. Nest and site as in Tufted Duck. Eggs, 7 to 12, olive-drab. Average size of 150 eggs 62.7 × 43.8 mm. (Baker). Incubation 23-27 days (Delacour).

MUSEUM DIAGNOSIS. Female differentiated from female Tufted Duck by broader, sharply defined white band around base of bill, larger wing, and longer, broader bill. For details of plumages see Witherby 1959, 3: 305-7.

Chick (in down). See Delacour 1959, 3: 140 (plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	217-235	c. 43-47	34-38	45-63 mm. (Baker)
♀♀	209-225	c. 40-46		

Weight. ♂ 1 lb. 12 oz. to 2 lb. 8 oz. (c. 795-1135 gm.). — Hume.

COLOURS OF BARE PARTS. Iris yellow or golden yellow. Bill greyish blue to dull slaty grey; nail black. Legs and feet greyish blue to dull slaty, darker on joints; webs and claws black.

MISCELLANEOUS. Longevity (from ringing data): c. 13 years (Ring, 1962, 33: 148).

Genus *Aix* Boie

Aix Boie, 1828, Isis, 21, col. 329. Type, by subsequent designation, *Anas sponsa* Linnaeus (Eyton, 1838, Monogr. Anat.: 35)

Foreneck feathers in male much elongated, forming a conspicuous ruff. Innermost secondary highly ornamental, very broad and long. Head crested. Culmen short,

DUCKS, GEESE, SWANS 189

nearly straight. Legs placed well forward; tarsus short; claws sharp enabling the birds to climb steeply inclined tree-trunks and boughs. For further details see Delacour 1959, 3: 99-100.

113. Mandarin Duck. *Aix galericulata* (Linnaeus)

Anas galericulata Linnaeus, 1758, Syst. Nat., ed. 10, 1: 128 (China)
Baker, FBI No. 2251, Vol. 6: 394

LOCAL NAME. None.

SIZE. Domestic duck —; Common Teal +; length c. 44 cm. (c. 17 in.).

FIELD CHARACTERS.

Male (breeding). A multicoloured, highly ornamental little duck — orange-buff, metallic bronzy and coppery blue, green, purple, cinnamon, and chestnut. Sides of face greyish buff, bordered above by white supercilium from bill to nape. A long, thick metallic purple nuchal crest falling over upper back. Enormously broadened fan-shaped tertiary feathers, steel blue and orange-chestnut, upstanding like sails (or like exaggerated tail-fins of an aeroplane). Lower neck and sides of breast brilliant purple-copper. Sides of lower breast with a composite band of 3 black and 2 white stripes — a broken pectoral band. Altogether a unique combination of feather structure and colour, seen in no other duck.

Male (in eclipse). More or less like female, but more glossy. Bill remains reddish and legs yellow.

Female (adult). Above, head and mop-like crest grey, with a white ring round eye continued as a streak behind it. Rest of upperparts olive-brown. A deep blue-green wing speculum margined with black and white. Below, chin, throat, and upper neck white. Lower neck, breast, sides, and flanks olive-brown broadly mottled paler. Rest of underparts white.

Young (immature). 'Like females only more uniform brownish grey, the male with less conspicuous eye markings' (Delacour).

STATUS, DISTRIBUTION and HABITAT. Exceptional vagrant. Only taken twice within our limits: a specimen in Assam (Lakhimpur dist.) and four in one day in Manipur (Mayangthang Valley, c. 930 m.). The latter in March 1934 on a small stream with occasional high grassy pools along its bed. Stuart Baker once observed a party of six birds also in Lakhimpur district, Assam.

Extralimital. E. Asia from the Amur and Ussuri, south through Korea, E. China, Japan to Formosa (Taiwan).

GENERAL HABITS. In its residential range associates in small flocks of a dozen or so, frequenting and feeding in forest streams and ponds. Perches freely in tall trees, 'whole families together exactly like a family of rooks or crows' (Sowerby). Is a strong flier (reminiscent of Common Teal) and good swimmer; walks well but dives poorly.

FOOD. Animal and vegetable matter. Particulars not recorded.

VOICE. Said to utter 'a peculiar whistling note'.

BREEDING. Extralimital. Nest, of grass, thickly lined with down, in holes in trees by forest streams. Eggs, 9 to 12, buffy stone colour, glossy. Average size 49 × 36.5 mm. Incubation 28-30 days (Delacour).

DUCKS, GEESE, SWANS 191

STATUS, DISTRIBUTION and HABITAT. Resident but local, practically throughout the Indian Union, both Pakistans, Nepal terai, Ceylon. Straggler to Andaman and Maldivé Is. Plains to c. 300 metres altitude. Commonest in deltaic West Bengal and E. Pakistan. Rare or absent in arid portions of W. Pakistan, Punjab, and Rajasthan. Not recorded from Kerala. Subject to local movements dependent on water conditions. Affects vegetation-covered jheels, village tanks, and ponds; also shallow lagoons, e.g. 'Salt Lakes', Calcutta.

Extralimital. Burma, east to S. China, south to Malaya and north-western East Indies (Peter Scott).

MIGRATION. Locally migratory to some extent, but no precise indication.

GENERAL HABITS. Usually pairs in breeding season; small flocks from 5 to 15, occasionally up to 50 or more, at other times 'up to 500' in Mysore (Phylian-Adams). Tame and confiding where unmolested, e.g. on secluded village tanks; exceedingly wild where persecuted by hunters. Flight strong and swift with rapid whirring wing-beats, usually with a great deal of agile turning and twisting, fairly low over water and skimming the tree-tops. Feeds on surface but can dive creditably to avoid capture when winged by shot or while moulting flight feathers. Clumsy on land.

FOOD. Mainly vegetarian: shoots, corms, seeds of aquatic plants, grains of cultivated and wild rice (known as *parai* in U.P.), etc. Also crustacea, worms, and insects and their larvae. For details see Mukherjee, A. K., 1974. JBNHS 71(2): 192-4.

VOICE. A peculiar short, sharp, chuckling cackle, rendered by Col. Tickell as resembling the words 'Fix baggonets! Fix baggonets!', uttered chiefly on the wing.

BREEDING. Season, June to September — mainly July and August — in N. India; February to August in Ceylon. Nest, a natural hollow in a tree-trunk standing in or near water, 2 to 5 metres above water level. Occasionally a hole in a building. Unlined or scantily so with grass, feathers, and rubbish; no down. One nest recorded in a box-like hole in the coping of Government House, Rangoon, in 1924, 68 feet (c. 20 m.) above ground. Eggs, normally 6 to 14 (once 22, probably product of more than one female), pearly white, becoming stained and dirty during incubation. Short broad ovals, equal at both ends; fine and close-textured. Average size of 100 eggs 43.1 × 32.9 mm. Incubation by female alone (?); period 15-16 days from last egg (Baker).

In the case of the Rangoon nest, the thirteen ducklings were pushed out of nest-hole by parent, dropped like stones for some distance, then fluttered to break fall, and reached ground safely. Elsewhere female has also been observed carrying down duckling on her back (H. S. Wood).

MUSEUM DIAGNOSIS

Chick (in down). Dark greyish brown above, with large white patches on scapulars, wings, flanks, and sides of rump. Cap black; hindneck greyish. Rest of head and neck white; a black streak through eye continued over hindneck. Underparts pale buff. See Delacour 1959, 3: 140 (plate).

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♂	152-167	22-24	23-25	72-75 mm.
♀♀	150-153	20-23	—	—

(Delacour)

190 ANSERIFORMES

MUSEUM DIAGNOSIS. For fuller description of plumage see Baker, loc. cit. Chick (in down). See Delacour 1959, 3: 106 (description); 140 (plate).

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	220-235	27-31	35-42	110-115 mm.
♀♀	217-230	26-30	—	—

(Delacour)

COLOURS OF BARE PARTS. Iris dark brown with a yellow outer ring. Bill red (pink in some females); nail fleshy pink. Legs orange-buff.

MISCELLANEOUS. The Mandarin duck occupies an important place in Japanese folklore and art as a symbol of marital fidelity, on a par with the Sarus crane in India. In Japanese paintings and embroidery the ornate male is seldom depicted alone; traditionally he is always accompanied by his plain-coloured spouse (Austin & Kuroda, 1953).

Genus NETTAPUS Brandt

Nettapus Brandt, 1836, Descr. Icon. Anim. Ross. Nov., Avcs, fasc. 1: 5. Type, by monotypy, *Anas madagascariensis* Gmelin = *Anas avara* Boddaert

Distinguished by small size and short goose-like bill, high at base narrowing gradually in front. Nostrils small, oval, situated near base of commissure. Legs short; hind toe narrowly but distinctly lobed. Wings pointed. Tail rounded. Sexes dimorphic.

114. Cotton Teal or Quacky-duck. *Nettapus coromandelianus* coromandelianus (Gmelin)

Anas coromandelianus Gmelin, 1789, Syst. Nat., 1(2): 522 (Coromandel, India)
Baker, FBI No. 2250. Vol. 6: 392
Plate 11, fig. 12 and Plate 13, fig. 12

LOCAL NAMES. Girri, Girria, Girja (Hindi); Gūrgūra (Etawah); Bālī hāns (Bengal); Bhullia hāns (E. Pakistan); Dāndāna (Orissa); Ade, Aila (Ratnagiri); Naher, Kesh, Chuwa (Nowgong, Assam); Bahār, Kārārhi (Sind).

SIZE. Partridge; length c. 33 cm. (13 in.).

FIELD CHARACTERS. The smallest of our ducks; with a short stubby goose-like bill.

Male (breeding). Crown and back blackish brown, the latter glossed with purple and green. Face, neck and underparts white, with a prominent black collar round base of neck, and white wing-bar. In flight diminutive size, predominatingly white plumage, and white bar on trailing edge of wing diagnostic.

Male (in eclipse) like female but upperparts darker and wing-bar prominent as in breeding dress.

Female (adult), duller and browner with less contrasty white in plumage. White wing-bar less prominent. A dark line through eyes.

Young (immature). Like female but more brown about the head and more banded with light brown on flanks. Wing-bar in males more prominent.

192 ANSERIFORMES

Weight. ♂ c. 8 to 11 oz. (c. 225-312 gm.); ♀ 6½ to 9 oz. (c. 185-255 gm.) — Hume; 5 ♂♂ 230-385 (av. 298), 5 ♀♀ 250-320 (av. 267) gm. — BNHS.

COLOURS OF BARE PARTS. Iris ♂ red-brown; ♀ brown. Bill ♂ black; ♀ brown or dark olive, yellowish on lower mandible and gape. Legs and feet blackish brown or black.

Genus SARKIDIORNIS Eyton

Sarkidiornis Eyton, 1838, Monogr. Anat.: 20. Type, by original designation, *Anas melanotos* Pennant

Bill of moderate length furnished in the male with a fleshy knob on the base which becomes greatly swollen in the breeding season. Tail of twelve feathers, long and graduated. Hind toe narrowly lobed. A spur on shoulder of wing.

Tropical; found in America, Africa, Madagascar, east to Burma and the Indo-chinese subregion. A single species in India.

115. Nakta or Comb Duck. *Sarkidiornis melanotos melanotos* (Pennant)

Anser melanotos Pennant, 1769, Ind. Zool.: 12, pl. 11 (Ceylon)
Baker, FBI No. 2247. Vol. 6: 385
Plate 12, fig. 5

LOCAL NAMES. Nākta (Hindi; Bengal); Nāktā (Bihar); Nāki hāns (Orissa); Jutta chiluvu (Telugu); Doddā sarle hākki (Kannada); Kāro hānj (Sind); Kābaliyā (Sinhala); Mookkān thāri (Tamil).

SIZE. Domestic duck +; length c. 76 cm. (30 in.).

FIELD CHARACTERS. A large perching duck of superficially similar colour pattern to Cotton Teal.

Male (adult). Upper back black, glossed with blue-green and purple. Lower back grey, conspicuous in flight. Head and neck white, speckled with black. A black half-collar down side of breast; another similar black band descending in front of under tail-coverts. Wing speculum (secondaries) bronze. A curious fleshy knob, or comb, on base of bill at forehead, becoming greatly swollen in breeding season.

No eclipse plumage.

Female (adult). Like male, but without comb on bill and considerably smaller and duller. Underparts somewhat mottled with brown and lacking demi-collar on upper breast, and band near tail.

Young (immature), differs from female in being less glossy on black upperparts. White of hindneck sullied with brown and barred with blackish. Lower back and rump dull greyish white; upper tail-coverts and tail dull brown (Whistler).

STATUS, DISTRIBUTION and HABITAT. Resident, shifting locally with water conditions. Rare in southern and eastern Sind; absent elsewhere in W. Pakistan. Occurs practically in all India, Nepal terai, and E. Pakistan, east through Assam, south to Mysore (rare). Formerly sparse resident in Ceylon; now believed extinct as no record in present century. Affects reedy banded tanks and jheels in well-wooded plains country.

Extralimital. Africa from Gambia and the Sudan, south to the Cape and Madagascar; Burma and SE. China (Peter Scott).

DUCKS, GEESE, SWANS

193

Another race, *syliatica* (= *canaliculatus*) in South America.

GENERAL HABITS. Keeps in family parties of 4 to 10 birds, but flocks of 25 to 30 occasional; more rarely gatherings of even up to a hundred. Flight strong and swift with wing-action reminiscent of geese. A good walker and perches freely on branches of trees during daytime; can cling on with ease to tree-trunk outside nest-hollow with its strong claws. Does not normally dive for food which obtained chiefly by grazing, but can dive very effectively to evade capture when in moult and flightless, or when winged.

FOOD. Largely vegetarian: corms, shoots, and seeds of aquatic and marsh plants, and grains of wild and cultivated rice. Also water insects and their larvae; occasionally frogs and fish.

VOICE. Normally silent except for an occasional low harsh croak. A 'fine loud honk' in the breeding season (Baker).

BREEDING. *Season*, during the SW. monsoon, mainly July to September. *Nest*, normally in a large natural hollow at moderate height in an ancient tree standing in or close to water, sometimes a considerable distance away. Unlined or scantily so with dry leaves, grass, and feathers. Occasionally recorded breeding in old vulture nests, and in holes in old fort walls and earth cliffs. *Eggs*, 7 to 15, pale cream, of the texture and appearance of polished ivory. Average size of 100 eggs 61.8 × 43.3 mm. (Baker). Incubation by female alone (?); period 30 days.

Up to 47 eggs have been taken from a single nest, the product of two or more females, as is commonly the case where large trees with suitable hollows are scarce.

MUSEUM DIAGNOSIS

Chick (in down). 'Hair brown above with two large buffy yellow spots on the sides, and one on the wing. Face and underparts buffy yellow with a small brown line, often interrupted, through the eyes' — Delacour 1959, 3: 122; 140 (plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	339-406	c. 63-70	c. 64-75	139-153 mm.
♀♀	c. 280-309	c. 59-66	—	—

Comb of ♂ in breeding season c. 55-60 mm. at widest point.

(Baker)

Weight of a fine adult ♂ 5 lb. 12 oz. (c. 2610 gm.); ♀ 4 lb. 4 oz. to 5 lb. 2 oz. (c. 1925-2325 gm.). — Hume.

COLOURS OF BARE PARTS. Iris dark brown. Bill and comb black. Legs and feet plumbeous.

Genus CAIRINA Fleming

Cairina Fleming, 1822, Philos. Zool. 2: 260. Type, by monotypy, *Anas masehata* Linnaeus

Asarcornis Salvadori, 1895, Cat. Bds. Brit. Mus. 27: 46 (in key), 59. Type, by original designation and monotypy, *Anas scutulata* S. Müller

Close to *Sarkidiornis* in its dark coloration and general proportions of body, wings, bill, legs, and tail. Also in possession of a bony knob on wing. Male appreciably larger than female; bill without comb but becoming considerably swollen at base

DUCKS, GEESE, SWANS

195

recent (1948) observation of two parties totalling about 30 birds on the open Padma river in East Pakistan — February (H. G. Alexander). Habits little known except that like Nakta perches in trees. Flights at dusk to feed in open waters and marshes during night, returning at dawn to daytime refuge on secluded forest pool.

Cairina scutulata

Residential range

FOOD. Feeding habits in wild state not recorded. The crop of a specimen was full of 'pyramidal seeds of a marsh plant' (species?) (T. C. Hutchinson). In captivity apparently omnivorous with a preference for animal food; skimming along the water with head and neck immersed, and diving to chase small fish (Baker).

VOICE. Described as a 'peculiar, distinctive whistle' (R. E. Parsons). The male's as a trumpet-like *crank-crank* (B. E. Smythies). Another observer in Burma likens it to a very mournful wail rather than *crank*, usually heard when the bird is fighting at dusk. Female said to whistle on wing. 'When alarmed, uttered a goose-like *hank*' (Hutchinson).

BREEDING. Presumably similar to Nakta. No authentic record in our area. An egg brought to Baker in Cachar by his local collector was reported to be taken from a nest of grass and rubbish in a deep natural hollow c. 6 metres p in the bifurcation of a tree-trunk alongside a jungle stream. It matched the eggs of Nakta, and measured 65 × 48.1 mm.

Delacour (1959) quoting Schuyf gives 'Eggs greenish yellow, 7 to 10, 5 × 48 mm.; incubation 30 days'.

MUSEUM DIAGNOSIS. For detailed description of plumage etc. see Baker, loc. cit.

Chick (in down). 'Dark brown, the head and neck deeper in colour, the underparts lighter' — Delacour 1959, 3: 140 (plate).

194

ANSERIFORMES

of culmen in breeding season. Differs from *Sarkidiornis* mainly in pattern of plumage and possession of a conspicuous white wing-patch formed by secondaries and upper wing-coverts.

The genus, which contains the familiar domesticated Muscovy Duck, is represented in India by only a single species.

116. Whitewinged Wood Duck. *Cairina scutulata* (S. Müller)

Anas scutulata S. Müller, 1842, Verh. Nat. Ges. Ned. Land-en Volkenk.: 159 (Java) Baker, FBI No. 2248, Vol. 6: 387 Plate 12, fig. 6

LOCAL NAMES. *Deo hāns* (Assam); *Hagrani*, *Daphlanta* (Cachar).

SIZE. Domestic duck +; length c. 81 cm. (32 in.).

FIELD CHARACTERS.

Male (adult). Head and neck white, variably speckled with black as in Nakta. Rest of plumage above and below largely glistening blackish and rich chestnut-brown. A bluish grey speculum bordered anteriorly by a broad black band. A large white patch on wing-shoulder (upper coverts) diagnostic at rest and in flight. This white wing-patch and dark underparts at once distinguish it from Nakta (of about same large size) even at long range.

No eclipse plumage.

× c. 1

Female (adult). Much smaller, otherwise not conspicuously different from male.

Young (immature). Duller and browner.

STATUS, DISTRIBUTION AND HABITAT. Resident, Assam, particularly the NE. Frontier tracts; Manipur (up to c. 900 m.), and E. Pakistan. Rare and apparently becoming scarcer. Affects waterlogged depressions in evergreen forest, often with gaunt dead trees standing about, and *bheels* amidst dense cane brakes and tall elephant-grass jungle.

Extralimital. Burma, Thailand, Indochina, and through Malaya to Sumatra and Java.

GENERAL HABITS. Keeps in pairs or small parties of 5 or 6 on jungle ponds. Not infrequent in NEFA wherever it occurs, a pair or so present on almost every secluded jungle pool, the more sheltered and overgrown the more likely to hold the duck. Once 11 recorded together; another unusual

ANSERIFORMES

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	363-401	58-66	54-60	127-178 mm.
♀♀	305-356	55-61	—	—

(Delacour)

(Baker)

Weight. ♂ 6 lb. 8 oz. to 8 lb. 8 oz. (c. 2945-3855 gm.); ♀ 4 lb. 12 oz. to 6 lb. 12 oz. (c. 2150-3050 gm.). — Baker.

COLOURS OF BARE PARTS. Iris ♂ orange-yellow, ♀ brown. Bill orange, mottled with black; in breeding season base becomes swollen in ♂. Legs and feet orange-yellow.

Genus CLANGULA Leach

Clangula Leach, 1819, in Ross, Voy. Disc., App.: xlviii. Type, by monotypy, *Anas glacialis* Linnaeus = *Anas hyemalis* Linnaeus

'Bill shorter than head and than tarsus; high at base. Cutting edge of upper mandible ascending rapidly towards nail, which occupies whole tip of bill. Culmen straight but nail slightly elevated. Nostril close to feathers. Feathering advancing farthest on culmen; on sides of culmen forming a nearly straight oblique line. Rectrices 14, exceptionally 16; tail strongly rounded, rectrices pointed, those of male greatly elongated. Sexes very different, summer and winter also. One species in arctic regions of Northern Hemisphere' (Witherby 1939, 3: 317-18).

117. Longtail Duck, or Old Squaw. *Clangula hyemalis* (Linnaeus)

Anas hyemalis Linnaeus, 1758, Syst. Nat., ed. 10, 1: 126 (Northern Sweden)

Baker, JBNHS 37: 549

Plate 12, fig. 2

LOCAL NAMES. Unrecorded.

SIZE. Domestic duck —; length body c. 30 cm. (12 in.); pointed tail c. 13 cm. (5 in.).

FIELD CHARACTERS. In winter, when recorded and likely to occur in our area, the contrasty dark chocolate-brown and white plumage pattern of male combined with small head, short bill, and long pointed tail distinctive. The last normally carried horizontal when swimming, partly expanded and erected vertically under excitement.

Male (adult). *Winter*: Head, neck, and upper breast pure white. A dark brown patch on either side of neck behind ear-coverts. Back (i.e. a broad band along spine), pointed central tail, and a collar descending from upper back widening below into a broad pectoral band to include upper abdomen, dark brown. Scapulars, abdomen, flanks, and vent, white.

In flight the scapulars showing up as broad white streaks between dark wings, and the broad brown spinal band (tapering posteriorly into pointed central tail-feathers), aid identification.

Male (adult). *Summer*: Head, neck, and upper breast largely blackish brown. Back same scalloped with chestnut-buff.

Male (in eclipse). 'Mantle darker, the black more pronounced; the sides of the body and flanks have drab and grey feathers mingled with the white' (Baker).

Female (adult). *Winter*: Entire back dark brown, more or less scalloped with fulvous. Head white with dusky crown and patches on sides of upper

DUCKS, GEESE, SWANS 197

neck. Lower foreneck and upper breast brownish, forming a diffuse pectoral band. Rest of underparts white.

Female (adult). Summer: Upperparts darker and duller than in winter, the scalloping less bright and conspicuous.

STATUS, DISTRIBUTION AND HABITAT. Rare straggler in winter. Three records from W. Pakistan (Baluchistan, 1933, 1938; Sind, 1936); one each from Kashmir (Hokarsar, 1939) and NE. Assam (Sadiya Frontier Tract, 1935). A half dozen or so together observed on some of these occasions. Shot on jheels, and Brahmaputra river.

Extralimital. 'Breeds on arctic coasts of Europe, Asia, and N. America. Winters south to Britain, France, Holland, Black Sea, Caspian Sea, Japan, California, the Great Lakes, N. Carolina; S. Greenland' (Peter Scott).

Clangula hyemalis

■ Breeding range

GENERAL HABITS. Normally a maritime duck, often found far out from the coast even on a choppy sea. A good swimmer and diver, obtaining its food under water, sometimes remaining submerged in the quest for many seconds at a time. Flight reminiscent of Pintail, somewhat less swift.

FOOD. Recorded as mainly animal — molluscs, crustaceans, etc. The Brahmaputra specimen had its crop and gullet crammed with small shrimps.

VOICE. Not recorded in India. A very deep guttural croak, said to be entirely unlike that of any other duck. 'Resembles low or distant bark of dog' (E. M. Nicholson).

BREEDING. Extralimital. Nest a depression in the ground on open tundras, thickly lined with down; well hidden in undergrowth by lakes and pools. Eggs, 6 to 11, olive or yellowish buff, 54 × 38 mm.; incubation 24 days (Delacour).

DUCKS, GEESE, SWANS 199

Male (in eclipse). Like female, but always retaining full wing colour with pure white speculum.

Female (adult). Head and neck hair-brown, with a dull white collar round base. Upperparts mottled blackish and grey with a white wing-patch (secondaries and coverts, in part). A grey band on upper breast (below white collar), greyish flanks and vent. Rest of underparts white.

Young (immature). Male like adult female, somewhat larger and darker. Female similar but with less white on wing. Male assumes adult plumage in second year.

STATUS, DISTRIBUTION AND HABITAT. Uncommon winter visitor mainly to W. Pakistan, N. India, Nepal (up to 3000 m.), and Assam. Recorded from Sind (?), Punjab (Attock, on the Indus), U.P. (Lucknow dist.), Bihar (Champaran dist.), Assam (Lakhimpur dist.), Manipur. On open reaches of swift-flowing rivers where these debouch from the hills, and on jheels.

Extralimital. 'Breeds from northern Scandinavia east across Europe and Asia, north to the limit of trees, south to Germany, Balkans, central Russia and Siberia to Kamchatka and Sakhalin. Winters from British Isles, Mediterranean, to southern China and Japan' (Peter Scott).

Bucephala clangula

■ Breeding range

GENERAL HABITS. A diving duck like the pochards, partial outside the breeding season to the sea coast. Inland it prefers fairly deep clear open water to vegetation-covered jheels. Has been met with in winter in small parties of 5 or 6. A good swimmer and diver; awkward on land. Flight swift and erratic, with rapid strokes of the short, pointed wings which produce a peculiar whistling sound.

198 ANSERIFORMES

MUSEUM DIAGNOSIS. For details of plumages etc. see Witherby 1939, 3: 321-4; Baker, loc. cit.

Chick (in down). See Delacour 1959, 3: 173 (description), 256 (plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	219-236	26-29	32-35	199-246 mm.
♀♀	202-210	23-28	—	—

COLOURS OF BARE PARTS. Iris ♂ carmine to hazel, ♀ yellow, immature ♂ brown. Bill ♂ basal half black, terminal portion rose-red to orange-yellow, nail bluish grey; ♀ greyish black; imm. ♂ blue-grey. Legs and feet ♂ light bluish grey, webs dusky, claws black; ♀ greenish grey, webs dusky; imm. ♂ pale grey, webs nearly black (Witherby).

Genus BUCEPHALA Baird

Bucephala Baird, 1858, Rep. Expl. and Surv. R. R. Pac. 9: 1, 788, 795. Type, by original designation, *Anas albifrons* Linnaeus

Bill short, higher than broad at base, not much flattened at tip, tapering slightly throughout, more rapidly and rounded at end. Profile of culmen very slightly concave. Nostril placed nearer to tip than to base of bill, a feature peculiar to this duck. Lamellae short, stout, and placed very close together. Tarsus short; scutellate in front. Hind toe well developed, with broad lobe. Legs placed far back rendering walking difficult. Wings pointed. Tail long and strongly graduated. Posterior end of sternum prolonged as in *Merganser*. Sexes dimorphic.

Only one species occurs in India as a rare winter visitor.

118. Goldeneye Duck. Bucephala clangula clangula (Linnaeus)

Anas Clangula Linnaeus, 1758, Syst. Nat., ed. 10, 1: 125 (Sweden)

Baker, FBI No. 2284, Vol. 6: 460 (= *Glaucionetta c. clangula*)

Plate 12, fig. 3

LOCAL NAMES. None recorded.

SIZE. Domestic duck —; length c. 46 cm. (18 in.).

FIELD CHARACTERS.

Male (breeding). Head, nape, chin, and throat black, the first two brilliantly glossed with metallic green. A distinctive white oval cheek-patch at base of bill. Back and tail black, with bold white streaks on scapulars and flanks. Wings black with a conspicuous broad white patch along basal half when closed. Neck, breast, and underparts white.

× c. 1

At rest black and white plumage, and triangular mop-shaped head with white cheek-patch, peculiar. In flight, black head, white cheek-patch, short-looking white neck, black back between streaked white scapulars, and white patch on wings next to body (secondaries and coverts) are leading clues.

200 ANSERIFORMES

FOOD. Mainly animal matter — molluscs, crustaceans, aquatic insects, etc.

VOICE. Unrecorded in India. Elsewhere, female said to emit a loud hoarse note occasionally; male a penetrating *speer, speer*, and in the spring 'a rasping, vibrating double note *quee-reek*' (Delacour).

BREEDING. Extralimital. Nest, a natural hollow in tree-trunks etc., lined with down. Nest-boxes put up for it in likely places are frequently occupied. Eggs, 6 to 15, bluish green. Average size of 200 eggs 55.2 × 42.5 mm. (Baker).

MUSEUM DIAGNOSIS. For details of plumages, structure, etc. see Witherby 1939, 3: 311-14.

Chick (in down). See Delacour 1959, 3: 178 (description); 256 (plate).

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	207-227	31-36	34-38	77-90 mm.
♀♀	197-210	28-31	—	—

Weight. ♂ 1 lb. 12 oz. to 2 lb. 8 oz. (c. 795-1135 gm.); ♀ 1 lb. 8 oz. to 2 lb. (c. 680-910 gm.) — Baker.

COLOURS OF BARE PARTS. ♂ Iris golden yellow. Bill black. Legs and feet yellow or orange with blackish webs. ♀ Iris pale yellow or pale blue-green. Bill black, with a yellow patch next to nail. Legs and feet brownish yellow.

Genus MERGUS Linnaeus

Mergus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 129. Type, by subsequent designation, *Mergus castor* Linnaeus = *Mergus serrator* Linnaeus

Sexes dimorphic; both with a nuchal crest. Bill long, narrow, tapering throughout with culmen nearly straight, the nail strongly hooked. Serrations or 'teeth' coarse, with tips pointing backwards saw-like. Nostril large, oblong, placed between $\frac{1}{2}$ and $\frac{1}{3}$ length of bill from base. Tarsi very short, placed far back on the body. Feet large with well-lobed hallux. Tail fairly long, rounded, of 16 to 18 stiff cuneate feathers.

(Mediterranean Sea near Smyrna)
Baker, FBI No. 2286, Vol. 6: 466
Plate 11, fig. 11 and Plate 13, fig. 10

LOCAL NAMES. *Nikerne* (Hindi); *Jhali* (Sind).

SIZE. Domestic duck —; length c. 46 cm. (18 in.).

FIELD CHARACTERS.

Male (breeding). Predominantly white, with a large metallic black patch on face, a black band from behind eye to nape, and drooping nuchal crest. Back black with two black streaks diverging from its anterior end down each side of white breast. Sides of body, and tail, grey. In flight an easily recognized pied duck, mainly white, with a broad black spinal band, dark tail, and conspicuous black-and-white wings.

Female (adult). Forehead, crown, nape, and short peak-like nuchal crest chestnut-red. Throat and sides of head contrasty white. Back greyish brown. Breast and flanks grey. Rest of underparts white. In flight the contrasty chestnut and white head, greyish body and black-and-white wings distinctive.

Male (in eclipse). Like female, but larger with some black on mantle and larger white patch on secondaries.

Young (immature). Like female but paler, more uniform generally and with the white wing-coverts tipped with ashy brown.

STATUS, DISTRIBUTION AND HABITAT. Uncommon and sparse but regular winter visitor to W. Pakistan and northern India. Recorded from Baluchistan, Sind, NWFP, NW. Punjab, Delhi, Bhutan duars, NE. Assam; south from N. Gujarat, Bihar (Hazariabagh), Orissa (Cuttack), W. Bengal

Mergus Merganser Linnaeus, 1758, Syst. Nat., ed. 10, 1: 129 (Sweden)
Baker, FBI No. 2287, Vol. 6: 469

LOCAL NAMES. Unrecorded.

SIZE. Domestic duck +; slimmer. Length c. 66 cm. (26 in.).

FIELD CHARACTERS.

Male (breeding). Head, crest, and upper neck black glossed with metallic green and purple. Mantle (scapulars) glossy black; lower back, rump, and upper tail-coverts grey vermiculated with white. Tail silvery brown. Primaries black; secondaries and coverts white or partly white. Extreme upper back, lower neck, and underparts white, faintly tinged with salmon-pink.

In flight general aspect black and white with slender head and neck, narrow pointed red bill, and red legs.

Female (adult). Head, crest, and neck dark chestnut and cinnamon-brown; chin and upper throat white. Upperparts mottled bluish grey-brown. Primaries blackish; secondaries white and grey, forming a conspicuous white speculum. Tail grey-brown. Underparts white, striped with grey on flanks.

In flight rufous head, grey back, white underparts, black-and-white wings, thin neck, pointed red bill, and red legs distinctive.

Male (in eclipse). Resembles female, but retains white wing-coverts.

Young (immature). Male like adult female but upperparts browner, head paler, chin and throat less white.

Chick (in down). See Delacour 1959, 3: 217 (description), 256 (plate).

Bill from above $\times c. \frac{1}{2}$

202

ANSERIFORMES

(Raniganj). Affects small open jheels, but chiefly clear Himalayan streams where these debouch from the foothills into the plains.

Extralimital. 'Breeds in Europe and Asia from Scandinavia to Siberia and south to the Volga, Turkestan and the Amur. Winters on coasts and lakes from Britain, the Mediterranean, Persia, to China and Japan' (Peter Scott).

GENERAL HABITS. Keeps in small parties; occasionally large flocks. A fast swimmer and proficient diver. Normally rides high on the water but, like the pochards, will lower itself considerably on alarm. Flies swiftly with rapid though noiseless beats of the pointed wings.

FOOD. Mainly fish. Crustaceans, molluscs, aquatic insects and their larvae, worms, etc. also taken; occasionally some vegetable matter.

Mergus albellus

■ Breeding range ▨ Main wintering areas

VOICE. Unrecorded in India.

BREEDING. Extralimital. Col. A. E. Ward's record of breeding in Ladakh has not been confirmed, and is doubtful. Nest, in natural hollows in tree-trunks near water; sometimes in nest-boxes in Finland. Eggs, 6 to 10, pale creamy buff. Average size of 137 eggs 52.2 × 37.5 mm. (Baker).

MUSEUM DIAGNOSIS. For detailed description of plumages and structure see Witherby 1939, 3: 377–9.

Chick (in down). See Delacour 1959, 3: 193 (description), 256 (plate).

ANSERIFORMES

1 *Mergus m. merganser* 2 *M. m. orientalis*

■ Breeding ▨ Non-breeding: 1, 2

121. Eastern Merganser. *Mergus merganser orientalis* Gould

Mergus Orientalis Gould, 1845, Proc. Zool. Soc. London: 1 (Amoy, China)
Baker, FBI No. 2288, Vol. 6: 472
Plate 12, fig. 4 and Plate 13, fig. 11

LOCAL NAME. None recorded.

SIZE. Slightly smaller than 120. Length c. 63 cm. (25 in.).

FIELD CHARACTERS.

Male (breeding). Differs from western (nominate) race in somewhat smaller size and greater extent of black on mantle. Grey of lower back and rump paler and more freckled with white; salmon-pink tinge on underparts more pronounced.

Female, male in eclipse, and immature male differ from adult as in the western form (q.v.).

STATUS, DISTRIBUTION AND HABITAT. Chiefly winter visitor. Rare in NW. India; Nepal; fairly common in the E. Himalayan foothills. Status of the two races within our limits uncertain. Specimens of nominate race taken in winter in West Pakistan (Sind, Makran coast), U.P., Maharashtra (Bombay), M.P. (Raipur district, sp.?), and NE. Assam (Lohit river). *M. m. orientalis* partly resident in Ladakh (and possibly in N. Sikkim), but specimens collected in Ladakh in May/June approximate in coloration and wing measurement to nominate race (Meinertzhagen, *Ibis*, 1927: 616).

DUCKS, GEESE, SWANS

205

Sight records racially indeterminate. Affects large rivers and lakes; also fast-flowing streams, especially where these debouch from the northern hills into the plains.

Extralimital. *M. m. merganser* breeds in Europe and Asia from Iceland, British Isles, Switzerland, the Balkans, to Kamchatka, the Kurile and Commander Islands. South in winter to Mediterranean and China.

M. m. orientalis breeds principally in Afghanistan, Turkestan, Altai, Tibet. Winters N. India, N. Burma and China (Szechuan) and farther east, where it occurs with the nominate race (Peter Scott).

GENERAL HABITS. An expert swimmer and diver, perfectly at home on icy torrential E. Himalayan streams. Apparently uncomfortable on land. When disturbed resting on bank, shuffles into water on its breast. Keeps in pairs or small parties of 5 to 8—often the sexes separate—which coalesce into larger mixed flocks of 40-50, or more, while courising up and down to hunt in favourite reaches of clear rapid streams. Characteristically follows their bends, seldom deviating or altering course even at sight of a gunner. Usually flies low almost clipping the wavelets, effectively camouflaged against the shimmering background of wet stones and cascading water. Often hunts by cooperative effort like cormorants, a flock swimming in a semicircle from bank to bank across a rapid rippling stream, herding small fish into the less turbulent shallows near the banks—dashing and splashing in the white water in pursuit and diving energetically after the quarry. Little Egrets (*Egretta garzetta*) commonly take advantage of this habit by attending on the hunting flocks, leap-frogging over the duck, back and forth, to take up advance positions on the banks, and seizing any fish stranded in the marginal shallows in their rush to escape. When cruising in calm water, the males especially have a curious habit of arching their necks, and then darting their bills vertically upwards. This is not in an effort to swallow some large morsel, but evidently a kind of display (R. E. Parsons).

FOOD. Almost exclusively fish (up to 125 or 150 mm. long), for seizing which the serrated bill is specially adapted. In Britain 49 perch averaging 3 inches (75 mm.), and a young pike, have been taken from a single stomach (Witherby). Occasionally also some crustaceans, aquatic insects, etc. along with a quantity of pebbles.

VOICE. Only an occasional croak or *krrr* recorded in India.

BREEDING. Within our limits *M. m. orientalis* (?) breeds in Ladakh (possibly also in northern Sikkim and Bhutan) at elevations between c. 3000 and 4000 metres, and perhaps higher, e.g. on Tso Moriri and Pangong lakes, and Indus and Tankse rivers (B. B. Osmaston, R. Meinertzhagen). *Season.* No nests with eggs found, but downy ducklings reported on various lakes in June. *Nest.* (in Tibet) in hollows and crevices in crumbling rock cliffs, lined with rubbish, and thickly with down. *Eggs,* 6 to 10 (?) like those of Goosander but darker and smaller—pale buff or stone-buff, close and fine textured, fairly glossy. Average size of 20 eggs 64.6 × 44.8 mm. (Baker). Incubation period ? In *M. m. merganser* full clutch of 7 to 16 eggs; incubation period 28-32 days (Delacour).

MUSEUM DIAGNOSIS. For description of plumages, structure, etc. of nominate race see Witherby 1939, 3: 364-7.

DUCKS, GEESE, SWANS

coast, November 1875; Sind (Karachi harbour); Baluchistan, Quetta dist. (Khushdil Khan lake 1902, Pishin 1908)] and two in W. Bengal: an example procured in Calcutta market, presumably from that neighbourhood (December 1889), and another more recently (January 1961) in the 24-Parganas district (Biswas, *in epist.*). According to C. B. Ticehurst (JBNHS 32: 95) a not uncommon winter visitor to the Makran coast; recorded from Ormara, Chharbar and Jask (December/January).

Mergus serrator

■ Breeding □ Non-breeding

Extralimital. 'Breeds in suitable places throughout northern Europe, Asia, N. America (including British Isles). South in winter to the Mediterranean, Persian Gulf, China, Formosa, Gulf of Mexico, and Florida' (Peter Scott).

GENERAL HABITS. Not markedly different from those of the Goosander (q.v.).

BREEDING. Extralimital. Unlike Goosander does not usually nest in tree hollows. *Nest,* large, compact, of moss, grass, etc. lined with down. In dense cover of bushes, or in holes in banks and cliffs. *Eggs,* 7 to 12 greyish to greenish buff, 65 × 45 mm.; incubation 26-28 days' (Delacour).

MUSEUM DIAGNOSIS. Bill proportionately longer and narrower than in Goosander, less hooked at tip, and with more teeth or lamellae. See figures, p. 201. Chick (in down). See Delacour 1959, 3: 210 (description), 256 (plate).

COLOURS OF BARE PARTS. Iris ♂ carmine or deep red, sometimes tinged with brown in younger birds; ♀ brown. Bill vermillion; culmen sometimes rather dusky in non-breeding season; nail black. Legs and feet bright vermillion. Colours in ♀ duller.

122. Redbreasted Merganser. *Mergus serrator* Linnaeus

Mergus Serrator Linnaeus, 1758, Syst. Nat., ed. 10, 1: 129 (Sweden)
Baker, FBI No. 2289, Vol. 6: 473

LOCAL NAMES. None recorded.

SIZE. Domestic duck —; slimmer. Length c. 58 cm. (23 in.).

FIELD CHARACTERS. Smaller and slimmer than Goosander, with a prominent straggly, backwardly-directed double crest (with an upper and lower portion) sticking out stiffly from hindcrown.

Male (breeding). Differs from male Goosander (with entire underparts white) in having a dark band (blotchy chestnut and black) on upper breast; rest of underparts white. This comparative feature particularly helpful in identification at distance and in flight. Head, crest, throat and upper neck glossy blackish green. A broad white collar below this, interrupted on hindneck by a black longitudinal stripe continuing from nape into black upper back. Black of back broader, with bold white spots in a chequer pattern at its anterior end covering wing-shoulder. A broad white lateral band along closed wing (secondaries and coverts). Lower back, rump, upper tail-coverts, and upper flanks pale grey vermiculated with black.

Male (in eclipse). Like female, but with the mantle darker; wings more or less as in breeding male.

Female (adult). Rather like female Goosander. Crown, crest (shorter than male's), nape, and hindneck brown; sides of head and neck cinnamon. Chin, throat, and foreneck duller, rufous-washed white. Upperparts dark greyish brown, scalloped paler. Wings as in male but with less white. Underparts white, the breast and sides mottled with ashy brown.

Young (immature) male like adult female, but overall more brown less grey. Crest shorter; bare parts duller coloured.

STATUS, DISTRIBUTION AND HABITAT. Vagrant in winter. Only six authentic occurrences within our limits: four in W. Pakistan [Chharbar, Makran

208

ANSERIFORMES

Two adult ♂♂ obtained in India have wings of c. 253 and 254 mm.

Weight ♂ 1 lb. 12 oz. to 2 lb. 4 oz. (c. 790-1025 gm.); ♀ under 2 lb. (910 gm.); possibly goes somewhat higher — (Baker).

COLOURS OF BARE PARTS. Iris ♂ carmine or red-brown; ♀ brown or red-brown, sometimes carmine. Bill ♂ orange-red to deep vermillion, the edge of culmen and nail black; ♀ duller, more orange-red with the culmen dusky over a greater area. Legs and feet orange-red to deep vermillion, the joints and webs dusker. Duller in ♀.

Genus *OXYURA* Bonaparte

Oxyura Bonaparte, 1828, Ann. Lyc. Nat. Hist. New-York 2: 390. Type, by monotypy, *Anas rubidus* Wilson

Eristura Bonaparte, 1832, Giorn. Acad. Sci. Lett. Arti, Roma, 53(54): 208, new name for *Oxyura* Bonaparte

Bill large, very swollen at base; nail small and curved inwards. Culmen concave; anterior part of bill flat and broad, the lamellae coarse and set far apart. Nostrils large, oval, placed nearer to base than to tip of bill. Tarsi short, placed far back as in Diving Ducks; feet very large; middle toe almost twice length of tarsus; hind toe broadly lobed. Wings short and pointed. Tail well graduated, of very narrow, stiff-feathers, longer than tarsus; tail-coverts short and scanty. Sexes slightly dimorphic.

123. Whiteheaded Stiff-tailed Duck. *Oxyura leucocephala* (Scopoli)

Anas leucocephala Scopoli, 1769, Annus I Hist. Nat.: 65

(probably from northern Italy)

Baker, FBI No. 2285, Vol. 6: 463

Plate 12, fig. 1 and Plate 13, fig. 15

LOCAL NAMES. None recorded.

SIZE. Domestic duck —; length c. 46 cm. (c. 18 in.).

FIELD CHARACTERS. A little larger than Common Teal, but squat and tubby, with very peculiar bill and tail. Bill very high and swollen at base, sinking abruptly and broadening towards tip. Tail of stiff, narrow, pointed feathers with very short coverts at its base, looking like a bunch of wires artificially stuck in; often carried comically upright when swimming.

× c. 1

Male (breeding). Head white, with a black patch on crown, and slaty blue to sky-blue bill. Neck blackish, fading into chestnut on

DUCKS, GEESE, SWANS

209

upper breast and sides, and to rusty grey on back and mantle. Lower back and rump pencilled with black. Upper tail-coverts chestnut, finely pencilled with black. Underparts silvery white mottled with grey. Wings grey.

Female (adult) and male in eclipse have the head and neck brown with blackish bars; the crown darker. A conspicuous whitish line below eye from bill to nape. Throat and sides of upper neck whitish; rest of plumage as in breeding male, somewhat greyer and paler, with finer barring.

Young (immature). Like adult female; male redder on back.

STATUS, DISTRIBUTION AND HABITAT. Casual and sparse winter visitor mainly to the northwestern portions of our area. Sporadically, but not infrequently recorded (specimens and observation) from W. Pakistan (Peshawar, Nowshera, Shahpur, Kohat districts), Punjab (Gujrat and Mianwali dists.), Baluchistan (Langi-nawar, Nushki and Quetta dists.), Sind (Larkana and Sukkur dists.), Bahawalpur. In recent years found in large numbers on certain lakes on the Punjab Salt Range—Khabakki, Kallar Kahar, Nammal. Maximum number counted 723 (February 1965) on Khabakki (C. D. W. Savage). Also N. India—E. Punjab (Ludhiana dist.), Kashmir, Delhi dist., Uttar Pradesh (Pilibhit and Hardwar dists.), Rajasthan (Bharatpur, once). Not farther east or south except reportedly twice in Calcutta market (Finn). On large freshwater lakes and brackish lagoons with underwater vegetation.

Extralimital. Breeds in the Mediterranean, Black and Caspian Sea areas, and Turkestan. Winters south to Egypt, Palestine and Iraq.

GENERAL HABITS. In many ways reminiscent of the grebes. Keeps in parties of a half dozen or so, and flocks of 20 to 30. Very local, usually affecting particular portions of a lake either by itself or in association with grebes; rarely with other ducks. Normally rides very low on the water, like

Oxyura leucocephala

FALCONIFORMES

a cormorant, showing only head, a small portion of rump, and the stiff, pointed tail cocked vertically when at rest; lowered into water when swimming. Flight laboured and grebe-like, preceded by much skittering on the surface to take off. But is an expert swimmer and diver, seeking safety in the water in preference to flying away even when closely approached. Partially submerges itself to escape observation, swimming away from the intruder with only the head and part of rounded back showing, and body and tail out of sight, thus looking like a dabchick in the distance. Dives by quietly lowering itself and vanishing below, or by rolling over smoothly like a porpoise, head in first, the whole back, tail, and legs turned over in succession. The tail is bent downwards, with the legs showing below, these parts being the last to go under.

FOOD. Mainly vegetable matter: corms, seeds, and leaves of aquatic plants; also insect larvae, molluscs, and crustaceans. The stomach of an Indian-killed example contained vegetable matter exclusively (W. A. Whitehead, JBNHS 35: 212).

VOICE AND CALLS. None recorded in winter.

BREEDING. Extralimital. Nest, a floating pad of reeds and rushes overlaid with down; anchored and concealed among reeds and sedges. Eggs, 6 to 13, white, about 66 × 50 mm.; incubation period unrecorded (Delacour).

MUSEUM DIAGNOSIS

Chick (in down). See Delacour 1959, 3: 242 (description), 256 (plate).

(from feathers) (Delacour) (C. D. W. Savage)

Weight 1 ♂ 690 gm. (BNHS).

COLOURS OF BARE PARTS. Iris dark brown. Bill ♂ generally slaty blue turning to pale sky- or ultramarine blue just before emigration in February-March (C. D. W. Savage); ♀ and imm. duller. Legs and feet plumbeous-black, the webs and toes black.

Order FALCONIFORMES

Family ACCIPITRIDAE. Hawks, Vultures, etc.

Bill short with upper mandible longer than lower, curved and strongly hooked at tip; basal portion covered with a cere, usually bright coloured, in which the nostrils are situated. Feet strong, furnished with powerful hooked claws. Hallux always present. Sexes more or less alike; female usually larger.

For further details of structure and morphology see Stresemann 1927-34, Aves: 811-16; Baker 1928, FBI 5: 1-2; Witherby 1939, 3: 1. Cf. also Brown, L. & Amadon D., 1968, *Eagles, Hawks and Falcons of the World*.

Genus ELANUS Savigny

Elanus Savigny, 1809, Descr. Egypte 1: 69, 97. Type, by monotypy, *Elanus caesus* Savigny = *Falco caeruleus* Desfontaines

Bill small, wide at base, compressed near tip; culmen sharply curved from cere; festoon distinct. Nostrils oval, nearly horizontal, protected by long loreal bristles. Wings long and pointed, reaching beyond tip of tail; second primary (as.) longest. Tail moderately long, slightly forked. Tarsi short and stout, feathered in front for more than half their length; naked parts reticulated throughout. Toes strong, reticulated above except near claws; lateral toes subequal in length. Middle claw keeled, the others rounded beneath.

The genus contains small hawks allied to Kites (*Milvus*), occurring in America, Africa, and Asia to Australia. Only one species (*E. caeruleus*) represented in India.

124. Blackwinged Kite. *Elanus caeruleus vociferus* (Latham)

Falco vociferus Latham, 1790, Index Orn., 1: 46
(India = Coromandel Coast, ex Sonnerat, apud Hartert)

Baker, FBI No. 1789, Vol. 5: 125

Plate 22, fig. 1, Plate 23, fig. 3 and Plate 28, fig. 2

LOCAL NAMES. Kāpāsi (Hindi; Bengali); Māsumā (Oudh); Chūmā (Nepal); Adari ramadasu (Telugu); Argellur (Yerkali); Velli-eriyān (Malayalam); Kurulla geyya, Ukusa (Sinhala).

SIZE. House Crow —; length c. 33 cm. (13 in.).

FIELD CHARACTERS. A small dainty grey and white hawk. Crown, nape, back, rump, and upper tail-coverts pale ashy grey; rest of head and neck, underparts, and tail pure white. A black line from lores to behind the blood-red eyes, and black patches on wing shoulders conspicuous at rest and also in flight. Tips of closed wings (black) extend beyond short square (slightly forked) tail. Sexes alike.

In flight, colour pattern resembles Pale Harrier (q.v.) which also has black wing tips (primaries). But larger size of Harrier slimmer streamlined

× c. 1

HAWKS, VULTURES, ETC. 213

body, longer pointed wings, buoyant sailing flight, and absence of black shoulder-patches readily distinguish it.

Young (immature). Brownish ashy above scalloped paler. Wing coverts (black and grey) also edged with whitish. Remiges and rectrices tipped white. Breast tinged with buff or finely streaked with fulvous.

STATUS, DISTRIBUTION and HABITAT. Resident. Widely but patchily distributed from W. Pakistan [Baluchistan (straggler), Sind, Bahawalpur, W. Punjab] east to Assam plains and Manipur, and from the Himalayan foothills (from c. 1600 m.) and terai south to Kanyakumari; up to c. 1200 m. in the peninsular hills. Nepal, chiefly terai and lowlands, but recorded at c. 1370 m. (Biswas). Ceylon (all zones to c. 2100 mm.); Laccadive Islands; Bangladesh (Pabna, Dacca)-Husain & Sarker, 1972, *Bull. B.O.C.* 92(2): 40.

Affects deciduous biotope: sparse savannah forest, secondary scrub country and grassland interspersed with cultivation; riverain tamarisk and kandi (*Prosopis*) jungle in W. Pakistan and semi-desert areas.

Extralimital, east to S. Yunnan, south to N. Tenasserim and the Indo-chinese countries. The darker nominate race inhabits practically all Africa and Madagascar; occasionally found in S. Europe.

LOCAL MOVEMENTS. Seasonal local fluctuations, and appearances and disappearances often recorded, e.g. in Coorg ('regular winter-migrant'—F. N. Betts), but no precise data.

GENERAL HABITS. Keeps singly or in widely scattered pairs. Somewhat crepuscular; more so in some localities and at certain times than others, presumably dependent on habits of the prevailing food supply. Adopts a favourite patch of open grass-and-scrub jungle, occupying the same pole or tree-top within it day after day. From this perch surveys the surroundings—cocking up the tail from time to time, opening and closing it, raising and lowering it gently or jerking it up and down between the drooping wings—and pounces on any prey that stirs on the ground. More usually quarters the territory, flying and sailing in wide circles 30 metres or so above, turning every now and then to face the wind and hover like a kestrel ('over a minute'—SA) to scan the ground. On suspicion of movement, parachutes obliquely down a few metres to investigate more closely—wings open and upraised back to back, with only the tips quivering. The parachute descent, controlled by slight up and down manipulations of the tail, is often interrupted with bouts of stationary hovering to make sure, the legs being gradually let down in readiness at the same time. Finally when within striking range, the wings are pulled in and the bird drops or stoops on the quarry with a rush, bearing it away in its claws.

Flight sluggish, with deliberate wing-beats, strongly reminiscent of a gull or roller (in head-on silhouette also of a flying fox), alternated with spurts of sailing. When in pursuit, bird capable of swift falcon-like dash. Once carried off a wounded quail 'with quite the rapidity and dash of a peregrine' (Butler, SF 3: 448).

Roosts communally at night in leafy trees, 15–20 birds or more converging on the selected one at dusk from over a wide area.

FOOD. Locusts, grasshoppers, crickets, and other insects. Lizards, field rats and mice, young and sickly birds, etc. Snake and frog also taken among stomach contents.

HAWKS, VULTURES, ETC. 215

125. Blyth's Baza or Northern Brown Lizard Hawk. *Aviceda jerdoni jerdoni* (Blyth)

Pernis Jerdoni Blyth, 1842, *Jour. Asiat. Soc. Bengal*, 11:464 (no type locality = Malacca)
Baker, FBI No. 1824, Vol. 5:174

Plate 21, fig. 8, Plate 22, fig. 3 and Plate 23, fig. 2

LOCAL NAMES. None recorded.

SIZE. Jungle Crow; length c. 48 cm. (19 in.).

FIELD CHARACTERS. A moderate sized brown hawk with rufous and black head and a prominent upstanding black occipital crest, narrowly white-tipped. Chin and throat rufous and white, with a bold black mesial stripe. Breast rufous-brown; rest of underparts conspicuously barred with rufous-brown and white. Tail brown with three dark bands, the terminal one broadest and darkest.

On a casual view could be confused with the Crested Goshawk (*Accipiter trivirgatus*) of somewhat similar coloration, also crested, q.v.

Female (adult). Much paler throughout, with breast fulvous-white instead of rufous.

Young (immature). Like adult female, but paler; with four, or sometimes five, distinct dark bands in tail, the basal one partly concealed; bases of rectrices much mottled with white. Still younger birds have feathers of upper plumage fringed with white, and underparts even paler and more feebly barred and streaked than in female.

STATUS, DISTRIBUTION and HABITAT. Resident. Rare. Darjeeling district (W. Bengal), Sikkim to eastern Assam, between c. 350 and 1800 m. altitude, with some seasonal up and down movement. Confined to evergreen foothills biotope.

Extralimital. Burma, Thailand, Malay Peninsula, Sumatra.

Aviceda jerdoni

214 FALCONIFORMES

VOICE and CALLS. Normally silent. A thin high-pitched squeal occasional. A soft whistle as of man (A. E. Jones).

BREEDING. Season, very extended, varying locally to cover practically entire year, with a marked recession in April and May. Nest, loose, untidy, crow-like; of twigs, lined with roots and grass; sometimes unlined. Placed in a small tree, seldom above c. 9 metres from ground. Eggs, 3 to 5 or 6—most commonly 3 or 4—richly coloured, handsome, highly variable. Ground colour white to pale cream, buff, or yellowish stone, boldly blotched, smeared and spotted with deep red or reddish brown, occasionally with a few scattered specks of blackish blood-red. Last laid egg of a clutch often very poorly marked. Average size of 100 eggs 39.3 × 30.9 mm. (Baker). Both sexes share all domestic chores; major part in nest-building and incubation by female, in foraging for young by male.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	260–276	20–23	30–37	116–124 mm.
♀♀	262–283	23–24	c. 36	119–130 mm. (SA)

Weight 1 ♂ 164 gm. (BNHS).

COLOURS OF BARE PARTS. Iris, adult crimson; imm. yellow or yellow-brown. Bill black; cere and gape pale yellow. Legs and feet deep yellow; claws black.

Genus AVICEDA Swainson

Aviceda Swainson, 1836, *Classif. Bds.*, 1: 300. Type, by subsequent designation, *Aviceda cuculoides* Swainson, 1837, op. cit. 2: 214

Baza Hodgson, 1837, *Jour. Asiat. Soc. Bengal*, 5: 777. Type, by original designation, *Baza tyama* Hodgson

Small to medium sized hawks. Head with thin upstanding crest. Bill strong and well curved. Cutting edge of upper mandible furnished with two sharp conical 'teeth' on each side near tip; lower mandible with three or four pointed serrations on each side near tip. Cere small; nostril very narrow, slanting, placed at anterior edge of cere, partly covered by a membrane. Lores partly feathered as in Honey Buzzard (*Pernis*). Tarsus short, stout, scutellated in front and above the toes, reticulated elsewhere; feathered in front on upper third or more. Claws small, well curved, almost subequal in length. Wings moderately pointed. Tail longish, square-ended or very slightly graduated.

Key to the Subspecies

Larger, wing over 320 mm.....	<i>A. j. jerdoni</i>
Smaller, wing under 315 mm.....	<i>A. j. ceylonensis</i>

216 FALCONIFORMES

GENERAL HABITS. Largely crepuscular. Even lesser known than of the southern race (No. 126). Usually keeps in pairs, but family parties of 3 to 5 occasionally seen flying and sailing in circles at treetop height at the edge of a forest clearing. Flight rather sluggish.

FOOD. Lizards, grasshoppers, and other large insects. The stomach contents of a specimen (Kurseong) included two Agamid lizards (*Japaltura variegata*), several longicorn beetles and mantises (Coleoptera, Orthoptera)—D'Abreu, JBNHS 20:518.

VOICE and CALLS. Not recorded.

BREEDING. Only two authentic records, both from Darjeeling district, W. Bengal, at c. 610 and 1825 m. elevation; April and June. The nests—small and compact, of sticks, lined with green leaves—were placed among stout branches of large forest trees at heights of c. 10 and 20 metres respectively. Eggs, 2 in each, closely resembling Shikra's (*Accipiter badius*), greyish white, stained from contact with leafy nest-lining. (Sometimes with sparse reddish blotches and specks.) Fine-textured, smooth, broad ovals. Average size of the 4 eggs 44.7 × 36.5 mm. (Baker).

Share of the sexes in the nesting chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. Wing structure of *A. jerdoni* differs from *A. truphotus* in having the 4th primary (as.) longest instead of 3rd; or sometimes 4th and 5th subequal.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	327 (Sumatra)— 360 (Sikkim)	29–30	35–40	210–244 mm.

COLOURS OF BARE PARTS. Iris golden yellow. Bill plumbeous black, base bluish slate; tip and culmen quite black; cere pale bluish plumbeous to almost black. Legs and feet chrome yellow or 'white slightly tinged with blue' (Hume), or 'tarsus china white' (Stevens); claws horny black (Baker).

126. Legge's Baza or Southern Brown Lizard Hawk. *Aviceda jerdoni ceylonensis* (Legge)

Baza ceylonensis Legge, 1876, *Stray Feathers*, 4:247 (near Kandy, Ceylon)
Baker, FBI No. 1825, Vol. 5:175

LOCAL NAMES. *Kurulla goya* (Sinhala); *Parundu* (Tamil); *Propperundu* (Malayalam).

SIZE. Jungle Crow; length c. 48 cm. (19 in.).

FIELD CHARACTERS. Similar to the last (No. 125) sex for sex and age for age, only slightly smaller (see Measurements). General shape in flight, and wing action, reminiscent of a small buzzard. Crest depressed in flight; characteristically erect from occiput when bird at rest.

STATUS, DISTRIBUTION and HABITAT. One of the peculiar discontinuously distributed Indo-Malayan forms separated from its nearest east-Himalayan relative by at least 1900 km. of ecologically unsuited country. Resident, but scattered and rare in south-west India south of c. 12°N. lat.—W.

HAWKS, VULTURES, ETC.

217

Mysore and Kerala (including Coorg and Wynaad), and Ceylon (hill zone in Central and Uva provinces). Affects evergreen forest biotope in the foothills between c. 150 and 900 metres altitude.

GENERAL HABITS. Like No. 125, shy and rather crepuscular. Sluggish on the wing, flying with strong flaps alternated with short intervals of gliding. Keeps in pairs or family parties of 3 to 5 — the young birds distinguishable by their much paler coloration — to hilly forested country where sometimes met with on the edge of sholas and clearings. Still-hunts lizards and large insects, pouncing on them from its look-out perch in a leafy tree. Prey carried in beak not in talons. Rarely seen except when flying in circles at treetop height or soaring aloft. On approach of breeding season much given to extravagant aerobatics accompanied by excited mewling screams, *kip-kip-kip* or *kikiya*, *kikiya*, etc., at times confusingly like the calls of the Palm Squirrel (*Funambulus*).

DISPLAY. The pair soar round each other in circles high up in the air. The male (?) suddenly nose-dives steeply with half-closed wings for 10 to 15 metres, uttering a loud, sharp *kip-kip-kip*; then, using the momentum, he doubles upon himself and zooms almost vertically upwards. When on the crest of the curve, standing on his tail as it were, and seemingly about to stall and topple over backwards, he presently rights himself and continues to soar around. These spectacular antics are repeated at short intervals (F. N. Betts, JBNHS 36: 258; 50: 251).

FOOD. Lizards, frogs, large insects, and other small animals. *Calotes calotes* and field rat (*Golunda ellioti*) recorded in Ceylon (Phillips).

VOICE AND CALLS. Besides the courtship cries, a loud plaintive mewling *pee-ow* uttered by both sexes while circling in the air (W. W. A. Phillips). Also a conversational 'long drawn mournful *gweer* with something of the intonation of a serpent eagle's cry' (Mrs Lushington).

BREEDING. Copulation accompanied by loud cries observed in tree on 26 September. *Season*, in SW. India normally February through April; in Ceylon during the NE. monsoon, from c. November to May. *Nest*, a well-made smallish structure (shallow cup) of leafy twigs, occasionally lined with grass and roots but always with fresh green leaves. Built 7 to 20 metres up in a leafy tree in humid forest; sometimes in trees standing in tea plantations. *Eggs*, 2 or 3, greyish white getting stained during incubation; indistinguishable from those of the northern race. Average size of 32 eggs 44.9 × 33.6 mm. (Baker). Both birds participate in building the nest. Share in incubation, and incubation period, unrecorded.

MUSEUM DIAGNOSIS

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail

HAWKS, VULTURES, ETC.

219

Aviceda leuphotes

■ Residential range ▨ Winter extension: 1, 2 (1)

1 *A. l. leuphotes*; 2 *A. l. syama*

GENERAL HABITS. Met with singly or in small (family ?) parties; large gatherings of up to 20 birds or so have been recorded. Somewhat crepuscular; more active in cloudy overcast weather and at dusk than during the glare of mid-day. Perches upright high up in the canopy of a lofty forest tree, unnoticed till it makes its aerial sorties after flying insects, returning to a nearby perch after each capture. Insects always seized in the feet (cf. No. 126); sometimes in the air, sometimes picked off a leaf, the bird fluttering or hovering momentarily to do so. When disturbed the birds promptly commence to soar in circles above the tree-tops, sometimes ascending to considerable heights. Normal flapping flight reminiscent of a crow's, and interrupted by short spurts of sailing.

VOICE AND CALLS. A soft, quavering plaintive squeal or whistle, recalling the Pariah Kite's; also described as a shrill gull-like mewling.

FOOD. Chiefly lizards, frogs, large grasshoppers, mantises, and other insects. Bats and small birds only occasionally. We have observed an individual at dusk and dawn day after day flying into and criss-crossing through swarms of yellow wagtails arriving at and leaving their roosts in sugarcane fields in Kerala, making timid unsuccessful dashes at birds within easy reach, but only rarely securing one.

BREEDING. *Season*, in NE. India April to June; in Kerala between February and July, mainly March/April. *Nest*, a well-made platform of thin sticks with the central depression c. 20 cm. across and 5 to 10 cm. deep. Generally well lined with grass and fibre, overlaid with a bed of green leaves which are renewed from time to time. *Eggs*, 2 or 3, like those of *Acriditer badius*, broad, fine-textured and smooth ovals, greyish white,

218

FALCONIFORMES

127. Indian Blackcrested Baza or Lizard Hawk. *Aviceda leuphotes leuphotes* (Dumont)

Aviceda leuphotes Dumont, 1820, Dict. Sci. Nat., 16: 217 (Pondicherry)
Baker, FBI No. 1822, Vol. 5: 171

Plate 22, fig. 2, Plate 23, fig. 1 and Plate 28, fig. 1

LOCAL NAMES. *Prepperandu* (Malayalam).

SIZE. Pigeon ±; length c. 33 cm. (13 in.).

FIELD CHARACTERS. A handsome, prominently crested black and white hawk with barred underparts and black belly.

Adult. *Above*, black, including head with long upstanding occipital crest, neck, back, rump, tail-coverts and tail. Conspicuous white and chestnut blotches on scapulars and flight feathers. *Below*, foreneck and upper breast black; a broad white gorget below it, succeeded by a black-and-chestnut band. Lower breast and flanks buffy white boldly barred with chestnut. Centre of abdomen, vent, and under tail-coverts black. Sexes alike.

× c. 2

In overhead flight paler underside of tail with contrasting black abdomen and vent, dark-barred underparts and white breast band are leading pointers.

Young (immature). Unrecorded.

STATUS, DISTRIBUTION and HABITAT. Resident. Uncommon. Kerala (including Wynaad, Nilgiri Hills); possibly also Coorg and western Mysore (Malnad) though as yet unrecorded thence. Eastern Nepal, Sikkim, northern West Bengal, East Pakistan, to eastern Assam north of Brahmaputra river; terai and up to c. 1200 m. elevation (but see under 128 — *A. l. syama*). A specimen (ssp?) collected in Bastar dist., eastern Madhya Pradesh, in April (JBNHS 62: 556). Rare NE. monsoon (winter) visitor to Ceylon in the low country (all zones), apparently the E. Himalayan form. Status of the two races insufficiently understood owing to paucity of relevant skins for study (see H. G. Deignan 1948, *Auk*, 65: 85). Frequents evergreen forest in the neighbourhood of clearings and wide streams, chiefly in foothills country.

Has the same curious widely discontinuous Indo-Malayan distribution as *Aviceda jerdoni*. More material from Kerala may show that as in that species the resident southern population is discrete.

220

FALCONIFORMES

rarely with specks and blotches of reddish at the broad end. Average size of 24 eggs 37.4 × 31.1 mm. (Baker).

Both sexes participate in nest-building and incubation. Incubation period and share in feeding young unrecorded.

MUSEUM DIAGNOSIS. Distinguished from the Burmese race (*A. l. syama*) by the band across breast being largely intermixed with rufous and chestnut v. almost wholly black.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	227-243	20-22	26-27	130-145 mm.

COLOURS OF BARE PARTS. Iris purple-brown or crimson-brown. Bill deep slaty- or horny-plumbeous; upper mandible tipped black, lower whitish, cere plumbeous-blue. Legs and feet dull plumbeous to plumbeous-blue; claws horny brown (Baker).

MISCELLANEOUS. When freshly killed, the bird 'has a most peculiar and disagreeable odour; what might be termed a regular frog-like or bug-like smell; nor does this wear off till the skin has been exposed to air for some considerable time' (W. Davison, SF 6: 24-5).

128. Burmese Blackcrested Baza or Lizard Hawk. *Aviceda leuphotes syama* (Hodgson)

Baza Syama Hodgson, 1836, Jour. Asiat. Soc. Bengal 5: 777
(Lower region of Nepal)

Baza lephotes burmana W. L. Sclater, 1920, Bull. Brit. Orn. Cl. 41: 31
(Malewoon, Patchan Estuary, Tenasserim)
Baker FBI No. 1823, Vol. 5: 173

LOCAL NAMES. *Deakura*, *Daoling* (Cachar).

SIZE. Same as No. 127, Pigeon ±; length c. 33 cm. (13 in.).

FIELD CHARACTERS. A handsome, prominently crested black and white hawk with barred underparts and black belly. Differs from 127 in having the upper plumage blacker with less chestnut markings, and the breast band below the white gorget almost wholly black (without chestnut admixture).

Young (immature). Like adult but with more chestnut and white in upper plumage.

STATUS, DISTRIBUTION and HABITAT. Uncertain and rather confused. According to H. G. Deignan (*Auk*, 1948, 65: 85), the latest reviewer of this species, *syama* is the breeding form of N. Burma, Assam, and the lower slopes of the E. Himalayas west to Nepal. He considers the breeding bird of Kerala, S. Burma, and N. & E. Thailand to be the nominate *leuphotes*. As Deignan points out, however, it is by no means certain that the Kerala-breeding race is in fact inseparable from that of N. Thailand, as at present assumed. More material from Kerala is needed to settle the point. He suggests that the birds found in Ceylon in winter may be migrants of the east Himalayan population (*syama*).

Like 127, inhabits evergreen forest biotope; broken plains and foothills country up to c. 1000 m. elevation.

GENERAL HABITS, FOOD, VOICE, etc. No differences from 127 recorded.

HAWKS, VULTURES, ETC.

221

MUSEUM DIAGNOSIS. Distinguished from nominate *leuphotes* by the band across the breast being nearly all black v. largely intermixed with rufous and chestnut.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail (Baker)
♂ ♀	221-246	20-23	25-30	130-149 mm.

COLOURS OF BARE PARTS. As in the nominate race.

128a. **Andaman Blackcrested Baza.** *Aviceda leuphotes andamanica* Abdulali & Grubb. See Appendix.

Genus *PERNIS* Cuvier

Pernis Cuvier, 1817(1816), Règne Animal., 1: 322. Type, by monotypy, *Falco apivorus* Linnaeus

Cf. Stresemann, E., 1940, Archiv. f. Naturg.: 137-93

Distinguished from all other accipitrine genera by having the lores, sides of head, forehead, and chin, covered with small scale-like feathers, with no bristles or prolonged shafts. Bill weak, rather long, not much hooked; festoon small or absent. Cere nearly as long as rest of bill. Nostrils long, narrow, oblique; upper margin membranous. Wings long; 3rd and 4th primaries (as.) subequal and longest, 5th a little shorter. Tail moderately long; slightly rounded. Tarsus stout, short, and feathered on the upper half in front, the naked parts covered with hexagonal scales; toes long, covered above with bony transverse shields, all divided except the last two or three; claws long and slightly curved, the middle one dilated on the inner side.

The genus is found in Europe and Africa to Central Asia, extending to the Malay Archipelago and China.

PERNIS PTILORHYNCHUS (Temminck)

Key to the Subspecies

- Black subterminal and median bands on tail nearly as wide as paler bands..... *P. p. ruficollis*
Black subterminal and median bands on tail much narrower than paler bands..... *P. p. orientalis*

129. **Siberian Honey Buzzard.** *Pernis ptilorhynchus orientalis* Taczanowski

Pernis apivorus orientalis Taczanowski, 1891, Fauna, Orn. Sib.-Orient. pt. 1: 50 (in Mém. Acad. Imp. Sci. St. Pétersb. (7), 39) (Eastern Siberia)
Baker, FBI No. 1820, Vol. 5: 168

LOCAL NAMES. As in 130.

SIZE. Pariah Kite \pm ; length c. 68 cm. (27 in.).

FIELD CHARACTERS. Doubtfully distinguishable in the field from Crested Honey Buzzard (No. 130) by its different tail pattern in which the black

HAWKS, VULTURES, ETC.

223

Slenderer head and longer neck readily distinguish it from Short-toed Eagle which it resembles in overhead flight.

STATUS, DISTRIBUTION AND HABITAT. Resident, with considerable local movements depending on food supply. West Pakistan, and all India from c. 1800 metres in the Himalayas south to Kanyakumari and Ceylon (partly winter visitor), east to Assam and E. Pakistan. Inhabits deciduous and semi-evergreen well-wooded country, hill and plain, affecting forest glades, groves of trees about towns, villages and cultivation, even in semi-desert areas, e.g. Bahawalpur, Rajasthan, N. Gujarat.

Extralimital. East to Tonkin and Laos. Probably also SW. Yunnan (Peters). 'Somewhat migratory' (Vaurie & Amadon, Am. Mus. Novit., No. 2111 — Oct. 29, 1962).

GENERAL HABITS. Usually seen singly or in pairs soaring aloft and circling on motionless wings, or perched on a tree-top; in urban and suburban localities invariably mobbed and chivvied by House and Jungle Crows, often abetted by parakeets and other birds. Normal flight with steady wing-beats punctuated with occasional spurts of sailing. Numbers gather to roost at night in groves of large leafy trees, e.g. *Dalbergia*.

FOOD. Chiefly honey and larvae of bees — even of the ferocious Rock Bee (*Apis dorsata*) — either from combs within natural tree hollows or those festooning the branches. Bits of the comb are broken off regardless of the onslaughts of the infuriated insects (exact method in case of exposed combs not recorded). If the chunk is too large and drops down, the bird descends to deal with it on the ground, digging into the cells with its bill; if of manageable size it is carried off to a perch on a bough, held under foot and torn with the bill, the honey and larvae being gulped down. The dense covering of scale-like feathers on the face afford adequate protection against the stings, but how the eye escapes is not clear. Stomach and crop contents of specimens also show considerable quantities of wax. Whether, as in Honeyguides, this is deliberately swallowed, and digested, is not known. Large insects, reptiles, mice and young birds are also taken. One reported devouring an oriole (Donald) and another attacking a blackbird enmeshed in mist net (J. Panday). Alleged to rob village chickens at times.

VOICE AND CALLS. A single high-pitched screaming whistle *wheteeew* uttered from a perch with crest slightly raised; also on the wing. Sometimes calls during the night (?).

BREEDING. Season, April, May, and early June over most of northern and peninsular India; in south India apparently more birds lay in February than later. No nest actually discovered in Ceylon though copulation once

222

FALCONIFORMES

subterminal and median bands are narrower than the paler (mottled grey) bands that separate them. This character is more noticeable in overhead soaring flight, but is variable and not always a reliable guide. Sexes alike; female larger

STATUS, DISTRIBUTION AND HABITAT. Uncommon winter visitor to N. India. Possibly more frequent than supposed also elsewhere in the subcontinent but not differentiated from 130, q.v.; one specimen from as far south as Ceylon (Mannar — Phillips).

Honey Buzzard, overhead view
(Diagrammatic sketches by L. Tinbergen)

Extralimital. Breeds in S. Siberia from SW. Altai to the Amur region and the mountains of Hondo (Japan); probably also in Manchuria and N. China. In winter south to Burma, and S. China (Peters).

'Japan and northeastern Asia where it is highly migratory' (Vaurie & Amadon, Am. Mus. Novit., No. 2111, Oct. 29, 1962).

GENERAL HABITS, etc. Nothing specifically recorded. See 130.

130. **Crested Honey Buzzard.** *Pernis ptilorhynchus ruficollis* Lesson

Pernis ruficollis Lesson, 1830, Traité d'Orn., livr. 1: 77

('Patrie inconnue' = Bengal)

Baker, FBI No. 1819, Vol. 5: 167

Plate 24, fig. 1 and Plate 25, fig. 1

LOCAL NAMES. *Shahutela*, *Makkare* (Hindi); *Madhava* (Nepal); *Tenu geddu* (Telugu); *Ten parandu* (Tamil); *Jen alawa* (Kannada); *Jutalu* (Yerkali); *Malnecari* (Mhar); *Katta parantha*, *Ten kolichi* (Malayalam); *Rajaliya* (Sinhala).

SIZE. Same as 129; Pariah Kite \pm ; length c. 68 cm. (27 in.).

FIELD CHARACTERS. Extremely variable in coloration. One of the commonest phases greyish brown above with darker grey head; pale brown below narrowly cross-banded with white. A short blackish nuchal crest seen in profile when slightly raised. Underside of wings silvery grey with close dark barring; rounded greyish tail with broad blackish subterminal and median cross-bands separated by about equally broad pale ones; but tail pattern also variable. Sexes alike.

224

FALCONIFORMES

observed in January, and young ex nest being fed in May (Phillips 1953). Nest, a compact platform of sticks c. 40-45 cm. in diameter and 20 cm. deep, the inner cup lined with a thick layer of dry leaves; rarely green ones. Placed in large mango, banyan, and suchlike leafy trees, or in a casuarina, or even date or coconut palms, from 6 to 20 metres up. Eggs, normally 2, smooth-surfaced broad ovals, almost equal at both ends. Handsome but extremely variable in ground colour and markings: pale cream, pale reddish- or yellowish buff, speckled, mottled, or blotched in varying degree with reddish brown or chestnut-brown. Some eggs closely resemble those of Kestrel or Sparrow-Hawk; some are mistakable for those of the Kite, but Baker points out that the inner membrane is *always* yellow, never green as in the latter. Average size of 80 eggs 52.8 x 42.8 mm. (Baker). Both sexes share in nest-building, incubation, and feeding the young. Incubation period about 32 days. Chick when c. 15 days old, covered with white powder-puff down all over except head and neck, where it is buffy-cream colour.

MUSEUM DIAGNOSIS. According to Stresemann¹ the race *ruficollis* has 'tail-wing' index (length of tail multiplied by 100 and divided by length of wing) usually under 65. 'Wing-tip' (distance from tip of longest secondary to tip of longest primary) usually under 110 mm.; wing length 392-460 mm.

MEASUREMENTS (of Indian birds)

	Wing	Bill (from skull)	Tarsus	Tail
♂ ♂	382-417	36-42	48-57	245-262 mm.
♀ ♀	398-445	38-42	50-60	250-276 mm. (SA)

COLOURS OF BARE PARTS. Iris golden yellow to orange-red, sometimes with a very fine golden ring round pupil; browner in young birds. Bill slaty black; lower mandible paler (whitish) with black tip; cere blackish plumbeous. Legs and feet yellow; claws black. In 15-day old downy chick: Iris brown. Bill black; cere greyish. Legs and feet pinkish flesh-colour.

MISCELLANEOUS. Nematode worms (*Pelecius* sp.) recorded from under skin of toes, especially at base of claws (Sálim Ali 1943, JBNHS 44: 23).

Genus *MILVUS* Lacépède

Milvus Lacépède, 1799, Tabl. Ois.: 4. Type, by tautonymy, *Falco milvus* Linnaeus

Hawks distinguished by their long, forked tails. Bill comparatively weak; culmen slightly curved at base, sharply rounded but distinct; cere well developed, with oval, oblique nostril at its anterior edge. Wing long and pointed, reaching almost to tip of tail; 3rd and 4th primaries (as.) longest. Tarsus short, feathered for about half its length, the naked lower portion with broad shields in front, reticulated

¹ Stresemann, E. (1940): Review of the genus *Pernis*. *Archiv für Naturgeschichte*, pp. 157-91.

HAWKS, VULTURES, ETC.

225

behind and at sides. Toes short, scutellate above; lateral toes uneven; claws moderately curved; middle claw dilated on the inside.

Represented throughout the Old World; within our limits by two species, one of which is of uncertain status.

Key to the Species

Depth of fork in tail (i.e. distance outer tail-feather projects beyond central tail-feather) greater than length of tarsus.....*M. milvus*

LOCAL NAMES. *Chel* (Hindi and Bengali); *Kurit* (Santhali); *Il* (Chamba); *Malla gaddi* (Telugu); *Paria paranda*, *Kalu paranda* (Tamil); *Genda* (Mhari); *Rajaliya* (Sinhala); *Chilana*, *Mugacharani* (Assam); *Chakki paranda* (Malayalam); *Chir* (Marathi); *Sirin* (Sind).

SIZE. Length c. 61 cm. (24 in.).

FIELD CHARACTERS. A large dark fulvous-brown hawk distinguishable from all similar birds of prey by its deeply forked tail, particularly conspicuous in flight. Sexes alike.

Young (immature). Overall pale brown, speckled and streaked with fulvous. Head brown, streaked with pale fulvous; a white patch under eye.

Upper plumage brown, darker than adult, the feathers tipped or edged paler. Underparts brown with broad whitish or fulvous streaks. In older young these streaks narrower with black shafts. Tail more strongly barred or rayed.

STATUS, DISTRIBUTION and HABITAT.

Resident. Common throughout both Pakistans, all India (plains and to c. 2200 metres altitude in the Hima-

layan and peninsular hills), Nepal, Ceylon (low country Dry Zone), Andaman Is. Affects urban localities and human habitations on the countryside, including outlying nomadic herdsman's encampments.

Extralimital. Burma; Malaysia (occasional).

LOCAL MIGRATION from heavy-rainfall localities to drier areas observed before commencement of monsoon, but precise data lacking.

GENERAL HABITS. Gregarious about towns and villages. A confirmed commensal of man, and useful and efficient scavenger, haunting the precincts of slaughter-houses, fish markets, refuse dumps, harbours, and bazaars. Is an expert stunt flier possessing astonishing dash and manoeuvrability on the wing. Will swoop and carry off a dead rat or other titbit lying in

SIZE. Pariah Kite; length c. 61 cm. (24 in.).

FIELD CHARACTERS. Differs from the Pariah Kite (No. 133) in having the head and neck in adults whitish (v. fulvous-brown) with black shaft streaks. Upperparts paler brown; underparts more rufous. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident (breeding) in W. Pakistan (Quetta, NE. Baluchistan); in winter probably spreading to Sind, Kutch (?).

Extralimital. Breeds from Spain, S. France, Germany, and Finland south to NW. Africa, SE. Europe, Asia Minor, Kirghiz steppes, and NE. Baluchistan. Winters in N. Africa (Peters).

228

FALCONIFORMES

the middle of a congested thoroughfare, turning and twisting with masterly adroitness to avoid the tangle of overhead electric wires and the bustling traffic below. Or one will bide his time and suddenly swoop down from nowhere before the picnicer's sandwich has reached his mouth, whisk it neatly out of his hand and decamp as suddenly as it came! Prefers garbage and offal to sharing large animal carcasses with vultures. Less given to soaring on thermals and circling aloft than vultures, but large rabbles or 'armadas' commonly seen high up, drifting with the wind on motionless wings at sunset. From time to time one individual will suddenly tumble sideways and dive at another, the attacked one turning over on his back, legs and claws outstretched to parry the onslaught, then as soon right himself to resume the sailing, both birds obviously enjoying the game. Has communal roosts in selected trees or groves at which large numbers — sometimes several scores — will flock at dusk and indulge in much wrangling, wing-flapping, and wheeling in the air before settling down for the night.

FOOD. Largely omnivorous. Chiefly offal and garbage in urbanized areas. When feeding nest-young, individuals sometimes become a serious menace to young chickens and ducklings in poultry runs. At this time also given to carrying off golf balls from links. Saunters about to pick up earthworms on watered lawns. Winged termites awkwardly hawked in the air, the insects seized in the talons and head bent down to transfer them to bill. Observed capturing *Rousettus leschenaulti* bats swarming out of a cave on disturbance during daytime; held in talons and torn up with bill in sailing flight. Among stomach contents the following insects have been identified: *Gryllotalpa africana*, *Chrotogonus* sp., *Brachytrypus achatinus*, in addition to remains of mice, lizards, frogs, chickens, and kitchen refuse (Mason & Lefroy 1912).

VOICE and CALLS. Normal call, more heard at commencement of breeding season, a shrill, almost musical whistle *ave-wir-r-r-r* uttered singly or in quick succession 4 to 7 times from perch as well as on wing. In defence of nest an agitated 'war cry' version of same, *ave-wi-wir*, while frantically diving at intruder. During copulation a series of six to ten excited squeals (uttered by female?) rising in crescendo and ending abruptly on completion of act.

BREEDING. Season prolonged, varying with latitude and locality; in the Himalayas March to May; in the Peninsula mainly between September and April; in Ceylon December to May. Nest, an untidy platform of sticks, iron wire, rags, tow, and rubbish of every description. Placed 7 to 14 metres up in a forking trunk, or crotch of branches of large trees — neem (*Melia*), banyan or peepul (*Ficus*), tamarind (*Tamarindus*), shisham (*Delbergia*), mango (*Mangifera*) or other, commonly near human habitations. Often in the head of a palm (*Cocos* or *Borassus*). Eggs, 2 or 3, rarely 4, broad ovals almost equal at both ends. Very variable in coloration and markings; usually greyish-, greenish-, or pinkish white, with blotches, smears, or freckles of blackish brown, reddish brown, purplish, or blood red. Average size of 200 eggs 52.7 x 42.7 mm. (Baker). Both sexes participate in nest-building, incubation and nest-feeding. Incubation period unrecorded. To copulate, the male alights directly from the air on the female's back in response to her peculiar squealing invitation, flapping his wings to steady

HAWKS, VULTURES, ETC.

229

himself. The length of the pre-incubation copulatory period (in one case 13 September to 21 January and then decreasingly on till 24 February), and the daily frequency of copulation (five to seven times in the early stages) is astonishing. (For details see Sálím Ali 1926, JBNHS 31: 524-6.)

Baker, FBI No. 1788, Vol. 5: 124

Plate 14, fig. 9 and Plate 15, fig. 2

LOCAL NAMES. Same as for No. 133.

SIZE. Pariah Kite, slightly +; length c. 66 cm. (26 in.).

FIELD CHARACTERS. In overhead flight distinguishable from Pariah Kite by larger size and a conspicuous white buzzard-like underwing patch (lower wing-coverts) which is only dimly indicated in *gorinda*. At rest, larger size and somewhat paler underparts, without rufous tinge, are suggestive pointers. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Breeds in Ladakh and N. Kashmir, and possibly throughout the Himalayas, between c. 1500 and 4500 m. alt. Observed in Nepal at c. 5330 m. in May and collected at c. 4260 m. in July (Biswas). Breeds also in the higher hill ranges of Assam south of the Brahmaputra (vide Baker). Winter visitor in small numbers to W. Pakistan and northern and peninsular India south at least to about lat. 18°N. in the Deccan (Maharashtra, Andhra).

Extralimital. 'Breeds in W. Siberia from about lat. 58°N. east to Transbaikalia and Japan, south to Transcaspiia, Turkestan, and N. China. Winters south to N. India, Burma, Indochina, and Hainan' (Peters).

MIGRATION. No ringing data. Frank Ludlow (Ibis 1937: 493) witnessed a spectacular migration in Bhutan on 5 September. A continuous stream of

¹ Brackets as used by Stresemann in revised edition of Vol. 1 of Peters's *Checklist*. For explanation see Stresemann, E. (1959): 'Die Gliederung der Schlangengadler-Gattung *Spilornis*' *Vierteiljahrsschrift der Naturforschenden Gesellschaft in Zürich*, 104: 208-13.

HAWKS, VULTURES, ETC.

231

Gāruda laava, *Gāruda mantaru* (Telugu); *Sam parundu*, *Krishna paranthu* (Tamil); *Shemberid* (Yerkali); *Ranga cheelani* (Assam); *Garudan*, *Krishna parundu* (Malayalam); *Piljo*, *Rutta okāb* (Sind); *Ukusa* (Sinhala).

SIZE. Pariah Kite —; length c. 48 cm. (19 in.).

FIELD CHARACTERS. A handsome rusty red or deep chestnut hawk with white head, neck, upper back, and breast, and brown abdomen. Under aspect of wings in overhead flight greyish with a cinnamon tinge; black at tips (primaries). Sexes alike.

Young (immature). Brown, rather like Pariah Kite but always distinguishable by rounded (not forked) tail. Sometimes with whitish patches on underwing, confusingly like buzzard (*Buteo*).

STATUS, DISTRIBUTION and HABITAT. Resident — with some local seasonal movements governed by monsoon and water conditions — throughout India (up to c. 1800 m. in the Himalayas), both Pakistans (except Baluchistan and NW F. Province), Nepal (terai to c. 1400 m. alt.), Ceylon (low country Dry and Wet zones), Andaman Is. Affects well-watered localities inland, and sea coast.

Extralimital. Burma east to S. China, south to Tenasserim, N. Thailand, central Vietnam.

GENERAL HABITS. A water-loving hawk, haunting the vicinity of tidal creeks, fishing villages, docks, and harbours on the seaboard, and dammed reservoirs, rivers, jheels, inundated rice-fields, and flooded areas inland. Occasional pairs become parasitic on man like the Pariah Kite, scavenging about towns and villages far from any large body of water. Of comparatively timid disposition and largely subjected to piracy by kites and crows in seaports. Swoops to pick up in its talons floating jetsam or small fish off the surface, often commencing to demolish them in flight. Has been frequently observed to flop down on the water in the attempt, riding buoyantly even on a choppy sea, and taking off again without effort.

FOOD. Fish (chiefly dead or near the surface, or stranded high and dry by receding flood) including mud-skippers (*Periophthalmus*); frogs, land and strand crabs (*Paratelphusa* spp.), *Oryzodromus*, lizards, small snakes, garbage thrown overboard from ships in harbour, winged termites hawked in the air, orthopterous insects fleeing from fired grassland, young chicks of poultry, sickly birds (once *Alcedo althius*); rarely also carrion in company with vultures. Among stomach contents the following insects have been identified; *Schizodactylus monstruosus*, *Gryllotalpa africana*, *Liogryllus bimaculatus*, *Brachytrypus echinatus*, *Atractomorpha crenulata*, *Chrologonus* spp., in addition to remains of small birds, mice, frogs and lizards (Mason & Lefroy 1912). One caught a living garfish from surface of water with the action of a sea eagle; another seen attacking a hare (W. F. Sinclair).

VOICE and CALLS. A harsh wheezy squeal. When swooping to drive off intruding crow etc. from proximity of nest, a louder, agitated and bellicose version of the same.

BREEDING. Season, over the subcontinent as a whole during the cold weather, between December and March/April, varying locally; in Ceylon December to May. Nest, a rough untidy structure c. 30-60 cm. across and up to c. 20 cm. deep, lined with miscellaneous rubbish — wool, rags, bits of skin, tow, etc. — sometimes with green leaves. Placed c. 6 to 15 m. up in

230

FALCONIFORMES

these kites was coming from the north down the Kuru Chu Gorge to Bhutan, not in dense formation but a long-drawn line of 3 or 4 birds followed at intervals of a hundred metres or so by 3 or 4 more, and so on. Several hundreds of birds must have passed the observer thus during the half-hour he was watching, and the stream was continuing when he left.

GENERAL HABITS etc. Not appreciably different from Pariah Kite's, but both in its residential area and winter quarters more of a mountain bird, less commensal with man and less of a municipal scavenger.

BREEDING. Season, in Kashmir March/April; in Ladakh and the Himalayas April/May; in the Assam hills February to early April. In Kashmir Whistler found some nests in mulberry and poplar trees at moderate heights; Osmaston in huge chenars c. 20 to 30 metres up. Nest, of sticks lined with wool, hair, rags, etc. — not different from Pariah Kite's — perhaps with less sophisticated rubbish admixed than in urban localities. Eggs, 2 or 3, like the Pariah's in coloration and with the same range of variations; slightly larger. Average size of 100 eggs 57.3 × 45.2 mm. (Baker). Apparently both sexes share all the domestic chores, though as yet male's share proven only in incubation. Incubation period unrecorded.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	475-529	34-37	52-62	288-345 mm.
♀♀	480-552	—	—	—

COLOURS OF BARE PARTS. As in Pariah Kite. Legs and feet sometimes nearly white.

Genus *HALIASTUR* Selby

Haliastur Selby, 1840, Cat. Gen. Subgen. Types Aves: 2 (note), 3. Type, by original designation, *Haliastur pondicerianus* = *Falco indus* Boddaert

Bill fairly large, compressed, slightly curved near base, sharply so at tip; festoon on cutting edge of upper mandible small but distinct. Nostrils almost round and oblique. Wings very long, extending to or beyond tip of tail; 4th primary (as) longest; first about equal to two-thirds length of 4th. Tail moderately long, slightly rounded. Tarsi short and feathered above; the naked portion with broad transverse scutes in front and on toes, elsewhere with hexagonal scales, small at sides large behind, where in young birds they form broad scutes; soles furnished with tiny prickly scales; outer toe longer than inner; claws curved, moderately strong.

The genus contains two species found throughout the Oriental and Australian regions, one of which occurs within Indian limits.

135. **Brahminy Kite.** *Haliastur indus indus* (Boddaert)

Falco Indus Boddaert, 1783, Table Pl. enlum.: 25

(Pondicherry ex Daubenton, pl. 416 and Buffon 1: 490)

Baker, FBI No. 1784, Vol. 5: 118

LOCAL NAMES. *Brahmini cheel*, *Sankar cheel*, *Dhobia cheel*, *Roo mibhāt* (Hindi); *Shankha cheel* (Bengal); *Kehe* (Santhali); *Khemankari* (Sanskrit); *Gāruda* (Kannada);

232

FALCONIFORMES

a large banyan or peepul (*Ficus*), tamarind, neem, casuarina, or other tree or in the head of coconut palm, preferably near water, often within or close to a village; rarely on a ruined building. Eggs, normally 2, sometimes 3, rarely 4, greyish white, feebly speckled and blotched with pale dingy reddish brown — poorly marked replicas of Pariah Kite eggs; variable. Average size of 100 eggs 50.7 × 40.2 mm. (Baker).

Both sexes share in nest-building, incubation¹, and feeding the young. Incubation period about 26/27 days.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	359-394	34-38	51-59	180-207 mm.
♀♀	379-403	35-38	51-59	189-205 mm. (SA)

Weight 10 ♂♀ 520-700 gm. (BNHS).

COLOURS OF BARE PARTS. Iris brown. Bill bluish horny, culmen and tip paler, sometimes yellowish; cere yellow (bluish in young). Legs and feet dull yellow, greyish yellow, or greenish yellow.

Genus *ACCIPITER* Brisson

Accipiter Brisson, 1760, Orn., 1: 28, 6: 310. Type, by tautonymy, *Accipiter Brisson* = *Falco nisus* Linnaeus

Astur Lacépède, 1799, Tabl. Ois.: 4. Type, by subsequent designation, Vigors, 1824, *Falco palumbarius* Linnaeus = *F. gentilis* Linnaeus

Bill short, powerful, curving sharply from cere and with a well-pronounced festoon. Nostrils large, oval, horizontal, thinly covered with bristles. Wings short, rounded; 3rd, 4th, or 5th primary (as) longest, or all three subequal. Tail long, extending beyond wing tips, rather graduated. Tarsus long, thin, unfeathered; scutellated in front and behind, reticulated on sides. Toes powerful; middle toe exceeding the lateral ones in length, greatly so in some species. Claws well curved, unequal; inner claw very large, about equal to that on hind toe.

Genus cosmopolitan; represented by six species within our limits.

136. Eastern Goshawk. *Accipiter gentilis schvedowi* (Menzbier)

Asur palumbarius schvedowi Menzbier, 1882, Orn. Geogr. Eur. Russl.: 439
(Transbaikalia)

Baker, FBI No. 1801, Vol. 5: 146

Plate 22, fig. 10 and Plate 23, fig. 11

LOCAL NAMES. *Jarra* ♂, *Baaz* ♀ (Hindi); *Zorrez* ♂, *Shāhbāz* ♀ (Sind).

SIZE. Pariah Kite — length ♂ c. 50 cm. (20 in.), ♀ c. 61 cm. (24 in.).

FIELD CHARACTERS.

Adult. Like a huge Shikra in shape and general aspect, with longish tail and short rounded wings. Above, dark grey, darker on crown, nape, sides of head and neck; edge of forehead and supercilium white. Below, white, cross-banded with black — narrowly on body, broadly on tail.

In overhead soaring flight the close-banded body and broad rounded wings, and longish fanned tail with 3 (or 4) black bands (subterminal broadest) are suggestive pointers. Sexes alike; female larger.

Young (immature). Above, light brown, the feathers edged or tipped buffy white; the markings broader on crown, nape, and hindneck. Tail mottled brown with 4 or 5 broad blackish bands. Below, buff or pale rufous, boldly streaked with blackish oval spots or drops; not barred.

STATUS, DISTRIBUTION AND HABITAT. Breeds sparingly in the NW. Himalaya above c. 2400 m. altitude; possibly also in high Garhwal and eastward. Chiefly a rare winter visitor to N. India and the lower Himalayas, from Kashmir to Sikkim and Assam. Vagrant in W. Pakistan (Sind, Bahawalpur), and Gujarat (Saurashtra). Affects Himalayan forests of oak (*Quercus*), spruce (*Picea*), silver fir (*Abies*), etc.

Extralimital. Central Asia from Barnaul and Krasnoyarsk to Yakutsk and the Aldan river, south to the Tien Shan and Altai mountains and the Amur river (Peters).

GENERAL HABITS. Like the Shikra and other 'true' hawks (*Accipiter*) and hawk-eagles, hunts from an ambush up in the branches of some thickly foliated tree, pouncing on its prey before it has realized the danger. If unsuccessful will pursue the quarry for distances up to several hundred metres before striking or abandoning the chase. If disturbed in its vigil, drops down from the perch and flies low and fast with rapid wing-beats close to the ground, shooting steeply up into the branches of another tree some distance away. In the High Himalayas above the tree-line uses rocks as look-out posts whence to pounce on snow partridges etc. coming out to feed in open ground. Often seen late morning or early afternoon soaring and circling at great heights, tail partly fanned, wings outspread and motionless.

Highly prized by falconers, and was in great demand when falconry was more popular in W. Pakistan and India. The more powerful female was

137. Central Asian Shikra. *Accipiter badius cenchroides* (Severtzov)

Asur cenchroides Severtzov, 1873, Bull. Imp. Soc. Fr. Nat. Sci., Anthr. and Ethnogr. Moscow, 8 (2): 113 (Auljeata and Chinkent, Russian Turkestan. Restricted to the lower Syr-Darya by Heptner & Stachanov)

Baker, FBI No. 1804, Vol. 5: 150

LOCAL NAMES. *Shikra* ♀, *Chipka* ♂ (Hindi).

SIZE. House Crow —; length ♂ c. 31 cm. (12-13 in.), ♀ c. 36 cm. (14 in.).

FIELD CHARACTERS. Doubtfully recognizable from Indian Shikra (q.v.); somewhat larger and paler.

Adult also more brown less grey above and with the barring on underparts paler and extending to thigh coverts and vent. Sexes alike; female larger.

Young (immature). As in the Indian form (No. 138).

STATUS, DISTRIBUTION AND HABITAT. Resident in W. Pakistan (breeding in Baluchistan, NWF. Province, upper Sind (?) extending, at least in winter, to lower Sind, Bahawalpur, Punjab, but status here uncertain.

Extralimital. E. Iran, Afghanistan, Russian Turkestan. ('Syr-Darya Valley, W. Tien Shan, Ferghana' — Peters.)

GENERAL HABITS, etc. Same as No. 138.

BREEDING. Recorded in NWF. Province and Baluchistan between March and June. Nest and eggs as in Indian Shikra (q.v.). Average size of 30 eggs 40.4 × 31.3 mm. (Baker).

MUSEUM DIAGNOSIS. In the species *A. badius* the second primary (as.) is longer than sixth. For details of plumages and structure of *A. b. cenchroides* see Hartert 1912-21, Vög. pal. Fauna, 2: 1158-9.

MEASUREMENTS	Wing	Bill (from cere)	Tarsus	Tail
♂ ♂	185-197	12-13	45-46	c. 150-160 mm.
♀ ♀	210-222	—	—	180-192 mm.

Middle toe without claw: ♂ under 30 mm.; ♀ 31-35 mm. (Hartert).

COLOURS OF BARE PARTS. As in No. 138.

138. Indian Shikra. *Accipiter badius dussumieri* (Temminck)

Felco dussumieri Temminck, 1824, Pl. Col. Livr. 52, text to pl. 308 (adult), pl. 336 (immature). (India, type from Bengal)

Baker, FBI No. 1803, Vol. 5: 149

LOCAL NAMES. *Shikra* ♀, *Chipta* or *Chetpā* ♂ (Hindi and Marathi); *Shikre* (Bengal); *Kuthia* ♂, *Tunna* ♀ (Nepal); *Tinghyi* (Lepcha); *U-cham* (Sikkim).

SIZE. House Crow —; length ♂ c. 31, ♀ c. 36 cm. (12-14 in.).

FIELD CHARACTERS. A small, short and rounded-winged hawk with a longish multibanded (4 or 5) tail.

Adult. Above ashy blue-grey. Below, white closely barred with rusty brown, especially on breast. A median grey stripe on throat. Sexes more or less alike; female larger and dark smoky brown washed with grey above.

Difficult to distinguish in the field from migratory Sparrow-Hawk (147) (q.v.), but is somewhat paler in coloration, with stouter legs and shorter toes.

234

FALCONIFORMES

trained to strike hares, houbara bustards, ducks, herons, and other large birds. (For methods of catching goshawks in the Punjab see Donald, C. H., 1920, JBNHS 27: 133-4.)

FOOD. Birds and small mammals, such as pheasants, partridges, pigeon and hares.

VOICE AND CALLS. Unrecorded in India. Elsewhere a short squeal or scream like a buzzard's, a chattering *giak, giak, giak*, and others have been described.

BREEDING. Possibly nests less rarely in the higher NW. Himalayas than the paucity of records would indicate. According to Baker the only authentic one is Whymper's of a nest containing two young birds in Garhwal in March, though the altitude given as 'under 3000 ft.' (under c. 1000 metres) would seem unusual. The only eggs known are two (hard-set) taken by Hume's Indian collector from a nest about 40 ft. up in a deodar tree in 'Busahir' (Bashahr), c. 2700 m. altitude, on 15 April. The female parent was produced with the eggs to confirm identification. They were broad ovals, greyish white, one mottled and spotted with faint brown stains (possibly not natural). They measured '2.2 × 1.78 and 2.1 × 1.7 inches' (= 55.9 × 45.2 and 53.3 × 43.2 mm.) — Baker.

Share of the sexes in nesting activities, incubation period, etc. unrecorded.

MUSEUM DIAGNOSIS. No definite crest. 4th primary (as.) longest. [For detailed description of plumages etc. see Witherby 1939, 3:75-7 for the western (nominate) race which differs only in being slightly larger and paler, with the upperparts more brown less grey.]

MEASUREMENTS. Wing ♂ ♂ 290-323; ♀ ♀ 353-362 (Baker). An ad. ♂ from Sikkim has wing 324 mm. (Meinertzhagen).

Bill (from feathers) 21-24; tarsus 70-78; tail 210-230 mm. (for *A. g. gentilis* — Witherby).

COLOURS OF BARE PARTS. Iris, varying with age, lemon- or golden yellow to red (in old birds). Bill dark plumbeous slate, paler at base and often yellow at gape; cere yellow, greenish above. Legs and feet yellow; claws black.

236

FALCONIFORMES

Young (immature). Above, dark brown; tail with more bars (5-7). Below, white with broad brown vertical streaks and spots.

STATUS, DISTRIBUTION AND HABITAT. Resident. Sind (?), West Pakistan, Nepal (dun and Valley), all India excepting Kerala and Assam (where replaced by other races, q.v.), up to c. 1400 metres altitude in the Himalayas. Affects open wooded biotope, hill and plain, and the environs of villages and cultivation.

GENERAL HABITS. Uses the same surprise tactics in its hunting as the Goshawk, pouncing on unsuspecting quarry from its ambush up in a leafy tree. Sometimes stampedes small birds out of a thicket, selecting one from the flock, chasing it with speed and determination till struck. Normal flight swift, attained by rapid wing-strokes and punctuated with glides, the bird sweeping steeply up to alight on a branch, its progress through the trees often heralded by 'Ware hawk!' alarm-calls of squirrels and small birds. Much given to soaring on thermals and circling high up in the heavens, particularly during breeding season when also a pair will indulge in noisy and spectacular aerobatics, spiralling upwards, tumbling, and stooping at each other. At times during this season assumes a peculiar hovering flight: wings slightly bent and held above level of back, and flapped very slowly and deliberately. Possesses great pluck and dash; in heyday of falconry was commonly trained to strike quails, partridges, and crows, and even such large birds as young peafowl.

FOOD. All living animals of manageable size recorded: mammals (field rats and mice, striped squirrels), birds (sparrow, myna, babbler, quail, dove, black and racket-tailed drongo), lizards (*Calotes versicolor*, *Mabuya carinata*, *Hemidactylus* sp., *Lygosoma* sp.), frogs, locusts, grasshoppers, mantises, dragonflies, flying termites, etc. The following insects specifically identified among stomach contents: *Chrotogonus* sp., *Gryllobates melanoccephalus*, *Schizodactylus monstrosus*, *Gryllotalpa africana*, *Brachytrypus achatinus*, and geometrid caterpillars (Mason & Lefroy 1912). Observed walking about picking winged termites emerging from rain-sodden ground alongside bulbuls and jungle babblers. Individuals often become confirmed chicken-lifters and then a serious menace to poultry-keepers.

VOICE AND CALLS. Normal calls a loud, harsh, and challenging, *titu-titu* very like black drongo's, and long-drawn screams rendered by G. M. Henry as *ihya, ihya*, etc. During breeding season, in the aerial courtship display as well as when perched, a noisy sharp double note *ti-ti* constantly repeated.

BREEDING. Season, overall March to June, varying locally in different parts of the country; perhaps April and May most general. Nest, untidy crow-like structure of twigs lined with grass and roots, c. 30 cm. across and c. 10 cm. deep. Placed 7 to 15 metres up in a leafy mango, neem, tamarind, or other tree, or at the base of leaf stalks in a palmyra (*Borassus*) palm. Eggs, 3 or 4, rarely 5, pale bluish grey, sometimes finely stippled with blackish at the larger end, and blotched with pale grey or lavender. Average size of 100 eggs 38.8 × 31.1 mm. (Baker). Both sexes share nest-building (twigs carried in feet) and feeding the young. Male's part in incubation uncertain. Incubation period 18-21 days.

MUSEUM DIAGNOSIS. Smaller and purer grey on upperparts than *A. b. cenchroides*; larger and more ashy above than *A. b. badius*, with the rufous barring below paler.

HAWKS, VULTURES, ETC.

237

But all races subject to great individual variation; their gradual and complete intergradation precludes fixing of definite racial boundaries.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	176-206	18-21	50-54	157-166 mm.
♀♀	200-222	21-23	51-55	160-175 mm.

(SA)

Weight 4 ♂♂ 124-158 (av. 135), 5 ♀♀ 170-238 (av. 192) gm. (BNHS).

COLOURS OF BARE PARTS. Iris golden- or orange-yellow. Bill slaty blue, black at tip, paler at base, yellowish on gape; cere bright yellow to deep orange. Legs and feet yellow; claws black.

139. Ceylon Shikra. *Accipiter badius badius* (Gmelin)

Falco badius Gmelin, 1783, Syst. Nat., 1(1): 280 (Ceylon)

Baker, FBI No. 1802, Vol. 5: 147

Plate 22, fig. 4 and Plate 23, fig. 5

LOCAL NAMES. *Keloyi shikra*, *Keralia gya* (Sinhala); *Pirappilatt*, *Shikra* (Malayalam); *Jeli daga* (Telugu); *Vellara* (Tamil).

SIZE. House Crow —; length c. 30-34 cm. (c. 12-13 in.).

FIELD CHARACTERS. Slightly smaller than Indian Shikra (q.v.), with upperparts more grey, less ashy. Female and immature as in above.

STATUS, DISTRIBUTION and HABITAT. Resident. Ceylon (common in all zones up to c. 1800 m.); Kerala (low country and up to at least c. 1500 m. elevation). Affects open deciduous biotope. Groves near villages etc.

GENERAL HABITS etc. Same as Indian Shikra.

REPRODUCTION. *Sp. n.*, January to April/May. Nest and Eggs as in the Indian form. Average size of 18 eggs 59.0 × 31.8 mm. (Baker).

MUSEUM DIAGNOSIS. Smaller and distinctly darker above than ♂ *A. b. dinnieri*; darker barred with darker rufous below, leaving only narrow white lines between the bars. Kerala birds largely intermediate between Indian and Ceylonese races.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	170-182	19-21	c. 50-54	128-134 mm.
♀♀	186-206	22-23	—	145-161 mm.

♀	167	—	43	152 mm. (Baker)

COLOURS OF BARE PARTS. Iris bright orange. Bill pale bluish horn; tip dusky; cere pale greenish. Feet yellow (Butler). Bill bright bluish (Hartert).

142. Katchal Shikra. *Accipiter badius elanoides* (Richmond)

Accipiter elanoides Richmond, 1902, Proc. U.S. Nat. Mus., 25: 306 (Katchal Island)

Baker, FBI No. 1807, Vol. 5: 152

LOCAL NAMES. Unrecorded.

SIZE. House Crow —; length c. 33-34 cm. (c. 13-14 in.).

FIELD CHARACTERS. Richly coloured above like *A. b. badius*, also with a single subterminal black band in tail. Somewhat larger.

STATUS, DISTRIBUTION and HABITAT. Resident (endemic?). So far known only from Katchal Island, Nicobars.

GENERAL HABITS etc. Unrecorded.

REPRODUCTION. Unrecorded.

MUSEUM DIAGNOSIS. Differs from *A. b. badius* in being paler on nape and sides of head; also in the indistinct white supercilial line, and white lores and throat. Underparts resembling *A. b. badius* in pattern but the reddish colour on breast almost entirely absent (Richmond).

MEASUREMENTS. Wing 192; culmen 21.5; tarsus 52; tail 157 mm. (Abbott).

COLOURS OF BARE PARTS. Iris dark crimson; eyelids greenish. Bill blackish at tip, horn-blue at base; cere greenish. Feet yellow (Abbott).

143. Horsfield's or Chinese Goshawk. *Accipiter soloensis* (Horsfield)

Falco soloensis Horsfield, 1821, Trans. Linn. Soc. London, 13: 137 (Java)

Baker, FBI No. 1808, Vol. 5: 153

Plate 22, fig. 6 and Plate 23, fig. 6

LOCAL NAMES. Unrecorded.

SIZE. House Crow —; length c. 30 cm. (c. 12 in.).

FIELD CHARACTERS.

Adult. Like the Shikra but slaty to ashy black above, with sides of head and neck ashy grey; throat buffy white streaked with grey. Scapulars and tertaries with broad white bars or patches. *Below*, breast and flanks variably tinged with vinous or pale ferruginous, paling to white on abdomen and vent.

In overhead flight reddish breast, barred tail, and buff lining to broad rounded wings suggestive. Orange cere prominent.

238

FALCONIFORMES

SIZE. House Crow —; length ♂ c. 31 cm., ♀ c. 36 cm. (12-14 in.).

FIELD CHARACTERS. Like Indian Shikra (q.v.) but darker.

STATUS, DISTRIBUTION and HABITAT. Resident. Assam, Bangladesh (plain and hills up to c. 900 m. altitude).

Extremities. Burma, Thailand, Malay Peninsula, east through the Indochinese countries to Hainan and Formosa.

GENERAL HABITS etc. As in Indian Shikra.

REPRODUCTION. *Sp. n.*, April-May. Nest and Eggs, as in the Indian form. Average size of 28 eggs 39.0 × 31.8 mm. (Baker).

MUSEUM DIAGNOSIS. As dark as the Ceylon race above, with crown and sides of head a purer grey. Underparts much more richly and broadly barred with rufous than any other race. Female and immature differ from adult in same way as in other races.

MEASUREMENTS

	Wing	Bill (from feathers)
♂♂	186-203	19-21 mm.
♀♀	221-226	20-22 mm.

(Baker)

COLOURS OF BARE PARTS. As in the Indian form.

141. Car Nicobar Shikra. *Accipiter badius badius* (Gurney)

Accipiter badius Gurney, 1893, Bull. Brit. Orn. Cl., 7: 27 (Car Nicobar Island)

Baker, FBI No. 1806, Vol. 5: 151

Plate 22, fig. 7 and Plate 23, fig. 8

LOCAL NAME. *Kadira* (Car Nicobar).

SIZE. House Crow —; length ♀ c. 30 cm. (12 in.).

FIELD CHARACTERS.

Male (adult). Like Indian Shikra (q.v.), but very small and much more richly coloured, and with only a single subterminal black band in tail.

Female and Young (immature). Much more rufous-chestnut and richly coloured everywhere than other races. 'Young birds on the wing looking as red as, or redder than kestrels' (Butler, A. L., 1899, JBNHS 12: 686).

STATUS, DISTRIBUTION and HABITAT. Resident (endemic?). So far known only from Car Nicobar, Nicobar Islands, Camorta (?).

GENERAL HABITS etc. Nothing specifically recorded except that 'young birds have a trick of fluttering on a bough exactly like a broken-legged bird, probably a trick practised when they are just out of the nest to first catch the eye of the old bird bringing food' (Butler, loc. cit.).

REPRODUCTION. Unknown. Butler found a nest (February?) just completed and apparently about to be laid in, c. 13 metres up at the end of a horizontal *Ficus* branch.

MUSEUM DIAGNOSIS. Male bright grey above, brightest on crown and sides of head and neck; the latter without reddish flecking on sides. Chin greyish cream with median stripe obsolete. Inner webs of primaries unbarred; under wing-coverts

240

FALCONIFORMES

Young (immature). Resembles immature *A. badius* but is darker above, especially on head (brownish slate), with broadly streaked or spotted underparts, and rufous-barred flanks.

STATUS, DISTRIBUTION and HABITAT. Uncertain. 'Common' (winter?) on Katchal I. and the Great and Little Nicobar Is. (Abbott & Boden Kloss). Andaman Is.

Extremities. 'Breeds from N. China and Korea south to Kwangtung and Formosa (?). In winter to the Malay Peninsula and the East Indies to Waigu' (Peters). Stragglers reaching E. Burma and N. Thailand.

GENERAL HABITS. Very little known. Apparently a shy forest-dweller.

MUSEUM DIAGNOSIS. 3rd primary (as.) longest; 4th almost subequal; both matched on outer webs. 2nd primary about equal to 5th. Cere orange; bright yellow even in museum skins.

MEASUREMENTS	Wing	Bill	Tarsus	Tail

(occ. 147)

♂♀ Wing 180-202; tail 128-145; middle toe without claw 24-27 mm. (Hartert).

COLOURS OF BARE PARTS. Iris dark brown, pale yellow, or straw colour; eyelids yellow. Bill horny plumbeous, black at tip, yellowish at gape; cere orange or bright yellow. Legs and feet orange-yellow.

ACCIPITER TRIVIRGATUS (Temminck)

144. North Indian Crested Goshawk. *Accipiter trivirgatus infans* (Hodgson)

Accipiter infans Hodgson, 1836, Bengal Sporting Mag., 8: 177 (Nepal)

Spizacus ruficinctus McClelland, 1840 (1839), Proc. Zool. Soc. London, pt. 7: 153

(Banks of the Brahmaputra, Assam)

Baker, FBI No. 1810, Vol. 5: 155 (= *A. t. ruficinctus*)

Plate 22, fig. 5 and Plate 23, fig. 4

LOCAL NAMES. *Chavari*, *Jamal kanti*, *Jays* (Nepal); *Hagani daling* (Cachar).

SIZE. House Crow +; length c. 40-46 cm. (16-18 in.).

FIELD CHARACTERS. A medium-sized short-winged hawk. Above, dark brown with forehead, crown, and small nuchal crest blackish grey. Tail with four visible dark brown bars. *Below*, white, broadly streaked on breast and barred on rest of underparts with rich rufous-brown. Throat and under tail-coverts pure white, the former with a conspicuous blackish medial stripe from chin to breast. Sexes more or less alike; female larger. On casual observation could be mistaken for *Accipiter jerdoni* (No. 125, q.v.). Coloration rather similar and both also crested.

Young (immature). Above, brown; head and nape feathers edged with pale rufous; a broad fulvous supercilium. *Below*, buffy white or pale rufous

HAWKS, VULTURES, ETC.

241

with blackish mesial throat-stripe and broad streaks or drops on breast and sides of body. Thighs variably barred brown and buff.

STATUS, DISTRIBUTION and HABITAT. Resident. Northern India from Garhwal through Nepal, Sikkim, and Bhutan (?) (terai to c. 2000 m. altitude in the Himalayas) to E. and S. Assam, East Pakistan (?) (foothills and up to c. 1500 m.); south to the Godavari river. Affects fairly open deciduous and semi-evergreen forest.

Extralimital. '... Yunnan and Formosa, south to Burma [Thailand, Malay Peninsula] and Indochinese countries' (Peters).

GENERAL HABITS. A forest-dwelling hawk, otherwise of very similar habits to the Shikra, q.v. Employs the same tactics of Surprise in its hunting, pouncing on prey from a concealed perch up in a leafy tree overlooking a clearing. Sedentary and parochial; often seen in the same patch of jungle day after day. Also much given to circling high above forest in the characteristic manner of the genus — a few rapid wing-beats to spiral gradually upwards, followed by sailing and soaring.

FOOD. Chiefly small mammals, and birds. Green pigeons, wood partridges, and larger game birds such as junglefowl and pheasants recorded.

VOICE and CALLS. Described as 'a shrill prolonged yelp', 'a hoarse chuckling note', and loud screams and deep croaks as it swoops to attack nest-robbers.

BREEDING. Season, March through May. *Nest*, a massive structure of sticks, c. 50 cm. across and up to some 30 cm. deep, lined with leaves. Placed c. 9 to 13 metres up in a densely foliated tree standing in a ravine or broken foothills country. *Eggs*, 2 or 3, bluish white with a fine, smooth texture, usually without markings though often stained. Average size of 20 eggs 48.4 × 39.6 mm. (Baker). Share of the sexes in the domestic chores, and incubation period, unrecorded. The birds are bold and truculent in defence of nest.

MUSEUM DIAGNOSIS. In the species *A. trivirgatus* 4th primary (as.) longest; 5th subequal, 6th primary longer than 2nd (contra in *A. badius*). Adult male *A. t. indicus* differs from nominate *trivirgatus* of Sumatra in larger size, darker upperparts with blackish crown and short crest. Breast shield brownish rufous, rather extensive; barring of abdomen narrow and rather rufous; thighs strongly barred; under wing-coverts heavily marked. Adult female darker above and lighter below than *peninsular* (No. 145). Crown very blackish. Striping and barring of underparts reduced; no pronounced breast shield developed because brown stripes on breast rather narrow; bars on abdomen and flanks brownish and rather faded (Mayr, E., 1949 *Amer. Mus. Novitates*, No. 1415).

MEASUREMENTS (North Indian specimens)

	Wing	Tail
2 ♂♂ (ad.)	229.5	188-195 mm.
3 ♀♀ (ad.)	245-260	200-213 mm.
1 ♂ (imm.)	219	180 mm.

(Mayr)

COLOURS OF BARE PARTS. Iris golden yellow (brown in young); eyelids greenish yellow. Bill horny brown or plumbeous horny; culmen and tip blackish; gape yellowish; cere greenish yellow. Legs and feet dull pale yellow to fairly bright dark yellow; claws blackish horny (Baker).

HAWKS, VULTURES, ETC.

243

FIELD CHARACTERS. A medium-sized short-winged hawk.

Adults and Young like No. 144, but smaller even than 145. May be distinguished from Ceylon Shikra, of about same size, by pointed crest and boldly black-barred thigh coverts; in overhead flight by chequered pattern on the wing quills. Sexes more or less alike; female larger.

STATUS, DISTRIBUTION and HABITAT. Endemic in Ceylon. Resident, subject to certain seasonal movements. Affects forested areas in all zones, particularly in the hills and Wet Zone, to at least c. 1800 m. altitude.

GENERAL HABITS. As in 144.

FOOD. Mainly lizards, small birds, etc.

VOICE and CALLS. A shrill scream *he, he, hehehe* (Henry).

BREEDING. Season, February to July. *Nest* and *eggs* as in 145. Incubation period about 34 days (Phillips).

MUSEUM DIAGNOSIS. Small size the chief diagnostic character. Very similar to 144 and 145, but smaller even than the latter. Markings on breast, flanks and upper abdomen in adults much deeper more chocolate-brown, smaller and pear-shaped giving the impression of a white breast spotted with dark brown, contra *peninsular* Indian race, q.v. But see also Mayr, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂♂ (ad.)	183-184	24-26	—	150-152 mm.
6 ♀♀ (ad.)	198-206	27-28	50-53 (2)	157-168 mm.

(Whistler)

COLOURS OF BARE PARTS. As in 144.

ACCIPITER NISUS (Linnaeus)

Key to the Subspecies

Much paler *A. n. nisosimilis*
 Much darker *A. n. melaschistos**

147. Asiatic Sparrow-Hawk. *Accipiter nisus nisosimilis* (Tickell)

Falco Nisosimilis Tickell, 1833, Jour. Asiat. Soc. Bengal, 2: 571

(Marcha, Borabhum, India)

Baker, FBI No. 1811, Vol. 5: 156

Plate 22, fig. 11

LOCAL NAMES. *Bāsha* ♀, *Bāshin* ♂ (Hindi); *Wannapa dega* (Telugu); *Prappidiam* (Malayalam); *Tanki* (Lepcha); *Uchum* (Sikkim).

SIZE. House Crow —; Shikra ±. Length c. 31-36 cm. (12-14 in.).

FIELD CHARACTERS. A medium-sized short-winged hawk.

Male (adult). Very like Shikra; somewhat longer in body but doubtfully distinguishable from it in the field by its darker, slatter upperparts (almost blackish on head), more barred tail-feathers, and only on a close and unobstructed view by its longer, slenderer legs. A white supercilium. Throat without black mesial line. Four or five blackish bands in tail.

Female (adult). Much larger than male, otherwise rather similar; more brown, less pure grey above; paler below.

242

FALCONIFORMES

145. South Indian Crested Goshawk. *Accipiter trivirgatus peninsulæ* Koelz

Accipiter trivirgatus peninsulæ Koelz, 1949, Auk, 66: 83

(Londa, Bombay district, peninsular India)

Baker, FBI No. 1809, Vol. 5: 154. (= *A. t. trivirgatus* in part)

LOCAL NAMES. *Gör besra*, *Manik besra*, *Kūteswar* (Hindi); *Kōkila dega* (Telugu).

SIZE. House Crow —; length c. 31-36 cm. (c. 12-14 in.).

FIELD CHARACTERS. A medium-sized short-winged hawk.

Adult and Young like No. 144, slightly smaller, but not distinguishable from it in the field. Sexes more or less alike; female larger.

STATUS, DISTRIBUTION and HABITAT. Resident. SW. India from about Goa and N. Mysore (c. lat. 16°N.) south through Kerala. The species has not been recorded east of the W. Ghats strip in this section. Affects moist deciduous and evergreen forested foothills and broken country and up to at least c. 1100 metres elevation in the Western Ghats system and Nilgiri Hills.

GENERAL HABITS etc. As in 144.

BREEDING. Season, nest, and eggs, as in 144, the last somewhat smaller. Average size of 24 eggs (from SW. India including those from Ceylon) 46.7 × 37.1 mm. (Baker).

MUSEUM DIAGNOSIS. Very similar to 144, but slightly smaller. Markings on breast, flanks, and upper abdomen in adult give the impression of a brown breast with the feathers edged white, contra Ceylonese race q.v. For additional details see Mayr, loc. cit.

MEASUREMENTS. (SW. Indian specimens)

	Wing	Bill (from skull)	Tail
6 ♂♂ (ad.)	196-208	26-28	159-168 mm.
6 ♀♀ (ad.)	214-237	c. 29-31	169-180 mm.

(Whistler)

Wing 1 ♂ (imm.) 211; 2 ♀♀ (imm.) 228-230 mm. (Mayr)

Tarsus c. 51-57 mm. (Baker)

COLOURS OF BARE PARTS. As in 144.

146. Ceylon Crested Goshawk. *Accipiter trivirgatus layardi* (Whistler & Kinnear)

Astur trivirgatus layardi Whistler & Kinnear, 1936, Jour. Bom. nat. Hist. Soc., 38: 434 (Gillymally, Peak Forest, Ceylon)

Baker, FBI No. 1809, Vol. 5: 154 (= *A. t. trivirgatus* part)

LOCAL NAMES. *Ukussa*, *Kurulla goya* (Sinhala); *Valluru* (Tamil).

SIZE. House Crow —; Ceylon Shikra ±; length c. 30-34 cm. (c. 12-13 in.).

* The distribution given by Mayr (loc. cit.), presumably based in part on FBI 5: 154, as 'Southern India approximately south of a line from Bombay to the mouth of the Krishna river' is not quite correct. In *Modification* (4: 107) Baker attributes 'Khandesh' to Davidson; the latter does not mention this species at all in his Khandesh list (SF, vol. 10) 1

244

FALCONIFORMES

Young (immature). Above, dark brown, the feathers edged with rufous. White bases to feathers of nape and neck conspicuous. Tail with five bars. Below, breast with heart-shaped rufous-brown spots, turning to bars on abdomen, flanks and thigh-coverts.

STATUS, DISTRIBUTION and HABITAT. Rather sparse winter visitor (September/October to March). All India from c. 2400 m. alt. in Kashmir and along Himalayas, south to Kerala; both Pakistans, Nepal, Andaman Is. Not Ceylon. Affects well wooded, preferably broken and foothills country — light forest, groves, orchards, etc.

Extralimital. 'Breeds in N. and C. Asia from Turkestan to the Sea of Okhotsk, Japan, N. China, and E. China south to the Yangtze. Winters to India, Burma, and S. China' (Peters).

MIGRATION. No precise data.

Accipiter nisus

■ Breeding range 1 *A. n. melaschistos*; 2 *A. n. nisosimilis* and other races

GENERAL HABITS. Usually solitary. When disturbed, drops from a branch, flies very low and flat along the ground, shooting up almost vertically to alight in another tree. Method of hunting as of the genus — by Surprise tactics. Either pounces on quarry from an ambush up in a leafy tree or cruises at great speed close along the ground with rapid wing-beats and glides, 'hedge-hopping' to stampede little birds resting within a hedge-grove or bush or feeding unsuspectingly on the ground, getting a flying start on any that panic and dash out and striking in its stride, sometimes almost turning on its back to seize the quarry from underneath. Turns and twists skillfully in pursuit to avoid tree-trunks and other obstacles. The victim is carried off some distance and usually eaten on the ground, held underfoot and dismembered by upward pulls of the hooked bill. Often soars and

HAWKS, VULTURES, ETC.

249

COLOURS OF BARE PARTS. Iris golden yellow or orange-yellow; in young birds grey or greyish white, and later pale yellow. Bill slaty grey with black tip; cere lemon-yellow. Legs and feet bright yellow; claws blackish.

151. Southern Besra Sparrow-Hawk. *Accipiter virgatus. besra* Jerdon

Accipiter besra Jerdon, 1839, Madras Jour. Lit. Sci., 10: 84

(Soonda Jungles, South India)

Baker, FBI No. 1813, Vol. 5: 159

Plate 22, fig. 8 and Plate 23, fig. 9

LOCAL NAMES. *Vaishlapa dega* (Telugu); *Urchila* (Kannada); *Ukusa*, *Kurulla* (Sinhala); *Sinna palluru* (Tamil).

SIZE. House Crow —; Shikra ±. Length c. 29-34 cm. (c. 11-13 in.).

FIELD CHARACTERS. A medium-sized, short-winged Shikra-like hawk with conspicuous black mesial stripe on throat. Similar to No. 150 (q.v.) but somewhat smaller and paler.

STATUS, DISTRIBUTION and HABITAT. Resident in Ceylon (all zones) up to c. 1800 m. elevation, and the Western Ghats strip including Nilgiri and Palni Hills through Kerala north at least to Bombay. Once in Gujarat (Saurashtra). Sparingly in E. Ghats in Madras State, but status there uncertain. Confined to evergreen and moist deciduous biotope; affects heavy forest between c. 600 and at least 1200 metres elevation.

GENERAL HABITS, FOOD, etc. As in 150.

VOICE and CALLS. 'A frequently uttered squealing cry, rapidly repeated, *cheer-ichee-ichee*...' (Mrs Lushington).

BREEDING. Season, March to May. Nest and site as in 150, the former often lined with green leaves. Shabby old nests of other birds likewise repaired and utilized. Eggs, 3 or 4 — exceptionally 5 — like those of 150, similarly variable. Average size of 60 eggs 36.9 × 29.7 mm. (Baker). Share of the sexes in the domestic chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. Male (adult) similar to 150 but differs in being smaller and much paler above, more slaty grey than blackish grey, the head, back, and lesser wing-coverts darker. Below also paler rufescent.

Female dark brown without the chocolate tint; the crown only slightly darker than back. In its smaller size it matches the more richly coloured nominate race (*virgatus*) of Java.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
4 ♂♂ (ad.)	148-155	17-18	45-54	112-119.5 mm.

251

MEASUREMENTS ¹	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	156-173	14-15	51-54	117-137 mm.
♀♀	182-198	16-18	—	—
				(Baker)

Three specimens collected recently by H. Abdulali in the Middle and South Andamans measure:

	Wing	Bill (from skull)	Tarsus	Tail
1 ♂ (ad.)	150	15	45	105 mm.
1 ♂ (imm.)	159 +	16	49	111 mm.
1 ♀ (ad.)	187	22	53	133 mm.
				(SA)

COLOURS OF BARE PARTS. Iris ♂ crimson (La Touche); ♀ straw yellow (Whitehead). Bill slaty blue, tipped black; cere yellow. Legs and feet yellow; claws black.

Genus BUTEO Lacépède

Buteo Lacépède, 1799, Tabl. Ois.: 4. Type, by tautonymy, *Falco buteo* Linnaeus

Very closely allied to *Aquila* (eagles) from which it differs in its weaker bill and feet, the absence of a regular immature plumage, and the extreme individual variation exhibited by the members in their coloration, largely independent of age or sex.

Bill moderate or small; culmen curved from cere; commissure almost straight; festoon on cutting edge obsolete. Nostrils oval and oblique. Wings long: 4th primary (m.) longest or about equal to 5th and 3rd. First four quills deeply notched on inner web near tip. Tail rather long, slightly rounded at end. Tarsus long, partly feathered in front, transversely scutellated behind. Toes short; inner toe much shorter than outer. (Tarsus and toes almost identical with *Haliastur*, q.v.)

Genus widely distributed in Europe, Africa, America, and Asia, but unrepresented southeast from India.

Key to the Species

		Page
A	Larger: Wing above 475 mm.	<i>B. hemilanius</i> 253
B	Smaller: Wing below 475 mm.	
	1 General colour of tail creamy rufous.	<i>B. rufinus</i> 252
	General colour of tail brown or bright rufous.	<i>B. buteo</i> 254

¹ Composite of *A. e. gularis* and *A. r. risoides*, now considered synonymous.

² For the sake of consistency, the measurements given above are taken from Stuart Baker, but those of Vaurie (*Am. Mus. Nov.* No. 2042, 1961, p. 9) seem a little more discrete and clear cut and are listed below for comparison.

B. rufinus — wing ♂ 343-370 (353); ♀ 358-383 (369)

B. buteo — wing ♂ 362-400 (375); ♀ 370-408 (389)

FALCONIFORMES

250

152. Eastern Sparrow-Hawk. *Accipiter virgatus gularis* (Temminck & Schlegel)

Astur (Nisus) gularis (Temminck & Schlegel), 1845, in Siebold, Fauna Jap., Aves, 5, pl. 2 (Japan)

Accipiter nisoides Blyth, 1847, Jour. Asiatic Soc. Bengal, 16: 727 (Malacca)

Baker, FBI Nos. 1815. 1817, Vol. 5: 162, 164

Plate 22, fig. 9 and Plate 23, fig. 7

LOCAL NAMES. None recorded.

SIZE. House Crow —; Shikra ±. Length c. 29-34 cm. (c. 11-13 in.).

FIELD CHARACTERS. As in 150, but adult male more or less uniformly blackish slaty above (black on crown), without white marks on nape. Below, chin and throat white with a narrow black mesial line. Rest of underparts varying from pale to intense rufous with faint traces of barring, often obsolete on lower breast, flanks, and abdomen. Tail with four blackish cross-bands.

Female (adult). Above, dark brown, blackish on head. Below, a distinct black mesial line on white chin and throat. Lower parts barred with grey-brown or rufous and white from foreneck to vent.

Young (immature). Above, brown, the feathers edged with buff or rufous. Below, black mesial streak on throat bolder. Breast with broad brown streaks or drops; abdomen broadly barred.

STATUS, DISTRIBUTION and HABITAT. Resident (breeding) in the Andaman Is.; not uncommon near Port Blair (B. B. Osmaston). Occurs in the Nicobars; probably breeding, but status unconfirmed.

Extralimital. Breeds also in Japan and China. Winter visitor to the Philippines. Scarce in Burma, apparently only in winter (?). Winter visitor and common passage migrant (autumn and spring) through Malaya where status undetermined.¹

MIGRATION. An immature male taken on board ship in the Bay of Bengal c. 10°N. lat., 90°E. long. on 22 April 1952 (F. Salomonsen, 1953, *Dansk. Orn. For. Tidr.*, 47: 138).

GENERAL HABITS and FOOD. As in 150.

VOICE and CALLS. Unrecorded.

BREEDING. Season in the Andamans principally March-April. Nest, crow-like, of sticks as in 150, often old nests of other birds; in roadside trees near habitation, mangrove forest, and padauk (*Pterocarpus marsupium*) plantation (Wickham; Osmaston). Eggs, 3, coloured as in the other races. Average size of 14 eggs 36.7 × 29.5 mm. (Baker). Owners plucky and aggressive in defence of nest. Other details unrecorded.

MUSEUM DIAGNOSIS. First primary (as.) about equal in length to longest secondary. 2nd primary equal to 6th or somewhat longer; 4th primary longest, 3rd and 5th only slightly shorter. Outer web of 2nd primary attenuated quite near its base; of 3rd, 4th and 5th more so and extending further upward from base (Hartert). Throat with narrow black mesial line.

¹ Gibson-Hill, C. A., 1949, *An Annotated Checklist of the Birds of Malaya, Raffles Mus. Bull.* No. 20, Singapore.

FALCONIFORMES

252

153. Longlegged¹ Buzzard. *Buteo rufinus rufinus* (Cretzschmar)

Falco rufinus Cretzschmar, 1826, in Reppell's Atlas Vög. 40, pl. 27

(Upper Nubia, Schendi and Sennar, and Ethiopia)

Baker, FBI No. 1796, Vol. 5: 137

Plate 24, fig. 6 and Plate 25, fig. 8

LOCAL NAME. *Chūhāmār* (Hindi).

SIZE. Pariah Kite; length c. 61 cm. (24 in.).

FIELD CHARACTERS. Like a small eagle or immature Brahminy Kite (*Haliastur indus*) in general aspect and proportions. Extremely variable in coloration, ranging from dark brown through reddish brown and fulvous to pale sandy, with brown or almost white head, neck, and breast, and sometimes blackish moustachial stripes. The heavy build and somewhat sluggish habit, coupled with variable chocolate- or cinnamon-brown plumage, pale or dark head and unfeathered legs are suggestive.

In overhead aspect the short neck, expanded, rounded, transversely barred tail — pale to bright rufous or rufous-brown — and whitish or dark brown halfmoon-shaped patches on the chestnutting underside of the broad 'splayed finger' wings are fairly diagnostic of a buzzard. But differentiation as to species with certainty impossible in the field, and not easy even with the bird in the hand (see Museum Diagnosis).

In Longlegged Buzzard pale creamy rufous tail with obsolete brown cross-bars and a broader prominent subterminal band are pointers to identify. In immature birds (?) tail ashy brown with numerous dark transverse bars.

STATUS, DISTRIBUTION and HABITAT. Within our limits breeds in the Himalayas in NW. Pakistan (Peshawar and Kohat dists.); reportedly also in Baluchistan (Ziarat and Chaman dists.), and in India in Ladakh (?), Kashmir and Garhwal, between c. 1500 and 3700 m. elevation. Winter visitor September/October to end March — to Nepal (terai and Valley) and Sikkim, the birds in the E. Himalayas being probably derived from the E. Turkestan-Mongolian breeding area. Fairly common in winter in Sind and N. India east to Upper Assam (N. Lakhimpur dist.) south to the Deccan and possibly further, but specific sight records of buzzards unsupported by skins unsatisfactory. In breeding area affects hilly forest country with open glades etc.; in winter range every type, from semi-desert and cultivation to deciduous forest.

Extralimital. Breeds from S. Russia, Kirghiz Steppes, Turkestan and W. Mongolia, south to Greece, Asia Minor, and the W. Himalayas. Winters chiefly in Africa from N. Sudan to the valleys of the White and Blue Nile, and in NW. India (Peters). Eastward to N. Burma.

GENERAL HABITS. More or less common to all buzzards. In winter range usually seen singly or in pairs perched sluggishly on a tree-top, or on a stone

¹ This is a misnomer. The name rightly belongs to *Buteo hemilanius* (154) which possesses the longest tarsi of all our buzzards.

× c. 1

HAWKS, VULTURES, ETC.

253

or mound in open hummocky country. Numbers will sometimes collect (6 or 7 observed loosely together — SA) at jungle fires or fired grass patches to feast on the fleeing lizards, rats, and insects in company with other raptors and drongos, etc., frequently sauntering about on the charred ground to pick up their roasted remains. Hunts live prey by pouncing on it from a lookout post or from 30 metres or so up in the air where it sometimes hovers, head to wind like a kestrel, though rather cumbrously, to scan the ground. Much given to soaring and circling for hours on end high up in the heavens on outspread motionless wings. On approach of breeding season pairs indulge in spectacular acrobatic displays — flying round each other, plunging and stooping with wings half pulled in, shooting up with the momentum almost vertically to a wave crest, then tilting forward to nose-dive again. Occasionally a bird will do a perfect 'loop the loop', turning over completely on its back during the manoeuvre.

FOOD. Carrion, small mammals, sick and disabled birds, reptiles, frogs, locusts and other large orthopterous insects, etc. Occasionally takes domestic chickens and pigeons. In north-western semi-desert areas preys largely on gerbilles (*Meriones hurrianus*) and fat-tailed lizards (*Uromastix hardwickii*); in Kashmir (Gulmarg) on voles (*Microtinae*) and mouse-hares (*Ochotona*) — (Osmaston).

VOICE AND CALLS. A loud, wailing, kitten-like mewing uttered from time to time. Particularly noisy on approach of breeding season and during the aerial displays.

BREEDING. Authentic data very meagre. *Season*, c. March to May. *Nest*, a large stick structure built in a high tree growing on a forested hillside, or on a crag or shelf of rock. *Eggs*, 2 or 3, sometimes 4 (?), very broad ovals, variable in colour and markings: white to greyish or buff, blotched all over or only at larger end with deep rich brown with some obsolete grey smears. Average size of 8 Indian-taken eggs 59.6 × 47.6 mm. (Baker), which agrees fairly closely with the average of European eggs.

Share of the sexes in domestic chores, period of incubation, etc., unrecorded in India.

MUSEUM DIAGNOSIS. Tail in adult *rufinus* pale rufous with barring obsolete except for a dark subterminal band. For description of various plumage phases see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	415-431	32-34	56-62	228-250 mm.
♀♀	428-458	—	60-77	230-257 mm. (Baker)

COLOURS OF BARE PARTS. Iris golden brown or yellowish brown. Bill horny or brownish slate, black at tip, yellowish at base of lower mandible and gape; cere yellowish green. Legs and feet dingy or pale lemon-yellow.

154. Upland Buzzard. *Buteo hemiliasius* Temminck & Schlegel

Buteo hemiliasius Temminck & Schlegel, 1845 (1844), in Siebold, Fauna Jap., Aves: 18, pl. 7 (Japan)
Baker, FBI No. 1797, Vol. 5: 140
Plate 24, fig. 5 and Plate 25, fig. 9

HAWKS, VULTURES, ETC.

255

FIELD CHARACTERS. Similar to Longlegged Buzzard but smaller. Also variable in coloration. In a common phase:

Adult. Above, brown, the feathers largely edged with rufous. Below, rufous, paler on throat, faintly barred and spotted on abdomen. Tail diagnostic bright rufous (v. pale creamy rufous in Longlegged) with a dark subterminal band and generally one or two more visible on outer rectrices. Sexes alike.

Another phase (age ?) is whitish or pale buff below, more distinctly barred with light rufous-brown.

STATUS, DISTRIBUTION AND HABITAT. Claimed to breed in W. Pakistan (NWF. Province) and Kashmir, but records uncertain and conflicting. Occurrence south of the Himalayas unconfirmed.

Extralimital. 'Breeds from the Urals and SE. Russia east to the Kentei Mountains and Turkestan. Winters in E. Africa, Arabia, and W. India' (Peters).

GENERAL HABITS, FOOD, VOICE, etc. Nothing unequivocally recorded for India. 'A shrill, harsh *ky-yah*, much harsher than the mewing cry of *Buteo buteo*' (Kirke-Swann).

BREEDING. Doubtful. *Season* in NWFP. and Kashmir mentioned by Baker as March-May. Needs confirmation by collecting of breeding birds.

MUSEUM DIAGNOSIS. Tail bright rufous. Tarsus normally only one-third feathered in front; sometimes half. Naked portion scutellated in front; rarely reticulated (Baker). For description of plumages see Baker, loc. cit.; Withersby 1939, 3: 55-6.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	350-385	20-23	65-75	175-195 mm.
♀♀	350-390	—	—	—

(from cere)

(Withersby)

COLOURS OF BARE PARTS. Iris hazel to yellow. Bill dark plumbeous, lighter at base and gape; cere yellow. Legs and feet yellow; claws black.

156. Buzzard. *Buteo buteo japonicus* (Temminck & Schlegel)

Falco buteo japonicus Temminck & Schlegel, 1844,

in Siebold's Fauna Jap., Aves, p. 16 (Japan)

Buteo burmanicus Hume, 1875, Stray Feathers, 3: 30, in text
(Thayemyo, Upper Pegu)

Baker, FBI No. 1799, Vol. 5: 143

Plate 24, fig. 2 and Plate 25, fig. 5

LOCAL NAMES. For all buzzards *Chūhāmār* (Hindi); *Ukusa* (Tamil); *Parundu* (Tamil, Malayalam — apparently general for all hawks).

SIZE. Pariah Kite —; length c. 51-56 cm. (20-22 in.).

FIELD CHARACTERS. Like other buzzards has dark and light plumage phases. In one of these, with creamy brown head and patchy underwing, confusingly like immature Brahminy Kite (*Haliastur indus*). Field identification unreliable. (See Museum Diagnosis.)

STATUS, DISTRIBUTION AND HABITAT. Unsatisfactorily known owing to chaos in nomenclature, confusion in field identifications, and lack of better collected material. All Indian records of buzzards, especially of breeding, should be treated with reservation unless supported by skins.

254

FALCONIFORMES

LOCAL NAME. *Chūhāmār* (Hindi) for all buzzards.

SIZE. Pariah Kite +; c. 71 cm. (28 in.).

FIELD CHARACTERS. Similar to Longlegged Buzzard, slightly larger but also extremely variable in coloration and doubtfully identifiable in the field. A usual phase is pale greyish brown above, with some rufous on nape, upper back and upper tail-coverts. White bases of feathers conspicuous on head and neck. Below, streaked with brown on throat, and with large brown irregular spots on breast and abdomen. Sometimes underparts all brown. Tail brown rather than rufous, with a subterminal and seven other bars, somewhat more clearly visible than in immature Longlegged Buzzard.

STATUS, DISTRIBUTION AND HABITAT. Not satisfactorily worked out owing to possible confusion with other species. Evidently a rare winter visitor to the Himalayas. Very few records; specimens definitely identified only from Kashmir, Himachal Pradesh, Punjab, Nepal, Sikkim.

Extralimital. 'Breeds from Lake Baikal to Ussuri and the Amur south to Tibet and Mongolia, probably also in N. China. Winters south to India, Burma and C. China' (Peters).

GENERAL HABITS, FOOD, etc. Similar to 153. No information available specifically for India. Apparently more powerful than Longlegged Buzzard, reported in Tibet as preying on hares, Tibetan Sandgrouse (*Syrhaptes tibetanus*) and snowcock (*Tetraogallus tibetanus*), and alleged to take young lambs (F. M. Bailey).

VOICE AND CALLS. Unrecorded in India.

BREEDING. Extralimital as far as known, but possibly may nest in the higher Himalayas. *Nest*, a large stick structure on ledges of cliffs etc.

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♂	480-501	34-36	81-90	255-282 mm.

(from feathers)

(Baker)

COLOURS OF BARE PARTS. Iris buff to golden yellow, or white. Bill bluish or dusky horn, paler and yellowish at gape and on base of lower mandible; cere greenish yellow. Legs and feet wax yellow, or yellowish grey; claws black.

LOCAL NAMES. *Dang pang ti on*, *Pang ti on nok* (Lepcha).

SIZE. Pariah Kite —; length c. 51-56 cm. (20-22 in.).

¹Now given specific status, *Buteo vulpinus*.

256

FALCONIFORMES

Winter visitor. Irregular and uncommon but widespread: N. India, Nepal (between c. 275 and 2240 m.), Sikkim, Bengal, Bhutan, Arunachal Pradesh, and hills south of the Brahmaputra to Manipur. Peninsular India south to Tamil Nadu and Kerala. Ceylon (all zones up to c. 2000 m.).

Extralimital. 'Breeds in Asia from E. Turkestan and the Upper Yenesei north to Dauria and Lake Baikal, east to Ussuriland, south to the Himalayas, Manchuria, Korea, and Japan. Winters south to India, Burma, and S. China' (Peters).

Common Buzzard (*B. buteo*)Roughlegged Buzzard (*B. lagopus*). SE

Overhead view
(Diagrammatic sketches by L. Tinbergen)

GENERAL HABITS, FOOD, VOICE, etc. Unrecorded specifically.

BREEDING. Extralimital. *Nest*, the usual stick structure built on ledges of cliffs or on the ground on steep hillsides.

MUSEUM DIAGNOSIS. Tail more brown than rufous, with 4 or 5 nearly obsolete dark bars; flanks and thighs rufous. Feathering on tarsus variable; in most birds covering half to two-thirds in front. For description of plumage phases see Baker, loc. cit.

Distinguished from immature Brahminy Kite (*Haliastur indus*) in comparative colour phase by longer tarsus: 63-74 mm. c. 51-59 mm.

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♂	374-379	c. 29	63-65	198-209 mm.

(from feathers)

(Baker)

COLOURS OF BARE PARTS. Iris brown. Bill plumbeous-brown to black, the base paler; cere yellow. Legs and feet yellow; claws black.

Genus BUTASTUR Hodgson

Butastur Hodgson, 1843, Jour. Asiat. Soc. Bengal, 12: 311. Type, by original designation, *Circus leuca* Franklin

Bill laterally compressed; culmen curved from base; festoon generally present on edge of upper mandible, sometimes well marked. Nostrils oval, oblique. Wing long: 3rd primary (as) longest, 4th almost subequal. 2nd primary only a little longer than 5th, these two much shorter than 3rd and 4th. First 3 primaries marked: 4th slightly, emarginate on inner web. Tail rounded. Toes short; tarsus considerably longer than middle toe, feathered only at extreme tip; covered with imbricated shields, rather larger in front.

Genus represented in Africa and the Oriental Region; only one species within our limits.

HAWKS, VULTURES, ETC.

Baker, FBI No. 1774, Vol. 5: 104

Plate 25, fig. 3, Plate 28, fig. 3 and Plate 29, fig. 3

LOCAL NAMES. *Tisa* (Hindi); *Buda mali gedda* (Telugu); *Tellur* (Yerkali); *Parundu* (Malayalam, for all hawks).SIZE. Jungle Crow \pm ; length c. 43 cm. (17 in.).

FIELD CHARACTERS. A small greyish brown hawk with white throat, two dark cheek-stripes, and a third central stripe running down from chin. A small whitish patch on nape. Underparts brown and whitish. Orange-yellow cere and white (or pale yellow) eyes conspicuous at close range and through binoculars. At rest closed wings reach almost to end of rufous-tinged tail. Sexes alike.

In overhead flight silvery grey-brown undersides of broad, blunt wings, contrasting with darker body, a suggestive clue. From above a patch of buffy grey on wing shoulder is conspicuous.

Young (immature). Feathers of crown and nape brown with broad pale edges. Forehead and a broad supercilium buffy white. Underparts variable, white to buff, the feathers more or less streaked with dark brown. Cheek-stripes narrow or absent.

STATUS, DISTRIBUTION and HABITAT. Resident practically throughout our area from about 1200 m. in the Himalayas (less common south of Madhya Pradesh) to Kanyakumari, and from W. Pakistan (Baluchistan) to Assam and E. Pakistan. Nepal. Absent in Ceylon. Affects open deciduous forest, and scrub-and-bush and cultivated country in the plains. Avoids moist forest biotope.

Extralimital. Northern and western Burma south to Tenasserim.

GENERAL HABITS. Sluggish and usually tame. Single birds seen day after day perched on the same stump, tree-top or telegraph pole in a chosen locality whence they pounce on any small animals of manageable size that show themselves in the surroundings below. Sometimes one will take up its position on the ground, on some mound or boundary stone in scrub jungle or cultivation whence to hurl itself on any lizard or grasshopper that stirs in the proximity, changing the coign of vantage from time to time. Occasionally walks about in the open, picking up flying termites as they emerge from their holes, or on charred ground after a forest fire, even while the rubbish is still smouldering, looking for roasted lizards and other titbits. Although somewhat sluggish, its flight is swift and direct, attained by rapid strokes of the rounded wings, reminiscent of a shikra. In the breeding season the birds become very noisy. Pairs commonly soar in circles high up in the sky for long periods and also indulge in spectacular aerial play, side-slipping, somersaulting, and stooping at each other with astonishing velocity.

x c. 1/2

HAWKS, VULTURES, ETC.

259

proportions. Tarsus long and slender; fully feathered. Toes short and stout; outer toe longer than inner; claws long and well curved.

A forest-haunting genus, represented in Africa, tropical America and throughout the Oriental Region.

Baker, FBI No. 1760, Vol. 5: 89

Plate 20, fig. 4 and Plate 21, fig. 10

LOCAL NAMES. *Kanda panthiong*, *Kanzha chil* (Lepcha); *Reijore* (Sikkim); Spotted Hawk-Eagle of Jerdon.SIZE. Kite \pm ; length c. 72 cm. (c. 29 in.).

FIELD CHARACTERS. A comparatively slender forest-frequenting eagle with a prominent crest of a few long black feathers (white-tipped in young birds) sticking out from hindcrown, and long, slender, feathered legs. Above, dark brown, barred with white on rump and upper tail-coverts. Tail dark brown barred with dark grey. Below, two broad black moustachial streaks to foreneck and a third down centre of chin and throat. Foreneck and upper breast fulvous white, with broad black vertical streaks or oval drops, or (in very old birds) broken brown-and-white barring. Remainder of underparts chocolate-brown, paler on lower breast, darker on abdomen. Flanks, thigh- and under tail-coverts barred brown and white. Sexes alike; female larger.

Young birds till their second year show a confusing variety of plumages, and are difficult to tell in the field.

In overhead flight all hawk-eagles of this genus appear grey throughout, the body sometimes darker sometimes lighter than the wings, profusely barred and streaked ('spotted'). They may be further identified by the short rounded wings, upturned near the end, and the longish tail.

STATUS, DISTRIBUTION and HABITAT. Resident in the Himalayas between 600 and 2400 m. altitude from NW. Pakistan (Hazara dist.) and Kashmir to eastern Assam, north and south of Brahmaputra river; Nepal; Manipur; E. Pakistan (?). In winter wanders into the Gangetic Plain; has been taken as far south as Pachmarhi (lat. 22°30'N.). Affects hill forest.

Extralimital. Yunnan, N. Burma (?).

GENERAL HABITS. Very similar to the commoner Indian Crested Hawk-Eagle (*Spizaetus c. cirrhatus*) of peninsular India, q.v. Hunts from ambush

258

FALCONIFORMES

FOOD. Rats, and mice, small snakes, lizards, frogs, crabs. Also locusts grasshoppers and other large insects, and winged termites — sometimes hawked in the air. Though accused of destroying quails and partridges, it seldom takes any except a sickly or disabled one. On the contrary it is highly beneficial as a destroyer of rats and lizards which are proven enemies of ground game. Among stomach contents the following identified specifically: Mammals: *Meriones hurrianus*. Reptiles: *Natrix stolatus*, *Mabuya carinata*. Insects: *Chrologonus* sp., *Termes obesus*, *Catharsius sabarus*, *Anomala varians* (larvae), *Brachytrypes achatinus*, *Schizodactylus monstrosus*, *Gryllotalpa africana* (Mason & Lefroy); *Acridium peregrinum* (?), katydid grasshopper.VOICE and CALLS. A peculiar plaintive, mewing *pit-weer, pit-weer*, constantly uttered in the nest precincts in breeding season; also while the pair is circling aloft.

BREEDING. Season, chiefly between February and May, varying with locality. Nest, a loose unlined structure of twigs like a crow's. Placed fairly high up (9-12 m.) in the fork or thickly foliated branch of a tree such as mango or neem, preferably one of a clump. Eggs, normally 3; greenish white, broad ovals with a fairly smooth texture. Usually unmarked; rarely with flecks of pale reddish. Average size of 100 eggs, 46.4 x 38.4 mm. (Baker). Both sexes share in building the nest and feeding the young. Incubation by female alone; period about 19 days.

MUSEUM DIAGNOSIS. In newly hatched chick prepennae and preplumulae both present. Prepennae fairly long and plentiful over the whole body: white above, tinged with isabelline at tips; white below. Preplumulae short, tufted, white (C. B. Ticehurst).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
σ σ	278-304	28-32	62-67	169-180 mm.
\varnothing \varnothing	295-314	29-32	61-68	170-183 mm.

(SA)

COLOURS OF BARE PARTS. Iris: adult almost white or pale yellow; immature, brown. Bill black at tip, changing to yellow on gape, base of lower mandible, and cere. Legs and feet dingy orange-yellow; claws black.

Downy nestling. Iris dark brown. Bill bluish, black at tip; cere yellow. Legs yellow, claws slate.

Genus SPIZAETUS Vieillot

Spizaetus Vieillot, 1816, Analyse: 24. Type, by subsequent designation, *Falco ernatus* Daudin. (Gray, 1840, List Gen. Bds.: 2)*Limnaetops* Baker, 1930, Fauna Brit. Ind. Bds., ed. 2, 7: 408. Type, by original designation, *Limnaetops c. cirrhatus* (Gmelin) = *Falco cirrhatus* Gmelin

Cf. Amadon, D.; 1953, Ibis, 95: 492-500.

An occipital crest of several long black feathers (c. 10-13 cm.) generally but not always present. Bill short, rather deep at base; culmen laterally compressed; curved throughout, with a prominent festoon on edge of upper mandible. Nostrils round, ear-shaped. Wings short and rounded; 5th primary (as.) longest or 4th and 5th subequal. Longest primary exceeds longest secondary by less than length of tarsus. Tail longer than in most true eagles, approximating the Sparrow-Hawk in its

260

FALCONIFORMES

up in branches of leafy tree, at edge of forest clearing, pouncing on quarry coming out to feed in the open. Very tractable, and easily tamed and trained to hunt (Donald). 'The fastest eagle on the Indian subcontinent, with astonishing manoeuvrability' (M. Osman).

FOOD. Chiefly small mammals like hares and large game birds like pheasants. Once observed striking, carrying off and eating a fish (Ingilis).

VOICE and CALLS. 'A shrill metallic whistle which might easily be imitated on a penny whistle' (A. E. Jones). A sharp *kee-kikik*, like Green Magpie's, repeatedly uttered from perch or on wing (SA).BREEDING. Season, principally February and March, sometimes extending into April and even May. Nest, a large platform of sticks with a depression in the centre lined with green leaves; repaired and used in successive years. Some birds apparently have alternate nests used irregularly, one this season the other possibly the next. Built 12 to 25 metres up in large trees like sal (*Shorea robusta*) — in the higher Himalayas almost invariably deodar (*Cedrus deodara*) — in forest at the edge of a broad nullah or ravine overlooking forest and cultivation. Eggs, a single, rarely 2; mostly of two types (a) pale clay colour or reddish white, profusely stippled with red and spattered with darker red or red-brown blotches, (b) white, variously blotched and spotted with rich red, chiefly at the broader end. Average size of 16 eggs 69.9 x 53.8 mm. (Baker). Share of the sexes in building unrecorded. Apparently female alone incubates; period unknown. Birds very bold and truculent in defence of nest.MUSEUM DIAGNOSIS. In the species *nipalensis* feathering of tarsus extends to base of toes, *contra* in *cirrhatus* where it terminates just above them. For plumages and other details see Baker, loc. cit., and Amadon, loc. cit. *infra*.

	Wing	Bill (from feathers)	Tarsus	Tail

(Baker)

A sexed \varnothing (from Himalayas) has wing 502 mm.Amadon¹ gives for Indian examples:1 σ ad. Wing 440; 1 σ imm. 415 mm.2 \varnothing \varnothing ad. Wing 440, 480; 1 \varnothing imm. 440? mm.Weight 1 \varnothing c. 1825 gm. (SA).

COLOURS OF BARE PARTS. Adult: Iris brilliant golden yellow. Bill black; cere blackish grey. Feet pale dull yellow, yellowish white, or livid yellow; claws black (Baker).

Iris in nestling bluish grey; in young (1 to 2 years old) bright yellow; then bright golden and finally orange in very old birds (Donald).

159. Legge's or Ceylon Feather-toed Hawk-Eagle. *Spizaetus nipalensis kelaarti* Legge*Spizaetus kelaarti* Legge, 1878, Ibis: 202 (Ceylon)

Baker, FBI No. 1762, Vol. 5: 91

LOCAL NAMES. *Maha kende rajaliya* (Sinhala); *Priya kende rasali*, *Kalugu* (Tamil).SIZE. Kite \pm ; length c. 70 cm. (c. 28 in.).¹ Amadon, Dean (1953): 'Remarks on the Asiatic Hawk-Eagles of the genus *Spizaetus*', Ibis, 95: 492-500.

HAWKS, VULTURES, ETC.

261

FIELD CHARACTERS. As for the nominate race. Superficially a larger edition of Legge's Baza (126), q.v. See Museum Diagnosis, for differentiation from No. 158 in the hand.

STATUS, DISTRIBUTION and HABITAT. Resident. Ceylon (hill zone above c. 600 m.); Kerala, Nilgiris, W. Mysore (Malnad). Affects evergreen hill forest.

GENERAL HABITS. Same as of 158. Occasionally takes to poultry-lifting near forest villages.

FOOD. As in 158.

VOICE and CALLS. Normally silent. A 'loud scream' while soaring (Legge).

BREEDING. Season. December to February/March in Ceylon. Stewart found most eggs in Kerala to be laid in January. Nest and site similar to those of the nominate race, the former often at heights of 25 to 30 m. in lofty forest trees. Eggs, normally a singleton, white to greyish white lightly freckled or speckled with reddish; very similar to eggs of *S. cirrhatus*. Average size of 32 eggs 69.1 × 54.6 mm. (Baker). Said to be less bold than the northern bird in defence of nest.

MUSEUM DIAGNOSIS. Differs from the nominate race (158) in being smaller and paler, especially on the underparts. However, according to Amadon, loc. cit., the form *kelaarti* requires confirmation.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus

LOCAL NAMES. *Sadal* (Hindi, Bengali); *Morhaila* (Garhwal).

SIZE. Kite +; length c. 70 cm. (c. 28 in.).

FIELD CHARACTERS. Crest rudimentary or very small, seldom longer than about 3 cm. Otherwise bird similar to Crested Hawk-Eagle (No. 161) but

HAWKS, VULTURES, ETC.

263

FIELD CHARACTERS. A comparatively slender, crested forest eagle, normally brown above white below, with narrow black longitudinal streaks on throat, and broad chocolate streaks on breast. The prominent crest of a few long black feathers sticking out from hindcrown, and long slender but powerful feathered legs, are diagnostic. Sexes alike; female larger.

In overhead flight, the short, broad, rounded wings (upturned near tip), longish tail, white body (lightly or heavily spotted) are leading pointers to the adult.

Young (immature). Head buffy or brownish white; the long black crest feathers with whitish apical edges. Tips of greater wing-coverts largely buffy white. Underparts uniform buffy white with faint, sparse, fine shaft streaks on breast.

STATUS, DISTRIBUTION and HABITAT. Fairly common in well-wooded tracts throughout peninsular India roughly south of the range of *S. n. nipalensis* (No. 158), and in Ceylon. Its northern limit is fairly indicated by a line drawn from Mount Abu (Rajasthan) to Etawah (U.P.) and thence through Sherghati (Bihar) to Calcutta (Hume, SF, 3: 446). Affects deciduous and semi-evergreen forest biotope.

Extralimital. Burma (Myitkyina dist.), SE. Thailand — probably straggler.

GENERAL HABITS. Keeps to open forest and the neighbourhood of outlying forest villages and cultivation. Perches bolt upright on a horizontal bough up in the foliage canopy of a high tree overlooking a glade or clearing, not so much hidden by the leaves as backed and camouflaged by them. The bird thus remains surprisingly unnoticed till it flies out on the observer's approach to settle in another tree some distance away with a graceful upward sweep into the branches. From such ambush it surveys the surroundings for any small animal venturing into the open, pouncing on it with a whirlwind rush, smothering it with its wings, and bearing it away in its powerful talons. Perhaps less given to soaring than many other raptors except during the breeding season when pairs — even single birds (male?) — indulge in noisy aerial displays, zooming up vertically and nose-diving, or stooping at each other at lightning speed, sometimes doing a complete looping-the-loop turn in the air.

FALCONIFORMES

262

with paler underparts, and more or less barred with rufous-white on the brown abdomen and vent. Dimorphic: also commonly met in a melanistic phase with the entire plumage dark chocolate-brown, or almost black, the latter confusable with Black Eagle (No. 172), q.v. Intermediates between the two phases occur.

Young (immature). Lower parts often pure white without any spotting or barring.

STATUS, DISTRIBUTION and HABITAT. Resident in the sub-Himalayan terai and duars from Garhwal to Bengal, (E. Pakistan?), and Assam; Nepal. Affects forest biotope in the foothills and up to c. 1900 m. altitude.

Extralimital. Burma, Thailand, Malay Peninsula, Indochinese countries, Sumatra, Java, Borneo, Philippine Islands.

GENERAL HABITS. As in 161. Wild and wary, flying off to another perch a hundred metres away when approached, and so on, constantly maintaining distance between itself and observer. If persistently followed, becomes suspicious and flies away over the tree-tops, quickly spiralling upward to great height.

FOOD. As in 161. Often becomes a habitual and determined robber of domestic poultry from forest villages.

VOICE and CALLS. Silent except in the breeding season. When soaring aloft, utters 'a clear whistling call very closely resembling the cry of the curlew — *cur-lee-ee-ee*' (G. C. Madoc, Malaya). Also likened to the screams of the Serpent Eagle (*Spilornis cheela*).

BREEDING. From plains level to c. 1800 m. altitude, chiefly foothills between 300 and 900 metres. Season, January to April: principally February and March. Nest, the typical large platform of sticks and twigs, c. 1 metre across and 35 cm. deep, with a shallow depression for the eggs, lined with green leaves. Built high up in a forest tree. Egg, a singleton, indistinguishable from that of 161. Average size of 16 eggs 69.8 × 51.9 mm. (Baker). Share of the sexes in the domestic chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. Considered by some authors as a crestless race of *S. cirrhatus*, by others as a valid species (*S. limnaeetus*) because of the apparent sympatry in parts of Burma and Thailand. Its true position needs further study.

MEASUREMENTS

LOCAL NAMES. *Shah baaz* (Hindi); *Jutu bhyri*, *Namli pari gadda* (Telugu); *Mir baaz* (Gujarat).

SIZE. Kite +; length c. 72 cm. (c. 29 in.).

FALCONIFORMES

264

FOOD. Hares, young peafowl, junglefowl, partridges, bush quails, squirrels, field rats, lizards, etc. Very destructive to domestic poultry around forest villages.

VOICE and CALLS. A loud high-pitched cry *Ki-ki-ki-ki-ki-ki-ki-ki-ki*, commencing short, rising in crescendo, and ending in a long-drawn scream. Mostly heard during the breeding season, from perch as well as from air. Also alleged, with some degree of plausibility, to be the enigmatical 'Devil Bird' which sometimes utters the weird nocturnal cries — a wailing *hoo-hoo* immediately preceded by a 'harsh cough' — as of a woman being strangled (JBNHS, 1925, 30: 914-15). Final confirmation of identity is lacking.

BREEDING. Season, in peninsular India overall November to April, chiefly January and February; in Ceylon continuing till June. Nest, a large platform of sticks and twigs, c. 95 cm. across and some 45 cm. thick with a central depression lined with fresh green leaves kept renovated (by ♂?) during incubation. Built between 12 and 30 metres up in a tall *Ficus*, *Bastia*, *Dipterocarpus*, *Albizia* or similar tree generally on a hillside or edge of a ravine and commanding a wide view. Egg, a singleton, white, feebly speckled and blotched with light reddish at the larger end; sometimes sparingly all over. Average size c. 64.0 × 50.5 mm. Ceylon eggs generally smaller. Both sexes share in building the nest, but apparently female alone incubates. Incubation period undetermined; in one case calculated as over 40 days (Phillips).

MUSEUM DIAGNOSIS. As for the genus. The species differs from *S. nipalensis* (158) by the feathering of the tarsus terminating just above the toes, not extending down to their base. Resemblance between immatures of the two species particularly striking. Ceylon and S. Indian birds are smaller but otherwise identical with the peninsular population. Size difference clinal, not meriting racial separation as hitherto done. For plumage and other details see Baker, loc. cit.

♀♀ ad.	353-462	37-46	96-106	266-300 mm.
				(SA)

COLOURS OF BARE PARTS. Adult. Iris pale khaki to bright orange-yellow varying with age. Bill horny black; cere greyish to greenish brown. Gape and eyelids greyish green. Feet lemon-yellow; claws horny black.

Downy nestling. Iris greyish brown. Bill horny black; cere and bare skin in front of and around eyes slaty grey; gape greenish grey; mouth pink. Feet pale greenish grey; claws horny black.

Chick (in down, c. fortnight old). Prepennae and preplumulae white. A thick rudimentary tuft of white down at nape where crest in adult. Brown primaries sprouting; also bastard wing quills, secondaries, upper wing-coverts, dark brown scapulars, upper tail-coverts and rectrices. A central (spinal) tract of brown feathers down back of neck to midway between the scapulars, and two tracts of fulvous brown feathers on either side of breast.

MISCELLANEOUS. A downy nestling being hand-reared drank water regularly — avidly and copiously — which shows the obvious need for it and poses the question: How do eagles carry water to their must surely do?

HAWKS, VULTURES, ETC.

162. Andamans Crested Hawk-Eagle. *Spizaetus cirrhatus andamanensis* Tytler

Spizaetus Andamanensis Tytler, 1865, Proc. Asiat. Soc. Bengal: 112
(Port Blair, S. Andaman Island)
Baker, FBI No. 1759, Vol. 5: 88

LOCAL NAME. *Arungdda* (Andamans, near Port Blair).

SIZE. Kite; length c. 61 cm. (24 in.).

FIELD CHARACTERS. Smaller even than Ceylon examples of Indian Crested Hawk-Eagle (No. 161) and with a markedly shorter crest; otherwise quite similar.

STATUS, DISTRIBUTION and HABITAT. Rather rare resident. Race endemic to the Andaman group of islands. (Nicobars?). Generally keeps to outskirts of forest near open places (Davison).

GENERAL HABITS. Nothing specifically recorded as different from No. 161.

FOOD. Frequently takes a chicken or pigeon close to a bungalow. One observed to capture a Myna (*Acridotheres tristis*), and another devouring a Koel (*Eudynamis*) — A. L. Butler.

VOICE. Unrecorded.

BREEDING. The only nest known was found by B. B. Osmaston at Haddo, near Port Blair, containing a single egg on 21 January. It was the typical twig structure c. 10 metres up in a teak tree, lined with green jamun (*Eugenia*) leaves. Egg, as of the peninsular race (161), measuring 62.2 × 50.1 mm.

MUSEUM DIAGNOSIS. Size smaller than *S. c. cirrhatus*; length of crest intermediate between it and *S. c. himalaetus* (160).

MEASUREMENTS. Wing 1 ♂ 355, 1 ♀ 377 (Amadon, loc. cit.).

A sexed ♂ in the British Museum collection has wing 375, and a sexed ♀ 366 mm.; bill from feathers 38 and 37 mm. respectively (Baker).

COLOURS OF BARE PARTS. As in 161.

Genus *HIERAETUS* Kaup

Hieraetus Kaup, 1844, Classif. Säugeth. u. Vög.: 120. Type, by original designation, *Falco pennatus* Gmelin

Like *Spizaetus* contains hawk-eagles which differ from true eagles (e.g. *Aquila*) in their lighter and slenderer build, smaller bills, longer and slenderer tarsi, and proportionately longer tails. Most species have a phase of plumage in which the underparts are partly or wholly white. The emarginations of the primaries are generally much deeper than in the genus *Aquila*.

Bill moderately strong, much hooked at the end and with a prominent falcate to upper mandible. Nostrils elliptical and oblique. Tarsi feathered to the toes. Toes long; outer toe somewhat longer than inner. Claws sharp and well curved; inner and hind claw both large, the latter larger. Wing long; 4th primary (as.) longest, exceeding secondaries by more than length of tarsus. Tail nearly square, equal to more than half the length of wing.

Genus represented in Europe, Asia, Africa and Australia. Three species occur in India.

Key to the Species

- Larger; wing over 480 mm. *H. fasciatus*
Smaller; wing under 450 mm. *H. pennatus*
Underparts rufous-chestnut. *H. kienerii*

HAWKS, VULTURES, ETC.

267

in the Himalayas south to Kanyakumari; Nepal. Ceylon (rare vagrant; once). Affects well wooded country, hill and plain.

Extralimital. Southern Europe south to N. Africa and east to southern China (Peters).

GENERAL HABITS. A bold and active hunter, often killing mammals and birds much heavier than itself. Either pounces on them from an ambush up in a leafy tree like the Crested Hawk-Eagle, or strikes them by aerial pursuit. The victim is killed by being gripped fiercely with both feet, the claws dug deeply in. Frequently a pair will hunt in concert, one bird swooping at and scattering a flock, e.g. of roost-bound crows, picking on an individual thus isolated for determined chase and harrying — turning and twisting after it, high and low — while its partner short-circuits the quarry by off-side tactics, both birds then sharing the spoils. In chasing large birds, gets under them and turns over on its back to bind from below (Osman). Pairs indulge in spectacular courtship (also distraction?) displays, swishing down through space almost perpendicularly for 50 metres or more, wings pressed to the sides, then zooming vertically skyward again. On the crest of the wave the bird 'stands on its tail' for a split second then tumbles over to repeat the dive or resume sailing. They frequently soar and circle aloft like most raptors.

FOOD. Mainly large birds and small mammals like hares. Recorded prey includes myna, house crow, green pigeon, crow-pheasant, partridges, spurfowl, junglefowl, pheasant, florican, houbara bustard, pond heron, painted stork, kite and other raptors. Wounded or disabled waterfowl as large as Greylag goose (*Anser anser*) are frequently carried off with great audacity from almost under the sportsman's nose. Crows are at all times a favourite food item. Occasionally becomes a scourge to domestic poultry including young turkeys, and is particularly destructive to dove-cock pigeons. Lizards also taken, but it seldom if ever descends to carrion-eating.

VOICE and CALLS. Seldom heard. Described as a shrill creaking cry; a chattering *kie, kie, kikiki*.

BREEDING. Season, principally December and January; sometimes a couple of months later locally. Nest, a massive platform of sticks with a central depression lined with fresh green leaves. Added to in successive seasons, sometimes the pile assuming enormous thickness. In S. India (Kerala and the Nilgiris) built most commonly on lofty trees; elsewhere and in the Himalayas chiefly on ledges of cliffs. Eggs, normally 2, broad ovals, white, almost unmarked or faintly blotched with pale brown or reddish brown. Average size of 46 Indian-taken eggs 69.1 × 53.4 mm. (Baker). Both sexes share in nest-building, the male bringing large sticks and tangles of branches in his feet, often with green leaves adhering, the female arranging them. Incubation apparently by both, but mostly by female. Period unrecorded. Nest-feeding by both parents, the male procuring the booty, the female tearing it up and giving pieces to the small young.

266

FALCONIFORMES

163. Bonelli's or Slender Hawk-Eagle. *Hieraetus fasciatus fasciatus* (Vieillot)

Aquila fasciatus Vieillot, 1822, Mém. Soc. Linn. Paris, 2(2): 152 (Montpellier, France)
Baker, FBI No. 1752, Vol. 5: 77

Plate 20, fig. 1, Plate 21, fig. 2 and Plate 28, fig. 11

LOCAL NAMES. *Morangi* (Hindi); *Kundeli salara* (Telugu); *Rajali* (Tamil). Crestless Hawk-Eagle of Jerdon.

SIZE. Kite +; length c. 68–72 cm. (27–29 in.).

FIELD CHARACTERS. A comparatively slender but powerful uncrested raptor with a proportionately longer tail than in true eagles, extending 5 to 8 cm. beyond tips of closed wings.

Adult. Above, dark umber-brown. Below, white to rufous-buff, streaked with blackish. Tail dark grey above, whitish below with a broad black subterminal band and several others narrower and ill-defined. Sexes alike; female larger.

In overhead aspect the silvery white body, dark brown under wing-coverts, finely grey-barred flight feathers, and broad black subterminal band in the longish tail are suggestive pointers for the adult.

Young (immature). Above, paler brown, the feathers of head and nape with still paler edges. Below, rufous or rufous-buff, streaked with blackish. Tail narrowly barred and mottled; without the broad subterminal band.

Distinguished in flight from Tawny Eagle in comparable colour phase by slenderer build, narrower wings and relatively longer square-ended tail.

STATUS, DISTRIBUTION and HABITAT. Resident. Widespread but not common. West Pakistan (Baluchistan, Sind, NWFP), India from Kashmir and Punjab to W. Bengal. Assam (?); East Pakistan (?), and from c. 2400 m.

Hieraetus fasciatus

Residential range

FALCONIFORMES

MUSEUM DIAGNOSIS

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♂	458–520	42–49	100–104	246–266 mm.
♀♀	490–550	47–49	106–110	254–285 mm.
		(from skull)		(SA)

COLOURS OF BARE PARTS. Iris yellowish brown to orange-yellow. Bill bluish grey at base, horny black distally; cere and gape pale sulphur-yellow. Feet pale sulphur-yellow; claws horny brown.

164. Booted Hawk-Eagle. *Hieraetus pennatus* (Gmelin)

Falco pennatus Gmelin, 1788, Syst. Nat., 1(1): 272 (No type locality given)
Baker, FBI No. 1753, Vol. 5: 79

Plate 17, fig. 5, Plate 20, fig. 2 and Plate 25, fig. 11

LOCAL NAMES. *Baghati*, *Jumiz*, *Gilehri rair* (Hindi); *Udatal gedda* (Telugu); *Purja paranda*, *Rasali*, *Kalugu* (Tamil); *Rajaliya* (Sinhala).

SIZE. Kite —; length c. 50–54 cm. (20–22 in.).

FIELD CHARACTERS. Superficially a smaller edition of Bonelli's Hawk-Eagle, also with long feathered tarsus. In two very distinct plumage phases:

(1) Light phase. Above, from pale buffy or rufous-white to umber-brown, darkest (blackish) on the primaries. Top of head, nape, sides and back of neck pale rufescent buff, the feathers with darker centres. Forehead and lores buffy white; a narrow black streak running between the eyes and the lores, and similar streaks both above and below the eyes. Below, buffy white with blackish streaks, particularly on chin and upper breast. In overhead aspect colour pattern of light phase reminiscent of dirty white Neophron vulture with blackish band along trailing edges of wings.

(2) Dark phase. Above, brown with dark shaft-stripes, and whitish upper tail-coverts. Below, either dark brown or pale rufous with blackish streaks on breast. Tail greyish brown above, pale below, banded and tipped paler. Sexes alike; female larger.

Young (immature). More or less like (2) above. On the wing, dark and immature phases very like immature Brahminy Kite, but the relatively slenderer proportions and markedly longer and square-ended tail (contra rounded) usually diagnostic. Often flies with Pariah Kites in urban localities and is frequently mistaken for one; also because of its kite-like flight. But shape of tail, square-ended r. forked, establishes its identity.

STATUS, DISTRIBUTION and HABITAT. Partly resident; chiefly winter visitor (fairly common). Indian range practically as for Bonelli's Eagle: W. Pakistan (Baluchistan, Sind, NWFP), and all India from c. 2400 m. in the Himalayas south through the Gangetic Plain and Deccan to Kanyakumari. Nepal; Ceylon (occasional in winter). Not specifically recorded in Assam or E. Pakistan, but doubtless occurs. Affects well-wooded country, hill and plain. Commonly also semi-desert with *Dalbergia* and other forest plantations, and groves of trees around human habitations or within cultivation.

Extralimital. 'Breeds in the Iberian Peninsula, S. France, SE. Europe and S. Russia east to S. Transbaikalia, south to N. Africa and India. Winters chiefly in India and NE. Africa' (Peters). Also Burma and Malay Peninsula.

GENERAL HABITS. The smallest of our 'stockinged' eagles. Though superficially a miniature of Bonelli's at rest, its flight is much more like a kite's, light and wavering, the bird constantly swerving in its course. Takes its prey on the ground or in the air, either pouncing on it from an ambush or chasing it on the wing like a falcon. Regularly hunts in couples (whence known as *Dū bārdārān* = two brothers, in Iran), the birds stooping alternately on the quarry till struck, then sharing the spoils. Collects in numbers to roost at night in groves of large leafy trees. Invariably mobbed by crows who evidently differentiate it readily from the Pariah Kites with whom it may be associating.

FOOD. Small mammals, birds and reptiles. The following specifically recorded: squirrel, rat, lark, pipit, barbet, chukor, bulbul, dove, pigeon, domestic chicken. Often becomes a serious marauder of the poultry yard.

VOICE AND CALLS. 'A very harsh falcon-like cry *kik-kik-kik* oft repeated' (A. E. Jones). Very noisy in the breeding season 'with a shrill piercing call' (Donald). 'Series of calls like Himalayan Pied Woodpecker, louder, more musical and varied.' 'Striking whistling notes' while going through aerial evolutions in breeding season (Whitehead).

Hieraetus pennatus

Breeding range

BREEDING. Breeds freely in NWFP. and the high Himalayas in Kashmir Himachal Pradesh, Garhwal, etc. between 1800 and 3000 m. altitude (Whitehead, Donald, Osmaston, Jones, and others). Possibly also nests sparingly and locally in peninsular India, doubtfully recorded as such in Salem in Madras State (Theobald), and circumstantially in Gujarat (SA).

Extralimital. Burma, Thailand (?), Malay Peninsula.

GENERAL HABITS. A forest eagle, usually seen soaring or flying with rapid falcon-like wing-beats above the tree-tops on forest-clad hillsides or over wooded valleys. Or it may perch bolt upright and alert on a horizontal bough up in the foliage canopy of some lofty tree overlooking a glade or clearing, watching for prey venturing into the open. From this ambush it pounces on its quarry, killing it on the ground, or striking in the air before the victim has time to get properly under way by a thunderbolt stoop reminiscent of a peregrine falcon.

Hieraetus kienersi

Residential range

FOOD. Chiefly large birds and small mammals. Kaley pigeons, jungle-fowl, spurfowl, wood partridge, green pigeon, squirrel have been specifically recorded. Destructive to domestic pigeons and poultry in forest habitations.

VOICE AND CALLS. Various described as 'a plaintive scream not unlike a kite's' (Baker); 'a piercing scream' (H. C. Smith) and 'a wild resounding call' (H. Stevens). Normally silent.

BREEDING. Very little data concerning the northern population, and apparently no nest ever taken. Better known in Kerala where it breeds at elevations between 300 and 1200 m., principally 500 to 900. *Season*, c. December to March. *Nest*, a large platform of sticks, some often with green leaves still attached, the central depression lined with green leaves which are frequently renewed during incubation. Built high up (24-30 m.) in a tall tree in dense forest. As with some other raptors it occasionally has two nests at varying distances from each other, used in successive or alternate seasons. *Egg*, a singleton, broad oval, white, almost unmarked or densely blotched with pale reddish brown primary and lavender-grey secondary markings. Average size of 19 eggs 61.2 x 48.1 mm. (Baker). Share of sexes

Season, c. March to June in the Himalayas. *Nest*, a platform of sticks with a central depression lined with fresh green leaves or pine or deodar needles. Built high up (25-35 m.) in a lofty chenar, deodar or pine, or in a tree growing out of a precipice. *Eggs*, normally 2, white or skim-milk blue faintly and evenly stippled and blotched with pale rusty red. The edges of the nests and ground underneath, even before the eggs hatch, are often littered with feathers and remains of doves and other victims of the eagles. Average size of 6 Indian-taken eggs 56.7 x 44.2 mm. (Baker). Share of the sexes in the domestic chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	370-412	31-33	61-64	188-192 mm. (Baker)
		(from skull)		
♀♀	385-423	34-36	65-69	204-225 mm. (SA)

COLOURS OF BARE PARTS. Iris brown. Bill bluish grey or pale blue with black tip; cere and gape yellow. Feet dull yellow.

165. **Rufousbellied Hawk-Eagle.** *Hieraetus kienersi kienersi* (E. Geoffroy) *Astur kienersi* G. S. (= E. Geoffroy), 1835, Mag. Zool., cl. 2, pl. 35 (Himalayas) Baker, FBI No. 1754, Vol. 5: 80
Plate 20, fig. 3 and Plate 25, fig. 10

LOCAL NAMES. None recorded.

SIZE. Kite ±; length c. 53-61 cm. (21-24 in.).

FIELD CHARACTERS. A handsome slender eagle with a distinct occipital crest as in 161, but shorter. *Above*, including crown, crest, and sides of head glossy black. *Below*, chin, throat and upper breast white with long black stripes. Rest of underparts deep rufous-chestnut, streaked with black on abdomen and flanks. In flight a large pale brownish patch (secondaries) on upper side of wing conspicuous. In overhead aspect the long wings and comparatively short tail give it the look of a large falcon, but pale grey underside of wings and tail, contrasting with white breast and rich ferruginous abdomen, are diagnostic points. Sexes alike; female larger.

Young (immature). *Above*, brown, the feathers dark centred. A line across forehead, and broad supercilium white. Tail dark brown, tipped paler and broadly barred with grey. *Below*, white, sparsely streaked with black.

STATUS, DISTRIBUTION AND HABITAT. Resident. With a curiously discontinuous Indo-Malayan distribution: Eastern Himalayas, from (Nepal?), Sikkim to E. Assam, Manipur, E. Pakistan; the Western Ghats strip in south India from c. Goa and N. Mysore through Kerala (up to c. 1200 m.), and Ceylon (all zones). Absent in the intervening country. Affects evergreen and moist deciduous forest biotope; occasionally lowlands (Ceylon), but chiefly foothills and up to c. 1500 m. altitude in the E. Himalayas and to c. 1200 m. in SW. India.

in the domestic chores, and incubation period, unrecorded. The birds are said to be fierce in defence of their nest and eggs.

MUSEUM DIAGNOSIS. Owing to inadequate comparative material it is uncertain whether the populations in the north and south are identical, as presumed.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	c. 380	c. 33-35	c. 76	c. 204 mm.
♀♀	405-433	35-37	79-82	228-242 mm. (Baker)

COLOURS OF BARE PARTS. Iris dark brown. Bill plumbeous grey, black at tip; cere yellow. Legs and feet dull yellow.

Genus *Aquila* Brisson

Aquila Brisson, 1760, Orn., 1: 28, 419. Type, by tautonymy, *Aquila* Brisson = *Falco chrysaetos* Linnaeus

Large and powerful raptors. Bill strong, rather long and curved from the cere; margins of upper mandible straight or with a very slight falcation. Wings long; 4th and 5th primaries (as.) longest; first primary generally more or less equal to 6th. Tail moderate; slightly rounded or almost square-ended. Tarsus feathered to toes; claws curved, strong and sharp, the hind toe and claw especially powerful.

The genus is found throughout Europe, Asia and N. America. Represented in our area by six species.

166. **Himalayan Golden Eagle.** *Aquila chrysaetos daphanea* Severtzov
Aquila daphanea Severtzov, 1888, Nouv. Mém. Soc. Imp. Nat. Moscou, 15 (livr. 5) :
 190 (Russian Turkestan, Mongolia, Himalayas, Transbaikalia and Ala-shan
 Mountains)

Aquila chrysaetos hodgsoni Ticehurst, 1932, Bull. Brit. Orn. Cl. 52: 25 (Hazara). New
 name for *A. daphanea* Hodgson, 1844, in Gray's Zool. Misc.: 81, *nomen nudum*
 Baker, FBI No. 1746, Vol. 5: 68
 Plate 26, fig. 6, Plate 27, fig. 6 and Plate 28, fig. 9

LOCAL NAMES. *Mūriari* (Chamba); *Dhungthoorish* (= 'monal tiger' or monal
 killer — Bashahr, Himachal Pradesh).

SIZE. Vulture ±; length c. 90–100 cm. (c. 35–40 in.).

FIELD CHARACTERS. A very large and powerful eagle, deep chocolate-
 brown (almost black) with golden or tawny-rufous hindcrown, nape and
 hindneck. Thighs, upper and under tail-coverts, and shoulders of wings
 rufous-brown. Sexes alike; female larger.

In soaring overhead flight the broad wings, held in a wide open V slightly
 above line of back (as in King Vulture and Black Eagle) and ending in
 upturned widely splayed 'fingers', make it distinctive. Confusion possible
 with adult Imperial Eagle (167) as when flying in high wind the
 white bases of scapulars and back feathers may show up like the irregular
 white marks on back of Imperial; but rufous-buff feathers on hindcrown
 and nape of Golden are usually suggestive of its identity. Also tail relatively
 longer, and wings narrower than in Imperial.

Young (immature). Glossy brownish black with tawny head and neck.
 In flight a white moon-shaped patch in centre of wings both above and below
 (bases of primaries), and white tail with broad blackish terminal band,
 are revealing features. No confusion possible with young Imperial Eagle
 which has a brown lined plumage, much lighter below.

STATUS, DISTRIBUTION AND HABITAT. Resident. Baluchistan and the
 Himalayas from W. Pakistan (NWFP, Province) to eastern Assam (including
 Nepal), from c. 1850 metres altitude to summer snowline, c. 3000–5500 m.
 Affects desolate, rugged high mountain country with crags and precipices,
 and sparse stunted vegetation. Unlikely to be found near any hill-station.

Extralimital. Turkestan and E. Persia to C. Asia, south to the Himalayas
 (Peters).

GENERAL HABITS. In its typical Himalayan habitat perhaps less un-
 common than generally supposed. Pairs hold sway over enormous territories,
 occupying them throughout the year for many years in succession — almost
 traditionally. Flight direct and seemingly unhurried, with powerful wing-
 beats and long glides. Method of hunting very falcon-like. Sometimes
 chases its quarry with speed and determination, but usually stoops at it
 from a height at terrific velocity, striking with the huge hindclaw and vir-

HAWKS, VULTURES, ETC.

275

FIELD CHARACTERS. Adult, deep glossy blackish brown with paler
 (tawny-buff to whitish) head and neck. Tail with mottled bands of grey
 and brown, tipped whitish and with a broad blackish subterminal band.
 Irregular white marks on back (scapulars). Vent and under tail-coverts
 dull buff. Sexes alike; female larger.

Confusable with adult Golden Eagle, q.v., but head much paler. At one
 stage of plumage — dark chocolate with golden whitish head — reminiscent
 of colour pattern of immature Marsh Harrier. In flight the relatively shorter,
 less protruding tail and broader wings (held in line with body not in flat
 V above it) are suggestive pointers.

Young (immature). *Above*, light to dark brown, feathers of head and
 nape with paler edges. Upper tail-coverts whitish. Tail light brown tipped
 with fulvous, with pale bars towards base. *Below*, always conspicuously
 paler and lined or streaked, i.e. with lines of darker brown spots running
 down entire underside.

Confusion of immature possible with adult Steppe and Tawny, but its
 lined or streaked underparts diagnostic.

STATUS, DISTRIBUTION AND HABITAT. Rare resident (?), but mainly
 winter visitor. W. Pakistan (Baluchistan, Sind, NWFP), N. and NW. India
 (Kashmir, Himachal Pradesh, Nepal) south to Gujarat (Kutch, Saurashtra).
 How much further east and south uncertain due to records being vitiated
 by confusion in field identifications. Affects open treeless country.

Extralimital. 'S. Europe from Hungary to S. Russia, thence eastward
 to Lake Baikal; south to Greece, Cyprus, Asia Minor, N. India, and
 China. South in winter to Sudan and Somaliland, India, and SE. China'
 (Peters).

MIGRATION. Absent in the Himalayas (NWFP, Kashmir, Himachal
 Pradesh, etc.) and the Indian plains between March and September.
 Migration (evidently of this species) observed by C. H. Donald in Himachal
 Pradesh on 9 November 1923; many birds flying steadily and purposefully
 in single file c. 100 m. up, spaced out at a few minutes' interval each, in an
 ENE. to WSW. direction (JBHNS, 1924, 29: 1054).

GENERAL HABITS. A heavy sluggish eagle, normally seen perched for hours
 on end on a stump or tree-top, or on the bare ground, in open semi-desert
 or flat featureless country such as at the edge of the Rann of Kutch. Obtains
 its food by pouncing on any small animal that may show itself in its vicinity,
 but mostly by pirating — chasing other hawks and eagles (including Laggar
 Falcon) and forcing them to surrender what they have hunted. Also very
 largely a carrion eater, commonly seen at animal carcasses and about
 slaughter-houses and municipal refuse dumps. Flight slow and heavy like
 a vulture's.

FOOD. Apart from carrion and miscellaneous booty procured by piracy,
 occasionally kills rodents, reptiles and ground birds. Stomach of a specimen
 taken in Kutch contained a freshly swallowed Russell's Viper (*Vipera*
russelli) c. 36 cm. long, and remains of a Common Sandpiper (*Tringa hypo-*
leucos), the latter doubtless pirated. Another held remains of two large Fat-
 tailed lizards (*Uromastix hardwickii*).

VOICE AND CALLS. Unrecorded in India. In Europe 'a quick barking
 cuck-cuck-cuck'.

274

FALCONIFORMES

tually splitting open the largest prey. Pairs often hunt in concert, one bird
 driving and harrying the quarry while its mate stoops from above and
 strikes. Circles aloft singly or in pairs, and in breeding season indulges
 in the spectacular stooping and nose-diving displays common to many of
 its lesser relatives.

FOOD. Mainly game birds and mammals, of which the following speci-
 fically recorded: pigeon, chukor, snowcock, monal and other pheasants;
 nest young fed predominantly on crows, chiefly *Corvus macrorhynchos*. Also
 kills foxes, marmots, pine martens, hares, flying squirrels (*Petaurista* spp.),
 young bharal (*Naemorhaedus*), and fawns of musk deer (*Moschus*). Occasion-
 ally new-born lambs of domestic sheep and full-grown tahr (*Hemitragus*),
 the latter attacked on the edge of a cliff and hurtled to its death below
 (C. H. Donald). Hardly ever carrion.

VOICE AND CALLS. Normally very silent. A thin shrill yelp as of a dog,
 and 'barking cries' have been described.

BREEDING. *Season*, principally January to March; somewhat later at
 higher altitudes than at lower. *Nest*, a huge platform of sticks on a ledge of
 a cliff, but more usually in a deodar, juniper or such-like tree overhanging
 a steep precipice or growing out of a cliff-face in difficult and fearsome situa-
 tions. *Eggs*, almost invariably 2, white, marked with fairly large blotches,
 and freckles and spots of light reddish brown. One of the pair usually more
 darkly marked, the pale one with very faint lavender secondary markings.
 Average size of 10 Indian-taken eggs 77.1 × 61.7 mm. (Baker). Share of
 the sexes in the domestic chores and other details unrecorded in India. In
 Europe incubation mostly by female; period in wild state estimated as c.
 40 days (Witherby).

MUSEUM DIAGNOSIS. Primaries exceed secondaries by more than length of tarsus;
 in closed wing reach to within 3 cm. of tail-tip. Nostril elliptical, higher than broad.
 Hind claw much curved, enormous, over 63 cm. round curve (*vide* Donald). For
 detailed description of plumage and structure see Witherby 1939, 3: 41–2 for
 nominate race, from which *A. c. daphanea* differs only in being somewhat larger
 and paler.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	630–655	53–56	89–95	315–335 mm.
♀♀	660–700	58–60	95–105	350–365 mm. (Baker)

COLOURS OF BARE PARTS. Iris dark brown; eyelids yellow. Bill dark horn or
 bluish horn, black at tip; cere yellow. Feet yellow; claws horny black.

167. Imperial Eagle. *Aquila heliaca heliaca* Savigny

Aquila heliaca Savigny, 1809, Descr. Egypte, Ois., 82, pl. 12 (Upper Egypt)
 Baker, FBI No. 1747, Vol. 5: 69

Plate 26, fig. 7, Plate 27, fig. 7 and Plate 28, fig. 10

LOCAL NAMES. *Jūmiz*, *Bādd jūmiz*, *Satangal* (Hindi); *Frus* (Bengal).

SIZE. Vulture —; length c. 81–90 cm. (32–35 in.).

276

FALCONIFORMES

BREEDING. In view of past misidentifications, old breeding records not
 completely trustworthy. The only two dependable ones, both from Punjab,
 seem to be (1) from Hansi (February, Blewitt), (2) from near Jhelum
 (April, Rattray) when the incubating females were shot and identified.
 The nests were large compact masses of sticks and twigs built c. 6 and 9 m.
 respectively up in trees. *Eggs*, 2 (?), generally broad ovals, dull white
 scantily spotted and blotched with pale lavender-grey. Average size of
 eight 'Indian' eggs 70.9 × 54.6 mm. (Baker). No other information
 recorded.

MUSEUM DIAGNOSIS. As in No. 166, but toes somewhat shorter and hind claw
 markedly so — under c. 63 mm. round curve (*vide* Donald).

MEASUREMENTS OF Indian specimens

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	575–600	c. 54–55	c. 91–95	253–270 mm.
♀♀	605–630	c. 60–66	—	—
2♀♀ (Gujarat)	630–632	60–66 (from skull)	102–105	284–328 mm. (Baker) (SA)

A ♀ shot in Kohat weighed 8 lb. = 3630 gm. — Whitehead.

COLOURS OF BARE PARTS. Iris: adult, hazel or brownish yellow; immature, duller
 and browner. Eyeshade and eyelids yellow. Bill bluish horny, tipped blackish;
 cere yellow to greenish yellow. Legs and feet chrome-yellow; claws black.

168. Tawny Eagle. *Aquila rapax vindhiana* Franklin

Aquila Vindhiana Franklin, 1831, Proc. zool. Soc. Lond. pt. 1: 114
 (Vindhya Hills, central India)

Baker, FBI No. 1749, Vol. 5: 72

Plate 26, fig. 4, Plate 27, fig. 5 and Plate 28, fig. 8

LOCAL NAMES. *Okaab*, *Ragar* (Hindi); *Dhela* (Wagri); *Bursauwl* (Yerkali);
Alāwa, *Sālāwa* (Telugu); *Ali* (Tamil, for all eagles); *Parmar* (Sind); *Deshi jummas*
 (Gujarat).

SIZE. Pariah Kite +; length c. 63–71 cm. (c. 25–28 in.).

FIELD CHARACTERS. Our commonest and most widely distributed eagle
 in the plains. A heavy and extremely variable-coloured raptor ranging from
 dirty buff (almost whitish) to brownish black. Legs feathered down to toes.
 Tail rounded like vulture's but relatively longer. Wings long, reaching
 almost to tail-tip when bird at rest. Sexes alike; female larger.

In sailing flight wings held in line with body. Easily confused with the
 migratory Steppe Eagle (No. 169, q.v.), especially when the two whitish
 wing-bars of the latter are not conspicuous.

Whether, and to what extent, colour variability due to age is uncertain.
 Juvenile plumages in this and other eagles impossible to study without good
 series of fledged juveniles of properly identified parents actually collected
 from nest. This is a poser for Indian ornithologists.

STATUS, DISTRIBUTION AND HABITAT. Resident. W. Pakistan (Baluchistan,
 Sind, NWFP, Province), and the drier parts of the subcontinent. Nepal terai,
 Assam, and east to Bangladesh. South to N. Kanara and northern Tamil

HAWKS, VULTURES, ETC. 277

Nadu. Affects semi-desert and dry deciduous country, chiefly plains and plateaux.

Extralimital. North central Burma; dry parts.

GENERAL HABITS. Usually seen perched singly on a tree-top in the mids of ploughed fields, fallow land, or low scrub jungle. Often on the outskirts of villages at animal carcasses or scavenging at refuse dumps in association with vultures, kites, and crows, by the last of whom it is invariably chivvied. Like most eagles, performs spectacular aerobatics in the breeding season consisting of series of steep nose-dives and upsweeps. At crest of every wave, just when reversing to vertical with wings closed, utters a harsh grating kekeke. The display (by ♂?) often lasts for ten minutes or more at a time even when no mate participating. Obtains its food largely by piracy, chasing with speed and determination smaller hawks and falcons and bullying them into surrendering their lawful prize. Rarely also hunts small mammals or disabled birds. Has been observed to catch an unwounded Purple Coot (*Porphyrio*) and Florican (*Sypheotides*). On account of this pirating habit it sometimes becomes a nuisance to falconers, mistaking the jesses of a trained falcon for captured prey and chasing it till lost to sight and unrecoverable. Individuals occasionally take to habitual chicken-lifting, especially when feeding nest-young, and then become a serious menace to poultry keepers. Numbers roost collectively in groves of leafy trees in company with other raptors, e.g. Honey Buzzards.

FOOD. Small mammals, birds, and reptiles, mostly robbed from kites and other hawks; carrion and garbage. Among crop and stomach contents the following identified: Short-tailed Bandicoot (*Nesokia* sp.), Gerbille (*Meriones*), Grey Quail (*Coturnix*), Bush Quail (*Perdicula*).

VOICE AND CALLS. A variety of loud raucous cackles; a distinctive guttural kra as 'war cry' while in pursuit; a harsh grating kekeke in display flight. Fledged young in nest when hungry and calling for food utters loud cheeps like a two-month-old chicken separated from its mother hen.

BREEDING. Season, overall November to March/April, varying locally. Nest, a large platform of sticks and twigs, sometimes thinly lined with grass and leaves. Built at or near the top of a babool (*Acacia arabica*), kandi (*Prosopis spicigera*), sheesham (*Dalbergia sissoo*), peepul (*Ficus religiosa*) or similar tree, preferably standing by itself, often close to a village. Eggs, 2 or 3, white or greyish white with a few reddish brown spots and specks. Average size of 80 eggs 66.0 x 52.8 mm. (Baker). Both sexes share in nest-

HAWKS, VULTURES, ETC. 279

by a Swiss expedition in autumn 1952. The South Col would therefore seem to lie on one of the regular routes of this eagle across the Himalayas between its summer and winter habitats.

GENERAL HABITS. More closely resemble those of Imperial than of Tawny which usually occupies a somewhat different ecological niche—more wooded country. But the two often occur side by side in winter. Said to be more active in its hunting than Imperial; but living largely by piracy and carrion-eating.

FOOD. As in 167. Nothing specifically different recorded.

VOICE AND CALLS. Unrecorded.

BREEDING. Extralimital. Its alleged occasional breeding in India requires confirmation by actually nesting specimens.

MUSEUM DIAGNOSIS. Nostrils elliptical or ear-shaped, higher than broad. Two whitish bars on upperside of wings formed by pale tips to secondaries and greater coverts. Hindclaw about same size as in Imperial (35-45 mm.) but foot smaller and weaker. Considered by some authorities conspecific with *A. rapax*, q.v.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	510-595	50-56	85-89	250-290 mm.
♀♀	602-625	56-58	—	—

(Baker)

Tarsus of specimens in BNHS collection 2 ♂♂ 92-96; 4 o? (84) 92-98 mm. The South Col specimen (sex ?) measured: Wing 585; bill (from skull) 55; tarsus 98; hindclaw 35; tail 290 mm.

Weight of one from Punjab 3060 gm. (Whistler).

COLOURS OF BARE PARTS. Iris hazel to dark brown. Bill black; cere deep yellow. Legs and feet dull yellow or greenish yellow to bright yellow; claws black (Baker).

170. Greater Spotted Eagle. *Aquila clanga* Pallas

Aquila Clanga Pallas, 1811, Zoogr. Rosso-Asiat., 1: 351 (Russia and Siberia)

Baker, FBI No. 1750, Vol. 5: 74

Plate 26, fig. 3, Plate 27, fig. 3 and Plate 28, fig. 7

LOCAL NAMES. *Kāljāngā* (Hindi); *Nālla gāddā* (Telugu).

SIZE. Kite+; length c. 64-72 cm. (c. 25-28 in.).

FIELD CHARACTERS. A very dark eagle without whitish head seen in the vicinity of a jheel is pretty certain to be an adult Greater Spotted.

Adult. Above, dark blackish brown with purplish or maroon reflections on mantle. Usually a little white visible in upper tail-coverts, and sometimes minute white specks on body and wings (due to white bases of feathers showing through). Below, slightly paler. Sexes alike; female larger.

In sailing flight wings held in line with body with the tips slightly downcurved. Two pale bands visible on upper side of wings. But indistinguishable with certainty in the field from adult Lesser Spotted except when upper tail-coverts are pure white; dingy white may apply to both species.

Young (immature). Above, dark blackish brown sometimes with paler crown and nape due to buff tips to the feathers. Back and wings sparsely

278 FALCONIFORMES

building and feeding young; evidently female alone incubates and is a close sitter. Incubation period unrecorded.

MUSEUM DIAGNOSIS. Usually distinguishable from Steppe Eagle (169) by somewhat smaller size and absence of the two whitish bars on upper side of wing (tips of secondaries and greater coverts). But in borderline cases there seems to be no character by which the two can be told with certainty; hence considered conspecific by some authorities.

Chick (in down). 'Prepennae and preplumulae present—white, sparse on cere and round orbit, otherwise completely covering body. Preplumulae make up the bulk of the down. Iris bluish brown; bill dull black; cere, gape and legs yellow' (C. B. Ticehurst).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	500-535	c. 48-51	80-87	242-258 mm.
♀♀	510-560	48-56	84-91	242-285 mm.

(Baker and SA)

COLOURS OF BARE PARTS. Adult. Iris yellow-brown. Bill horny black, plumbeous at base of lower mandible; cere and gape lemon-yellow. Feet yellow; claws black. (One in very pale buff plumage had the cere ivory white.)

169. Eastern Steppe Eagle. *Aquila rapax nipalensis* Hodgson

Aquila nipalensis Hodgson, 1833, Asiat. Res., 18(2): 13, pl. 1 (Nepal)

Baker, FBI No. 1748, Vol. 5: 70

Plate 26, fig. 5, Plate 27, fig. 4 and Plate 28, fig. 6

LOCAL NAMES. *Jūmiz* (Hindi); *Cong-au* (Lepcha).

SIZE. Kite+; c. 76-80 cm. (30-32 in.).

FIELD CHARACTERS. Very similar to the Tawny Eagle (168) and like it variable in coloration, ranging from deep blackish brown to pale, almost buffish brown; often with a rufous patch on nape. Usually two diagnostic pale bars on upper as well as underside of wings formed by whitish tips of secondaries and coverts. Connexion, if any, between colour phases and age not properly understood.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. Common in W. Pakistan, Nepal and N. India, wandering south at least to the Bombay Deccan, east to S. Orissa (to c. 22°N. lat.). Said to occur uncommonly in Assam. E. Pakistan(?). Affects open treeless country in its breeding range; more or less the same biotope as Imperial and Tawny in its winter quarters.

Extralimital. 'Breeds from the Altai to Mongolia and SE. Siberia, south to NW. India and Himalayas[?]. Winters to India and S. China' (Peters).

MIGRATION. Donald shot one on a high pass in Bashahr (Himachal Pradesh) in October where southward migration was in progress. The 1960 Indian Mt Everest Expedition found three large eagles lying dead on the South Col c. 7925 m. (26,000 ft.) altitude on 23 May, which had obviously perished while on passage over this difficult pass. One of these was brought down to the Bombay Natural History Society and identified as this species. Another eagle, possibly also Steppe, had been found dead in the same pass

280 FALCONIFORMES

streaked and spotted with buff or white. Rump pale brown; upper tail-coverts whitish, showing up prominently in flight as a broad crescentic patch above base of tail. Below, dark brown broadly streaked with buff.

'Separable from immature Lesser Spotted Eagle (171) by darker coloration with more pale spots and streaks on upperparts, and (usually) more distinct white crescent above base of tail.

Many confusing intermediate colour phases between the above two, presumably according to age.

STATUS, DISTRIBUTION AND HABITAT. Resident and breeding in W. Pakistan (Baluchistan, Sind, Punjab) and N. India (Gangetic Plain). Nepal (lowlands), east through Bihar, W. Bengal, and Assam. Manipur; E. Pakistan. South to about 22°N. lat. (Khandesh, N. Gujarat, etc.). Wandering south in the Peninsula in winter when population augmented by influx of migrants. No recent records from the Carnatic and Malabar coasts where a hundred years ago Jerdon (1862) described it as 'tolerably common'. This change in status doubtless due, as noticeable even today, to altering ecological conditions, natural or man-made, the Greater Spotted—a predominantly water- and marsh-linked eagle—being particularly vulnerable to draining and marsh reclamation. A specimen taken at Londa, N. Mysore (15°31'N., 74°32'E., Koelz c. 1941), is perhaps the southernmost recent record in the Peninsula. Absent in Ceylon. Restricted to well-watered tracts; affects the neighbourhood of jheels, canals and marshes.

Extralimital. 'Breeds in European Russia from lat. 60°N. south to the Balkan States; east through Turkestan, S. Siberia and Transbaikalia to Amurland, south to NW. India and N. China. Winters south to NE. Africa, India and S. China' (Peters).

GENERAL HABITS. Keeps to well-wooded, well-watered tracts with perennial rivers, canals, swamps, and jheels. Usually perched singly on a tree-top, stump, or canal bank on the look-out for prey. Heavy movements much resemble a buzzard's. Flight less sluggish than Tawny Eagle's, and though largely a frog-eater it also actively hunts waterfowl such as coots and moorhens. The usual method with coots is first to stampee a compact herd floating on the water by swooping low over ('buzzing') it and scattering the birds. While some of the coots patter away and others dive, the eagle repeats the attack again and again until it has managed to isolate one individual. It stoops on the quarry repeatedly whenever it surfaces for breath, and after maybe a number of unsuccessful assaults pounces on it like a hurricane immediately the harassed bird breaks the surface again, and leisurely bears it away in its talons.

FOOD. The following items have been recorded: frogs (mainly), fish, chameleon, *Coleles* lizard, Purple and Indian Moorhens (*Porphyrio* and *Gallinula*), Coot (*Fulica*), Tree Pie (*Dendrocyitta vagabunda*), Kingfisher (*Halcyon smyrnensis*)—complete head with bill in stomach! Frequently makes off with waterfowl falling to a sportsman's gun with great audacity.

VOICE AND CALLS. A wild, clanging jeb, jeb, jeb (Pallas) frequently uttered from a tree-top.

BREEDING. Season, mainly April to June, but may begin a month or two earlier. Nest, the usual massive circular platform of sticks and twigs, the central depression lined with a few leaves. Normally built at or near the

HAWKS, VULTURES, ETC.

281

top of a tree 10 to 15 metres up, standing by itself or in a clump in open marshy or pasture land. Eggs, 1 or 2, broad ovals, white, sometimes faintly freckled with reddish or blotched with grey or reddish grey. Average size of 72 eggs (including European) 68.3 × 54.1 mm. (Baker). Shape of the sexes in the domestic chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. Nostrils round; as high as broad. 7th primary (as.) usually less than 6 cm. shorter than longest. Outer web markedly narrowed and steeply notched near tip. For description of plumages etc. see Witherby 1939, 3: 45-6.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	486-501	45-50	103-106	240-260 mm.
♀♀	542-565	48-52	—	250-276 mm. (Baker)

It is uncertain whether extralimital birds are included above. Specimens recently collected in India measure:

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂♂	485-500	47-53	85(1)	227-242 mm.
4 ♀♀	514-545	52-55	90-110	242-272 mm. (SA)

COLOURS OF BARE PARTS. Iris brown. Bill slaty blue, black at tip of both mandibles, paler or greenish yellow near gape; cere greenish sulphur-yellow. Feet dull sulphur-yellow; claws black.

171. Lesser Spotted Eagle. *Aquila pomarina hastata* (Lesson)

Morphnus hastatus Lesson, 1834, in Bélanger, Voy. Ind.-Orient., Zool.: 217 (Bengal)
Baker, FBI No. 1751, Vol. 5: 75
Plate 26, fig. 2 and Plate 27, fig. 2

LOCAL NAMES. *Gūtīmār* (= 'cocoon destroyer' in Bengal); *Pahāri teesa* (Hindi); 'Longlegged Eagle' of Jerdon.

SIZE. Kite; length c. 61-66 cm. (24-26 in.).

FIELD CHARACTERS. A large blackish brown or dark chocolate-brown eagle.

Adult. Slightly smaller but indistinguishable in the field with certainty from Greater Spotted (170). Both may have dingy white upper tail-coverts, but Lesser never has them pure white as is diagnostic of typical examples of *A. clanga*. Difference in ecology usually a more dependable guide. Greater Spotted never met away from water; Lesser normally in open wooded country.

Young (immature). Separable from immature Greater Spotted (170) by somewhat less dark coloration, with the paler spots and streaks on upper plumage smaller and fewer.

Also found in many puzzling intermediate colour stages.

STATUS, DISTRIBUTION AND HABITAT. Rare resident in Saurashtra and the western side of the Peninsula south to Bombay. Comparatively rare wherever it occurs, viz. chiefly the Gangetic Plain east through Bihar, Bengal, and Bangladesh; south to Madhya Pradesh and Orissa. How much further

HAWKS, VULTURES, ETC.

283

In the race *hastata* adult similar to nominate *pomarina* though somewhat slimmer: crown and upper wing-coverts same colour as back; underside with distinct dark shaft stripes. Immatures of the two readily separable. In *hastata* crown and nape feathers only tipped with rufous (not streaked); likewise lesser wing-coverts. Upper tail-coverts distinctly cross-barred (Hartert).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	470-505	40-43	100-104	230-248 mm.
♀♀	493-508	48-52	—	— mm. (Baker)

COLOURS OF BARE PARTS. Iris brown. Bill slaty blue, black at tip of both mandibles; cere and gape yellow. Feet dull yellow; claws black.

Genus *ICTINAEETUS* Blyth

Ictinaetus Blyth, 1843, Jour. Asiat. Soc. Bengal, 12: 128. Type, by monotypy, *Ictinaetus orivorus* Blyth = *Aquila pennigra* Hodgson

Tarsi feathered to toes. Shape of foot peculiar and diagnostic. Outer toe and claw very small. The other toes also short, inner toe stouter, but nearly equal in length to middle toe. Claws less strongly curved than in other genera of eagles. Inner claw longest, longer even than hind claw. Bill rather small; edge of upper mandible almost straight. Nostrils broadly oval and oblique. Wing long; 5th or 6th primary (as.) longest; first primary a little longer than secondaries. Tail long, somewhat rounded.

The genus contains a single Indo-Malayan species.

172. Black Eagle. *Ictinaetus malayensis penniger* (Hodgson)

Aquila Pennigra Hodgson, 1836, Jour. Asiat. Soc. Bengal, 5: 227 (Nepal)
Baker, FBI No. 1755, Vol. 5: 83

Plate 26, fig. 1 and Plate 27, fig. 1

LOCAL NAMES. *Laknanghang* (Lepcha); *Hugong* (Nepal); *Ādāri nālla gā'āi* (Telugu); *Kūzhūgū* (Tamil); *Daoling gashim* (Cachari); *Karimparundu* (Malayalam).

SIZE. Kite +; length c. 69-81 cm. (27-32 in.).

FIELD CHARACTERS. A large black eagle, with wings reaching to end of tail at rest. Superficially confusable with melanistic form of Changeable

282

FALCONIFORMES

south is uncertain since not obtained by the recent scientific bird surveys in Andhra, Madras, Mysore or Kerala. Absent in Ceylon. There is an old specimen from Kotagiri, Nilgiri Hills, from the Hume Collection in the British Museum, and another recorded as shot off a nest in Mysore by J. Davidson some 70 years ago. In Assam it occurs (*vide* Baker) north and south of the Brahmaputra river, and also in Manipur. Affects wooded country, chiefly plains, with open expanses and cultivation, *contra* the Greater Spotted which is restricted to the neighbourhood of jheels and marshes; to confound the observer, however, it is sometimes also found side by side with the latter!

Eagles are notoriously difficult birds to identify in the field, and often even in the hand, without experience and adequate comparative material. There has undoubtedly been a great deal of confusion in their identification and distributions in the past, which partly persists today. Therefore all records unsupported by specimens, except in the case of very common and well marked species, must be treated with caution.

Extralimital. N. Burma (needs confirmation).

GENERAL HABITS. Not markedly different from *A. clanga* (170) except that it is not so narrowly dependent on jheels and marshes. A courtship display of nose-dives and upsweeps — of a pattern common to many raptorial birds, e.g. Tawny Eagle q.v., has been described for the nominate race in Europe (H. Siewert 1932, *Jour. Orn.*: 9-10). Prey is largely captured on the ground while the bird saunters about in the open in its search, bill pointing intently downward. It is seized in the claws.

FOOD. Frogs, lizards, young or weakling birds, field rats and mice, etc. Apparently silkworm pupae from cocoons largely eaten in Bengal. Has been observed purposefully tearing open the globular nests of Pied Mynas (*Sturnus contra*) to get at the young. Often lives by piracy, chasing and bullying Pariah Kites into jettisoning their lawful prize.

VOICE AND CALLS. 'A very high-pitched cackling laugh' (Baker). Nothing else specifically recorded.

BREEDING. Season, April to July, the majority of birds apparently laying in May. Nest, a large platform of sticks and twigs, some with leaves attached — of the typical eagle pattern. Built between c. 10 and 25 m. up in a large tree — simul (*Salmalia*), sal (*Shorea*), mango (*Alangifera*), peepul (*Ficus*), and such-like — either standing by itself or one of a clump in cultivated country, often near a village. Eggs, normally 1, sometimes 2, rarely 3. Similar to those of *A. clanga* (170) but readily distinguished by smaller size and richer marking; also resembling Tawny Eagle's, q.v. Average size of 22 eggs 63.8 × 49.8 mm. (Baker). Both sexes share in the domestic chores; the male chiefly collecting material and foraging, the female building the nest and feeding the young. Incubation by female alone; period c. 42-44 days (in nominate race *vide* Siewert). Circumstantial evidence (as yet unproven) that if disturbed at nest, e.g. by man climbing up, the bird will transfer its eggs to an alternative old nest in the vicinity.

MUSEUM DIAGNOSIS. As in *A. clanga* nostrils round; as high as broad. Differs from it by smaller size and slenderer bill, less high at base. 7th primary (as.) usually more than 6 cm. shorter than longest, with its outer web only slightly narrowed and notched near tip, *contra* in *A. clanga*, q.v.

284

FALCONIFORMES

Hawk-Eagle (160), but its much broader-wings are a leading clue. Mostly seen in flight when black plumage, narrowly grey-barred tail — longer than most eagles' — and bright yellow cere and feet are diagnostic. Wings very long and broad with rounded tip and exceptionally widely splayed and upturned primaries. Sexes alike; female larger.

At a distance, in sailing flight, outlines reminiscent of Golden Eagle — broad wings held in a wide V above line of back. When overhead a pale patch on dark underside of wings conspicuous, as also is, at close range, a white patch under the eye.

Young (immature). Above, paler brown stippled with buffy brown on head, nape, and neck. Upper tail-coverts fringed with white. Below, throat and breast with oval drops of fulvous-brown. Abdomen and flanks dark-streaked.

STATUS, DISTRIBUTION AND HABITAT. Resident. Widely but patchily distributed in evergreen and moist deciduous forest biotope; foothills and up to c. 2700 metres altitude in the Himalayas, and c. 2000 m. in the peninsular hills. From W. Pakistan (Murree, Rawalpindi dist.), through Himachal Pradesh and Nepal to E. Assam, E. Pakistan (?), W. Bengal, Orissa, E. Ghats in Andhra and Madras (including Shevaroy Hills), Madhya Pradesh (Hoshangabad and Bastar dists.). Ceylon and the W. Ghats strip from Kanyakumari northward at least to Goa and N. Mysore (including the Nilgiri and Palni Hills). Well documented sight records from Gujarat (Jambughoda, c. 22°26'N., 73°48'E.) and from within a 50 km. radius of Bombay City.

Extralimital. Burma (Chin Hills and Tenasserim), Thailand, Malay Peninsula. The somewhat smaller nominate race occurs in Java, Sumatra, Borneo, Celebes, and Sula Islands.

GENERAL HABITS. Partial to hill forest. Usually seen in pairs sailing gracefully and effortlessly on the enormous outspread wings within a foot or two above the forest canopy or gliding expertly in and out among the boles and foliage of the lofty trees, side-slipping and diving to avoid obstructions. The exceptionally widely splayed and upturned primaries function as ailerons and enable sailing at very low air speeds over and through the tree-tops while methodically searching for birds' nests — eggs and nestling birds forming an important part of its dietary. It has been observed flying off with entire nests of small birds in its claws examining the contents while sailing lazily away. The peculiar foot is believed to have some adaptive significance for nest robbing. Nearer the ground its hunting is very much like a harrier's — sailing on motionless wings up and down along the contours of a grassy hillside, peering intently below for movement, checking suddenly and turning upon itself when opportunity offers, and dropping into the grass to seize the quarry.

In the breeding season pairs indulge in impressive aerial displays, plunging with wings held down and forward, circling round each other and mutually stooping with wings folded to tail-tip, at astounding velocity. These manoeuvres are accompanied by shrill yelping cries.

FOOD. Large insects, frogs, lizards, rodents, birds — sometimes reportedly kills junglefowl and pheasants. But chiefly birds' eggs and nestlings. Among crop and stomach contents specifically recorded are: nestlings and incubated

eggs of *Garrulax* spp., eggs of *Perdica erythrorhynchos*, *Turdoides* spp., *Streptopelia* spp., small bats (sp. ?) and in one case 'six or more young field mice'.
VOICE AND CALLS. Normally silent. Shrill yelping cries uttered while darting and swooping at each other in aerial courtship — *kíp, kíp, kíp* or *kee, kee, kee* slowly repeated.
BREEDING. Season, mainly November to March in South India; apparently between January and April in the north. Curiously enough nesting not yet recorded in Ceylon. Nest, a rather neat and compact platform of sticks and twigs lined with green leaves. Built high up in a lofty tree in evergreen hill forest between c. 300 and 1200 metres altitude, usually hidden by the foliage. As in several other eagles, e.g. *Lophotriorchis* (1965), sometimes has two alternate nests, a short distance from each other, repaired and used irregularly in successive years. Eggs, normally a singleton, very rarely 2, broad oval in shape, handsome and variable in coloration. Most commonly whitish or pinkish in ground colour, finely and densely stippled with pale brick-red. Average size of 22 eggs 62.7 × 49.9 mm. (Baker). Although usually keeping in pairs and seemingly paired for life, if one bird is killed the survivor secures a new mate within a surprisingly short time. Share of the sexes in the nesting activities, period of incubation and other details unrecorded.

MUSEUM DIAGNOSIS. As for the genus. A whitish area, including upper throat, from base of bill to around eyes and behind ear-coverts. Chin and gular stripe black.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	520-523	37-38	69-73	285-312 mm.
♀♀	538-568	—	—	(Baker)

It is clear that Baker's measurements (above) refer only to the smaller South Indian and/or Ceylon birds. Specimens from Ceylon in the British Museum give:

	Wing	Bill (from feathers)	Tarsus	Tail
2 ♂♂	543, 547	40, 40.5	30, 30	303, 307 mm.
1 ♀	558	43	33	312 mm.
2 o?	522, 538	39, 40.5	28.5, 30	295 (1)mm.

As against this 4 specimens recently collected by Biswas in Nepal measure:

	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	563-580	40-43	—	315-326 mm.
1 ♀	600	46	—	350 mm.

and six specimens from Sikkim and Dhutan:

	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	563-576	42(1)	94(1)	379(1) mm.
3 ♀♀	580-610	48(1)	86(1)	335(1) mm.

Wing span 1 ♀ 187 cm.
Weight 1 ♂ 1000, 1 ♀ 1600 gm. (SA).

COLOURS OF BARE PARTS. Iris dark brown. Bill greenish- or plumbeous-horny with black tip; cere and gape yellow. Legs yellow; claws black.

water; only rarely by plunging. But will also take duck and small mammals on occasion; and carrion. One has been recorded frequenting a rubbish dump near Quetta Cantonment.

VOICE AND CALLS. A low yelping noise reminiscent of a puppy dog (T. J. Roberts).

BREEDING. Extralimital.
MUSEUM DIAGNOSIS. Feathers of hindneck and breast long lanceolate, but not forming a ruff as in *H. leucopyphus*. Upper tail-coverts very long and broad. For details of plumages, structure, etc. see Withersby 1939, 3: 93-5.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	593-632	c. 61	c. 85	285-325 mm.
♀♀	640-686	c. 65	—	318-352 mm.

(Baker)

COLOURS OF BARE PARTS. Iris, adult yellow, imm. brown. Bill and cere yellow; browner in young birds and blackish brown in the youngest. Feet yellow (Baker).

173. **Whitebellied Sea Eagle.** *Haliaeetus leucogaster* (Gmelin)
Falco leucogaster Gmelin, 1788, Syst. Nat., 1(1): 257
(Prince's Island, Indonesia, designated by Stresemann, 1950, Auk, 67: 82)
Baker, FBI No. 1778, Vol. 5: 111
Plate 14, fig. 1 and Plate 15, fig. 6

LOCAL NAMES. *Kohassa* (Hindi); *Sāmp mār* (in Orissa); *Āla gāddā* (Telugu); *Kāddā āli* (Tamil); *Muhudu rajaliya* (Sinhala); *Kānkan* (Kanara and Konkani); *Muttayya* (in Car Nicobar). Greybacked Sea Eagle of Jerdon.

SIZE. Kite +; length c. 66-71 cm. (26-28 in.).
FIELD CHARACTERS. A large, handsome eagle, ashy brown above with pure white head, neck, underparts, and terminal third of tail. Sexes alike; female larger.

In overhead aspect the broad blackish border on trailing edge of white underwing, and white wedge-shaped tail, are diagnostic features. In sailing flight wings held in a wide V above line of back. At rest, closed wings reach end of tail or a little beyond.

Young (immature). Dark brown with head and neck fulvous (almost whitish). Wedge-shaped tail white or whitish, with the terminal portion brown but pale tipped. Upper breast brown; rest of underparts fulvous or rufous-white, mixed with brown.

STATUS, DISTRIBUTION AND HABITAT. Resident. The seaboard and offshore islands from about the latitude of Bombay (c. 19°N.) down the west coast and up the east to E. Pakistan. Laccadive Is., Ceylon, Andaman and Nicobar Islands. Affects sea coast, and tidal creeks and estuaries. Occasionally met a few miles inland along tidal rivers and at freshwater lakes. A vagrant in Gujarat, one recorded near Ahmedabad c. 80 km. inland from sea coast, and another at the mouth of Shatrungi river, Saurashtra.

Extralimital. Coasts of Burma, Malay Peninsula and Archipelago east to Australia, Tasmania and W. Polynesia (Peters).

GENERAL HABITS. Usually seen in pairs or singly, perched upright on a fishing stake or islanded rock or tall tree overlooking the sea, or sailing majestically along the shoreline beyond the surf zone. From a height of

Genus *HALIAEETUS* Savigny

Haliaeetus Savigny, 1809, Descr. Egypte, Ois., 1: 68, 85. Type, by monotypy, *Haliaeetus* *minor* Savigny = *Falco albicilla* Linnaeus

Bill stout; culmen straight at base, then greatly curved; festoon generally well marked but variable. Nostrils rounded. Wings very broad; primaries comparatively little longer than secondaries. 3rd primary (as.) longest; 4th and 5th only slightly shorter. Tail rounded or wedge-shaped. Tarsus stout, moderately long; 1/8 to 1/4 feathered in front; rest scutellated in front and on toes, reticulated elsewhere. Claws grooved underneath.

Genus almost cosmopolitan, absent in S. America. Three species in Oriental Region.

172a. **Whitetailed Sea Eagle.** *Haliaeetus albicilla* (Linnaeus)

Falco albicilla Linnaeus, 1758, Syst. Nat., ed. 10, 1: 89 (Sweden)
Baker, FBI No. 1777, Vol. 5: 110
Plate 14, fig. 4 and Plate 15, fig. 8

LOCAL NAMES. None recorded.
SIZE. Kite +; length c. 69-86 cm. (27-34 in.).

FIELD CHARACTERS. A huge dark brown eagle with paler (whitish) head, neck and upper breast, and shortish distinctive white wedge-shaped tail. Sexes alike; female larger.

In overhead aspect the very broad wings, and comparatively short tail give a vulture-like appearance, but shape and colour of tail diagnostic.

Young (immature). Variable dark brown. Pale fulvous bases of feathers showing through, especially on underparts which look fulvous broadly streaked with dark brown. Tail mottled and edged with brown.

STATUS, DISTRIBUTION AND HABITAT. Casual winter visitor to Pakistan — Baluchistan, Sind, Punjab, NWFP. For specific occurrences see Roberts & Savage, 1969, JBNHS 66(3): 619-21. Recorded also in Himachal Pradesh (Kulu, Donald); Kutch (Mundra, Himmatsinhji, 1970, ibid. 67(2): 330); and Rajasthan (Bharatpur, Duke *et al.*, ibid. 72(1): 199). Essentially a sea eagle but wanders from the coast up large rivers and to jheels and inundations.

Extralimital. 'Breeds in Greenland, Iceland, northern British Isles (formerly), N. Europe and Asia east to Anadyr and Kamchatka south to the eastern Mediterranean (formerly Egypt and the Red Sea), Iraq, Iran, and Japan. Casually or in winter to N. Africa, NW. India, S. China and Aleutian Islands' (Peters).

GENERAL HABITS. Sluggish. Will sit hunched up and inert for hours together on a stump or on ground at edge of water. Lives largely on fish which is scooped up in its talons from near the surface while sailing close above

15 or 20 metres, with wings pulled in, a bird will stoop at tremendous speed and cleanly pick up in its stride a sea snake or fish from near the surface, its feet seeming hardly to touch the water before it deftly rises again with the quarry dangling from its talons. It is carried to a favourite branch or rock — strewn with bones of sea snakes and fish and whitened with evidences of numerous past meals — and torn to pieces and devoured. Does not plunge for fish like osprey. In the non-breeding season the old nest frequently serves as dining table, larder, and refuse dump, the leavings providing an excellent index to the ornithologist of the food items and their abundance at any particular time and place. In courtship, pairs indulge in the same pattern of aerobatics common to many birds of prey — stooping playfully, somersaulting, side-slipping, looping-the-loop and similar antics. Pairs keep together throughout the year, and roost on or near the traditional nest tree.

FOOD. Predominantly sea snakes (Hydrophiinae); largely also fish, some of considerable size. Reported to take crabs, rats, and any living thing it can catch, besides dead fish cast overboard from fishing boats. When feeding nest-young occasionally becomes a serious chicken robber near fishing villages; recorded carrying off a domestic duck and a striped piglet.

VOICE AND CALLS. Very noisy during breeding season. At this time, particularly just prior to copulation, the female utters a loud, nasal, metallic *kānk-kānk-kānk-kānk*, etc. the male responding with a shorter quick-repeated *ken-ken-ken-ken*, etc. (up to ten times) and continued for over three minutes or more with short breaks; this in an uneven duet. Female also utters *kānk-kānk-kānk* during copulation, now rather long drawn and slower in tempo, ending up ecstatically as in young koel (*Eudynamis*) receiving food from fosterer. Whether calls of male and female different, or common but dependent on context and occasion, uncertain. A single loud nasal clang also uttered from time to time reminiscent of Black Ibis's call (*Pseudibis papillorotus*), but louder.

BREEDING. Season, October to January. Nest, an enormous platform of sticks and twigs, often 1-25 to 1-50 metres across and some 50 to 75 cm. thick, the result of repairs and annual accretions. Placed 10 to 50 metres up in lofty trees such as casuarina growing on the coast or on an off-shore islet; sometimes directly on a rocky stack in the sea. Usually a single pair with a vast territory, but not uncommonly several pairs and nests on the same small island. The same nest and site are used year after year, sometimes becoming traditional and legendary, and occupied by 'the same' pair for 50 years and more. It is not known how the tenancy of a nest passes from one pair to its successor when the need arises. Nor where the young disperse after fledging, since local populations do not show any appreciable fluctuation. Evidently infertility in eggs is high and mortality among nestlings heavy. Eggs, almost invariably 2, broad to longish white ovals, unmarked. Average size of 32 eggs 77.7 × 53.4 mm. (Baker). Both sexes share in

HAWKS, VULTURES, ETC.

289

building and repairing the nest; apparently the male does some of the incubating as well. Period unrecorded.

MUSEUM DIAGNOSIS. No lanceolate feathers on breast or hindneck. Legs exceptionally powerful. Adult: tail brown with broad white ending. Immature: tail variegated and mottled brown and white. Head nearly always lighter than back.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	526-589	c. 48-55	c. 92-99	208-260 mm. (Baker)
♀♀	588-606			

COLOURS OF BARE PARTS. Iris hazel-brown. Bill dark leaden; cere paler bluish grey. Legs and feet pale yellowish white to greyish white; claws darker.

174. Ringtailed or Pallas's Fishing Eagle. *Haliaeetus leucoryphus* (Pallas)

Aquila leucorypha Pallas, 1771, Reise Versch. Prov. Russ. Reichs, 1: 454
(Lower Ural river)

Baker, FBI No. 1779, Vol. 5: 112.

Plate 14, fig. 5 and Plate 15, fig. 9

LOCAL NAMES. *Machharang*, *Machhmanga*, *Dhank*, *Patras* (Hindi); *Koral*, *Machhal* (Bengal); *Kankam* (Nepal); *Kural haaz* (Sind); *Kokna*, *Ugur* (C. India and on the Ganga at Rajmahal); *Sorail*, *Koolais* (local in Bihar).

SIZE. Kite+; length c. 76-84 cm. (c. 30-33 in.).

FIELD CHARACTERS. A large dark brown eagle with pale golden brown head and neck, and a broad white subterminal band across rounded (not wedged-shaped) tail, particularly conspicuous in flight though tail seldom spread out, and appearing rather narrow. Sexes alike; female slightly larger.

When sailing, wings held in same plane as body, the tips of the primaries slightly downcurved.

Young (immature). Dark brown, the wing quills and tail (unbanded) very dark. Ear-coverts dark. Underparts paler and greyer.

x.c.1

STATUS, DISTRIBUTION and HABITAT. Resident and partly migratory—W. Pakistan and N. India up to c. 1800 m. alt. in the Himalayas, from Kashmir, Himachal Pradesh, Punjab, Nepal (Valley and lowlands) through the Gangetic Plain east to Assam and E. Pakistan, south to a line roughly from Surat (21°10'N.) to Gopalpur (19°20'N.) south of Chilka lake in

HAWKS, VULTURES, ETC.

291

prize. At large breeding heronries, e.g. Keoladeo Ghana, Bharatpur, obtains good and easy living by marauding nests of white ibises, openbill storks, etc. Young darters (*Anhinga*) when half to three-quarters grown are particularly relished, the eagle sailing leisurely over the nest trees and picking its choice of the fat squabs. Every time it sails or skims over the nest colony the adults set up a chorus of deep long-drawn grunting 'alerts' which sounds like a continuous roar heralding the marauder's progress. At the same time all the birds train their bill-points at the eagle as if to ward off the threatened onslaught. Also works havoc among flightless young terns in river-bed colonies. In winter subsists largely on immigrant coots, making constant raids on the swimming herds and scattering them. Its strategy is to isolate one individual and stoop on it repeatedly as it surfaces for breath until it is exhausted and can be seized and borne away hanging limply from the talons. Occasionally both birds of a pair will take turns in this process of attrition. Has been observed to sit on a struggling victim in shallow water for some minutes in a seemingly deliberate attempt to drown it.

FOOD. Chiefly fish, but also water-birds such as coots and purple moorhens. Wildfowl as large as Barheaded Goose falling to a sportsman's gun snatched from almost under his nose. Sometimes even large uninjured birds like Demoiselle crane are killed. Snakes, frogs, mud turtles and carrion also recorded, and in one case an entire dead cat was carried off. In a nest near Hardwar (U.P.), B. B. Osmaston found three young eaglets together with the arm of a man, doubtless off a corpse floating in the Ganges. Takes heavy toll of young geese (*Anser indicus*) in Ladakh.

VOICE and CALLS. Loud, far-carrying raucous shrieks very like the creaking of the unoiled wooden block tackle of a village well. Reminiscent of 'a hoarse Pekinese barking and very similar to the call of the Whitetailed Sea Eagle, *H. albicilla*' (P. I. R. MacLaren). At very close range, a preliminary low croaking audible; also another note exactly like a hen clucking to her chickens only repeated rhythmically (H. A. F. Magrath).

BREEDING. Commonly to c. 1800 m. alt. in the Himalayas, and more or less wherever found in the plains. *Season*, October to February; mainly November, December, January. *Nest*, a huge stick platform as of No. 173 usually lined with green leaves. Built c. 15 to 35 metres up in a large simul (*Salmaal*), peepul (*Ficus*), chenar (*Platanus*) or other tree, or *Borassus* or coconut palm standing in or near a swamp, river, or lake often on village outskirts. *Eggs*, 2 to 4, usually 3, white, unmarked. Average size of 60 eggs 69.7 x 55.1 mm. (Baker). Both sexes share in building the nest and incubation. Period unrecorded. Both parents forage for and feed the young.

MUSEUM DIAGNOSIS. Adult, with a well-marked ruff of lanceolate feathers. Tail brown with a white cross-band c. 10 cm. broad, c. 8 cm. up from the end. Immature: Feathers of breast lanceolate; with a distinct ruff. Tail variegated and mottled brown and white.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	555-578	50-55	100-103	271-275 mm.
♀♀	558-598	59-62	98-106	274-291 mm. (Baker)

290

FALCONIFORMES

Orissa. Affects the neighbourhood of large rivers, tidal creeks, and inland lakes and jheels.

Extralimital. 'S. Russia through C. Asia to Transbaikalia and south to the Persian Gulf, N. India and N. Burma' (Peters).

MIGRATION. No specific data, but from the large numbers to be seen in summer in the treeless Kailas-Manasarovar region of W. Tibet, dotted about the meandering streams and bogs (Sálim Ali, JBNHS 46: 304) it is reasonable to surmise that these eagles migrate for reproduction purposes to our area. Suitable conditions for this include not only tree sites but also a plentiful fish supply for the young, which is unlikely to be obtainable in Tibet in winter due to freezing of the streams. According to Biswas it is very common and conspicuous [breeding] about the 'Salt Lakes' near Calcutta between October and April, but disappears during the hottest months, about May to September. This is good corroborative evidence.

Haliaeetus leucoryphus

Overall range

GENERAL HABITS. Normally seen perched on a mound, fishing stake or tree-top by a jheel, or on a sandbank in a river, or sailing aloft in wide circles uttering its loud creaking call from time to time. Particularly noisy during the breeding season when pairs indulge in aerobatics of the typical raptor pattern. Hunts fish by hurling itself on one near the surface and carrying it off in its talons. Does not plunge in like Osprey. Sometimes fish of large size are struck—once one weighing 6 kg. Being unable to lift such heavy weights clear, the bird is obliged to drag the quarry along the water till it can be beached on a shelving bank, and there devoured. Also obtains its food by pirating on ospreys, Brahminy kites, and marsh harriers, attacking and chasing them with determination and depriving them of their lawful

FALCONIFORMES

292

COLOURS OF BARE PARTS. Iris greyish yellow to yellow. Bill dark slaty black or plumbeous; cere and gape paler. Legs and feet dull white, yellowish white, or dull yellow; claws black.

Genus *ICTHYOPHAGA* Lesson

Ichthyophaga Lesson, 1843, Echo du Monde Savant (2), 7: col. 14. Type, by monotypy, *Ichthyophaga javana* Lesson = *Falco ichthyaeetus* Horsfield

In some respects very close to *Pandion*, but unlike it the feathers have aftershafts as in true eagles (*Aquila*). Tarsus very powerful, feathered on upper third or half; scutellated in front and behind, reticulated at sides. Toes equally powerful, scutellated above, with enormous strongly curved claws not grooved underneath. Soles of feet densely covered with little spicules for grasping slippery prey (fish). Outer toe reversible as in *Pandion* but to a lesser extent. Wing rounded; 4th and 5th primaries (as) longest and subequal; 1st primary shorter than secondaries. Tail moderately long; slightly rounded.

The genus contains two species confined to the Oriental Region.

Falco Ichthyaeetus Horsfield, 1821, Trans. Linn. Soc. London, 13(1): 136 (Java)
Baker, FBI No. 1780, Vol. 5: 114

Plate 14, fig. 2 and Plate 15, fig. 7

LOCAL NAMES. *Madhura* (Hindi); *Machmoral* (Bengal); *Na dooling gadaba* (Cachari).

SIZE. Kite+; length c. 74 cm. (29 in.).

FIELD CHARACTERS. Adult. *Above*, head and neck grey; crown, nape, and upper back light brown. Rest of upperparts dark brown; wing quills blackish. *Below*, breast paler brown than back. Abdomen, flanks and tail white, the last with a blackish terminal band 5 to 8 cm. broad. Sexes alike

In overhead aspect the comparatively short white black-bordered tail, brown breast, and white abdomen and vent diagnostic.

Young (immature). *Above*, Dark brown, the feathers edged with pale greyish. Wing quills barred. Head and neck brown streaked with whitish. *Below*, chin, throat, and sides of head greyish. Breast and flanks pale brown broadly streaked with white. White portions of abdomen, flanks and tail heavily mottled with brown.

HAWKS, VULTURES, ETC.

293

STATUS, DISTRIBUTION AND HABITAT. Resident. Widely though sparsely distributed except in W. Pakistan and north-west of Delhi (Punjab etc.), and in arid semi-desert biotope. East to Assam and E. Pakistan (commonest in W. Bengal, Bihar, E. Pakistan and Assam), south from the Himalayan terai and foothills to Kerala. Also Nepal (though no recent record). Affects the neighbourhood of perennial, comparatively sluggish streams, rivers, and lakes and tidal lagoons (Bengal), in well-watered, well-wooded plains country.

Extralimital. Burma, Malay Peninsula, Philippines, Greater Sunda Islands and eastward to Celebes (Sulawesi).

GENERAL HABITS. A predominantly fish-eating eagle, met singly or in widely spaced pairs sitting bolt upright on boughs overlooking clear shingly perennial streams and rock pools in forest — in more or less the same facies as favoured by the Storkbilled Kingfisher. Rather sluggish, and with a heavy-looking though rapid flight, the wing-beats sharp and full. Soars and circles aloft much less frequently, and for shorter periods, than most other eagles. Fish captured from near the surface by swooping from the air, while quartering a likely reach of river, but chiefly from a lookout perch. Does not plunge like osprey. Very noisy during breeding season. Courtship display not recorded.

FOOD. Almost exclusively fish, some of very large size which, being too heavy to lift clear of the water, are dragged along to the bank. When feeding nest-young may take birds and small mammals; thus remains of junglefowl and squirrels recorded near nest.

VOICE AND CALLS. A weird, clanging cry, loud and far-carrying, of the timbre of a Grey Hornbill's (*Tockus birostris*) 'laugh' or peacock's *may-awe*. Uttered singly as a shout or a succession of screams, on the wing or from a concealed perch.

BREEDING. *Season*, mainly November to January. *Nest*, an enormous platform of sticks and twigs sometimes up to 1.50 m. across and 1 m. thick — the result of additions year by year. Frequently maintains two (or three?) alternative nests within a mile or so of each other, used irregularly in successive seasons. Built 10 to 30 metres up in or at the top of large trees such as *Salmaal*, *Terminalia* or *Albizzia* near a forest stream or tank. The pair roosts in the proximity of one of the nests throughout the year. *Eggs*, normally 2, occasionally 3, very rarely 4. White, unmarked, similar to but proportionally longer than those of *Haliaeetus leucorhphus*. Average size of 20 eggs 68.5 × 51.9 mm. (Baker). Both sexes share in nest-building and repair, as well as in incubation and nest-feeding. Incubation period 28–30 days; young remain in nest c. 10 weeks (*vide* Baker).

MUSEUM DIAGNOSIS. All tail-feathers white on basal two-thirds; blackish brown on terminal one-third. Differs from the Ceylon race (176) in being larger.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	450–515	47–54	92–100	248–280 mm. (Baker)

COLOURS OF BARE PARTS. Iris: adult, bright golden yellow; immature, brown or mottled with brown; nestling, blue-brown. Bill dark horny brown; base bluish

HAWKS, VULTURES, ETC.

295

pair of tail-feathers dark brown throughout, with broad blackish subterminal band and pale tip. Sexes alike.

In overhead aspect the different tail pattern readily distinguishes it from 175.

Y o u n g (immature) differs from adult as in 175.

Ichthyophaga nana

Residential range I. n. plumbea, 2 I. n. nana

STATUS, DISTRIBUTION AND HABITAT. Resident, Kashmir and Himachal Pradesh, east through Nepal to eastern Assam and E. Pakistan (?), from the foothills to c. 2400 metres altitude. The optimum zone is apparently between c. 1000 and 1500 m. in Kashmir; under 1000 m. in the eastern Himalayas. In winter wanders into the adjoining terai and plains of the Punjab, Rajasthan (Sariska), U.P. and Bihar — once as far south as Melghat (c. 21°40'N., 77°10'E.), Madhya Pradesh (D'Abreu). Affects clear rapid forest streams in the foothills and terai, and jheels and irrigation tanks rarely even comparatively open reaches of rivers.

Extralimital. Upper Burma. Represented in L. Burma and Malaysia to Sumatra by the smaller nominate race.

GENERAL HABITS. Not appreciably different from 175. When disturbed sitting rather hunched up on a low snag or rock amid stream in forest, rises perpendicularly with a series of slow owl-like flaps to clear the tall trees fringing the banks.

FOOD. Like 175, almost exclusively fish. Sometimes destructive to trout in Himalayan streams.

VOICE AND CALLS. Very noisy when nesting. Incubating bird greets arrival of mate at nest by 'a succession of querulous shouts and cackles,

FALCONIFORMES

294

plumbeous; cere brown. Legs and feet china white to dull pale yellowish grey; claws black.

176. Ceylon Greyheaded Fishing Eagle. *Ichthyophaga ichthyaetus plumbeiceps* Baker

Ichthyophaga ichthyaetus plumbeiceps Baker, 1927, Bull. Brit. Orn. Cl., 47:150 (Trincomalee, Ceylon)

Baker, FBI No. 1781, Vol. 5: 116

LOCAL NAMES. *Wēwa rājaliya*, *Lāl māra* (Sinhala); *Vidai āli* (Tamil). 'Tank Eagle' of local birdwatchers.

SIZE. Kite+; length c. 69 cm. (27 in.).

FIELD CHARACTERS. As in 175.

STATUS, DISTRIBUTION AND HABITAT. Race peculiar to Ceylon. Fairly plentiful. Affects the jungle borders of irrigation tanks, coastal lagoons and estuaries, and the larger rivers in the low-country dry zone.

GENERAL HABITS AND FOOD. As in 175.

VOICE AND CALLS. 'A loud unmusical, rather weird shout with a curious gurgling quality — *awh awhrr*, etc. Uttered early morning and late evening and sometimes far into the night — especially in the breeding season' (G. M. Henry).

BREEDING. *Season*, December to March. *Nest* and site similar to those of the Indian bird. *Eggs*, only 1 or 2 recorded; dirty white measuring c. 64 × 51 mm. (Baker).

MUSEUM DIAGNOSIS. Differs from the nominate race by smaller size, and in most adult birds being perhaps less cinereous brown above.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	420–435 (once 445)	c. 46	c. 85–90	232–242 mm. (Baker)

COLOURS OF BARE PARTS. As in Indian birds.

177. Himalayan Greyheaded Fishing Eagle. *Ichthyophaga nana plumbea* (Jerdon)

Polioetus plumbeus 'Hodgson' = Jerdon, 1871, Ibis: 336 (North-western Himalayas) Baker, FBI No. 1783, Vol. 5: 117

Plate 14, fig. 3 and Plate 15, fig. 5

LOCAL NAME. *Na daoling kashiba* (Cachari).

SIZE. Kite±; length c. 64 cm. (25 in.).

FIELD CHARACTERS. Very similar to Greyheaded Fishing Eagle (175) except that the head is purer grey, less brown on crown, with the feathers black-shafted above and below. Basal two-thirds of tail mottled brown and white looking greyish instead of pure white; terminal third blackish. Central

FALCONIFORMES

296

not unlike a very small child crying. In the distance this sounds distinctly plaintive and childlike, but at close quarters querulous and unpleasant' (C. H. Donald).

BREEDING. *Season*, chiefly March, April, May. *Nest*, as in 175 a huge pile of sticks and twigs attaining enormous proportions by addition of more material year by year since the same nest is used for a great many years in succession; usually well lined with green leaves. Built in tall trees in forest on or near a river bank. *Eggs*, 2 or 3, small replicas of those of the larger Greyheaded species. Average size of 28 eggs 65.2 × 50.3 mm. (Baker). Share of the sexes in the domestic chores unrecorded.

MUSEUM DIAGNOSIS. Central tail-feathers brown throughout, darker and paler-tipped on terminal third, *contra* white with broad blackish terminal band in *l. ichthyartus*.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	435–495	40–46	78–91	223–248 mm. (Baker)
3 ♂♂ recently collected in Nepal measure:		(from skull)		
	426–467	43–48	—	215–238 mm. (Biswas)

COLOURS OF BARE PARTS. 'Iris golden yellow. Bill black, plumbeous on base and lower mandible; cere slaty. Legs and feet dull white with bluish tinge at "knees" and on the digits; claws black; pads dirty white' (Biswas).

Genus SARCOGYPS Lesson

Sarcogyps Lesson, 1842, Echo du Monde Savant (2), 6, col. 1038. Type, by monotypy *Vultur ponticrianius* Latham = *Vultur calvus* Scopoli

Distinguished by the possession of a large wattle of skin behind and below each ear. Skin of head and neck bare without any down. Ruff even smaller than in *Aegypius*, q.v.

See Field Key in Appendix.

178. Black or King Vulture. *Sarcogyps calvus* (Scopoli)

Vultur calvus Scopoli, 1786, Del. Faun. et Flor. Insubr., 2: 85 (Pondicherry, ex Sonnerat)

Baker, FBI No. 1706, Vol. 5: 9

Plate 16, fig. 7, Plate 17, fig. 8 and Plate 18, fig. 4

OTHER NAME. Pondicherry Vulture.

LOCAL NAMES. *Rāj gūh*, *Mulla gūh*, *Bhōorra* (Hindi); *Rāj shaloon*, *Kāla shaloon* (Bengal); *Kannara gūh* (Bihar); *Lāl gūh* (Cachar); *Rāj hegōn* (Assam); *Loong nong loong* (Lepcha); *Nilla tōra d* (Telugu).

SIZE. Whitebacked Vulture ±; length c. 81 cm. (c. 33 in.).

HAWKS, VULTURES, ETC.

297

FIELD CHARACTERS. A huge black vulture readily identified by its deep yellowish red naked head and neck, thighs and legs. White patches at base of neck and on upper thighs are additional pointers. When sailing aloft the red head, white breast- and thigh-patches, and a thin whitish band along underside of outstretched wings conspicuous, even at long range. Wings rather pointed with moderately splayed 'fingertips'; held above plane of back in a wide V. Sexes alike.

x c. 1

Young (immature). Above, brown, scalloped paler. Crown covered with white down; neck partly feathered. Below, crop white; breast, anterior flanks and abdomen pale brown; posterior flanks and abdomen, and under tail-coverts, white.

STATUS, DISTRIBUTION and HABITAT. Resident. Throughout the Indian Union, both Pakistans, Nepal, up to c. 2000 metres altitude in the Himalayas locally. Not Ceylon. Sparse and nowhere numerically abundant. Affects the open countryside — chiefly deciduous and semi-desert biotope — in the neighbourhood of habitations.

Extralimital. Burma, Thailand, Malay Peninsula, S. Viet Nam.

GENERAL HABITS. Much less gregarious than the other large vultures. Even at animal carcasses seldom more than a solitary or a couple present among the seething rabbles of Whitebacks and others. Very rarely, however, pure gatherings of up to 20 or 30 birds may be met. Called 'King' Vulture because of a spurious reputation for boldness and overbearing pugnacity inspiring awe amongst its fellow feasters and thus monopolizing a carcass until it has had its pick of the choicest titbits. In actual fact it may usually be marked out as the timidest member of the vulture gatherings at wayside carcasses. It keeps itself deferentially aloof of the scrimmage, only venturing forward surreptitiously now and again in obvious nervousness to tug at a goblet, and withdrawing hurriedly when overwhelmed by the press. It is a powerful bird and in spite of its size and weight can lift itself off the ground by a few wing-strokes even when fully gorged.

FOOD. Almost exclusively carrion. In common with other vultures highly beneficial as a scavenger, disposing quickly of animal carcasses from the precincts of villages where they would otherwise putrefy and breed disease. Once recorded swooping on a wounded Greenshank (*Tringa nebularia*)!

VOICE and CALLS. 'A hoarse croak, with a sort of scream affixed to it when quarrelling at a carcass' (T. R. Bell). A raucous 'roaring' during copulation.

BREEDING. Season, overall December to April, earlier in the plains, later in the lower Himalayas; most generally February and March. Nest, a large platform of sticks and twigs, untidily lined with straw and leaves; less massive and thick than of many eagles. Built c. 9 to 12 metres up on the top of a large tree like peepul (*Ficus*) or mango (*Mangifera*) often near a village.

HAWKS, VULTURES, ETC.

299

FIELD CHARACTERS. A huge, uniformly black or blackish brown vulture with naked leaden pinkish neck surrounded by a distinct blackish (not white) ruff. Partially naked head conspicuously broader than in other vultures. Crown, occiput, lores and cheeks covered with black fur-like feathers and down. No fleshy wattles on sides of neck. Sexes alike.

x c. 1

In overhead aspect dark plumage above and below, absence of white crop- and thigh-patches, broader wings without whitish stripe, and slightly wedge-shaped (v. rounded) tail distinguish it from King Vulture (178).

Young (immature). Paler and browner.

STATUS, DISTRIBUTION and HABITAT. Resident (breeding) in the high mountains of W. Pakistan (Baluchistan) and India in Gilgit, Punjab (Lahul), Assam (N. Cachar) and possibly elsewhere along the stretch of the Himalayan Dry Temperate zone between c. 1800 and 3600 m. alt. Rare and sparse winter visitor to Sind, NW, and northern India (including Nepal), Kutch, N. Gujarat and central India, south to about the latitude of Dhulia in Khandesh (c. 21°N.). Affects open savannah and semi-desert country; avoids forest.

Extralimital. 'Breeds locally in S. Europe from Portugal to the lower Danube, the Caucasus and southern Urals to NE. Tibet and E. China, south to N. Morocco, Asia Minor, and the Himalayas' (Peters).

GENERAL HABITS. Very little recorded in India. A rare vulture, seen singly in winter perched on mounds etc. where its enormous size and all-black coloration immediately attract attention. Joins the vulture mobs feasting on wayside animal carcasses where it seems to command a distinct deference from the other species, boldly striding forward through the jostling rabble and helping itself to the repast without let or hindrance. **FOOD.** Carrion. One feeding on dead Painted Stork (*Ibis leucocephalus*) (E. A. Butler). Elsewhere recorded as hunting tortoises and extracting the meat from under the carapace.

VOICE and CALLS. Unrecorded.

BREEDING. Within our limits only recorded in Baluchistan, between c. 2400 and 3000 metres elevation, and in the Barail Range of N. Cachar

298

FALCONIFORMES

In semi-desert areas even on bushes or small trees, e.g. *Prosopis*, barely 2 or 3 metres up. Same nest and/or site used year after year. Egg, a singleton, roundish oval, white, becoming stained and discoloured during incubation. Average size of 60 eggs 83.9 × 66.0 mm. (Baker). Both sexes share in building the nest, incubation, and feeding the young. Incubation period about 43 days.

Copulation on the wing has occasionally been reported, but in the case of such ponderous birds this seems an incredible feat of jugglery! Perhaps only slow-motion cinematography can reveal the actual details of the 'plunges and wing-flappings' of the birds (pair?) towards the ground with claws interlocked — not infrequently seen during aerial courtship in the breeding season — and of two birds sailing with outstretched motionless wings one over the other, so close as to appear almost in contact.

MUSEUM DIAGNOSIS

Chick (in down). 'Crown from level of eyes, and nape, clothed with short close grey-white down; rest of upperparts with longer grey-white. Centre of chin and throat sparsely tufted same. Crop with thicker buff-tinged down; sides of breast and flanks longer pale buff down. Bare skin of face, and upperparts of head and cere pale bluish lead colour in contrast to skin of throat, chin, and neck which is pinkish lead. A bare ring c. 32 mm.-wide round neck from nape, bare with longitudinal flaps of loose skin, a prominent one on each side, being probably the origin of the adult wattles' (Whistler).

MEASUREMENTS

	Wing	Bill (from forehead)	Tarsus	Tail
♂ ♀	600-625	74-80	108-116	226-257 mm. (Baker)

Two recent specimens from Nepal have Wing ♂ 566, ♀ 592; tail ♂ 248, ♀ 250 mm. (Biswas).

COLOURS OF BARE PARTS. Iris yellow, red-brown or crimson. Bill dark brown, yellowish at base of lower mandible. Cere and bare skin of head and neck deep yellowish red; wattles redder. Bare skin on either side of crop and inside thighs duller yellowish red. Legs dull livid fleshy to dull red.

Genus *AEGYPIUS* Savigny

Aegyptus Savigny, 1809, Descr. Egypte, Ois., 1: 68, 73. Type, by monotypy, *Vultur niger* Daudin = *Vultur monachus* Linnaeus

Bill comparatively short, very strong, deep and arching from the cere. Nostrils almost square (with rounded corners); oblique. Head broad and covered with down, short on crown longer on nape. Neck naked with a moderate ruff at base reaching up to its back. Claws grooved below.

Genus monotypic. Found in Southern Europe, temperate Asia, N. Africa.

179. Cinereous Vulture. *Aegyptus monachus* (Linnaeus)

Vultur Monachus Linnaeus, 1766, Syst. Nat., ed. 12, 1: 122

(Arabia, ex Edwards, pl. 290)

Baker, FBI No. 1705, Vol. 5: 7

Plate 16, fig. 6, Plate 17, fig. 7 and Plate 18, fig. 3

LOCAL NAMES. *Kāla gidh* (Hindi); *Gat panom* (Lepcha).

SIZE. Vulture +; length c. 100-110 cm. (40-42 in.).

300

FALCONIFORMES

Aegyptus monachus

■ Breeding range

at c. 1800 m. Season, apparently March and April though eggs have been taken in Assam in January and May. Nest, an enormous mass of sticks and twigs added to year after year; in one case c. 2 metres deep (from base to top) and c. 1.5 m. in diameter. Built right on top of a juniper or suchlike tree 8 to 12 m. high or more, growing on a steep hillside or out of a cliff. Egg, a singleton, very handsome, varying in ground colour from pure white to pale buff or creamy buff and richly marked with deep red, red-brown or purplish brown. Sometimes white, quite unmarked. Average size of 18 eggs taken in India and Turkestan 90.6 × 69.5 mm. (Baker). Share of the sexes in the domestic chores, and incubation period, unrecorded.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.

Chick (in down) about one week old, smoky grey. Cere light pink; bill darkish at tip. Iris yellowish. Legs and feet creamy white; claws black (F. L. Hughes).

MEASUREMENTS

	Wing	Bill (from forehead)	Tarsus	Tail
♂ ♀	756-843	c. 80-88	c. 132-146	350-400 mm. (Baker)

An adult measured 8 ft. 11½ inches (273 cm.) from wing-tip to wing-tip (Delme-Radcliffe).

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, sometimes yellowish at base and on lower mandible; cere pale mauve, plumbeous grey, or almost salmon pink. Naked skin of neck dirty white slightly tinged with red, or livid flesh colour. Legs and feet creamy or pearl white.

HAWKS, VULTURES, ETC.

301

Genus *Gyps* Savigny

Gyps Savigny, 1809, Descr. Egypte, Ois., 1: 63, 71. Type, by monotypy, *Gyps calcaris* Savigny = *Vultur falcatus* Hablitzl

Pseudogyps Sharpe, 1873, Ann. and Mag. Nat. Hist., 11(4): 133. Type, by subsequent designation, *Vultur bengalensis* Gmelin. (Sharpe, 1874, Cat. Bds. Brit. Mus., 1: 11) Distinguished from *Sarcogyps* in having no ear lappets. Head narrower and longer in proportion; bill slenderer and longer. Nostrils very narrow slit-like, vertical or slightly oblique. Ruff at base of neck well developed, consisting of long narrow feathers. Tail-feathers 12 or 14.

Genus represented throughout Africa, S. Europe, SW. and C. Asia.

180, 183. Indian Griffon Vulture. *Gyps fulvus fulvescens* Hume

Gyps fulvescens Hume, 1869, Rough Notes 1: 15, 19 (Punjab)

Gyps indicus jonesi Whistler, 1927, Bull. Brit. Orn. Cl. 47: 74 (Margala Range, Rawal Pindi district)

Baker, FBI No. 1707, Vol. 5: 11

Plate 16, fig. 5, Plate 17, fig. 10 and Plate 18, fig. 8

LOCAL NAMES. Unrecorded.

SIZE. Whitebacked Vulture +; length c. 110-122 cm. (40-48 in.).

FIELD CHARACTERS. Adult. An enormous cinnamon-brown vulture with scrawny, almost naked neck. Head covered uniformly with yellowish white hair-like feathers and down. Underparts pinkish brown with narrow pale shaft-stripes. A prominent whitish ruff of lanceolate downy feathers at base of neck. Sexes alike.

In overhead aspect looks a dirty white with the quills forming a broad black apex and trailing edge to the broad 'splayed finger' wings, and black tail. Cannot be differentiated from Himalayan Griffon (181) on the wing; distinguishable from Cinerous Vulture (179) by whitish underparts and square or slightly rounded (v. slightly wedge-shaped) tail.

Young (immature). Darker fulvous-brown with the ruff browner than in adult.

STATUS, DISTRIBUTION and HABITAT. W. Pakistan (Baluchistan, Sind, Punjab Salt Range) and northern India (including Nepal lowlands). Commoner in the semi-desert areas of W. Pakistan and N. Gujarat, straggling east to W. Assam, south to c. latitude 20° N., occasionally further in the Deccan. Southernmost authentic record, a specimen from Bombay (Kurla) in BNHS coll. Owing to constant confusion in sight records and paucity of collected

HAWKS, VULTURES, ETC.

303

FIELD CHARACTERS. Virtually the largest bird in the Himalayas. A typical vulture, very like 180, but adult sandy white or pale khaki above instead of cinnamon-brown. Below, pale brownish buff with conspicuously broader whitish shaft-streaks than in *fulvescens*. Ruff longer, pale brown streaked with white. Sexes alike. Many intermediate colour phases depending on age.

In overhead aspect, large size, very pale (almost whitish) underside, black tail, black trailing edges of the broad, almost rectangular wings together with their 'splayed finger' tips, and High Himalayan domicile are diagnostic.

Young (immature). Dark brown and chocolate-brown with whitish shaft-stripes, especially broad on ruff and underparts. Wing and tail-feathers nearly black. Overhead aspect very like *Aegypius monachus* except for the white round the crop-patch, the less uniformly dark colouring produced by striped underparts, and the somewhat less broad wings. Confusable also with immature Whitebacked and Longbilled vultures, but much larger and seldom likely to be met together in same habitats.

STATUS, DISTRIBUTION and HABITAT. A purely mountain bird. Resident in the Himalayas from W. Pakistan (NWFP) to Bhutan and E. Assam, normally between c. 600 and 2500 m. altitude, foraging up to 4500 m. and even higher.

Extralimital. Mountains of Afghanistan and Turkestan, Tibet, the Pamirs, and the Himalayas east to W. China.

GENERAL HABITS. Similar to those of Whitebacked Vulture (185) and others of the genus. Normally seen singly or in twos and threes sailing majestically on outspread motionless wings over mountaintop and valley, or sweeping round the rugged contours with astonishing speed and grace, scouting for food. Or it rises on the thermals to immense heights, circling for hours together in the heavens, obviously for fun. Commonly keeps in the neighbourhood of high mountain passes and along well-used trade routes where the stricken pack animals of the caravans provide it with regular sustenance. The birds also follow the flocks and herds of the graziers up to the alpine pastures in spring for any of the animals that may die. The way in which a rabble of 10 to 20 of the great birds will materialize at a carcass on a remote mountain pass from out of the clear blue sky, and the speed and thoroughness with which they will demolish it, is a source of never-failing wonderment. In a few short minutes all that is left of the animal is odd bits of skin, and bones stripped of everything that can be eaten.

BREEDING. Season, chiefly January to March or April. Nest, a large rough and untidy pad of sticks and rubbish placed on the ledge of a cliff, often inaccessible. Singly, or in small colonies of 5 or 6 nests spaced out on the same cliff-face. Favourite sites, advertised in the distance by the whitewash of the occupants' droppings, are resorted to year after year, the old nests being reconditioned by adding to the ragged remnants of the previous season. Egg, a singleton, white, usually unmarked; sometimes handsomely blotched with pale reddish to deep reddish brown. Inside membrane of all *Gyps* eggs dark bright green. Average size of 50 eggs 94.8 x 70.1 mm. (Baker). Share of the sexes in the nesting chores, and period of incubation, unrecorded.

302

FALCONIFORMES

material, accurate range difficult to define; also to determine whether this or the nominate race (found in Iran) breeds in Baluchistan. Affects bare mountains and open savannah and semi-desert country.

GENERAL HABITS. Small numbers usually present among the gatherings at animal carcasses of the commoner Whitebacked and Longbilled species, in the semi-desert parts of north-western India. Easily recognized from them by its great size and warm cinnamon coloration. Habits similar to those of other members of the genus, described under the Whiteback (185), q.v.

FOOD, VOICE and CALLS. As in 185.

BREEDING. Breeds in the Kala Chita Reserve in Campbellpur district, W. Pakistan. Old records of breeding in Bihar, Oudh and Madhya Pradesh, etc., are generally vitiated by doubtful identification as pointed out above. However, breeding in the mountains of Baluchistan, at c. 2500-3000 m. elevation, and in Kashmir, well authenticated though race merely presumed (probably correctly) as the Indian *fulvescens*. Probably also breeds in the Kirthar Hills between Sind and Baluchistan. Season, January to April. Nest, a large platform of sticks on ledges of cliffs, built singly or in small colonies.

Eggs, a singleton, white, occasionally flecked with red; rarely blotched and spotted with the same. Average size of 25 eggs 90.7 x 70.2 mm. (Baker). Both sexes said to assist in building the nest. Incubation period and other details unrecorded.

MUSEUM DIAGNOSIS. Differs from the nominate European race in being more cinnamon-brown than isabelline. For description of plumage etc. see Baker, loc. cit. Easily confusable with sub-adult *G. indicus*; may be differentiated as follows:

<i>indicus</i>	<i>fulvescens</i>
1. Smaller	1. Larger
2. Down on head more patchy; starred rather than a uniform covering	2. Head uniformly covered with down
3. General colour dirty earth-brown	3. General colour warm cinnamon-brown

MEASUREMENTS	Wing	Bill (from forehead)	Tarsus	Tail
♂ ♀	675-740	c. 71-74	c. 100-120	302-330 mm. (Baker)

Wing ♂ ♀ 685-747 mm. (both extremes ♂) (Kirke-Swann).

Weight 1 ♂ 7090 gm. (Grubb).

COLOURS OF BARE PARTS. Iris yellow-brown to brown. Bill yellowish or greenish horny to dusky brown sometimes paler along edge of culmen; cere black. Legs and feet dirty yellow to greenish grey (Baker).

181. Himalayan Griffon Vulture. *Gyps himalayensis* Hume

Gyps himalayensis Hume, 1869, Rough Notes, 12, 15

(Himalayas from Kabul to Bhutan)

Baker, FBI No. 1709, Vol. 5: 13

Plate 16, fig. 8, Plate 17, fig. 9 and Plate 18, fig. 6

LOCAL NAMES. *Bādā gīh* (Chamba); *Grāl* (Kashmir).

SIZE. Whitebacked Vulture +; c. 122 cm. (48 in.).

304

FALCONIFORMES

MUSEUM DIAGNOSIS. Bill large and stout; depth at base equal to length of cere. Lower plumage with broad shaft-stripes. For details of plumage etc. see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from forehead)	Tarsus	Tail
♂ ♀	755-805	71-77 (once 81)	c. 110-126	365-402 mm. (Baker)

Middle toe and claw 121-135 mm.

Wing ♂ ♀ 790-810 mm. (Kirke-Swann).

COLOURS OF BARE PARTS. Iris dull yellow or creamy yellow to pale brown. Bill horny green, dull yellowish horny or yellowish plumbeous; cere pale brown or greenish brown. Legs and feet dingy greenish grey or white (Baker).

Gyps indicus (Scopoli)

Key to the Subspecies

	Page
Crown of head almost or quite bare..... <i>G. i. tenuirostris</i>	306
Crown of head well covered with hair-like feathers..... <i>G. i. indicus</i>	304

182. Indian Longbilled Vulture. *Gyps indicus indicus* (Scopoli)

Vultur indicus Scopoli, 1786, Del. Faun. et Flor. Insubr., 2: 85 (India, ex Sonnerat)

Baker, FBI No. 1710, Vol. 5: 16

Plate 16, fig. 4, Plate 17, fig. 12 and Plate 18, fig. 7

LOCAL NAMES. *Gīh* (Hindi); *Gīhād*, *Mahā dū* (Marathi).

SIZE. Whitebacked Vulture +; length c. 92 cm. (38 in.).

FIELD CHARACTERS. Adult. Above, light to dark brown, the feathers edged paler (scalloped). Head, nape, and neck patchily covered with white brown hair-like feathers or down. Below, a distinct ruff of soft white feathers at base of neck. Underparts pale brown, almost sandy, with broad pale shaft-stripes. Sexes alike.

Easily confused with Indian Griffon Vulture (180). Differs from it in much smaller size; head not uniformly covered but 'starred' with down; general coloration dirty earth-brown v. warm cinnamon-brown.

In overhead aspect pale underparts and underwing with broad black trailing edge as in Griffon, v. a prominent white band stretching along underwing, distinguish it from adult Whitebacked Vulture (185) even at great height. Immature birds of the two species impossible to tell with certainty.

Young (immature). Chocolate-brown. Head and neck more thickly down-clad. Resembles immatures of both Whitebacked Vulture (185) and young Himalayan Griffon (181) but is much smaller than latter.

STATUS, DISTRIBUTION and HABITAT. Resident. Rajasthan, Gujarat and peninsular India south of the Gangetic Plain. Not in extreme SW. India or Ceylon. Wide ranging, with no perceptible habitat preferences.

Owing to paucity of collected material, ranges of this and the next race can only be approximately assigned.

HAWKS, VULTURES, ETC.

305

306

FALCONIFORMES

GENERAL HABITS. Gatherings, sometimes of 20 to 30 birds or more, commonly seen at animal carcasses on the countryside or on outskirts of towns and villages, in more or less equal numbers with the Whitebacked species (185) q.v., from which its habits do not appreciably differ.

FOOD. Carrion exclusively; sometimes at tiger or panther kills in forest.

VOICE AND CALLS. Not specifically recorded.

BREEDING. *Season*, overall November to March; principally December/January. *Nest*, a sketchy platform of sticks and twigs lined with straw invariably built on ledges of precipitous cliffs and hill forts. Usually in small colonies, the same cliff-faces and sites being occupied traditionally; easily identified in the distance by the excrementary whitewash of past and continuing vulture generations. By the time the young is fledged practically nothing is left of the nest, the materials being pushed off the ledge by the movements of the youngster or blown away by the wind. *Egg*, a singleton, generally white; sometimes spotted, blotched or freckled with reddish brown in varying degree: Average size of 20 eggs 86.6 × 67.3 mm. (Baker). Share of the sexes in the domestic chores, and period of incubation, unrecorded.

MUSEUM DIAGNOSIS. Bill smaller and less stout than in Griffon (181); depth at base less than length of cere.

MEASUREMENTS

	Wing	Bill (from forehead)	Tarsus	Tail
♂ ♀	560-650 (mostly 600-625)	c. 66-69	c. 90-94	238-274 mm. (Baker)

Wing ♂ ♀ 575-679 mm. (Kirke-Swann).

Weight 5 ♂ ♀ 5540-6250 (av. 5515) gm. (Grubb).

COLOURS OF BARE PARTS. Iris brown. Bill greenish or yellowish horny, darker on culmen; cere dull dirty greenish. Bare skin of head and face plumbeous ashy.

The description of *Gyps indicus jonesi* is omitted as the subspecies has been synonymized with No. 180, *Gyps fulvus fulvescens*, q.v.

184. Himalayan Longbilled Vulture. *Gyps indicus tenuirostris* G. R. Gray

Gyps tenuirostris 'Hodgson' = G. R. Gray, 1844, *Genera of Birds*, 1: 6, pl. 3 (Nepal)

Gyps indicus nudiceps Baker, 1927, *Bull. Brit. Orn. Cl.*, 47: 151 (New name for *Gyps tenuirostris* Hume, Khatmandoo, Nepal)

Baker, FBI No. 1711, Vol. 5: 17

LOCAL NAMES. Sakun (Bengal); Hagon (Assam); Gut (Lepcha).

SIZE. Whitebacked Vulture+; length c. 92 cm. (38 in.).

FIELD CHARACTERS. A d u l t and Y o u n g (immature) as in the Indian race (182), but with the head and neck entirely bald and shiny.

STATUS, DISTRIBUTION AND HABITAT. Resident. The Gangetic Plain north to and along the lower Himalayas from Kashmir through Nepal, Bengal and Assam. Very common in eastern Assam and East Pakistan.

HAWKS, VULTURES, ETC.

307

Extralimital, Burma, Malay Peninsula and Indochinese countries.

GENERAL HABITS. As of the Whitebacked Vulture (185), q.v.

FOOD. Carrion exclusively. While it would seem safe enough to tackle dead or dying animals, some curious accidents to feeding vultures have been reported. One got entrapped within the belly of a defunct horse; another had its head caught inside the mouth of a moribund ox which it had been too impatient to allow to die completely. The bird was found in this predicament flapping its wings helplessly to free itself! (Allen, JBNHS 26: 1045).

VOICE AND CALLS. Nothing specifically recorded.

BREEDING. Contrary to the other race, seems to nest exclusively on trees. *Season*, November to end February. *Nest*, of sticks and twigs sometimes with leaves attached, rather more compact than of the cliff-nesting race, built 7 to 14 metres up in large leafy trees, such as silk cotton, banyan and peepul; often several nests scattered over a small area, and frequently near a village. *Egg*, a singleton, broad oval, unspotted white, sometimes flecked and blotched with light reddish in varying degree. Average size of 100 eggs 84.7 × 63.6 mm. (Baker). Both sexes share in all the domestic chores. Incubation period unrecorded.

Chick (about a week old): covered with yellowish brown down (E. H. N. Gill).

MUSEUM DIAGNOSIS. Upper plumage usually darker and browner than in nominate *indicus*. No hairy down on crown and nape; very little or none on neck. Bill slenderer; with larger, more open nostrils.

MEASUREMENTS

	Wing	Bill (from forehead)	Tarsus	Tail
♂ ♀	590-630	66-68	c. 110	237-256 mm. (Baker)

COLOURS OF BARE PARTS. Iris dark brown. Bill brownish dusky horny; cere horny black; skin of head and neck dark muddy; tarsi and toes black; claws dusky and horny black (Hume).

185. Indian Whitebacked Vulture. *Gyps bengalensis* (Gmelin)

Vultur bengalensis Gmelin, 1788, *Syst. Nat.*, 1(1): 245 (Bengal)

Baker, FBI No. 1713, Vol. 5: 19

Plate 16, fig. 3, Plate 17, fig. 11 and Plate 18, fig. 5

LOCAL NAMES. Gidh (Hindi); Gidhid (Marathi); Sakun (Bengal); Mātī pūdm-gādu (Telugu); Wālorja (Yerukali); Kāzhūkan (Malayalam).

SIZE. Peacock minus train ±; length c. 90 cm. (35 in.).

FIELD CHARACTERS. A d u l t. Heavy brownish black with naked scrawny neck and head sunk into the shoulders while bird at rest. A white or whitish ruff of soft feathers round base of neck, broken in front by a black crop-patch. Sexes alike.

When perched, as well as in flight below eye level, or when banking high up in the air, white lower back diagnostic. In overhead aspect a broad whitish band along underside of wings distinguishes this species.

308

FALCONIFORMES

Young (immature). More brownish than black, without white back or underwing bands. Head and neck more or less covered with dirty white fluffy down. Impossible to distinguish with certainty in the field from Longbilled Vulture, with which it is commonly associated over most of its range.

STATUS, DISTRIBUTION AND HABITAT. Resident; our commonest vulture. Found more or less throughout the area from W. Pakistan (Baluchistan) east through Assam and Manipur; south from Kashmir and along the Himalayas between c. 1500 and 2500 m. elevation (including Nepal), through the Peninsula to Kanyakumari. Not Ceylon. Where absent or rare in pure desert facies a few years ago, e.g. Sind, Punjab, and Rajasthan, now well established and expanding with advent of river barrages, canal cultivation, populous villages with livestock, and trees for nesting.

Extralimital. East to Yunnan, south to Siam, and Cochinchina [S. Viet Nam], Malay Peninsula to Penang (Peters).

GENERAL HABITS. Usually seen in small groups, commonly in association with the Longbilled and other vultures, perched lunched-up on tree-tops and palms on the countryside, on roofs or walls in the vicinity of slaughter-houses, municipal refuse dumps, and outskirts of villages and habitations. Favourite roosts and the ground underneath become besmirched and reeking with the birds' acrid excreta, presenting a sepulchral whitewashed appearance, which kills off the trees if too long patronized. And in this way vultures sometimes become a serious local nuisance in coconut groves, mango orchards, forest plantations, etc.

Though a repulsive creature at close quarters, a vulture gliding majestically in the sky on outspread motionless wings looks the embodiment of grace and buoyancy. Unless busy feeding, or fully gorged and grounded, they spend most of the day scouting the countryside for food, covering immense distances in the quest. Or they will soar for hours on end and circle aloft in the sky with no other apparent motive than fun. Their eyesight is remarkably keen yet perhaps less phenomenal than popularly believed. That they are so quick to discover a carcass on the countryside, even though hidden under forest, and to gather at it from almost nowhere in such an incredibly short time, is usually due not so much to keenness of sight directly as to the low-flying birds being guided by the movement of crows, village dogs and jackals. These birds in turn are being watched by their fellows in the air above, and so on, till from tier to tier the message reaches the tiniest speck in the heavens. When following one another down to a carcass some birds make a wide spiral descent while others hurtle down through space more or less perpendicularly, wings half pulled in, legs dropped and dangling. Even while still quite high up in the air this dropping of the 'undercarriage' clearly proclaims a bird's intentions. No less astonishing is the speed and thoroughness with which a party of vultures will demolish the largest carcass. A mixed rabble of 60 to 70 birds (mostly of this species, and including a few kites and crows) was timed to strip the skinned carcasses of two sloth bears weighing not less than 125 kg. so thoroughly in the space of about 40 minutes that late comers at this stage had to stand around disappointed (Sālim Ali). In another case a mixed pack of this with a few Fulvous and King Vultures was timed to finish off a whole bullock in about

HAWKS, VULTURES, ETC.

309

20 minutes (T. R. Bell). This activity is attended by incessant jostling and squabbling amongst the feasters to a great deal of raucous braying, screeching and hissing as one bird jumps on another's back to dislodge it from a coign of vantage, or deprive it of a goblet of flesh. The combatants often spread out their wings and prance around, ludicrously tugging at the morsel with their beaks at either end. In order to take off from the ground, vultures are obliged to run and hop along for some distance against the wind aided by powerful wing-flaps. When fully gorged they are sometimes totally unable to get airborne, and often have to spend the night on the ground. Occasionally they feed throughout the night, whether moonlit or dark. It has been suggested that vultures properly gorged can go without a meal for several days. Such a facility could be of distinct survival value to birds which must frequently have to face feast-and-famine conditions.

In spite of foul feeding habits which often entail the head, neck and other parts becoming besmeared with gore, the Whiteback like the other large vultures is a comparatively cleanly bird and misses no opportunity for a bath. The birds wade into shallow water and douse themselves with the customary head-dipping, wing-fluttering and plumage-shuffling, drying themselves in the sun afterwards with open wings, like a cormorant. Possibly dependence on thermal currents contributes to their being late risers; individuals may frequently be seen fast asleep on a branch with head tucked under the wing till the sun is well up in the morning.

FOOD. Birds in aviary also avidly swallowed dry bone splinters 1-3 cm, washing them down with draughts of water (Grubb, 1973, JBNHS 70(1): 199).

VOICE AND CALLS. Raucous, strident, creaky screeches or 'laughter' kakakaka while one bird is supplanting another at a carcass or roost. Long-drawn grating noises, as of a hoe being scraped over a cement floor, uttered by female during copulation.

BREEDING. Season, principally October to March. Nest, a large untidy platform of sticks and twigs often with green leaves attached, with a shallow central depression lined with green leaves. Leafy twigs collected from living tree by bird (♂?) tugging at it with bill, assisted by vigorous wing-flapping. Nest built c. 10 to 18 m. up at or near the top of a large banyan or peepul (*Ficus bengalensis* or *F. religiosa*), mango (*Mangifera indica*), sheesham (*Dalbergia sissoo* or *D. latifolia*), casuarina, or similar tree growing in or near a village, or lining a road or canal bank. Sometimes in scattered colonies of up to 25 or 40 nests in a grove or small patch of forest. Nest added to and enlarged as the young occupant gets older and heftier (C. M. Inglis). Eggs, normally a singleton, very rarely 2, thick-shelled, glossless white unmarked, or variably and faintly so with reddish brown, grey-brown, or lavender. Average size of 100 eggs 85.8 × 64.2 mm. (Baker). Both sexes share in all the domestic chores. Incubation period about 45 days. Nest young fed on regurgitated gobbets of flesh. Several foraging birds of a colony often return together with food in spectacular high-flying armadas, sometimes over enormous distances. Copulation takes place close to the nest and often actually on it while the female is incubating; sometimes during moonlit nights. During the act the female flattens herself on the perch with neck stiffly stretched forward, uttering the harsh scraping screams. Male balances himself on her back with heavy flapping and performs with distinct jerks

HAWKS, VULTURES, ETC.

311

FIELD CHARACTERS. A small, rather kite-like vulture with naked head but without the long scrawny neck.

Adult. Overall dirty white (except for black wing-quills) with naked yellow head, face, and foreneck. In this race bill dark horny at all ages v. yellow in adult *ginginianus*. Sexes alike.

In overhead aspect white with wedge-shaped tail and broad black apex and trailing edge to pointed wings.

Young (immature). Blackish or chocolate-brown mottled with whitish blotches on back, breast, and greater wing-coverts. Many other intermediate colour phases during gradual transition to adult white plumage.

In overhead aspect looks like some eagle, but longer, narrower, wings and wedge-shaped tail always diagnostic. Also very like Lämmergeier, but is much smaller.

STATUS, DISTRIBUTION and HABITAT. Resident and partial altitudinal migrant; from plains level to c. 2500 metres in West Pakistan (Baluchistan, Sind, NWFP Province, W. Punjab) and NW. India (Kashmir, Punjab, Himachal Pradesh) possibly straggling into U.P., Kutch, W. Rajasthan, etc. Due to paucity of collected material and reliable specific observation, status of the two races impossible to unravel accurately. Probably both occur together and interbreed over large marginal areas in the north-west. Affects the neighbourhood of human habitations.

Extralimital. 'S. Europe north to S. France, Bukovina and S. Russia, east to Turkestan, Afghanistan and NW. India; south to Morocco, Egypt (and thence to S. Africa), Arabia, Persia, Sind, Canary and Cape Verde Islands' (Peters).

GENERAL HABITS. As in the commoner Indian race (187), q.v. Occurs in summer up to c. 2500 metres in the hills of N. Baluchistan, NWFP and Punjab between March and September; descending to lower levels for the winter. Also in Himachal Pradesh and Kashmir, where recorded in the Lidar Valley in summer as high as c. 3600 m. (R. S. P. Bates).

FOOD. Chiefly carrion and offal as in 187.

VOICE AND CALLS. Unrecorded.

BREEDING. Up to elevations of c. 2600 metres. Season, principally February to April. Nest, eggs, and other details as in No. 187. Average size of 100 'Indian' eggs 65.2 × 51.2 mm. (Baker).

MUSEUM DIAGNOSIS. Larger than *N. p. ginginianus*. For other differences between the races see Whistler 1922, *Ibis*: 414; for description of plumages etc. of nominate race, Baker, loc. cit.; Witherby 1939, 3: 105-6.

MEASUREMENTS

	Wing	Bill (from cere)	Tarsus	Tail
♂♂	470-520	31-34	75-88	220-260 mm.
♀♀	460-510	—	—	—

(Witherby)

COLOURS OF BARE PARTS. Iris yellow or dark brown. Bill dusky black; cere reddish yellow. Naked parts of head yellow. Legs and feet dusky yellow; claws black (Baker).

310

FALCONIFORMES

and pushes. One of a pair shot at nest brought a new mate on the 5th day, unless both the birds were new (Sálim Ali). Breeding has been observed in immature plumage (A. E. Jones).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Down covers whole body except a track from base of neck broadening to vent. Down of head and neck shorter than the rest. Mouse-grey in colour except darker patches to the uropygium and along ulnar border. Cere and base patch round eye blue-lead' (C. B. Ticehurst).

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♀	535-578	71-81	108-124	217-232 mm.

(from forehead)

(Baker)

Middle toe and claw 121-136 mm.

The figures for bill and tarsus given above are erroneous as pointed out by Biswas (JBNHS 57: 290, 1960). A specimen (♀) from Nepal measured by him gave wing 555, bill (from nostril) 62, tarsus 94, tail 238 mm. A young non-breeding male from Nepal measured wing 590 mm. (Ripley). Wing 557-608 mm. (Kirk-Swann).

Weight 29 ♂♀ 3500-3560 (av. 4385) gm. (Grubb).

COLOURS OF BARE PARTS. Iris yellowish brown or pale brown. Bill dark plumbeous or greenish plumbeous; culmen greyish or yellowish white; cere shining horny black. Naked skin of head and neck dusky plumbeous. Legs and feet greenish plumbeous to almost black (Baker).

Genus NEOPHRON Savigny

Neophron Savigny, 1809, Descr. Egypte, Ois., 1: 68, 75 and 76. Type, by monotypy, *Vultur percnopterus* Linnaeus.

Bill slender, long; cere and culmen straight at first, greatly hooked at tip. Nostrils elongate, horizontal, slit-like. Crown, sides of head, chin, throat and upper foreneck naked. Neck surrounded by a ruff of lanceolate hackle-like feathers extending up to the nape and round all the lower part of the neck; crop naked. Wings long and pointed; 3rd primary (as.) longest. Tail graduated; wedge-shaped. 3rd and 4th toes united by a web over the length of the basal phalange. Claws rather long, straight, and sharp.

The genus extends over the southern Palaearctic Region, Africa, and W. Asia.

NEOPHRON PERCNOPTERUS (Linnaeus)

Key to the Subspecies

Bill dark horny-blackish at all ages.....	<i>N. p. percnopterus</i>
Bill yellow in adults.....	<i>N. p. ginginianus</i>

186. Egyptian Vulture. *Neophron percnopterus percnopterus* (Linnaeus)

Vultur Percnopterus [sic] Linnaeus, 1758, Syst. Nat., ed. 10, 1: 87 (Egypt)
Baker FBI No. 1714, Vol. 5: 22

Plate 16, fig. 1, Plate 17, fig. 4 and Plate 18, fig. 1

LOCAL NAMES. *Sifed gidh*, *Kol murghab* (Hindi); *Hil* (Sind).

SIZE. Pariah Kite ±; length c. 66 cm. (26 in.).

FALCONIFORMES

312

187. Indian Scavenger Vulture. *Neophron percnopterus ginginianus* (Latham)

Vultur ginginianus Latham, 1790, Index Orn., 1: 7
(Gingee, Coromandel, ex Sonnerat)
Baker, FBI No. 1715, Vol. 5: 23

LOCAL NAMES. *Safed gidh*, *Kal murgh* (Hindi); *Suet sakun* (Bengal); *Gat gidh* (Bihar); *Tella bōrūā*, *Peethiri gādda* (Telugu); *Thottī kākhuān* (Malayalam); *Mānjāl thirudi* (Tamil); 'Pharaoh's Chicken'.

SIZE. Pariah Kite; length c. 61 cm. (24 in.).

FIELD CHARACTERS. As for No. 186 only slightly smaller. This race more-over has the bill yellow in adults as against dark horny at all ages in the nominate form.

Young (immature). Differs from young of *percnopterus* only in smaller size.

STATUS, DISTRIBUTION and HABITAT. Resident. All India (except the portions in the NW. occupied by nominate *percnopterus*) from c. 2000 m. up along the Himalayas locally, including Nepal, south to Kanyakumari, east to Bihar and western part of W. Bengal. Not E. Pakistan or Assam. Rare vagrant to Ceylon. Affects the drier peninsular hills (up to c. 2000 m., e.g. in the Nilgiris) and plains in the neighbourhood of human habitations.

x 4

GENERAL HABITS. A useful scavenger, invariably keeping to the neighbourhood of human settlements whether town, village, or shifting encampment of gypsies, pilgrims, or herdsmen. Here seen perched on mounds, ruined buildings and the like, or sauntering about on the ground—body held horizontal like a duck's and with a ludicrous, waddling, 'goose-stepping' gait—looking for food. Flight buoyant, easy and graceful, wings held level with body. Spends much time gliding aloft, but seldom at very great heights. Not gregarious; usually seen in twos and threes, but numbers will gather where prospects of food are promising, often associating with kites, crows, and other vultures at animal carcasses and municipal refuse dumps.

FOOD. Carrion, offal and garbage, and to a large extent human ordure. Occasionally takes frogs and large crickets on grassland; in one case *Brachytrypus achatus* (Mason & Lefroy). Also winged termites emerging from the ground (C. E. Fischer).

HAWKS, VULTURES, ETC.

313

VOICE and CALLS. Very silent. Unrecorded.

BREEDING. Season, February to May, chiefly March and April. Nest, a filthy, shabby platform of twigs, lined with rags, matted hair, scraps of mammals' skin, and other rubbish including sometimes dried dung of carnivores. Placed on a ledge or cornice, or in a niche, on cliffs, dilapidated mosques, tombs and other buildings or crumbling walls and battlements of ancient forts. Sometimes in the fork of a large banyan, peepul, or similar tree c. 4 to 6 metres up. The same sites are occupied year after year, the old nests being renovated by additions to the remnants. Old eagles' nests occasionally utilized. Exceptional sites recorded (1) on the ground at the base of a tree in the Ganges *khadar* (W. P. Paynter), and (2) on top of a termite mound c. 1.5 metres high islanded in the waterspread of a small irrigation tank (C. H. Biddulph). Eggs, 2, inconspicuously handsome for so unlovely a bird, varying in coloration from white to pale brick-red, blotched with reddish brown or blackish, rather densely at the broad end. Indistinguishable from those of the nominate race, only smaller. Average size of 100 eggs 64.3 × 49.3 mm. (Baker). Both sexes share all the domestic chores. Incubation period believed to be about 42 days. Incubating bird sits very close, but does not demonstrate against nest robber once disturbed off nest.

MUSEUM DIAGNOSIS. Smaller than nominate race with bill always yellow in adult.

MEASUREMENTS

	Wing	Tarsus	Middle toe and claw	Tail
♂ ♀	443-462	72-85	73-85	228-251 mm. (Baker)

Bill (from cere) 31-35 mm.

Paucity of skins in Indian collections does not permit checking the above figures, but it may be pointed out that a recent specimen from Nepal (sex?) measured: wing 434; bill from skull 57; tail 210 mm. (Biswas), showing a considerable divergence from Baker's figures.

COLOURS OF BARE PARTS. Bill in adults yellow. Skin of head yellow with no red tinge. Legs, feet and claws paler, otherwise as in 186.

MISCELLANEOUS. The Hindu hill temple at Thirukalikundram, some 55 km. from Madras, enjoys countrywide fame and added sanctity by virtue of two Neophron vultures that come there every day punctually between 11 a.m. and noon to be fed by the presiding priest. This is alleged to have been going on for 'centuries', and the birds are alleged to commute daily from Banaras (the Himalayas, according to some). The feast consists of balls of rice and wheat flour mixed with sugar and ghee, therefore, in effect, the very opposite extreme of the bird's natural food preference! That the sacred birds travel the 1,300-odd kilometres (or perhaps twice that distance) daily, and the many other myths and legends that have snowballed around this circumstance, perhaps need an extra dose of credulous piety to believe; nevertheless there are a number of curious anomalies in this connexion which challenge a scientific explanation. For instance, when the Neophron is such a common species in the Madras area, and numbers must often fly over this particular temple in their normal scouting for food, why is it that only two birds and no more come down to the proffered meal? Secondly, since Neophrons are not immortal, a replacement must become necessary

HAWKS, VULTURES, ETC.

315

to NE. Assam. Also recorded in N. Cachar hills. Normally between c. 1200 and 4000 metres elevation; rarely lower. Observed by the Everest expeditions soaring at between 7200 and 7500 metres.

Extralimital. Mountains of SE. Europe (Alps etc.), islands in the Mediterranean Sea, east to N. China and south to S. Arabia (and the Himalayas) — Peters.

x.c. 1

GENERAL HABITS. Usually seen quartering the mountain slopes and valleys, sailing majestically on outstretched motionless wings with hardly ever a wing-beat, hugging the contours and cliff-faces or soaring at immense heights. A loud droning of the wings, as of some gigantic wasp, is heard as a bird sweeps past the observer, and also a peculiar *trrrr* sound (produced by primaries?) as it sails low overhead. In spite of great size and weight, bird capable of taking off the ground without a preliminary run. Often scavenges around mountain villages and municipal refuse dumps at Himalayan hill stations and cantonments, walking about with an eagle-like gait and picking up scraps, or swooping from the air like a kite to snatch them in its talons. Its method of breaking large bones which, together with the marrow (?), form part of its normal diet is well known and reliably authenticated. The bone, which may be the femur of an ox, is carried up in the claws to a height of some 50 or 70 metres and dropped on rocks below — often at regular selected spots or 'ossuaries' — the bird retrieving the bone to repeat the process if necessary till it splinters, whereupon it will descend to the ground and leisurely swallow the pieces. On approach of the breeding season pairs indulge in spectacular aerobatics, flapping their wings, chasing one another, and indulging in mock fights. One bird will swoop at the other which dexterously turns over on its back to parry the attack with its talons. With claws thus interlocked and wings half-closed, the two tumble or 'cart-wheel' rapidly through space to the accompaniment of a sharp guttural *koolik, koolik*, separating only when a few metres from the ground. They may then either rise again to repeat the performance or soar aloft and sail away.

314

FALCONIFORMES

from time to time over the 'centuries'. By what process does this take place in such a way that continuity is not disturbed and the two visitors always remain two? A suggestion by the Bombay Natural History Society a few years ago to mark the birds for a rational investigation did not find favour with devout vested interests, so the mystery remains unsolved.

Genus *GYPÆTUS* Storr

Gypætus Storr, 1784, Alpenreise: 69. Type, by monotypy, *Gypætus grandis* Storr = *Vultur aureus* Hablizl

Bill moderately high, compressed, much hooked at end; culmen curved throughout. Nostrils ovals, longitudinal; concealed by long black bristles directed forwards from the cere and lores. Another beard-like tuft of black bristles depending perpendicularly from chin. Tarsi feathered to toes; feet fairly strong with moderate claws, blunt and well curved. Wings long and very pointed. Third primary (ascendant) longest; 1st primary between 5th and 6th. Tail of twelve feathers, long and very much graduated.

Genus monotypic; found in the mountains of SE. Europe, Africa east to S. Arabia and the Himalayas.

188. Himalayan Bearded Vulture or Lämmergeier. *Gypætus barbatus aureus* (Hablizl)

Vultur aureus Hablizl, 1783, Neue Nord. Beytr., 4: 64
(Province of Gilan, northern Persia)

Gypætus hemachalanus Hutton, 1838, Jour. As. Soc. Bengal, 7: 22 (Himalayas)
Gypætus altaicus Sharpe, 1874, Cat. Bds. Brit. Mus., 1: 229 ex Gebler, 1840, Bull.

Soc. Acad. St. Petersburg, 6: 292 (Altai)
Baker, FBI No. 1716, Vol. 5: 26

Plate 16, fig. 2, Plate 17, fig. 6 and Plate 18, fig. 2

LOCAL NAMES. *Argul* (Hindi, about Mussoree); *Ohkhab* (Chambaj). Commonly misnamed 'Golden Eagle'.

SIZE. Himalayan Griffon +, but less massive and with longer tail; length c. 122 cm. (c. 48 in.). Wing span (tip to tip) c. 275-285 cm. (9 ft. to 3 ft. 4 in.).

FIELD CHARACTERS. A handsome eagle-like vulture with feathered head and neck, and longish wedge-shaped tail.

Adult. Above, head and neck creamy or rusty white; rest of upperparts silvery grey and black, streaked with white. Below, pale rusty white. A tuft of black bristle-like feathers — the beard — pendant under chin and conspicuous in profile. Legs fully feathered. Sexes alike.

In overhead aspect like an oversize Neophron. Long and comparatively narrow pointed wings, and longish wedge-shaped tail readily distinguish it from Himalayan Griffon, and from eagles.

Young (immature). Very dark brown, with almost black head and black goatee as in adult.

STATUS, DISTRIBUTION and HABITAT. Resident. A purely northern mountain form, fairly common in Baluchistan and Sind, and throughout the Himalayas from NWFP, Ladakh and Kashmir east through Nepal and Bhutan

316

FALCONIFORMES

FOOD. Carrion and pieces of bone. Often feeds at wayside animal carcasses and refuse dumps in company with Griffons, Neophrons and ravens; but timid and keeping aloof until coast clear. In spite of allegations, never known to attack any living animal.

VOICE and CALLS. Normally silent except in courtship display, as above. Hungry nestling (about size of small goose) uttered 'a curious shrill squeak'; occasionally 'a kind of quack' when a few months older (Whistler).

BREEDING. Breeds at elevations between c. 1200 and 4200 metres; sometimes higher. Season, December to February/March. Nest, a huge pile of sticks along with quantities of miscellaneous rubbish such as sheep's wool, fragments of hairy-mammal skins, and large desiccated bones. Placed on an inaccessible ledge often under a rock overhang, or in a natural recess in a sheer cliff-face. Each pair usually has two or three alternative nest sites used in irregular rotation. Eggs, normally 1 or 2; but three have been recorded. Pale creamy yellow or pale rusty orange to deep reddish buff, variably mottled or blotched with reddish brown. Average size of 60 eggs 85.0 × 67.4 mm. (Baker). Share of the sexes in the domestic chores, and period of incubation, unrecorded.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for description of chick in down and changes with growth Whistler 1912, JBNHS, 21: 663-5; P. T. Dodsworth 1914, *ibid.*, 22: 801.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	726-890	74-85	86-95	440-555 mm. (Baker)

Mid toe and claw 95-102 mm.

COLOURS OF BARE PARTS. Iris: outer ring scarlet, inner ring khaki. 'Pale to blood-orange, the sclerotic membrane blood red' — Baker. Bill horny brown, greenish plumbeous at base, blackish at tip. Feet grey; claws plumbeous.

MISCELLANEOUS. Meat of the Lämmergeier highly prized by the hill people, and not only by the low castes; the birds are killed with spears at tethered chukor baits (! ?) — F. Stoliczka, 1868, *Jour. Asiat. Soc. Bengal*: 37.

Genus *CIRCUS* Lacépède

Circus Lacépède, 1799, Tabl. Ois.: 4. Type, by subsequent designation, *Falco eruginus* Linnaeus (Lesson, Man. d'Ois., 1: 105)

Contains slender, elegant, long-winged, long-tailed raptors — the harriers — readily distinguished by shape and flight. A more or less conspicuous ruff of close-set soft feathers extending across throat and up each side of neck behind ear-coverts. Bill weak and compressed; culmen curved from base to tip; a small festoon present. Nostril large, broadly oval, overhung by loreal bristles. Wing long and pointed: 3rd primary (ascendant) longest; 1st about equal to 6th or 7th. Tail long, square or slightly rounded. Tarsus long, slender, feathered next the thigh only; covered with transverse shields in front, smaller polygonal scales behind. Toes slender, with sharp well-curved claws.

Genus found throughout the temperate and tropical regions. Five species occur in our limits in winter; only one rarely breeding.

189. Hen Harrier. *Circus cyaneus cyaneus* (Linnaeus)*Falco cyaneus* Linnaeus, 1766, Syst. Nat., ed. 12, 1: 126

(Europe, Africa = vicinity of London, England, ex Edwards, pl. 225)

Baker, FBI No. 1792, Vol. 5: 131

Plate 19, fig. 1

LOCAL NAMES. Same as for 190.

SIZE. Kite —; slimmer. Length c. 46–54 cm. (18–21 in.).

FIELD CHARACTERS. Male (adult). Like Pale Harrier (190) but darker ashy grey above, this colour extending over chin, throat, and upper breast which are white in 190. Often a distinct brown-streaked white nuchal patch. Upper tail-coverts pure white v. banded grey and white in Pale.

In flight blunter, rounder black-tipped wings v. more pointed in Pale, is with a little practice a further and infallible differentiating character (Meinertzhagen).

Female. Dark brown above, brown-streaked below. Indistinguishable from Montagu's and not with certainty from Pale, but conspicuously broader white rump-patch suggestive. A light buff collar frequently visible as bird flies past.

Young (immature). Underparts rufous-buff, broadly striated with dark brown. Ruff well developed.

STATUS, DISTRIBUTION AND HABITAT. Rather uncommon winter visitor and/or passage migrant, September to April/May, in NW. Pakistan [Baluchistan (Quetta dist.) and NWFP (Rawalpindi, Chitral, Kohat dists.)] and northern India (Gilgit, Kashmir, Punjab, Himachal Pradesh, Nepal) east to Upper Assam (N. Lakhimpur dist.). Probably the commonest harrier in the Sikkim Himalayas. Affects open undulating plains and cultivated country, Himalayan foothills and up to c. 2500 metres elevation.

Extralimital. 'Breeds in Europe north to the Arctic Circle (casually further) and in Asia south of the tundra, east probably to the Lena River; south to

HAWKS, VULTURES, ETC.

319

MUSEUM DIAGNOSIS. First 6 primaries in male black. Outer webs of 2nd to 5th quills (as.) notched; upper tail-coverts pure white in both sexes. For details of plumage etc. see Withersby 1939, 3: 69–70.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	341–357	23–25	69–74	210–221 mm.
♀♀	375–392	27–29	71–78	246–255 mm. (Baker)

COLOURS OF BARE PARTS: Iris ♂ ad. bright orange-yellow; ♀ ad. gamboge yellow; imm. brown. Rest as in 190.

190. Pale Harrier. *Circus macrourus* (S. G. Gmelin)*Falco macrourus* S. G. Gmelin, 1770, Reise d. Russl. th. 1: 48

(Voronezh, southern Russia)

Baker FBI No. 1790, Vol. 5: 129

Plate 14, fig. 13 and Plate 19, fig. 2

LOCAL NAMES. Dāstmal, Girgit mār, Pūttai (Hindi); Māth cheel (Bengal); Tella chappa gādda, Pilli gādda (Telugu); Poonāi pārandū (Tamil); Kurulu geyā, Ukasta (Sinhala); Daoling wahlai (Cachari).

SIZE. Kite —; slimmer; length c. 46–51 cm. (18–20 in.).

FIELD CHARACTERS. A slender, elegant grey-and-white hawk.

Male (adult). Pale ashy grey above, pure white below, with black tips to the long narrow pointed wings. The last particularly conspicuous in the low sailing flight when wings held in a flat V above plane of body. Tail relatively long, white cross-banded with grey.

Differentiated from male Hen Harrier (189) by paler grey coloration (v. bluish grey) with pure white underparts and less pronounced rump patch (greyish- or brownish white v. broad pure white). From Montagu's (191) by being likewise paler grey and lacking the diagnostic black transverse wing-bar across secondaries.

Female. Umber brown, with prominent pale rufous owl-like ruff; inseparable from Montagu's in the field. Females of both these species only doubtfully distinguishable from ♀ Hen Harrier by smaller, less prominent white rump patch.

Young (immature). Above, brown like female but the feathers margined with pale rufous. Ruff very distinct, unstreaked. Upper tail-coverts pure white. Below, rufous-buff with faint darker rufous shafts on breast and flanks.

Indistinguishable with certainty from females and immatures of 189 and 191.

STATUS, DISTRIBUTION AND HABITAT. Common winter visitor to the entire Indian Union including Andaman, Nicobar (?) and Laccadive islands.

♀ x c. 1

318

FALCONIFORMES

the Pyrenees, Italy, Turkestan, and Tibet. Winters in the region about the Mediterranean, NE. Africa, N. India, Burma, China, Japan (?) — Peters.

GENERAL HABITS. Very similar to those of the Pale Harrier (190), q.v. Perhaps somewhat more given to soaring. During spring and autumn migrations found at great heights in the Punjab Himalayas; observed at 5000 metres and above beating over the barren hillsides, chasing accentors and finches (Donald).

M P H

Primaries of (M) Montagu's Harrier (*Circus pygargus*), (P) Pale Harrier (*C. macrourus*), (H) Hen Harrier (*C. cyaneus*) to show differences in wing formula and emarginations. In P and H primary-coverts are pushed aside to show emargination of 2nd visible primary, which they normally conceal, whereas in M this emargination is exposed. 5th visible primary in M and P is not emarginated and short; in H it is emarginated and longer.

FOOD. As of the genus: lizards, young rodents, sickly or nestling birds, grasshoppers, etc. Known to carry off snipe falling to shot. Among remains of small birds in stomachs of specimens, the following specifically identified: Common Babbler (*Turdoides caudatus*), Skylark (*Alauda* sp.) and Bustard Quail (*Turnix* sp.) — Whistler. One shot while carrying off a chicken (Biddulph); another seen demolishing a hoopoe (Stevens).

VOICE AND CALLS. Unrecorded. Very silent in winter; more vocal when breeding.

BREEDING. Extralimital. Season, May–June. Nest, on ground in heather, grass and reeds about swamps, or on exposed hillsides. Eggs, 6 to 8, white.

320

FALCONIFORMES

Both Pakistans, Nepal, Ceylon, Maldives (?). From plains level up to c. 3000 metres or higher in the Himalayas, and to the tops of the highest peninsular hills (Dodabetta, Nilgiris, c. 2600 m.; Anaimudi, Anaimalais, c. 2700 m.). In Ceylon a few non-breeding birds remain throughout summer (Phillips). Affects plateaux and undulating foothills country — open grassy hillsides, rolling downland, cultivation, stony semi-desert and scrub. Avoids wooded tracts.

Extralimital. 'Breeds from the Baltic Sea provinces east to Tarbagatai and the Tian Shans, south to Rumania, S. Russia and Ferghana. Winters in Africa from the Sudan to Cape Province; India, Ceylon, and Burma' (Peters).

Circus macrourus

Breeding range

MIGRATION. A female (this or *pygargus*?) ringed at Bharatpur, 25.iii.1962, recovered in Kazakh SSR, 53°45'N., 66°30'E., 7.v.1965 (JBNHS 62: 307). The influx commences in northern India already by the end of August, the birds spreading to southern India and Ceylon by October/November; mostly leaving again March/April. Autumn passage through NWFP (Kohat dist.) September to end November; spring passage February till May (Whitehead & Magrath). Very common in and around Quetta during spring passage between 15 March and 15 April (Marshall). Mostly gone from N. India by end April. On migration passage congregates to pass the night dotted about individually in a ploughed field or bare open ground — a stream of single birds arriving at dusk and on into darkness, and resuming the journey before daybreak. They do not fly in a flock but strung out individually at varying distances behind one another, sailing steadily or with purposeful wing-beats in a fixed direction, higher up than in normal foraging; occasionally descending lower to hunt as they work their way towards their destination.

HAWKS, VULTURES, ETC.

321

GENERAL HABITS. Not gregarious. Single birds spend the day tirelessly quartering the countryside a metre or two above the ground, sailing lightly and gracefully on outspread motionless wings, banking to skirt a bush, 'dipping to the hollow and rising to the mound', or skimming the tops of the standing crops and grass. From time to time the bird checks dead in its flight, wheeling almost double upon itself, swinging out its legs and pouncing noiselessly on some unsuspecting quarry. If successful, it alights to dispose of the victim on the spot before resuming the beat. When sated, rests on the bare ground or on a clod or mound in preference to a bush or tree. Roosts at night in the open, often in sizeable congregations and in company with other harrier species in a ploughed field, fallow land, or grassy swamp. The birds do not sleep huddled together but sit dotted about individually a few metres from one another — sometimes each in a regular 'form' of pressed-down grass as made by partridges.

FOOD. Frogs, lizards, field mice, sickly or young ground-nesting birds, grasshoppers, etc. A *Turnix* and remains of a sandgrouse (or partridge?) taken among stomach contents of a specimen. No fish recorded in India, but on migration across Red Sea from Africa to Europe harriers (species?) observed picking up flying fishes in their talons as they skimmed the water, and eating them (W. P. Lowe 1940, *Ibis*: 333).

VOICE and CALLS. Unrecorded. Very silent in winter.

BREEDING. Extralimital. *Nest*, a bed of leaves and grass in a natural hollow in the ground on a dry open meadow or on the edge of a swamp. *Eggs*, 4 or 5 white, usually spotted and blotched with reddish brown.

MUSEUM DIAGNOSIS. Outer webs of 2nd, 3rd, and 4th quills (as.) only notched. *Tarsus* over 65 mm. long. For details of plumage etc. see Witherby 1939, 3: 71-2.

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♂	332-360	25-27	66-70	201-222 mm.
♀♀	345-386	27-31	67-78	222-247 mm.
		(from skull)		(SA)

Weight 1 ♂ 300 gm. (BNHS)

COLOURS OF BARE PARTS. Iris a dull greenish yellow or yellow; juv. brown. Bill horny black, plumbeous at base of lower mandible; cere and gape lemon-yellow; mouth greyish pink. Legs and feet pale chrome-yellow; claws black.

191. Montagu's Harrier. *Circus pygargus* (Linnaeus)

Falco Pygargus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 89

(Europe = England. ex Albin)

Baker, FBI No. 1791, Vol. 5: 130

Plate 19, fig. 3

LOCAL NAMES. As for 190.

SIZE. Kite —; slimmer; length c. 46-49 cm. (18-19 in.).

FIELD CHARACTERS. Male (adult). Like the Pale Harrier but upperparts darker ashy grey (more or less tinged with brown), the grey extending to throat and breast. Rest of underparts white with chestnut shaft-stripes. A narrow black transverse wing-bar across secondaries diagnostic at rest and in flight. Rump greyish.

HAWKS, VULTURES, ETC.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
		(from feathers)		
♂♀	344-395	23-25	c. 55-65	213-241 mm.
				(Baker)

The sexes do not differ in size.

COLOURS OF BARE PARTS. As in Pale Harrier.

192. Pied Harrier. *Circus melanoleucos* (Pennant)

Falco melanoleucos Pennant, 1769, Ind. Zool.: 12, pl. 2 (Ceylon)

Baker, FBI No. 1793, Vol. 5: 132

Plate 14, fig. 12 and Plate 19, fig. 4

LOCAL NAMES. *Pahālai* (Hindi); *Āblāk petāha* (Nepal).

SIZE. Kite —; slimmer; length c. 46-49 cm. (18-19 in.).

FIELD CHARACTERS. Male (adult). A slim, handsome, black-and-white hawk. Head, mantle, throat, and breast black. Rest of underparts and rump white. Tail grey. Wings silvery grey broadly tipped with black (primaries) and with a black band across them above (median wing-coverts).

Female. Dark brown above, pale fulvous-rufous below, with whitish rump and some white on the nape. Doubtfully distinguishable in the field from females of Pale and Montagu's harriers except with much practice, by its blunter, less pointed wings (as in Hen Harrier), and somewhat heavier flight when flapping.

Young (immature). Above, darker than female with rufous edges to head and neck feathers. Whitish nuchal patch and ruff prominent. But field identification with certainty impossible.

STATUS, DISTRIBUTION and HABITAT. Chiefly winter visitor to the eastern parts of the subcontinent. Quite common in Manipur, Assam (where it occasionally breeds), East Pakistan, W. Bengal, Bihar, Orissa and decreasingly so down the eastern side of the Peninsula; in small numbers to Ceylon. Sparingly in Kerala, W. Madras (Nilgiri and Palni hills), Mysore (Londa dist.), Madhya Pradesh (esp. eastern districts, e.g. Balaghat, Bhandara, Bastar). Rare straggler or vagrant in Andhra Pradesh (Warangal dist.) and Maharashtra (Bombay environs). Not recorded north of Bombay in W. India, nor west of Nepal terai and Gorakhpur dist. in Uttar Pradesh, though putatively seen at Lahore (Currie). Affects open expanses of grassland, plain and hill (to c. 2100 metres — Kodaikanal). Also paddy-fields and stubbles, and grassy margins of jheels.

Extralimital. 'Breeds from Lake Baikal east to Ussuriland and south to Mongolia, N. China and the Amur region. Winters in E. India, Burma, and S. China; Indochinese countries, Borneo and the Philippines' — Peters. Breeds sparingly also in Assam and Burma.

GENERAL HABITS. Very similar to the Pale Harrier, q.v. Systematically quarters the ground for food in low sailing flight. Sometimes hovers stationary for a few moments a metre or so above standing crops or reeds to investigate, either pouncing on a quarry or resuming the beat. 'When not hunting, male

322

FALCONIFORMES

Female. Indistinguishable in the field from ♀ Pale; from ♀ Hen Harrier only doubtfully by slightly narrower white rump-patch.

Young (immature). Somewhat darker and more richly coloured than immature Pale Harrier, with the ruff indistinct; but not separable from it in the field with certainty.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Perhaps slightly less common than Pale Harrier overall, but equally widely distributed over the subcontinent. Occurs also in the Andaman and Laccadive islands, Ceylon and the Maldives. Affects identical facies to 190.

Circus pygargus

■ Breeding range

Extralimital. 'Breeds in England and through N. Europe (south of lat. 57°N.) and Asia to Turkestan, Altai, and NW. Mongolia; south to Spain. NW. Africa, Italy and Rumania. Winters from Palestine to S. Africa, India, Ceylon, and Assam' (Peters).

MIGRATION. As in 190. No ringing records, but see under 190.

GENERAL HABITS. Same as the Pale Harrier's, the two frequently confused in the field by observers.

FOOD. As in 190.

VOICE and CALLS. Unrecorded. Very silent in winter.

BREEDING. Extralimital. *Nest* of grass and reeds on the ground in a cornfield or on a bed of rushes near a swamp. *Eggs*, 4 to 6, bluish white unmarked, or faintly blotched with light red.

MUSEUM DIAGNOSIS. Outer webs of 2nd, 3rd, and 4th primaries (as.) only notched, as in 190. Most readily distinguished from Pale Harrier by shorter tarsus — under 65 mm. long. For details of plumages etc. see Witherby 1939, 3: 63-6.

FALCONIFORMES

324

always soared with tail tightly closed; female with tail spread out' (Stanford).

FOOD. As of the other harriers — frogs, lizards, mice, grasshoppers, etc. Occasionally takes sickly birds or nestlings from ground nests, but normally small birds do not regard it as a potential danger. Recorded eating a small snake, and robbing young from nest of Pied Myna (*Sturnus contra*).

VOICE and CALLS. Normally silent. Unrecorded except for a loud six-fold 'chacking', as of a magpie, uttered by female when nest containing young approached (Stanford).

BREEDING. Mainly extralimital, but a few birds breed in the uplands of Assam, e.g. in Dibrugarh dist. (Cripps), and evidently also in Cachar at c. 600-900 metres (Baker), as recently found to do in Burma (Stanford). Season, c. April to July (?). *Nest*, a rough pad of grasses placed a few centimetres above ground amongst pressed-down growing stems, in an open expanse of grassland. *Eggs*, 4 to 6 (in Siberia), white, sometimes faintly flecked with reddish. Average size of 28 Siberian eggs 43.6 × 34.5 mm. (Baker).

MUSEUM DIAGNOSIS. See key to the species. Outer webs of 2nd to 5th primaries (as.) notched. For details of plumage Baker, loc. cit.

MEASUREMENTS	Wing	Bill	Tarsus	Tail
♂♂	344-367	22-24	76-80	197-217 mm.
♀♀	366-387	25-27	81-88	211-240 mm.
		(from feathers)		(Baker)

Weight 1 ♂ 254 gm. (SA)

COLOURS OF BARE PARTS. Iris, ♂ ad. bright lemon-yellow. Bill, upper mandible and terminal half of lower blackish brown; rest of lower mandible plumbeous tinged with greenish yellow at base; cere greenish yellow. Legs and feet orange-yellow (in ♀ somewhat duller and paler); claws black.

Circus aeruginosus (Linnaeus)

Key to the Subspecies

Abdomen dark or rufous-brown or rufous with dark stripes..... *C. a. aeruginosus*
Abdomen plain white, or buff with dark shaft-stripes..... *C. a. spilometus*

193. Marsh Harrier. *Circus aeruginosus aeruginosus* (Linnaeus)

Falco aeruginosus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 91

(Europe, restricted type locality, Sweden)

Baker, FBI No. 1794, Vol. 5: 134

Plate 14, fig. 14 and Plate 19, fig. 5

LOCAL NAMES. *Kuter*, *Kulerir*, *Safid sira* (Hindi); *Pén cheel*, *Tika kauri* (Bengal); *Ukusa*, *Kuralla goya* (Sinhala); *Poonii pāvāndi* (Tamil); *Kariteppi* (Malayalam).

SIZE. Kite —; length c. 54-59 cm. (21-23 in.).

FIELD CHARACTERS. A predominantly marsh-frequenting harrier, more heavily built than others of the genus, with broader and less pointed wings. Male (adult). Dark brown with pale rufous head, neck and breast; dark rufous below. With silvery grey tail and black-tipped silvery grey wings.

HAWKS, VULTURES, ETC.

325

Female (adult) and Young (immature). Rather like a dark chocolate-brown Pariah Kite but slimmer, with a round (not forked) tail, and usually a creamy buff cap on head and buff leading edge to wing at shoulders.

The majority of birds seen in India are in this plumage.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, September to April, practically throughout the Indian Union, Andaman, Nicobar (?) and Laccadive islands. Both Pakistans; Nepal. Chiefly low country and to c. 2000 metres elevation. Ceylon (all zones); Maldives Islands. In Ceylon some non-breeding birds loiter throughout the summer (Phillips). This is doubtless also the explanation for the young birds occasionally seen in Kashmir and elsewhere in northern India as late (or as early?) as July. Affects jheels and marshes, flooded paddyfields, etc.

Extralimital. Breeds from S. Sweden and Denmark east to the Yenesei, south to the Mediterranean, Turkestan, and Mongolia. In winter south to Africa, India, Malay Peninsula, S. China, Japan, and Philippines (Peters).

MIGRATION. No ringing data.

GENERAL HABITS. As of the other harriers, e.g. Pale Harrier (q.v.) but more addicted to marshland and jheels. Sails leisurely a few metres above the reed-beds on motionless wings, occasionally boosted by a few heavy flaps, jinking suddenly in its flight from time to time and dropping into the reeds to seize some prey. Unlike the other harriers spends a considerable part of its time sitting about on the ground, on a canal bank, mound, or snag, and is also more given to soaring aloft in the sky. In this the wings are held in a wide V above the plane of the body. It is notorious for its habit of making off with wildfowl — sometimes as large and heavy as itself — falling to a sportsman's gun with the utmost audacity, regardless of his shouts and gesticulations.

FOOD. Frogs, fish, field mice and voles, weakling or wounded birds, large insects. Among stomach contents remains of lark (*Calandrella*) and redstart (*Phoenicurus*) have been specifically identified. Observed to take an apparently unwounded moorhen (*Gallinula chloropus*) among reeds by pouncing on it repeatedly from the air (SA); also feeding on carrion (D'Abreu).

VOICE AND CALLS. Very silent. Unrecorded in winter.

BREEDING. Extralimital. *Season*, April to June. *Nest*, a mass of reeds and rushes lined with grass; placed on the ground near a marsh. *Eggs*, 4-6, unmarked white. A pair recorded to have bred successfully at Malezai, N. Baluchistan, in 1940 (A. F. P. Christison). Presumptive or reported occasional breeding in Kashmir and elsewhere in N. India not yet proven.

MUSEUM DIAGNOSIS. Outer webs of 2nd to 5th quills (inclusive) notched. Bill from cere to tip usually over 29 mm. Abdomen dark or rufous-brown, or rufous with dark stripes. For details of plumage etc. see Baker, loc. cit.; Witherby 1939, 3: 59-61.

MEASUREMENTS

	Wing	Bill (from cere(?))	Tarsus	Tail
♂♂	385-405	28-30	80-85	234-245 mm.
♀♀	390-430	28-31	85-90	238-258 mm. (Baker)

In 2 ♀♀ measured by SA and H. Whistler bill (from skull) 36, 43 mm.; tarsus 91, 96 mm.

HAWKS, VULTURES, ETC.

327

except for c. 25 mm. next the tibia; covered all round with small ill-defined hexagonal imbricate scales. Toes short; the inner and outer toes about equal in length. Claws short and not much curved.

No crest, but feathers of nape lengthened and lanceolate.

Genus chiefly African; one species extending to Europe and Asia as far east and south as India.

195. Short-toed Eagle. *Circus gallicus gallicus* (Gmelin)

Accipiter ferox, S. G. Gmelin, 1771, Novi Comm. Acad. Petrop., 15: 422, pl. 10 (Astrakan, S. Russia). (Unidentifiable vide Mayr. E., 1944, Emu, 43:303).

Falco gallicus Gmelin, 1788, Syst. Nat., 1(1): 259 (France)

Baker, FBI No. 1764, Vol. 5: 93

Plate 20, fig. 7 and Plate 21, fig. 3

LOCAL NAMES. *Saampnaar* (Hindi); *Sāmparil* (Bengal); *Mālpatar* (Kannada); *Pāmīlā gāddā* (Telugu); *Onān koththi*, *Pāmbu pārāndū* (Tamil); *Rawal* (Wagri); *Kendatle* (Yerukali).

SIZE. Kite +; length c. 63-68 cm. (25-27 in.).

FIELD CHARACTERS. A thick-set brown and white eagle with large greyish owl-like head. *Above*, earthy brown. *Below* chin, throat, and upper breast paler earthy brown; rest of underparts white, barred with pale brown. Tail with 3 (or 4) dark bands, the terminal one broadest. Sexes alike; female larger.

At close range and through glasses unfeathered legs, thick frowzy head with upwardly directed bristly feathers on face, and wings reaching to end of tail, are diagnostic pointers when bird at rest.

In overhead aspect thick-set outline, silvery body and underwing contrasting with darker head and throat, blackish primaries, and dark crossbands in tail are suggestive. Wings held in the same plane as body.

Young (immature). Confusingly variable in coloration: from head and neck almost white to brown, and from underparts whitish buff with browner chin, throat, and breast, to white spotted or striped with brown, and other intermediate phases.

STATUS, DISTRIBUTION AND HABITAT. Resident. W. Pakistan, Nepal and practically throughout the Indian Union (except Assam), from c. 1000 metres elevation in the Himalayas south. Has been observed as high as c. 2300 metres (Dharamsala — Donald). Not in Ceylon, or E. Pakistan (?). Affects open cultivated plains, stony deciduous scrub and foothills country, and semi-desert. Observed at Kodaikanal, c. 2100 m.

Extralimital. Also breeds from C. Europe east to Turkestan and Mongolia south to N. Africa, Persia and N. China. Migratory in northern parts of its range. Winters chiefly in NE. Africa (Peters).

326

FALCONIFORMES

COLOURS OF BARE PARTS. Iris ad. hazel brown to dull golden; imm. brown. Bill horny black, plumbeous or greenish yellow at base and chin; cere yellow. Legs and feet yellow to orange-yellow; claws horny black.

194. Eastern Marsh Harrier or Striped Harrier. *Circus aeruginosus spilontus* Kaup

Circus spilontus Kaup, 1847, Isis von Oken, col. 953 (Asia)

Baker, FBI No. 1795, Vol. 5: 135

Plate 19, fig. 6

LOCAL NAMES. Unrecorded.

SIZE. Kite —; about same as 193.

FIELD CHARACTERS. Male (adult). Head black, mantle black with some white mottling. Nape and throat white, heavily streaked with black; breast and abdomen all white; rump white, lightly barred with black. Tail and wings light grey; flight feathers blackish; underwing white.

Female. Dark brown, buffy white on head, throat, and nape, streaked with dark brown on nape and lower throat. Underwing dark; rump not noticeably lighter than back.

Both sexes readily distinguished from 193 by conspicuously striped nape and throat, and white or whitish abdomen.

Young (immature). Brown above, pale rufous below, streaked with rufous brown; rump whitish (Delacour & Mayr).

STATUS, DISTRIBUTION AND HABITAT. An eastern winter visitor, recorded only from Assam (Cachar) and Manipur. Affects marshland.

GENERAL HABITS. As in 193.

FOOD. Presumably as in the Marsh Harrier; not specifically recorded.

VOICE AND CALLS. Unrecorded.

BREEDING. Extralimital. *Nest* and *eggs* similar to those of 193.

MUSEUM DIAGNOSIS. Outer webs of 2nd to 5th primaries (inclusive) notched. Bill from cere to tip over 29 mm. Abdomen plain white or buff with dark shaft-stripes. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from cere(?))	Tarsus	Tail
♂	384	29	91	224 mm.
♀♀	406-420	31-32	91-95	244-256 mm. (Baker)

Wing ♂♂ 385-425; ♀♀ 400-443 mm. (Kirke-Swann).

COLOURS OF BARE PARTS. Iris golden yellow. Bill deep slaty, black at tip yellowish at base and gape; cere dull yellow. Legs and feet pale yellow.

Genus *CIRCAETUS* Vieillot

Circetus Vieillot, 1816, Analyse: 23. Type, by monotypy, 'Jean-le-Blanc Buffon = *Falco gallicus* Gmelin

Bill moderate, greatly hooked and with the culmen much rounded. Nostril oval and slightly oblique, the loreal bristles growing over it in an upwards direction. Wing long: 4th primary (ascendant) longest; 3rd and 5th only slightly shorter. Primaries exceed secondaries by more than length of tarsus. Tarsi long, unfeathered

328

FALCONIFORMES

GENERAL HABITS. Usually seen singly soaring and circling high up in the blue, or quartering the ground on outstretched motionless wings like a harrier, 15 to 20 metres above scrub jungle and fields, for food. The sailing flight is frequently interrupted by bouts of cumbrous hovering to investigate prospects below more closely. Against strong wind will remain stationary for minutes merely with slight manipulation in angle of wings and tail. This often followed by a closing of the wings and spectacular, almost vertical dive at high velocity, pulling out when close to the ground and pouncing on prey. The great heights from which these dives are executed — in one case well over 400 metres — bespeaks a phenomenally keen eyesight for the bird. Sometimes surveys its surroundings from perch on tree-top or stake, swooping on any prey that comes into view; or walks about on the ground like a buzzard picking up grasshopper nymphs, termites, etc. One individual overhead when fired at and peppered with small shot suddenly jinked and disgorged a 30 cm. long snake, but promptly retrieved it in its talons in mid-air and complacently flew on despite further peppering!

During breeding season much given to circling aloft in pairs and noisily calling; and to remarkable tumbling and darting aerobatics.

FOOD. Largely snakes including poisonous ones, and some of considerable size (a *Ptyas mucosus* 150-180 cm. long recorded). The reptiles apparently killed by seizing at the head and neck, the wriggling body often winding itself round parts of the bird during the struggle. Among the species identified in crops is *Psammophis condanarus*, a snake of which the first ever record for Mysore was obtained via a Short-toed Eagle! Also takes lizards (including *Varanus*), frogs, field rats, disabled birds and large insects, etc.

VOICE AND CALLS. A loud, screaming, plaintive, rather kite-like cry *pieou, pieou* uttered chiefly on the wing, and commonly in the breeding season.

BREEDING. *Season*, December to March. *Nest*, comparatively small for such a large eagle, of sticks and twigs with a deepish central depression sometimes lined with a little grass. Built in or at the top of a moderate sized tree — neem (*Melia*), babool (*Acacia*), kandi (*Prosopis*), sheesham (*Dalbergia*), or other — standing in open country. Rarely on the ledge of a cliff or steep river-bank. *Egg*, invariably a singleton in India — in Europe frequently 2 — pure white. Average size of 38 Indian-taken eggs 73.5 × 58.4 mm. (Baker). Share of the sexes in nest-building unrecorded in India. Incubation chiefly by female who is a very close sitter. Both parents feed the young.

Incubation period in Europe c. 47 days; young flies from nest in 70-75 days (*Alauda*, 21: 86-127).

MUSEUM DIAGNOSIS. See under Genus. Toes and claws markedly short in proportion to the bird. For details of plumages see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	520-536	40-43	—	252-283 mm.
♀♀	530-571	40-43	92-97	287-330 mm.

Bill from skull ♂♂ 45-46, ♀♀ 47-53 mm.; tarsus ♂♂ 93-99, ♀♀ 94-96 mm. (SA).

HAWKS, VULTURES, ETC.

329

COLOURS OF BARE PARTS. Iris yellow or bright orange-yellow. Bill pale greyish blue, darkest at tip; cere whitish or pale plumbeous grey. Legs and feet dirty yellowish white to greyish brown; claws black.

Genus *SPILORNIS* G. R. Gray

Spilornis G. R. Gray, 1840, List Gen. Birds: 3. Type, by original designation, *Falco bido* Horsfield (ridg. Stresemann, E., 1959, Jour. f. Orn., 100: 35).
Harmotornis Vigors, March 1832 (1831), Proc. zool. Soc. London, pt. 1: 170. Not *Harmotornis* Swainson, Feb. 1832 (Turdidae).
Cf. Meise, W., 1939, J. f. O., 87: 65-74.

Amadon, D. 1974, Bull. Brit. Orn. Cl. 94: 159-63

Distinguished from other Indian accipitrine genera by having a broad nuchal crest covering the whole nape. Coloration also peculiar, brown both above and below in adults, lower plumage ocellated with round white spots. Bill rather long, well hooked; festoon on upper mandible obsolete or wanting. Nostrils oval, oblique; lores nearly naked. Wings short and rounded; 4th or 5th primary (as) longest. Tarsus (naked, covered with hexagonal scales), toes, and claws as in *Circus*.

Genus confined to Oriental Region. One species occurs within our limits.

LOCAL NAMES. *Furj bāj*, *Dīgra chel* (Hindi, Saharanpur); *Tilaj bāj*, *Sekher* (Bengal); *Six* (Assam).

SIZE. Kite +; length c. 74 cm. (29 in.).

FIELD CHARACTERS. A large dark brown eagle with a full, round black-and-white nuchal crest (very prominent when erected), a conspicuous yellow

HAWKS, VULTURES, ETC.

331

FOOD. Principally snakes, frogs, lizards, field rats and mice, maimed or sickly birds. Crabs, and 'an eel about a foot long' have been recorded. In spite of alleged destruction to game birds, it seldom if ever takes a healthy partridge or pheasant; occasionally domestic chickens.

VOICE AND CALLS. Loud, high-pitched, prolonged whistling screams *kee-kee-kee* or *kek-kek-kek-kee* while soaring—sometimes also from perch. Usually prefaced by a short double *whi-whi*, or three short notes like *pu-pu-pu*, quickly repeated in undertone and audible only at close range.

BREEDING. *Season*, in the plains chiefly February-March; in the hills March-May. *Nest*, a large structure of sticks and twigs, sometimes lined with green leaves. Built high up in a tree in or near a forest clearing, preferably close to a stream. *Egg*, invariably a singleton, handsome, and with a wide range of colour and markings, mostly creamy or yellowish white boldly blotched with reddish brown. Average size of 16 eggs 71.8 × 56.2 mm. (Baker). Both birds share in nest-building, but apparently the female alone incubates. Period unrecorded.

MUSEUM DIAGNOSIS. The nominate race *cheela* (northernmost) is larger and darker than the other races. Chin and throat blackish; breast somewhat barred; white ocelli on lower plumage with conspicuous black spots on either side. Tail in adults with one broad almost pure white band. For details of plumage see Baker, loc. cit.

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	468-507	41-45	100-102	295-315 mm. (Baker)

For Himalayan birds Kirke-Swann gives Wing ♂ 500-510; ♀ 495-532 mm. For birds from the Punjab foothills:

	Wing	Bill (from skull)	Tarsus	Tail
3 ad. ♂♂	472-479	42-50	—	296-305 mm.
2 ad. ♀♀	482-484	c. 48	—	299-304 mm. (Whistler)

COLOURS OF BARE PARTS. Iris golden yellow. Bill slaty blue, blackish on culmen and tip; cere and lores yellow, brighter in breeding season. Legs and feet dull yellow; claws black.

197. **Lesser or Peninsular Crested Serpent Eagle.** *Spilornis cheela melanotis* (Jerdon)

Buteo melanotis Jerdon, 1844, Madras Jour. Lit. Sci., 13: 166

(At the foot of the Nilgiris)

Falco eldii Temminck, 1820, Planch. Color. d'Ois., 4: pl. 19 (Pondicherry). Not *Falco eldii* Gmelin, 1788: 267

Spilornis minor Hume, 1873, Nests & Eggs of Indian Birds: 42

Baker, FBI No. 1766, Vol. 5: 98

LOCAL NAMES. *Mareyala* (Marathi); *Chataliyo sēpmār* (Gujarati); *Nēlla pēnēla* (Telugu); *Betta gada* (Gondi); *Geon* (Kannada); *Chattiparanda* (Malayalam).

SIZE. Kite +; length c. 74 cm. (29 in.).

330

FALCONIFORMES

patch at base of bill (cere and lores), and unfeathered yellow legs. Underparts paler brown, ocellated and finely barred with white and blackish. Sexes alike, but considerable individual colour variation consequent on age.

In overhead aspect brown coloration, very broad rounded wings with the characteristic markings, held far back and on same plane as body in sailing flight, together with the distinctive 3- or 4-noted screaming call assist identification. Underwing pattern as follows: a narrow black border with a broad white band behind it running across the primaries and along the entire trailing edge, with narrower concentric parallel black-and-white bands before it. Flight very like a hawk-eagle's (*Spizartus*). A broad whitish band across dark tail (not expanded in flight) and another ill-defined one near its base are further pointers.

Young (immature). *Above*, head, nape, and crest buffy or fulvous white with blackish tips to the feathers. Upperparts paler brown than in adult, scalloped with buffy white. Tail multi-banded dark and whitish brown. *Below*, buffy whitish, with sparse, irregular brown drops and streaks on breast and flanks. General colour pattern reminiscent of Greenland Falcon (*Falco rusticolus*).

STATUS, DISTRIBUTION and HABITAT. Resident, possibly subject to some local migration or wandering, as suggested by reports of seasonal commonness and rarity and the finding of occasional specimens of extralimital races in different parts of the country. W. Pakistan and N. India from Sind, NWFP, and Kashmir, through Nepal (where observed up to 3050 m. alt. in Gandak-Kosi watershed) to Assam north of Brahmaputra river. Gangetic Plain, foothills and normally up to c. 2000 m. in the Himalayas. Affects well-wooded well-watered country.

GENERAL HABITS. In effect the ecological counterpart in well-wooded biotope of the closely related Short-toed Eagle (*Circus gallicus*) of semi-desert areas. Keeps singly, or more usually in pairs, to jungle-clad ravines, wooded streams, and the edge of forest clearings and cultivation, perched bolt upright in the top of a lofty tree, partly concealed by the foliage, whence it can command a clear view of the surroundings for movements of prey. When alarmed the nuchal crest is erected 'so as to frame the face with a beautiful black and white ruff' (Deignan). Also commonly seen soaring and circling above the forest canopy, often at immense heights, uttering its characteristic screaming whistles which clearly proclaim its identity even when the bird itself is a mere speck in the heavens. In the breeding season pairs become particularly noisy and are much given to darting and tumbling acrobatic displays; sometimes three birds thus engaged in some form of 'triangular' courtship.

332

FALCONIFORMES

FIELD CHARACTERS. Same as for 196; somewhat smaller. Tail in adults with two broad pale bands instead of one, but the second not always very distinct. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Peninsular India south of the Gangetic Plain, arbitrarily south of lat. 25°N., from Gujarat eastward to Bengal. Affects well-watered wooded plains and foothills country.

GENERAL HABITS. As in the northern race (196).

FOOD, VOICE and CALLS. Ditto.

BREEDING. *Season*, December to March. *Nest*, site and egg as in 196. Average size of 36 eggs 65.7 × 50.9 mm. (Baker).

MUSEUM DIAGNOSIS. Chin and throat usually not blackish; breast generally uniform unbarred; tail bands (2) grey, not white. Peninsular and Ceylonese birds similar in coloration except for individual variation. Steady diminution in size from north to south, some Kerala birds approaching the smallest race *spilogaster* of Ceylon.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	421-461	42-46	94-101	275-310 mm. (Baker)

Recently collected random specimens of *melanotis* show the size trend N. to S. as follows:

		Wing	Bill (from skull)	Tarsus	Tail
Gujarat.	1 ♂	440+	—	—	—
	3 ♀♀	469-481	43-48	99-109	290-315 mm.
M.P. and Orissa	1 ♂	432	44	102	263 mm.
	3 ♀♀	440-467	40-46	100-110	273-310 mm.
Mysore	2 ♀♀	424-497 ¹	43-46	—	260-294 mm.
Kerala	7 ♂♂	357-440	43-46	91-107	211-279 mm.

Weight 1 ♂ 1300 gm. (SA)

COLOURS OF BARE PARTS. As in the nominate race.

198. **Ceylon Crested Serpent Eagle.** *Spilornis cheela spilogaster* (Blyth)

Harmotornis spilogaster Blyth, 1853, Journ. Asiat. Soc. Bengal, 21: 351 (Ceylon)

Baker, FBI No. 1769, Vol. 5: 100

LOCAL NAMES. *Rajaliye* (Sinhala); *Kūḷumḷē* (Tamil).

SIZE. Kite ±; length c. 59-63 cm. (23-25 in.).

FIELD CHARACTERS. Same as for 196; smaller than 197 otherwise similar. Also with individual colour variations. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Race peculiar to Ceylon. Common resident throughout the island. In wooded country all zones, to over c. 2100 metres in the hills.

GENERAL HABITS, FOOD, CALLS, etc. Same as in the Indian races. 'In the courting season it indulges in curious acrobatics, stooping and rolling on the wing, with tail raised and wings half closed and "shivering"' (G. M. Henry).

¹ This may be a vagrant (?) of the northern race.

HAWKS, VULTURES, ETC.

333

BREEDING. Season, February to May; chiefly March and April. *Nest*, site, and egg as in the Indian races. Average size of 22 eggs 68.2 × 49.4 mm. (Baker).

MUSEUM DIAGNOSIS. Upperparts often with a distinct purple-grey gloss; throat very grey; breast brown, unbarred. But no consistent difference in coloration apart from individual variation; thus best distinguished from *melanotis* of peninsular India (197) only by smaller size.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	355-402	38-45	—	— (Baker)
		(from skull)		
4 ad. ♂♂	370-389	41-44	—	222-240 mm.
4 ad. ♀♀	384-398	41-44	83(1)	240-254 mm. (Whistler)

COLOURS OF BARE PARTS. As in Indian birds.

199. **Burmese Crested Serpent Eagle.** *Spilornis cheela burmanicus* Swann

Spilornis cheela burmanicus Swann, 1920, Syn. List Accipitr.: 81

(Jobin, Thayetmyo, Burma)

Baker, FBI No. 1767, Vol. 5: 99

LOCAL NAMES. *Sin* (Assam).

SIZE. Kite +; length c. 68 cm. (27 in.).

FIELD CHARACTERS. Same as for the nominate race (196). Rather smaller and paler but doubtfully separable in the field. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, possibly with some local movement, in Assam south of the Brahmaputra river; Manipur (?), E. Pakistan (?). Andaman Islands.

Extralimital. Burma, Shan States, Thailand and Tonkin, south to Tenasserim.

GENERAL HABITS, FOOD, etc. Same as in 196 and the other races.

BREEDING. Not recorded within Indian limits.

MUSEUM DIAGNOSIS. Smaller and paler than nominate *cheela* (196). White spots on lower plumage larger and more conspicuous; the black adjoining spots paler and less conspicuous. Terminal black band on primaries narrower.

MEASUREMENTS. Wing 408-463 mm. (Baker). Baker points out that very few have a wing of over 450 mm., and those from the western area only. He pertinently suggests that the bigger birds may be wandering specimens of *S. c. cheela*.

COLOURS OF BARE PARTS. As in 196.

200. **Andaman Pale Serpent Eagle.** *Spilornis cheela davisoni* Hume

Spilornis Davisoni Hume, 1873, Stray Feathers, 1: 307

(Neighbourhood of Port Blair, South Andamans)

Baker, FBI No. 1770 & 1773, Vol. 5: 101, 103

Plate 20, fig. 9

LOCAL NAMES. Unrecorded.

HAWKS, VULTURES, ETC.

335

COLOURS OF BARE PARTS. Iris yellow. Bill light blue, dark horny at tip; cere, gape, and orbital skin bright yellow. Legs and feet yellow (Baker).

202. **Great Nicobar Crested Serpent Eagle.** *Spilornis klossi* Richmond

Spilornis klossi Richmond, 1902, Proc. U.S. Nat. Mus., 25: 304

(Pulo Kunyi, Great Nicobar Island)

Baker, FBI No. 1772, Vol. 5: 102

Plate 20, fig. 11 and Plate 21, fig. 5

LOCAL NAMES. Unrecorded.

SIZE. Kite —; length c. 46 cm. (18 in.).

FIELD CHARACTERS. The most diminutive race of *cheela*, but close relationship with it superficially unmistakable. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Apparently endemic on Great Nicobar Island or Sumbelung, the largest and southernmost of the Nicobar group.

GENERAL HABITS, FOOD, etc. Unrecorded, except that among the stomach contents of a specimen were found remains of lizards, rats, a small bird, and an Emerald Dove (*Chalcophaps*).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. General colour above . . . drab with light coppery sheen and some of the feathers with narrow white tips; nape and sides of the neck Isabella in colour; top of head black, the longer feathers with narrow tips of Isabella colour; ear coverts, cheeks, and malar region clear smoke grey; breast buffy wood brown, paler on abdomen, sides, thighs, and under tail-coverts; lesser and middle wing-coverts dark drab, prominently edged with white; primaries black with two dusky bars, one only on the outer primary; tail with two pale bars.

* Immature birds have buffy tips to the feathers of head, back and wing-coverts; the tail has three bars instead of two. (Richmond)

MEASUREMENTS. Wing 257; tail 165; tarsus 75; culmen 33 mm. (Richmond).

COLOURS OF BARE PARTS. Iris yellow. Bill, base yellow, middle bluish, tip, black; cere and naked skin on sides of head yellow (Richmond, 1903).

202a. **Andaman Dark Serpent Eagle.** *Spilornis elgini* Blyth. See Appendix.

Genus PANDION Savigny

Pandion Savigny, 1809, Descr. Egypte, Ois., 1: 69, 96. Type, by monotypy, *Pandion flavius* Savigny = *Falco haliastur* Linnaeus

Bill moderate; tip long and greatly hooked; festoon variable. Nostrils small, narrow, oblique. Tarsus short, stout, reticulated throughout except on the extremity of the toes. Toes very powerful with prickly scales on the soles; outer toes reversible. Claws rounded beneath, long, subequal, strongly curved. Wings very long and pointed; 3rd primary (as) longest; 1st between 4th and 5th or equal to latter. Tail almost square.

334

FALCONIFORMES

SIZE. Kite —; length c. 56 cm. (22 in.).

FIELD CHARACTERS. A smaller version of *S. c. cheela* (196). Below, pale brown; throat and breast finely barred with darker zigzag lines.

STATUS, DISTRIBUTION AND HABITAT. Common resident. Andaman and Nicobar Is. Affects tidal creeks and mangrove swamps.

GENERAL HABITS. Presumably similar to those of the better known races.

FOOD. Crabs (Butler, Abdulali), eel (Osmaston).

BREEDING. Unknown. A female collected on 22 February had enlarged gonads (Abdulali, JBNHS 61: 510).

MUSEUM DIAGNOSIS. Pale wing-bar next to tips of primaries much narrower than dark bands on either side of it (*contra* in nominate *cheela*). Legs and feet larger and coarser than in *S. elgini* (with which it was synonymized in the earlier edition of this volume) and with shorter claws (Biswas).

MEASUREMENTS

	Wing	Bill (from feathers)	Tail
♂ ♀	374-407	37-41	— (Baker)
2 ♀♀	393, 393	—	238, 250 mm. (Abdulali)

COLOURS OF BARE PARTS. As in 196.

201. **Nicobar Crested Serpent Eagle.** *Spilornis cheela minimus* Hume

Spilornis minimus Hume, 1873, Stray Feathers, 1: 464 (Camorta, Nicobar Islands)

Baker, FBI No. 1771, Vol. 5: 192

Plate 20, fig. 10

LOCAL NAMES. Unrecorded.

SIZE. Kite —; length c. 48 cm. (19 in.).

FIELD CHARACTERS. Like 196 but very small, pale brown or greyish brown. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Apparently endemic in the Camorta-Nancowry-Teressa-Katchall group of the Nicobar islands.

GENERAL HABITS. Davison in c. 1873 recorded it as wild and shy and found only in forest near rivers, not frequenting the shores or clearings. No further information has been added since.

FOOD. Stomachs of three specimens collected by Richmond (1903) contained remains of lizards, portions of a chicken, and a crab.

CALLS, etc. Unrecorded.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Upperparts pale grey or pale brown. Breast greyish brown, unbarred in adults. Chin and throat same colour as breast. Apical black band on primaries short; under 50 mm. in breadth.

MEASUREMENT	Wing	Bill	Tarsus	Tail
♂ ♀	286-290	35-37 (from feathers)	c. 75-77	191-192 mm. (Baker)

Wing ♂♂ 256-5-284.5; ♀♀ 288-292 mm. (Richmond).

336

FALCONIFORMES

On morphological characters retained by some authorities in a separate family Pandionidae. (See Witherby 1939, 3: 106-7.)

203. **Osprey.** *Pandion haliaetus haliaetus* (Linnaeus)

Falco Haliaetus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 91

(Europe, restricted type locality, Sweden ex Fn. Succ.)

Baker, FBI No. 1704, Vol. 5: 3

Plate 14, fig. 6 and Plate 21, fig. 1

LOCAL NAMES. *Māchhlīmār*, *Māchhlāriya*, *Māchhlānga* (Hindi); *Māchhlārang* (Nepal); *Māchhlāmarol*, *Kurari*, *Utkrosh* (Bengal); *Koramē gaddi* (Telugu); *Hegguli* (Yerukali); *Vrāl āddipān* (Tamil); *Talipparundu* (Malayalam); *Pantiang* (Lepcha).

SIZE. Kite —; length c. 56 cm. (22 in.).

FIELD CHARACTERS. A water-frequenting fish-eating hawk. Above, dark brown with some white streaking on the slightly tufted head. Below, pure white with a conspicuous broad brown-streaked band, or 'necklace', across upper breast. A blackish band running backwards from behind eye. Sexes alike; female larger.

In overhead aspect glistening white throat and belly separated by the brownish breast-band, closely barred pointed wings with black patches on 'wrist' region (near base of first 2 or 3 primaries), and barred squarish tail, diagnostic. Wings held in line with body, often slightly bent backwards and downwards from 'wrist'.

Young (immature). Feathers of upperparts and wing-coverts scalloped with whitish. Brown breast-band less defined; head, neck, and face more heavily marked with dark brown.

STATUS, DISTRIBUTION AND HABITAT. Breeds in small numbers, provenly or circumstantially, along the Himalayas between c. 2000 and 3300 m. altitude (Ladakh, Kashmir, Garhwal, Kumaon) and in Assam (Cachar). Observed throughout the year in Nepal Valley (Proud, JBNHS 48: 716). Mainly winter visitor, September through March, throughout the sub-continent — from Baluchistan east to Assam and Manipur, south to Kanyakumari. Andaman and Laccadive Is., Nepal (lowlands); Ceylon (to c. 1800 m. — Nuwara Eliya lake); Maldives Is. (vagrant ?). Not numerous but singly or pairs widely scattered; at large bodies of water — coastal lagoons, estuaries, broad rivers, jheels, and up to the highest multipurpose dammed reservoirs.

Extralimital. Breeds in Europe and Asia from Scotland (formerly) and Lapland east to Kamchatka and Japan, south to Spain, N. Africa, Mediterranean islands, Greece, Red Sea coasts, S. Arabia and S. China. In winter S. Africa, India, Burma, Thailand, Malay Peninsula, Philippines, Sunda Islands.

GENERAL HABITS. Single birds normally seen perched on fishing stakes, dead trees standing in or near water, islanded rocks, etc. From here it launches sorties to reconnoitre the waterspread, flying in wide circles or back and forth c. 20 or 30 m. up with slow deliberate wing-beats punctuated with bouts of gliding. Now and again the bird stops dead in mid-air hovering like a kestrel, legs dangling and a little forward in readiness, to investigate suspected movement in the water below. At a favourable opportunity hurls itself headlong on a fish with closed wings, going completely under with a

HAWKS, VULTURES, ETC.

337

great splash. Presently it emerges with the slippery prey gripped firmly in its talons, the prickly soles assisting in the process. With a convulsive shrug to shake off the water from its plumage, the bird makes for a favourite perch where the prey is torn to pieces and devoured. Occasionally a very large fish is struck which the bird has considerable difficulty in overpowering, bobbing up and down with it in the water as the quarry struggles to dive and escape. If too heavy to lift clear, the victim is dragged along the surface and beached on a shelving bank. Instances are known where an osprey, unable to extricate its claws from a particularly large and lively fish, has been pulled under and drowned. In flight occasionally descends to the water, ploughing the surface with dropped talons for 5 or 6 metres at a stretch as if to wash off the slimy remains of a meal. Seldom, if ever, soars and circles aloft for fun as so many other raptors do.

FOOD. Exclusively fish. Often strikes mahseer (*Barbus*) and others heavier than itself.

VOICE AND CALLS. Seldom heard in its winter quarters. Described elsewhere as a clear *kai, kai, kai*; also as a 'short cheeping whistle'.

BREEDING. Reports of Indian breeding not completely satisfactory, though evidently a few pairs do so in the Himalayas, e.g. in Kashmir and Ladakh. Baker found a pair breeding in several successive years in Cachar in March and April. Here the nest was a huge structure of sticks and branches c. 138 cm. across and nearly as deep. Built c. 12-14 m. up in a thinly foliated tree standing on high ground in the middle of a *bheel* or swamp. According to Baker average size of 100 European eggs 61.6 × 46.3 mm. with which three taken by him in Cachar agree. Normal clutch, 2 or 3, rarely 4, eggs white or yellowish white, spotted and blotched with dull red; very handsome. (For an excellent breeding biology see Horst Siewert 1941, 'Zur Brutbiologie des Fischadlers *Pandion h. haliaetus* (L.)', *Jour. f. Orn. Ergänzungsband* 3: 145-93.)

MUSEUM DIAGNOSIS. As for the genus. For details of plumage etc. see Witherby 1939, 3: 110-11.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	452-495	37-39	c. 59-65	191-223 mm.
♀♀	468-508	—	—	204-220 mm. (Baker)

Adults recently collected in India measure:

		Bill (from skull)		
2♂♂	481-481	41-41.5	—	201-210 mm.
3♀♀	482-537	41-43 (2 msd.)	60-61 (2 msd.)	200-251 mm. (2 msd.) (SA, Whistler, Meinertzhagen)

FALCONS

339

and under tail-coverts deep ferruginous. Rest of lower plumage rusty white. Sexes alike; female larger.

Young (immature). Forehead, supercilium, face, and collar more or less ferruginous or chestnut. Underparts generally whiter. In quite young birds upperparts and wing-coverts scalloped with pale rufous.

STATUS, DISTRIBUTION AND HABITAT. Resident. The Himalayan foothills (normally to c. 650 m. elevation; recorded as high as c. 2000 m.) and terai from Kumaon in Uttar Pradesh east through Nepal, Sikkim, Bhutan, and Assam south to Cachar. Westernmost record in U.P., Naini Tal (c. 79° 26'E.); southernmost Sultanpur (c. 26°15'N.). Affects outskirts of forest, deciduous and evergreen, and abandoned cultivation clearings with tall dead trees to serve as foraging bases. The race *burmanicus* replaces it extraliminally, in Burma, the Shan States, Thailand, etc.

GENERAL HABITS. Met with singly, in pairs, or loose (family?) parties of four or five, perched individually on a derelict spar standing in the middle of a forest clearing, or huddled on a snag near the top of a tall tree whence a good lookout can be kept over the surroundings, launching out after prey one by one or several together and circling back to the same huddle. On the pole-top the bird slowly rotates to face all directions in turn, its fierce eye alert and watchful, head bobbing ludicrously now and again like the spotted owl (*Athene*), and tail swinging slowly and deliberately up and down as in the blackwinged kite (*Elanus*). From time to time it darts out at lightning speed on rapidly beating wings at some butterfly or dragonfly — sometimes swooping quite low down — snatching the insect in its talons in mid-air and circling back to the same perch with a steep upward glide at the end — very like a shrike (*Lanius*). Sometimes descends to the ground in search of grasshoppers, etc. as drongos occasionally do. The abruptness with which such a fast-moving bird will become completely immobile immediately upon regaining its perch is quite astonishing. Here the victim is held under foot, the wings pulled off and floated to the ground, the body torn up with a distinct semblance of anger and ferocity — as if dealing punishment — before being devoured. The ground under favourite hunting bases is littered around with butterfly and dragonfly wings, providing a good index of the species taken. A butterfly chase by this pigmy falcon is strongly reminiscent of the twirls and turns of a merlin when in pursuit of a meadow pipit (Meinertzhagen).

Rather sluggish during the middle of the day but intensely active towards evening, dashing about after prey 'uttering all the while a shrill whistle'. Towards April the birds congregate in small colonies among clusters of lofty simul trees (*Salmalia*) in open tracts in preference to forest, but disperse widely after breeding (H. Stevens, 1923-5).

FOOD. Large insects, chiefly butterflies, dragonflies, grasshoppers, beetles. Occasionally small birds, wren warbler (*Prinia*), rubythroat (*Eritacus pectoralis*), and pipit (*Anthus rufus*) being recorded. '2pithma butterflies are captured on the wing, but larger species like *Papilio* and *Danaus* avoided' (Meinertzhagen), though a *Papilio memnon* was taken while sipping nectar from flower (G. E. Shaw). Butterflies form a regular and important item of its dietary. Observers have suggested that the birds can discriminate to some extent between unsavoury species and their palatable mimics, thus

338

FALCONIFORMES

COLOURS OF BARE PARTS. Iris yellow or golden yellow; eyelids greenish blue. Bill black; cere and gape dull greenish blue. Legs and feet pale greenish or yellowish; claws black.

Family FALCONIDAE, Falcons

For anatomical details see Stresemann 1927-34, *Aves*: 816; Witherby 1939, 3: 1-2

All Falconidae moult the primaries starting with the fourth (descending) whether they have pointed or rounded wings. This distinguishes them from all Accipitridae (Stresemann).

Key to the Genera

	Page
Wing under 170 mm.....	<i>Microhierax</i> 338
Wing over 180 mm.....	<i>Falco</i> 341

Genus MICROHIERAX Sharpe

Microhierax Sharpe, 1874, Cat. Bds. Brit. Mus., 1: 350 (in key), 366. Type, by original designation, *Falco fringillarius* Dapiez

Bill large, slightly compressed, with a very large tooth on upper mandible, sometimes with a second and smaller anterior tooth. Wings long in proportion to size of bird but rather rounded. 2nd and 3rd primaries (as.) longest; 1st and 4th subequal and nearly as long. Tail long and nearly square. Tarsi and toes powerful, with strong claws; lateral toes nearly equal in length and not much shorter than middle toe. Tarsus feathered about half way down.

Key to the Species

White collar present.....	<i>M. caeruleus</i>
White collar absent.....	<i>M. melanoleucus</i>

204. Himalayan Redbreasted Falconet. *Microhierax caeruleus* (Linnaeus)

Falco caeruleus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 88

(Asia = Bengal, ex Edwards, pl. 108)

Baker, FBI No. 1734, Vol. 5: 52

Plate 29, fig. 2 and Plate 30, fig. 3

LOCAL NAMES. *Ching fin nyel* (Lepcha); *Daoling kashiba* (Cachari).

SIZE. Bulbul ±; length c. 18 cm. (7 in.).

FIELD CHARACTERS. A diminutive black-and-white falcon, very shrike-like in silhouette when perched. Pointed wings and flight — a series of rapid flaps followed by a graceful glide — reminiscent of Ashy Swallow-Shrike (*Artamus fuscus*). Tail, partly spread in flight, square-ended and rather triangular, with apex at base — rather like a barbet's but proportionately longer.

x c. 1

Adult. Above, glossy black. Forehead, supercilium, and sides of face white. A prominent black band through the eye; a broad white collar on hindneck. Below, chin, throat, thighs

340

FALCONIFORMES

e.g. between Danaine or Euploeine models, and their *Papilio* mimics, avoiding the former and capturing the latter!

BREEDING. Curiously enough for such a comparatively common bird, unrecorded. Apparently the Burmese race (*M. c. burmanicus*) has also been found nesting only once or twice. Nest, a disused barbet (?) hole in a dead branch. Eggs, 4, dirty white (once 14 April). Average size of 12 laid by mated female in captivity 26.8 × 20.8 mm. (R. Hoppe, Stuttgart, in *epist.*).

MUSEUM DIAGNOSIS. As for the genus. For details of plumage see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from feathers?)	Tarsus	Tail
♂♂	91-106	11-12	c. 20-22	58-64 mm.
♀♀	100-112	12-13	—	64-67 mm. (Baker)

Recent specimens from Nepal and Sikkim measure:

		Bill (from cere)		
5♂♂	101-104	10-11 (4 msd.)	—	60-65 mm. (4 msd.)
3♀♀	109-110	11 (2)	25 (1)	63-65 mm. (2 msd.) (SA, Biswas, Ripley)

COLOURS OF BARE PARTS. Iris brown. Bill, basally yellowish green; distally black. Legs and feet blackish slate.

MISCELLANEOUS. This fierce and bold little falconet (or the next (205), or perhaps both) was trained in the Mogul Emperor Akbar's days, and also later, to strike sparrows and other small birds — some considerably larger and heavier than itself.

205. Whitelegged Falconet or Pied Pigmy Falcon. *Microhierax melanoleucus* (Blyth)

Ierax melanoleucus Blyth, 1843, Jour. Asiat. Soc. Bengal, 12; 179 (Assam)

Baker, FBI No. 1736, Vol. 5: 54

Plate 29, fig. 1 and Plate 30, fig. 1

LOCAL NAME. *Daoling kashiba* (Cachari).

SIZE. Bulbul ±; length c. 20 cm. (8 in.).

FIELD CHARACTERS. A diminutive shrike-like falcon, similar to Redbreasted Falconet (204) but above, black without the white hind collar; below, pure white with no rusty tinge. Sexes alike.

Young (immature). Undescribed.

STATUS, DISTRIBUTION AND HABITAT. Resident in Assam from Kamrup dist. eastward through Dibrugarh dist., south to Cachar; Manipur; E. Pakistan (Sylhet dist., Hill Tippera, Chittagong dist.). Plains, foothills and up to c. 1500 m. elevation. Affects the neighbourhood of forest clearings and tea plantations, and wooded foothills country in both deciduous and evergreen biotopes.

Extralimital. Yunnan (?), Tonkin and SE. China.

GENERAL HABITS. Similar to the Redbreasted Falconet (204). Usually bold and unafraid of man, e.g. in the neighbourhood of tea plantation labourers' barracks. Takes insects on the wing by lightning sorties from

FALCONS

341

an elevated stance, flying out with rapid wing-beats, circling and sailing back to the perch after the capture — actions very reminiscent of the Swallow-Shrike. Insects are disposed of in the air or, if large, brought back to the base for dismemberment before devouring. Capable of great speed, sometimes stooping on birds much larger than itself just like the true falcons, killing them by striking with the hind claw. Begins feeding by digging with its bill into the head of the victim with the same semblance of ferocity and vindictiveness as 204.

FOOD. Butterflies, dragonflies, grasshoppers and other large insects. Possibly also mice and lizards. Among its bird victims are recorded scimitar babbler, thrush, sparrow, and swallow.

VOICE and CALLS. A shrill scream; also a low chattering call. A prolonged hiss when angry (Baker).

BREEDING. Little known. *Season*, March to May. *Nest*, a disused woodpecker or barbet hole; in one case on the underside of a branch c. 13 m. up in a tree standing in a forest clearing, with a quantity of beetle elytra and other insect remains as (fortuitous?) lining. *Eggs*, presumably 3 or 4 (judging from flying broods) but so far more than one (incomplete clutch) never taken from nest; pure white, unmarked, with a soapy surface. Average size of 6 eggs 27.9 × 22.4 mm. (Baker). Presumably both sexes incubate, but this needs confirming. Incubation period unknown.

MUSEUM DIAGNOSIS. No white collar; lower plumage including thigh-coverts pure white.

MEASUREMENTS				
	Wing	Bill (from feathers)	Tarsus	Tail
♀ ♀	111-117	14-15	22	71-73 mm. (Baker)
Two specimens in the Bombay Natural History Society's collection measure: (from skull)				
♂	116	14	25	65 mm.
♀ ?	118	14	27	71 mm. (SA)

Kirke-Swann (p. 323) gives Wing ♂ 108; ♀ 121 mm.
COLOURS OF BARE PARTS. Iris bright brown. Bill deep slaty blue to blackish; tip black. Legs and feet dark horny brown to black.

Genus *FALCO* Linnaeus
Falco Linnaeus, 1758, Syst. Nat., ed. 10, 1: 80. Type, by subsequent designation, *Falco subbuteo* Linnaeus. (A.O.U. Committee, 1886)
Bill stout and strongly toothed inside the hooked tip, often with a blunt fescoon behind the tooth. Nostril circular, with a central tubercle. Tarsus equal to or shorter than middle toe without claw. Upper part of tarsus plumed in front; naked portions covered with small hexagonal scales. Toes very long, covered with transverse scales above; hind toe shorter in proportion and very powerful; claws sharp, curved and strong. Tail moderately long, slightly rounded but not graduated. Wing long and very pointed, the proportions of the primaries varying somewhat. (See Museum Diagnosis under the different species.)

FALCONS

343

streaks on ear-coverts, but no distinct moustache. Upperparts earthy brown, scalloped with rufous. *Below*, breast and belly whitish, thickly marked with longitudinal brown drops, becoming bars on flanks.

Female similar but larger and more heavily marked below.

Young (immature). *Above*, darker and more brown generally. Head more brown with the darker markings more extensive. *Below*, chin and throat unmarked white; rest of underparts boldly streaked with dark brown.

STATUS, DISTRIBUTION and HABITAT. Rather scarce winter visitor; arriving c. October, gone again by April. W. Pakistan (NWF. Province, Sind, Punjab) and adjoining NW. India in E. Punjab and Rajasthan — how far east uncertain but has been obtained in Delhi. Hodgson's specimens from Nepal referred to by Baker (loc. cit.) belong to the next race, *milvipes* (Biswas). Affects desert and open semi-desert biotope.

Extralimital. Breeds in Hungary, middle and southern Russia, and the Caucasus. In winter to Egypt and NW. India (Peters).

MIGRATION. No ringing records.

GENERAL HABITS. Keeps to open country like the Laggar. Much prized for falconry and trained to strike gazelle, kite, owl, houbara bustard, hare, etc., being considered second only to Goshawk or Peregrine for the sport. In the wild state its method of hunting small animals is to fly low over the ground and crash into its victim, 'binding' and crushing it to death. However, when trained to larger quarry like kite and houbara it adopts a different and more spectacular technique. It manoeuvres itself into a position higher than its quarry and then stoops on it with terrific velocity raking it with its powerful hind claw in passing, or 'binding' in mid-air, both birds interlocked and tumbling down together in spirals with extended wings. Excellent sport is said to be provided as pursuer and pursued both try to gain a position of advantage above each other, rising in spirals (or 'ringing' according to the term used in falconry) higher and higher till almost lost to sight.

FOOD. Largely spiny-tailed lizards (*Uromastix hardwickii*), desert gerbilles (*Meriones hurrianae*) and other small mammals, and birds like sandgrouse (*Pterocles*). A frog has been recorded, but this probably rather exceptional in its desert habitat.

VOICE and CALLS. Unrecorded.

BREEDING. Extralimital. *Season*, April to May. *Nest* of sticks in trees or on cliffs, bulky and well lined; occasionally usurped from a vulture or other bird. *Eggs*, 3 or 4, intermediate between those of the Peregrine and the Laggar in coloration and markings.

MUSEUM DIAGNOSIS. First primary (as.) about equal to 3rd. Upperparts not ashy- or slaty grey but brown with broad tawny edges (scalloping) and blackish shafts. No moustachial- or cheek-stripe; middle tail-feathers with white spots on each web. Differs from the race *F. b. milvipes* (207) in having upper plumage unbarred.

MEASUREMENTS				
	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	348-370	c. 26-27	c. 56-58	190-200 mm.
♀ ♀	390-412			207-210 mm. (Baker)

342

FALCONIFORMES

Genus nearly cosmopolitan, ten species with their races occurring within our limits as residents or winter visitors. Falcons (*Falco*) easily distinguishable from hawks (*Accipiter*) even at great heights in the sky by their long, pointed, swallow-like wings and shorter tails. When soaring the wings are held straight, on same plane as body, but when flapping they are usually bent as though preparing for a stoop. There is considerable change in all falcons from immature to adult plumage, and identification from descriptions in the transitional stages difficult and unsatisfactory. Immature usually distinguishable by bluish tinge of feet v. bright yellow in adults, *Falco p. peregrinator* being an exception.

206. **Saker or Cherrug Falcon.** *Falco biarmicus cherrug* J. E. Gray
Falco cherrug J. E. Gray, 1834, Ill. Ind. Zool., 2: pl. 25 (India)
Baker, FBI No. 1722; Vol. 5: 39
Plate 29, fig. 16 and Plate 30, fig. 11
LOCAL NAMES. *Chārg* ♀, *Chārgela* ♂ (Hindi). The name 'Saker' is evidently the same as *sāgr* (= falcon, Arabic).
SIZE. Kite —; length c. 50-56 cm. (20-22 in.).
FIELD CHARACTERS. Male (adult). *Above*, head pale rufous-white with narrow blackish shaft-strips. Sides of face and throat white with dusky

344

FALCONIFORMES

COLOURS OF BARE PARTS. Iris dark brown usually without any suggestion of yellow. Bill ivory white or yellowish white, tipped blackish; cere dull yellow. Legs and feet dull yellow or yellowish green; claws black.

207. **Shanghar Falcon.** *Falco biarmicus milvipes* Jerdon
Falco milvipes Jerdon, 1871, Ibis: 240 (Umballa, India)
Baker, FBI No. 1723, Vol. 5: 41
Plate 29, fig. 17

LOCAL NAMES. Apparently same as for 206.
SIZE. Kite —; length c. 50-58 cm. (20-23 in.).
FIELD CHARACTERS. Adult. *Above*, darker brown than in Cherrug (206) and barred all over with pale rufous, reminiscent of female kestrel. Crown darker rufous than in 206; sides of head more streaked with blackish; a distinct broad blackish moustachial stripe. *Below*, breast and belly whitish, marked similarly with longitudinal but more blackish drops, becoming bars on flanks. Sexes alike; female larger.

Young (immature). Difficult to distinguish from young of 206, but darker and generally with tail more completely cross-barred. Field identification unsatisfactory.

STATUS, DISTRIBUTION and HABITAT. Rare winter visitor. W. Pakistan (Baluchistan, W. Punjab) and adjoining open semi-desert country in NW India, but imperfectly known. Hodgson's specimens from Nepal, hithert considered *F. b. cherrug*, belong to this subspecies (Biswas).

Extralimital. Breeds from Pamirs and the Altai Mountains across SE Mongolia and south to the Nanshan and Alashan Mountains (Peters).

GENERAL HABITS, FOOD, etc. Little known, but apparently not different from those of the Cherrug.

MUSEUM DIAGNOSIS. First primary (as.) about equal to 3rd. Check-stripe not distinct than in Cherrug. Upper plumage barred with pale rufous throughout.

MEASUREMENTS				
	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	340-351	25-27	50-60	188-236 mm.
♀ ♀	374-435			(Baker)

COLOURS OF BARE PARTS. As in 206 but bill darker, more bluish slate than ivory white.

208. **Laggar Falcon.** *Falco biarmicus jugger* J. E. Gray
Falco Jugger J. E. Gray, 1834, in Hardwicke's Ill. Ind. Zool. 2: pl. 26 (India)
Baker, FBI No. 1721, Vol. 5: 37
Plate 29, fig. 14 and Plate 30, fig. 14
LOCAL NAMES. *Lāggār* ♀, *Jāggār* ♂ (Hindi); *Lāggadu* (Telugu).
SIZE. Kite —; c. 43-46 cm. (17-18 in.).
FIELD CHARACTERS. Adult. Upperparts dark and ashy brown. Crown and nape whitish. A narrow but distinct moustachial stripe running down

FALCONS

345

x.c.1

from in front and below eyes. Below, white or whitish with longitudinal light brown drops (sometimes obsolescent on breast and abdomen), larger and more numerous on flanks and thighs. Sexes alike; female larger.

At short range distinguished from Cherrug Falcon by middle tail-feathers being entirely brown, v. with much white in them.

In overhead flight the white breast, and dark-and-white markings on the lining of the pointed wings, also that two birds are usually seen together, suggest its identity.

Young (immature). Above, dark brown, the feathers scalloped paler. Below, only chin and throat whitish; rest of underparts dark brown.

STATUS, DISTRIBUTION and HABITAT. Resident (partial local migrant in some areas) practically throughout the subcontinent from W. Pakistan (Baluchistan, Sind, NWFP, Punjab) east through Assam and Manipur, and from c. 1000 metres up in the Himalayas southward to Kanyakumari, including Nepal and E. Pakistan. Rare in S. India; absent in Ceylon. Affects dry open country, thin jungle, and cultivation; avoids humid forest tracts.

Extralimital. Breeding also in Afghanistan north to Turkestan, near Tashkent, and in S. Turkmenia (Dementiev & Rustamov).

GENERAL HABITS. The commonest and most easily identified of all our falcons. Normally seen in separated pairs — each pair with a vast territory — perched on poles or tree-tops in open dry scrub country and the neighbourhood of cultivation and habitations; in the last invariably chivvied by house crows (*C. splendens*). A pair will sometimes take up its abode even in the midst of a noisy town, using a high tower or temple spire as foraging base for sorties against the urban pigeon population which provide the birds with comfortable living. Pairs usually hunt in coordination taking turns to chase and harry the prey, both birds then sharing the spoils. The laggar is well known for its habit of waiting on sportsmen as they walk the crops or beat the bushes for partridge or quail, and stooping and carrying off a bird that flushes or one that has been pricked by shot.

Not specially prized by falconers but is, or was, trained to fly at crows, partridges, cattle egrets, and birds much larger than itself such as grey heron, florican and houbara bustard — also at hare. When flown at large birds it adopts and same technique as the cherrug (q.v.), spiralling upwards or 'ringing' into the sky with its quarry, constantly manoeuvring for position above from which it can stoop and bind and drop to earth together with its victim.

On approach of the breeding season pairs commonly indulge in spectacular aerial play, stooping at each other with astonishing velocity, side-slipping, half somersaulting, and effortlessly zooming aloft again. Sometimes hovers against wind like kestrel (Roseveare).

FOOD. Field rats, bats, lizards, small birds, e.g. mynas, babblers, drongos, quails and partridges. Also grasshoppers and locusts. An occasional pair

346

FALCONIFORMES

sometimes attaches itself to a poultry run, the birds then becoming a serious menace to small chickens.

VOICE and CALLS. A shrill prolonged cry *whi-ee-ee*, seldom heard except in the breeding season.

BREEDING. Season, overall January to April. Nest, a deep platform of twigs, lined with straw, leaves, etc. 10 to 15 metres up in a large peepul, banyan or mango tree; lower down in acacias in Rajasthan, N. Gujarat and semi-desert areas. Sometimes built on a ledge of cliff, or on a minaret or cornice of a ruined building. Old nests of other birds of prey and crows are frequently appropriated. A curious circumstance commonly observed and recorded is that in the same tree, building, or cliff as holds a laggar's nest may often be found nests of such gentle species — rollers, pigeons, doves and others — as normally comprise its prey. The co-tenants are here left unmolested, and on their part seem completely unperturbed by the comings and goings of the falcons. Eggs, 3 or 4, rarely 2 or 5, handsome, rather variable in coloration: pale stone or pinkish cream, densely blotched and smudged with brick-red or reddish brown. Average size of 60 eggs 50.0 × 39.4 mm. (Baker). Both sexes assist in building or repairing the nest, the male bringing the material the female arranging it in position. Both sexes incubate and feed the young. Period of incubation unknown. The birds are remarkably close sitters and demonstrate fiercely against a human nest-robbler, diving at him repeatedly yet seldom striking.

MUSEUM DIAGNOSIS. First primary (as), about equal to 3rd. A distinct narrow check-stripe, *contra* Cherrug. Middle tail-feathers entirely brown in adults. For details of plumage see Baker, loc. cit.

Chick (in down). 'Fairly long, dull white. Whole body covered except in definite places (apteria). Whole head covered, and down continuous thence down hindneck to spinal track, which spreads out over back of thigh and is continuous with lateral ventral tracks. Between the spinal and humeral tracks, an apteria with sparse short tufts of down. From the chin run two ventral neck tracks, separated by apteria from the dorsal neck track and from each other, which at the top of the sternum divide into lateral and median sternal tracks, the apteria between them having scanty short tufts; apteria in centre of abdomen, rest covered with sparse down continuous with dorsal track laterally. Upper surface of wing except manus, clothed with long down, undersurface four rows of short down. Thumb with distinct claw' (Ticehurst, 1926). For description of down plumage and first plumage see also Whistler, JBNHS 22: 397. For plumage when 7 months old, and of the same bird when nearly adult at 17 months see Inglis, *ibid.* 14: 560. According to Hume acquires adult plumage when fully 3 years old (SF 5: 50).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	316-335	25-31	49-53	164-183 mm.
♀♀	357-370	27-33	46-54	186-210 mm.

(SA)

COLOURS OF BARE PARTS. Adult. Iris dark brown. Bill bluish slaty, darker at tip, paler and sometimes yellowish at base; cere yellow. Legs and feet yellow; claws black. Juvenile. As above, but cere pale greyish green; legs and feet pale grey, greenish grey, or dull slaty.

FALCONS

347

FALCO PEREGRINUS Tunstall

Key to the Subspecies

	Page
A Check-stripe narrow, a buff nuchal collar <i>F. p. babylonicus</i>	349
B Check-stripe broad, nuchal collar lacking	1
1 Above paler, below white or almost so <i>F. p. japonensis</i>	347
Above much darker, below very ferruginous ... <i>F. p. peregrinator</i>	350

209. Eastern Peregrine Falcon. *Falco peregrinus japonensis* Gmelin

Falco japonensis Gmelin, 1788, Syst. Nat., 1(1): 257, No. 44, α 'Japanese Hawk', Latham, J., Gen. Syn. Bds., 1: 33, No. 7b ('flew on board off Japan')

Falco calidus Latham, 1790, Index Orn., 1: 41 (India)

Falco peregrinus ussuriensis Buturlin, 1907, Prov. i. Ruzejn. Okhota, 13: 100 (Ussuriland and Japan)

Falco peregrinus harteiti Buturlin, 1907, Prov. i. Ruzejn. Okhota, 13: 100 (Lower Lena to Anadyr, common on the Kolyma)

Cf. Stresemann, E., 1949, Ibis 87: 253

Baker, FBI No. 1718, Vol. 5: 32

Plate 29, fig. 12 and Plate 30, fig. 13

LOCAL NAMES. *Bhyri* ♀, *Bhyri bacha* ♂ (Hindi. Apparently a corruption of the Arabic name 'Bāhārī', implying its connexion with water, cf. the American name Duck-hawk); *Bhyri daga* (Telugu); *Daga* (Yerukali); *Kāyāl pūllā* (Malayalam). Among falconers 'falcon gentle' = ♀ peregrine; 'tiercel' or 'tiercel gentle' = ♂.

SIZE. Kite —; Jungle Crow ±. Length c. 40-48 cm. (16-19 in.).

FIELD CHARACTERS. A typical, compact, pointed-winged, broad-shouldered, streamlined falcon.

Adult. Above, head slaty black with conspicuous black check- or moustachial stripes. Upperparts grey, barred with blackish. Below, pinky fulvous or rufous-white, narrowly barred from lower breast down with blackish. Sexes alike; female larger.

In overhead aspect robust bullet-shaped whitish body (v. rufous in Shaheen—211), underside of wings narrowly barred with black, and comparatively short unexpanded tail are suggestive. Prominent black moustachial stripes contrasting with white chin and throat, coupled with swift purposeful pigeon-like flight and short glides, are further pointers to its identity.

Young (immature). Above, dark brown, darkest on head. Below, rufescent white, all except chin and throat boldly streaked with brown, the streaks becoming bars on flanks and thighs. Transition plumages from juvenile to adult confusing and difficult to identify with certainty.

STATUS, DISTRIBUTION and HABITAT. Winter visitor (September/October to March/April) practically throughout the subcontinent from Baluchistan eastward through Assam and Manipur, and from Gilgit and Kashmir (once at c. 4000 metres in the Indus valley) and along the foot of the Himalayas south to Kanyakumari. Ceylon (Dry Zone — mostly in the juvenile plumage); Nepal (Valley); Andaman (?), Nicobar (?), Laccadive islands; Maldives Islands (apparently 'infrequent in winter' — Phillips.

348

FALCONIFORMES

Subspecies?). Affects the neighbourhood of rivers, jheels, coastal lagoons and marshes — the favourite haunts of migratory waterfowl.

Extralimital. 'Breeds in N. Asia from W. Siberia east to Anadyr and Kamchatka. In winter migrating to Japan, SE. India, Sunda Islands, the Moluccas, New Guinea, and occasionally to N. Africa' (Peters).

MIGRATION. No ringing records.

GENERAL HABITS. More individualistic than the Laggar, seldom hunting in couples. Not actually crepuscular but more active in its hunting just after dawn and towards evening. Spends the daytime ensconced on a shady bough of a tree overlooking its feeding territory, or perched in a sandy river-bed or on a tree-stump or mound. When hunting flies low and fast with rapid powerful wing-beats, the wings usually slightly bent back from the first joint. 'On viewing ducks on a pool or a flock of doves in the fields, the falcon drops to within a few feet of the ground, the beat of the wings becomes even faster than before and the wings bend closer to the body and it fairly hurls itself through the air into the middle of the flock, which will probably rise *en masse* when the falcon is still a few yards distant. Having selected one particular bird the chase begins. . . . Usually the dove succeeds in evading those dread talons in the first instance and neatly doubles back. Up rises the falcon almost vertically to her "pitch", turns and shoots down like an arrow in the wake of its quarry, following every turn and twist of the latter. Another miss and up she goes again determined to secure her breakfast before the dove can reach the shelter of the trees surrounding a village, not far distant. The dove reaches the fringe of trees closely followed by the falcon, and dashes right into the branches of the nearest tree. The falcon once more rises high into the air, circles round once or twice in the hope of its quarry or another bird leaving the security of the trees for the open ground beyond, gives up the chase and flies straight away, rising steadily as it goes, to make an attack elsewhere' (Donald, JBNHS, 27: 283).

Largely predatory on waterfowl, which are usually struck in mid-air, the falcon stooping almost vertically from above at incredible velocity, wings pressed to its sides and with a loud swishing sound, raking with the hind claw and literally ripping open the victim which falls limply to the ground. The peregrine circles a couple of times before stooping again to retrieve the quarry. It then repairs to its favourite feeding-perch and thoroughly plucks its victim before beginning to tear and devour it. Not infrequently it stoops, strikes, and binds on the quarry in mid-air all in the same lightning action, bearing it away in its stride. A peregrine will often stoop at a duck falling to a sportsman's gun, and so intense is its concentration on the quarry then that it will stoop again and again after an initial miss, regardless of shots fired at it which may even send its feathers flying.

FOOD. Chiefly waterfowl — ducks, coots, moorhens, lapwings, etc. — and waders; also pigeons, partridges, and many other birds. Among its prey have been specifically recorded Kaleej pheasant (*Lophura leucorhynchos*), Imperial Pigeon, Chough, Caspian Tern, and early-flying bats. The more robust female (*bhyri*) is trained to strike birds much larger and heavier than itself, e.g. egrets, herons, storks, cranes and bustard. Cases reported of single birds (subspecies?) coming on board ships in mid-ocean (once along Arabian

FALCONS

349

coast) and subsisting on Storm Petrels (*Oceanites oceanicus*), flying out over the sea and returning to ship with the prey (*Sea Swallow*, 1957, 10: 20; *Ardea*, 1961, 49: 176-7).

VOICE AND CALLS. None recorded in its winter quarters. Reportedly noisy when breeding.

BREEDING. Extralimital. Nest, situation, eggs, etc. as in the Shaheen (211) q.v.

MUSEUM DIAGNOSIS. First primary (as.) longer than 3rd. Upperparts ashy grey in adult. Cheek-stripe broader than eye. No nuchal collar. Crown slaty black; breast very slightly rufous. For details of plumage of nominate race see. Withersby 1939, 3: 13-15. *F. p. japonensis* differs from it (doubtfully) in being rather paler, with less black on sides of head and ear-coverts — a narrower moustachial stripe and large white patch behind it.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	297-316	c. 25-26	c. 49-51	134-145 mm.
♀♀	344-379	27-30	—	— mm. (Baker)

Middle toe with claw, ♂♂ c. 57-58; ♀♀ 62-70 mm.

Weight: 1 ♀ 920 gm. (SA).

COLOURS OF BARE PARTS. Iris brown or deep hazel. Bill bluish slaty, yellowish at base of lower mandible; cere yellow. Legs and feet dull chrome-yellow to almost orange-yellow; claws deep slaty to almost black.

210. Redcapped or Barbary Falcon. *Falco peregrinus babylonicus* P. L. Sclater

Falco babylonicus P. L. Sclater, 1861, *Ibis*: 218, pl. 7
(Oudh, in India, Babylonia and Abyssinia. Type from Oudh)
Baker, FBI No. 1720, Vol. 5: 36

LOCAL NAMES. *Shāheen*, *Safed shāheen* (Hindi); *Lālsir shāheen* (of Punjab falconers). **SIZE.** Kite —; Jungle Crow ±. Length c. 38-46 cm. (15-18 in.).

FIELD CHARACTERS. Like the Peregrine in shape and build.

Adult. *Above*, crown largely rufous or chestnut and ashy brown. Feathers round eye and narrow cheek-stripe black. Sides of neck buff; a broad rufous nuchal collar. Upperparts and tail ashy grey cross-banded with blackish. *Below*, chin and throat whitish; rest of underparts pale rufous; flanks and under wing-coverts barred blackish. Sexes alike; female larger.

Young (immature). *Above*, dark brown broadly scalloped with rufous. Tail barred rufous and brown. A broad rufous nuchal collar; black cheek-stripes and around eyes as in adult. *Below*, rufous with broad blackish streaks except on chin and throat.

STATUS, DISTRIBUTION AND HABITAT. Breeding sparsely in NW. Pakistan south of Kohat, and in Baluchistan. Chiefly winter visitor in Baluchistan, Sind, Punjab, NWFP and in NW. India (to Kashmir, Punjab, U.P., Rajasthan, N. Gujarat). Rare in Madhya Pradesh, taken at Raipur (21° 16'N., 81°42'E.). — D'Abreu. Along foot of hills from Jhelum to Peshawar and on through Kohat to border of Afghanistan at Parachinar, both *F. p.*

FALCONS

351

FIELD CHARACTERS. Very like the Peregrine (209) — a powerful, broad-shouldered, streamlined falcon with long pointed wings, and swift direct flight.

Adult. *Above*, slaty black with black head and prominent cheek or moustachial stripes on either side of throat. *Below*, pinkish white and rusty red, boldly cross-banded with black from abdomen down. Sexes alike; female larger.

Young (immature). Darker. More brownish black above; more ferruginous below.

STATUS, DISTRIBUTION AND HABITAT. Resident and breeding in NW. Pakistan (Thal, Chitral, Kohat dists.) and the entire Indian Union from about 2400 m. alt. in the Himalayas from Kashmir, Punjab, Himachal Pradesh, U.P. and Nepal, eastward through Assam; southward throughout the Peninsula to S. Kerala (with the exception of the desert and semi-desert areas in western Rajasthan and northern and western Gujarat where mostly *babylonicus*). E. Pakistan; Ceylon and Nicobar Is. Affects foothills and rugged hilly country to the highest peninsular hills.

Extralimital. Burma east to the lower Yangtze valley in E. China.

GENERAL HABITS. Very similar to the Peregrine (209), but keeps more to steep rugged hills than about lowland waterfowl resorts. Pairs occupy favourite crags, almost traditionally, for nesting and as bases for foraging over vast tracts of the surrounding countryside. Flight extremely swift and direct — a few rapid pigeon-like wing-beats followed by a glide at tremendous speed. Like the Peregrine hurls itself obliquely at its quarry from a height, or 'pitch', wings pressed to the sides, sometimes over a traverse of several hundred yards — literally a bolt from the blue. The loud tearing swish of this lightning stoop overhead can be quite disconcerting to an observer taken unawares, and by the time he can locate its source the falcon is already vanishing in the distance, maybe with the quarry dangling limply from its talons! Inclined to be somewhat crepuscular, hunting mostly soon after dawn and then again late afternoon and well into the dusk. In the breeding season pairs indulge in a great deal of aerial interplay, stooping at each other around their nesting cliff and deep down into the adjoining gorges with incredible speed and adroitness, going through remarkable acrobatics, throwing themselves momentarily upon their backs in mock battle, and executing perfect looping-the-loop turns.

FOOD. Chiefly birds: chukor, partridges, quails, pigeons, etc. In some areas parakeets, mainly *Ptilacula krameri*, form a major food item. Nightjars (*Caprimulgus* spp.) and bats also recorded. Easily trained to strike large birds like mallard, floricorn, and junglefowl, but crows said to afford far finer sport than all of these.

VOICE AND CALLS. Unrecorded except for a prolonged *chir-r-r-r* made by the female every now and then in the proximity of the nest-cliff, especially when nest being investigated (Dodsworth).

BREEDING. *Season*, in the Himalayas (up to c. 2400 m.) chiefly March to May; in the peninsular and S. Indian hills January to March/April; in Ceylon c. March-April. *Nest*, a large compact platform of sticks sometimes lined with wool and grass, placed on a ledge or in a niche on a cliff face — usually inaccessible situations. Often no nest, the eggs being laid directly

FALCONIFORMES

350

babylonicus and *F. p. peregrinator* found during breeding season (Ratray, *Ibis* 1919: 370). Affects barren stony semi-desert tracts with sand mounds, *Capparis* bushes, scattered trees of *Prosopis spicigera* and other xerophytic species — largely the neighbourhood of cultivation in such biotope.

Extralimital. Breeds in W. and C. Asia from Mesopotamia (Iraq) to the Gobi Desert, south to Persia and Baluchistan. Winters in NW. India (Peters). For biology in Turkestan and discussion on distribution, variation, moult, etc. see Dementiev, 1957, *Ibis* 99: 477-82.

GENERAL HABITS. Very similar to those of the Peregrine and Shaheen falcons except for its habitat preference of barren desert country and rocky hills. Inclined to be somewhat crepuscular like the Peregrine, hunting more actively at dawn and fairly late in the evening. Has sometimes been observed stooping playfully at birds on the wing, apparently with no intention to kill.

FOOD. Partridges, sandgrouse, and other birds. Presumably also gerbilles, lizards and large insects as available. Sometimes takes early-flying bats.

VOICE AND CALLS. Unrecorded.

BREEDING. On circumstantial evidence breeds in Baluchistan, but no direct confirmation by nest or eggs as yet. Two young recorded as taken from an eyrie in the Gumal Pass (32° 2'N., 70° 10'E.) at c. 650 m. alt., Dera Ismail Khan dist., W. Pakistan (date?), and believed to breed in some numbers in the hills about the Khyber Pass. *Nest* and site as in 211, q.v. Eggs, 3 or 4, creamy white blotched and spotted with reddish brown, but showing considerable variation in coloration and markings. Size c. 53 × 43 mm.

MUSEUM DIAGNOSIS. First primary (as.) longer than 3rd. Cheek-stripe narrower than eye; rufous-buff nuchal collar; head ashy grey and rufous. For details of plumage see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	273-284	23-26	45-46	126-135 mm.
♀♀	320-338	26-28	53-55	151-158 mm. (Baker)

A ♀ weighed 2 lb. 1 oz. = 930 gm. (Hume).

COLOURS OF BARE PARTS. Iris deep brown. Bill slaty blue, blackish at tip, sometimes yellowish at base; cere, orbital skin and gape bright yellow. Legs and feet bright to deep yellow; claws black.

211. Shaheen Falcon. *Falco peregrinus peregrinator* Sundevall

Falco peregrinator Sundevall, 1837, *Physiogr. Sällskapet Tidskr.*, 1(2): 177, pl. 4
(At sea in lat. 6°20'N. between Ceylon and Sumatra, 70 Swedish miles
[= 700 kilometres] off the Nicobars). Cf. however Abdulali, JBNHS 68: 398
Baker, FBI No. 1719, Vol. 5: 34
Plate 29, fig. 13 and Plate 30, fig. 12

LOCAL NAMES. *Shāheen kōhi* ♀, *Kōhila* ♂ (Hindi); *Kurulla goya* (Sinhala); *Valliriri* (Tamil); *Kārimpullu* (Malayalam). **SIZE.** Kite —; Jungle Crow ±. Length c. 38-46 cm. (15-18 in.).

FALCONIFORMES

352

on scanty grass growing on a ledge. (An exceptional record of a tree nest presumably self-built by the birds, in the top of a pine in Burma. — Livesey, JBNHS 36: 1003). Eggs, 3 or 4, pale stone to pale brick-red in ground colour, marked in varying degree with a few bold blotches or numerous small ones of reddish brown or brick-red. Average size of 65 eggs 51.8 × 40.7 mm. (Baker). Both sexes take part in nest-building and repair. Incubation evidently by female alone; the male when not hunting keeps watch from a neighbouring pinnacle. During daytime eggs often left exposed, shaded from direct sun by female standing over them with half-open wings. Incubation period 25-27 days (Baker). Chicks (a couple of days old) clad in white down. Iris light brown; legs and feet creamy white (Dodsworth).

MUSEUM DIAGNOSIS. First primary (as.) longer than 3rd. Crown black or blackish. Cheek-stripe broader than eye, sometimes fused into black of crown. No nuchal collar. Breast generally deep rufous. For details of plumage see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	265-295	25-27	48-50	128-162 mm.
♀♀	312-342	28-29	—	— mm. (Baker)

Middle toe with claw ♂ c. 53-55; ♀ c. 60-63 mm.

Wingspread of an ad. ♂ with wing 295 mm. — 911 mm. (Meinertzhagen).

COLOURS OF BARE PARTS. As in the Peregrine and Redcapped falcons. In juvenile birds of races of *peregrinus*, legs and feet yellow *contra* bluish in other immature falcons.

FALCO SUBBUTEO LINNAEUS

(Chukche, NE. Siberia)

Baker, FBI No. 1724, Vol. 5: 42

Plate 29, fig. 7 and Plate 30, fig. 10

LOCAL NAME. *Morassani* (Oudh, U.P.).

SIZE. Dove or Pigeon ±; length c. 31-34 cm. (12-13 in.).

FIELD CHARACTERS. A small, pointed-winged streamlined falcon.

Adult. *Above*, slaty grey with blackish head and moustachial streaks. *Below*, rusty white, broadly streaked with black. Thighs and under tail-coverts rufous. Sexes alike; female larger. In overall effect a very good miniature of the Peregrine falcon, but with underparts longitudinally streaked instead of cross-banded.

Young (immature). Much darker above, brownish rather than slaty, scalloped with rusty whitish.

FALCONS

353

STATUS, DISTRIBUTION and HABITAT. Winter visitor (September to March/April) to W. Pakistan (Baluchistan, Sind, NWFP, Punjab) and India south to about Mysore (Belgaum). Also Nepal and E. Pakistan; but the races not clearly separable. Affects open wooded country, cultivated areas, as well as semi-desert.

Extralimital. Breeds from Scandinavia and N. Russia across Asia to E. Siberia and Kamchatka, south to the Mediterranean, SW. Siberia, Transbaikalia (and probably NW. China) and Manchuria. In winter south to Africa, India, and SE. China (Peters).

GENERAL HABITS, FOOD, etc. As in the Central Asian race (213), q.v.

BREEDING. Extralimital. Nest, eggs, etc. as in 213.

MUSEUM DIAGNOSIS. Similar to *F. s. centralasiæ* but somewhat darker and on an average a trifle smaller. For description of plumage etc. see Witherby 1939, 3: 20-21.

MEASUREMENTS

	Wing	Bill (from cere)	Tarsus	Tail
♂♂	247-272 (one 240)	12.5-14 (one 11.5)	34-37	130-140 mm. (one 122)
♀♀	265-280	—	—	— mm. (Witherby)

COLOURS OF BARE PARTS. Adult. Iris dark brown. Bill leaden blue, tip bluish black; cere, gape, bare skin round eye, legs and feet bright yellow. Immature. Cere and round eye pale lead-blue or greenish. Legs and feet paler yellow (Witherby).

213. Central Asian Hobby. *Falco subbuteo centralasiæ* (Buturlin)

Hypotriorchis subbuteo centralasiæ Buturlin, 1911, Orn. Mitt., 2: 175, new name for *Falco subbuteo cyaneus* Lönnberg, 1905, Ark. Zool., 6(9): 6 (Baingol, Tianshan) *nec Falco cyaneus* Vieillot

Hypotriorchis subbuteo planicola Portenko, 1930, Bull. Acad. Sci. USSR, ser. 7. Cl. Physico-Math.: 308 (Yarkand Oasis, Kashgaria) Baker, FBI No. 1725, Vol. 5: 43

LOCAL NAME. *Morassani* (Oudh, U.P.).

SIZE. Dove or Pigeon \pm ; length c. 31-34 cm. (12-13 in.).

FIELD CHARACTERS. Same as for 212 from which it cannot be distinguished with certainty. In general effect and actions reminiscent of the Peregrine and Shaheen falcons.

STATUS, DISTRIBUTION and HABITAT. Partly resident in the Himalayas, breeding between c. 1200 and 4000 m. alt. in NWFP, Ladakh, Kashmir, Himachal Pradesh, U.P. (Garhwal). Mainly extralimital winter visitor (September-March/April), spreading out unevenly over W. Pakistan (Sind, Baluchistan, Punjab) and India east through Assam and Manipur, south to N. Mysore. Also E. Pakistan; but the races not clearly separable. In non-breeding season affects similar biotope to the last, the two forms often overlapping.

Extralimital. Turkestan south to N. Persia and E. Himalayas — Peters.

GENERAL HABITS. Partial to low-lying swampy ground in wooded country. Even in its residential and adjacent areas more commonly seen in winter when its numbers have been augmented by extralimital migrants. Distinctly

FALCONS

355

214. Indian Hobby. *Falco scterus rufepedoides* Hodgson

Falco Rufepedoides Anonymous = Hodgson, 1844, Calc. Jour. Nat. Hist., 4: 238 (Hills of India, restricted to Nepal by Baker, 1927, Bull. Brit. Orn. Cl., 47: 107) Baker, FBI No. 1729, Vol. 5: 47

LOCAL NAMES. *Dhülar* ♂, *Dhüli* ♀ (Hindi).

SIZE. Dove \pm ; length c. 27-30 cm. (11-12 in.).

FIELD CHARACTERS. Very similar to 212 but with breast and underparts ferruginous instead of rusty white. In overall effect a good miniature of Shaheen falcon, just as 212 is of the Peregrine. Sexes alike; female larger.

Young (immature). Above, very dark, narrowly scalloped with rufous in freshly moulted plumage. Below, boldly black-streaked from upper breast to vent.

STATUS, DISTRIBUTION and HABITAT. Resident and breeding in the lower Himalayas (c. 1800 to 2400 m.) in W. Pakistan (Murree?), Kashmir? and through Kumaon, Garhwal, and Nepal to W. Assam north of Brahmaputra river. Occurs also in Kerala (chiefly hills) where status indeterminate. Presumably only winter visitor; no breeding record to date. Straggler to Ceylon in winter. Affects well-wooded foothills country.

GENERAL HABITS. Very similar to *F. s. subbuteo* (212, 213), q.v. Often seen in loose flocks of ten or twelve birds hawking insects in the manner of swallows and swifts — darting at speed in pursuit, wheeling and circling in the air, chiefly in the twilight of dawn and at sunset till late into the dusk. Prey either eaten on the wing or carried to a perch.

FOOD. Chiefly large flying insects — locusts, cicadas, beetles, dragonflies, etc. Also small birds, and occasionally lizards, pipistrelle bats, and mice. 'Hunting small chickens near lowland villages' (Fleming, Nepal).

VOICE and CALLS. Only a loud squealing rapid ki-ki-ki recorded. 'Cry is rather shriller and weaker than that of the Kestrel' (Bourdillon, SF 4: 354).

BREEDING. Very little definite information. *Season*, 'probably late May and June' (Baker). A pair feeding young in nest in tall pine in British Embassy grounds, Kathmandu, Nepal — July-August (Proud, JBNHS 48: 716). *Nest*, of sticks, usually an old crow's or magpie's, in a pine or similar tree growing from the side of a precipice. According to Baker apparently has two alternate nests at varying distances from each other, used in irregular sequence. *Eggs*, 3 or 4, broad ovals, very like those of *F. s. subbuteo* — buff, reddish buff or light brick-red in ground colour, densely speckled with dark brick-red, brownish red or purplish red, with many variations. Size about 41 x 31 mm.

MUSEUM DIAGNOSIS. Middle toe without claw under 40 mm. Second primary (as) longest: 1st much longer than 4th. Breast rufous or ferruginous, unspotted in adults. Differs from the nominate race (215) only in having the lower plumage paler and less deep ferruginous. But this in effect merely represents a colour cline and the race is perhaps redundant. There is no significant difference in size.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	211-219	17	33-34	94-95 mm.
♀♀	237-248	19	—	105-112 mm. (Baker)

FALCONIFORMES

354

crepuscular; feeds chiefly in the twilight of dawn and at sunset, often well into the dusk. The birds fly about in curves and circles, climbing and sinking at will, flying straight some distance with rapid wing-beats followed by a downward swoop of 30 metres or so, and then a swift effortless rise. While soaring the primaries are slanted slightly downwards almost below level of back. Chases cicadas, dragonflies and small birds at great speed with rapid wing-beats followed by arrow-like glides a few metres above the ground. On catching its prey rises like a kite 20 or 30 metres up in the air, sailing slowly round in circles, devouring the victim from its talons. Like the Shaheen sometimes soars to a 'pitch' and 'waits on', stooping obliquely with tremendous velocity and taking the quarry in its stride. Occasionally will also hover for a moment over a field of gram or lucerne 'waiting on' for some small bird or grasshopper to take wing. Sometimes hawks winged insects in a loose flock of ten or more birds in the manner of swifts, high up in the air, turning, twisting, rising, falling, circling round and darting at the quarry with great agility. Has been observed thus engaged in association with swallows (*Hirundo rustica* and *H. daurica*), which themselves frequently form its prey (SA).

FOOD. Small birds (larks, pipits, swallows, wagtails, swifts, warblers, etc.), pipistrelle bats, and flying insects (dragonflies, cicadas, locusts, beetles, etc.). Can be easily tamed and taught to 'wait on' at great heights for pursuit of larks, drongos, quails, hoopoes, etc. but 'lacks the dash and daring of the Merlin and is disappointing from the falconry point of view' (Donald).

VOICE and CALLS. Very noisy in breeding season. 'A harsh, plaintive, rising tee-tee-tee-tee as common to most falcons, occasionally varied with harsh single notes pit pit or chip chip chip uttered two or three times in succession while flying about in circles above the trees, settling here and there on different trees' (Whistler, JBNHS 32: 730-2).

BREEDING. *Season*, principally May to July. *Nest*, usually an old stick nest of crow or magpie high up in a fir, deodar, or poplar tree on the outskirts of forest, repaired and utilized. *Eggs*, 3 or 4, dull yellowish buff to pale brick-red densely speckled and spotted with dull brick-red and brown, sparsely blotched with purplish black. Average size of 28 eggs 41.4 x 33.0 mm. (Baker). Incubation mostly by female; period unrecorded. 'Male brought plucked bird and passed it to incubating female who left nest to receive and deal with it on a nearby branch' (Whistler, loc. cit.).

Nestling covered with down 'of isabelline shade' (A. E. Jones).

MUSEUM DIAGNOSIS. Second primary (as) longest; first much longer than 4th. Middle toe without claw under 40 mm. Breast white or buff with brown streaks. *F. s. centralasiæ* differs from nominate *subbuteo* in being somewhat paler and on an average a trifle larger, but race very variable and of doubtful validity. For details of plumage see Baker, loc. cit.

MEASUREMENTS. Wing ♂♂ 250-275; ♀♀ 277-286 mm.

COLOURS OF BARE PARTS. As in 212.

COLOURS OF BARE PARTS. Iris hazel-brown to almost black. Bill bluish slate, paler at base, black at tip; cere, gape and orbital skin lemon-yellow. Legs and feet yellow to orange-yellow; claws black.

215. Burmese Hobby. *Falco scterus scterus* Horsfield

Falco scterus Horsfield, 1821, Trans. Linn. Soc. London, 13(1): 135 (Java)

Baker, FBI No. 1728, Vol. 5: 45

Plate 29, fig. 10 and Plate 30, fig. 9

LOCAL NAMES. Unrecorded.

SIZE. Same as 214.

FIELD CHARACTERS. Same as for 214 but with breast and underparts much deeper ferruginous. The two races indistinguishable with certainty.

STATUS, DISTRIBUTION and HABITAT. Resident. Assam south of the Brahmaputra river, Manipur; E. Pakistan. Affects well-wooded foothills country.

Extralimital. Burma, Thailand, Indochinese countries, Sumatra, Java, Philippines.

GENERAL HABITS, FOOD, etc. Similar to the other hobbies. In northern Assam (Dibrugarh dist.) frequents tea gardens and edge of forest and paddy land.

VOICE and CALLS. Not specifically recorded.

BREEDING. *Season*, March to May in the Assam hills. *Nest*, usually an appropriated old one of a crow or magpie in a tree growing out of a precipice or steep hillside; repaired and sometimes added to and lined with green twigs and leaves. *Eggs*, 3 or 4, as in 214. Average size of 54 eggs 40.1 x 31.9 mm. (Baker). Both sexes take part in nest-repair, incubation, and feeding the young. Incubation period 26 days (Baker).

MUSEUM DIAGNOSIS. Differs from the Indian race *rufepedoides* (214) only in having the lower plumage much darker and deeper ferruginous.

MEASUREMENTS

Measurements	Wing	Bill (from feathers)	Tarsus	Tail
221-238	c. 18 (?)	c. 30-33	95-110 mm.

Falco concolor Temminck, 1825, Pl. Col., livr. 56, text (but not pl. 330) (Senegal, Barbary Coast, Egypt, Arabia, Barakan Island, Gulf of Aqaba, suggested by Meinertzhagen, 1954, Birds of Arabia: 340)

Not in Baker, FBI

Plate 29, fig. 11 and Plate 30, fig. 8

LOCAL NAMES. Unrecorded.

SIZE. Jungle Crow \pm ; length c. 38 cm. (c. 15 in.).

FALCONS

357.

FIELD CHARACTERS. General aspect as of Hobby (212), but slightly larger and uniformly pale slaty grey above and below, with prominent yellow cere and legs. Sexes alike; female larger.

Young (immature). Not unlike that of *F. subbuteo* but with the pale nuchal patch of the latter almost absent.

STATUS, DISTRIBUTION and HABITAT. Only once obtained in W. Pakistan (ad. ♂, Qharbar, Baluchistan Coast, 31 August 1912 — W. D. Cumming). The specimen, which was examined by Dr C. B. Ticehurst in the Quetta Museum, was evidently destroyed in the great earthquake of 1936.

Extralimital. 'Red Sea coasts and Somaliland south to Mozambique; Madagascar' — Peters.

GENERAL HABITS, FOOD, etc. According to Meinertzhagen (1954: 340) crepuscular, with a very hobby-like flight; catching bats on the wing with ease. (For extralimital breeding, habits, etc. see Clapham, 1964, *Ibis*, 106: 381.)

MUSEUM DIAGNOSIS. 'Adults (both sexes): Whole upperparts pale slaty grey, primaries blackish. First primary unbarred on the inner web. All feathers of upperparts with dark shafts. Chin and centre of throat pale yellowish buff. Rest of underparts pale slate-grey. Tail as back. The immature bird is browner and has the feathers fringed paler. Cheeks and throat rusty yellow' (Meinertzhagen, *Birds of Egypt*: 374).

MEASUREMENTS. Wing 267-305 (Meinertzhagen). The Charbar specimen (♂) measured: Wing 278; bill from cere 13; tarsus 33; middle toe 32.5; tail 133 mm. (Ticehurst).

COLOURS OF BARE PARTS. Iris dark brown. Bill bluish horn; cere lemon-yellow. Legs and feet lemon-yellow; claws black.

Plate 29, fig. 9 and Plate 30, fig. 6

LOCAL NAMES. *Daurāla* ♂, *Daurāi* ♀ (Hindi); *Rāil tārūmti*, *Regi* (Punjab).

SIZE. Dove ±; length c. 27-30 cm. (11-12 in.).

FIELD CHARACTERS. Rather like Hobby (212) but without the cheek-stripes.

Male. (Adult). *Above*, forehead, supercilium, and sides of head whitish with black shaft-streaks. Upperparts bluish slaty with a broad rufous-and-black hindcollar. Tail tipped white, with broad subterminal black band. *Below*, sides of throat and underparts white tinged with rufous and boldly streaked with blackish; thighs and under tail-coverts darker rufous.

FALCONS

359

effect rufous rather than rufous-brown. Bars on primaries in both sexes especially pale.

STATUS, DISTRIBUTION and HABITAT. Uncommon. Vagrant in winter to W. Pakistan (specimens in the British Museum collection from Peshawar and Kohat districts, and Sind); also from Gilgit. Meinertzhagen procured one in Ladakh at c. 3000 m. alt. (Dras, 34°26'N., 75°46'E.) on 15 April.

Extralimital. 'Breeds on the Kirghiz Steppes from Orenburg to the Altai, north to Omsk and Lake Tschany. Winters to the Caucasus, Turkestan and Tarim Basin' (Peters).

GENERAL HABITS, FOOD, etc. As in 217.

MUSEUM DIAGNOSIS. Differs from *insignis* (217) in both adults and juveniles being very much paler.

MEASUREMENTS. Wing ♂♂ 203-226; ♀♀ 200-232 mm. (Baker); in Meinertzhagen's ♀ from Ladakh 230 mm.

COLOURS OF BARE PARTS. Bill paler bluish; cere paler yellow. Otherwise as in 217.

219. Redheaded Merlin, *Falco chicquera chicquera* Daudin

Falco chicquera Daudin, 1800, *Traité d'Orn.*, 2: 121 (Bengal)

Baker, FBI No. 1730, Vol. 5: 47

Plate 29, fig. 8 and Plate 30, fig. 7

LOCAL NAMES. *Tūrūmti*, *Tūrūmtāri* ♀ (Hindi); *Chūwa* ♂ (Sind); *Jellaganta*, *Jelgiddā* (Telugu); *Jelkūt* (Yerukali).

SIZE. Pigeon ±; length c. 31-36 cm. (12-14 in.).

FIELD CHARACTERS. An elegant little grey-and-white falcon with a diagnostic chestnut head.

Adult. *Above*, crown, nape, sides of head and cheek-stripe chestnut. Rest of upperparts ashy or bluish grey. Wing-quills blackish. Tail grey, narrowly barred with black, and with a broad black band near end; extreme tip white. *Below*, white, sparsely streaked with blackish on breast, barred on flanks and abdomen. Sexes alike; female larger.

Young (immature). More heavily barred below than adult. In still younger birds upperparts also barred throughout; chestnut of head duller, more rufous, and streaked with black; throat and breast also heavily marked with black.

STATUS, DISTRIBUTION and HABITAT. Resident and breeding. Not very common, but fairly generally distributed throughout the subcontinent, from W. Pakistan (Baluchistan, Sind, NWFP) eastward through Rajasthan and the Gangetic Plain (including the Himalayan foothills, terai, and Nepal Valley) to Assam and E. Pakistan. Southward through the Peninsula to Kerala and Madras (southernmost Tirunelveli c. 8°45'N.). Not in Ceylon. Common on the Deccan Plateau; rarely descending to the coastal districts. Apparently also partial local migrant, or nomadic, to some extent. Recorded as abundant in some localities in winter and as scarce in other seasons, but movements unstudied. Affects deciduous plains, plateau and low foothills country interspersed with groves of trees, cultivation and villages. Avoids forest.

358

FALCONIFORMES

Female. Larger. *Above*, slaty brown scalloped with rufous. Tail barred throughout with dark brown and rufous-grey. *Below*, paler than in male, more broadly streaked with brown.

Young (immature). *Above*, brown without any slaty tinge. Rufous of scalloping and head more pronounced.

STATUS, DISTRIBUTION and HABITAT. Scarce winter visitor (vagrant ?) to W. Pakistan [Baluchistan (Quetta-Pishin; Loralai dist.) and Sind (race presumed)]. Nepal (sight, Fleming). Has been obtained as a vagrant in Gilgit and Punjab in winter. Not very rare in Punjab (Donald), arriving in autumn, leaving again in spring. Affects open country with scrub and cultivation.

Extralimital. Breeds in N. Siberia across Yakutsk to the Stanovoy Mountains. In winter to Turkestan, N. India, S. China, Japan.

GENERAL HABITS. Hunts singly (not in pairs like *F. chiequera*) in open places, particularly crops, for larks and such-like small birds. Perches on the ground or on a mound or bund separating fields from where the sorties are launched. Occasionally hovers momentarily. Flies low along the ground, very fast with short sharp wing-beats interspersed with glides with half-closed wings. Seldom or never soars, and though often striking prey from above does not stoop at it from any distance or great height. Prey usually captured by swift, direct pursuit. Much esteemed for falconry. Very easily tamed and trained for pursuit of quails, hoopoes, larks, etc. Exhibits great speed and courage in the chase, turning, twisting, zigzagging, rising and falling in the air after the quarry with utmost adroitness.

FOOD. Mostly small birds. 'Took a Desert Wheatear from under my nose' in Sind (Ticehurst).

BREEDING. Extralimital. Nests on ground among grass and herbaceous vegetation, or in trees utilizing old stick-nests of crows, etc.

MUSEUM DIAGNOSIS. Middle toe without claw under 40 mm. as in Hobby, but 2nd and 3rd primaries subequal, and 1st and 4th subequal. Differs from *F. c. christianiludovici* (218) in both sexes being much darker above and below. For details of plumage, see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	196-204	14-15	c. 34-39	121-138 mm.
♀♀	220-224	15-16		(Baker)

COLOURS OF BARE PARTS. Iris brown. Bill slaty blue, black at tip, yellowish at base of lower mandible; cere yellow. Legs and feet yellow; claws black.

218. Pallid Merlin, *Falco columbarius pallidus* (Sushkin)

Lithofalco aesalon pallidus Sushkin, 1900, Bull. Brit. Orn. Cl. 11: 5

(Western Kirghiz steppes)

Baker, FBI No. 1732, Vol. 5: 50

LOCAL NAMES. As in 217.

SIZE. Dove ±; same as 217.

FIELD CHARACTERS. Much paler than 217, the adult ♂ a beautiful pale blue-grey above. Female and Young (immature) also paler; in general

360

FALCONIFORMES

GENERAL HABITS. Male and female almost invariably keep together and hunt in concert, one bird chasing the quarry close along the ground at incredible speed while the other heads it off. Its pursuit flight, attained by rapid, regular wing-beats, is straight and arrowlike; very different from the Merlin (*F. columbarius*) which goes in jerks and 'jumps'. Often beats out prey from shrubbery or foliage canopy, by suddenly darting through a gap in them or hedge-hopping at speed, stampeding any little birds sheltering within or on the ground behind. Like the Merlin it will also hover momentarily at times to investigate. Possesses the audacity of the Peregrine, sometimes swooping suddenly from nowhere, snatching a bird fallen to gunshot or chasing one thus wounded completely undeterred by the sportsman's warning shots. Comes down to water to drink, and walks easily on ground. Much esteemed by falconers for its pluck, and the ease with which it can be tamed and trained to take birds like hoopoes, rollers, quails, and even partridges and pigeons; pairs often made to hunt in coordination as in the wild state.

FOOD. Mainly small birds. Among items specifically recorded are sparrows (esp. *Passer montanus*), wagtails, pipits, larks (esp. the social *Calandrella* spp.), ring plovers (*Charadrius dubius*), and not unfrequently mice and bats. From the stomachs of a pair shot simultaneously were obtained the right and left leg respectively, along with other remains of a warbler (*Prinia sylvatica*) which had evidently been shared and shared alike! (SA).

VOICE and CALLS. 'Peculiar shrill querulous screams' as it sallies to drive off crows and kites from proximity of nest-tree. 'A continual *tiririri-tiririri*' uttered by full-fledged young when being chased off by (presumed) parent (K. K. Neelakantan).

BREEDING. Season, chiefly January to March, but continuing till about May. Nest, a fairly substantial cup or platform of sticks and twigs, lined with grass roots. Usually well concealed 5 to 10 metres up in the densely foliated branches of a mango or peepul tree in open country, often close to a village. Old nests of kites and crows are normally brought into commission. Eggs, 3 or 4, longish regular ovals, pale reddish white in ground colour, thickly speckled with reddish brown. Small replicas of the eggs of Laggar falcon. Average size of 120 eggs 42.4 × 31.1 mm. (Baker). Both sexes share in nest-building and/or repair and evidently also in incubation, though the female is chiefly responsible for this. Incubation period unknown. Both parents feed the young.

MUSEUM DIAGNOSIS. As in *F. columbarius* 2nd and 3rd primaries (as.) subequal; 1st and 4th subequal, but crown chestnut instead of black-streaked grey or brown as in that species. For details of plumage see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from skull)	Tarsus	Tail
♂♂	190-207	19-24	35-40	124-137 mm.
♀♀	220-232	c. 25	38-41	148-155 mm.
				(Baker, SA, BB)

COLOURS OF BARE PARTS. Iris brown. Bill dark plumbeous, black at tip, greenish yellow on basal half; cere and orbital skin yellow. Legs and feet yellow; claws black.

FALCONS

361

220. Eastern Redlegged Falcon. *Falco vespertinus amurensis* Radde

Falco vespertinus var. *amurensis* Radde, 1863, Reisen süd von Ost-Sibir, 2: 102, pl. 1, f. 2a, 2b (Amur)

Baker, FBI No. 1739, Vol. 5: 58 (= *Erythropus amurensis*)
Plate 29, fig. 5 and Plate 30, fig. 5

LOCAL NAME. *Daotu hagra* (Cachar).

SIZE. Pigeon —; length c. 28–31 cm. (11–12 in.).

FIELD CHARACTERS. A small, rare migratory falcon.

Adult (male). Above, slaty grey, below, ashy grey with deep ferruginous-red vent, thighs, and under tail-coverts. Distinctive orange-red orbital skin, cere and legs. Birds in this plumage easily distinguishable, but rare in the migrating flocks. Could casually be confused only with Sooty Falcon (216) q.v.

In flight (somewhat reminiscent of pratincole when hawking insects) dark body and black wing-quills contrasting with grey axillaries and wing lining, together with red legs and cere, are diagnostic features.

Female. Above, including tail, slaty grey barred with black. Crown dark slate; whitish nuchal collar on hindneck; black cheek-stripe. Below, pale rusty white with longitudinal black spots on upper breast, bars on lower breast and flanks; unmarked on lower abdomen. Underwing white, barred black.

Young (immature). Like female but upperparts browner and scalloped with rufous. Below, more heavily barred and broadly spotted. Intermediate stages between this and adult plumage common.

STATUS, DISTRIBUTION and HABITAT. In NE. India evidently partly resident, but mainly passage migrant. Breeds casually in N. Cachar vide Baker, where previously recorded by Hume as disappearing about mid-December and reappearing in large numbers about mid-October in the following year. Recorded as a regular cold-weather visitor to N. Assam (Dibrugarh dist.) and Manipur, and as 'comparatively common during the rains in E. Bengal' (!). In peninsular India only a through migrant to and from E. and S. Africa. Stragglers, obviously in transit, observed or collected between September and April (autumn and spring passage) in the Nilgiris, Carnatic, Nellore, Rajamundry, Madura districts, and once near Bombay. Rare straggler to Ceylon; one old record for Nepal (Hodgson's). Apparently sparse winter visitor to the Maldive Islands (Phillips 1963).

Extralimital. 'Breeds in Siberia east of Lake Baikal to Amurland south to Manchuria and N. China to the Tsin-ling Mountains. Winters in E. and S. Africa from Kenya Colony to Cape Province' (Peters).

MIGRATION. Records such as 'a huge flock numbering some thousands passing Belgaum (15°54'N., 74°36'E.) on 24 November (Butler, SF, 9: 371), 'immense scattered flocks in November–December in some years all along the coast near Karwar' (N. Kanara dist., Mysore, c. 14°30'N. lat.) — Davidson, JBNHS 12: 16), and of 'large numbers' in the same locality in November (E. H. Aitken, MS), suggest that the bulk of the migration between NE. India and E. Africa — at least in autumn — takes place across the Indian Ocean from somewhere in this area in a continuing NE.–SW. trend. It is a regular winter visitor to East Africa (Nyasaland, now Malawi) arriving December, most abundant January–February, leaving

FALCONS

363

ground, often round a village. Eggs, 4 to 6, in appearance like eggs of common Kestrel with all its variations: creamy to brick-red in ground colour, lightly or densely speckled and smeared with deep blood-red or blackish red. Average size of 50 eggs 35.8 × 28.9 mm. (Baker). Both sexes incubate.

MUSEUM DIAGNOSIS. Second primary (as.) longest; 1st longer than 3rd. For details of plumage see Baker, loc. cit. Nominate *vespertinus* differs from *amurensis* in male having the axillaries and under wing-coverts white *contra* dark slaty grey; in female having the crown and nape dark-streaked rusty brown *contra* dark slate.

MEASUREMENTS	Wing	Bill	Tarsus	Tail
		(from feathers)		
♂ ♀	230–246	16–18	28–33	124–131 mm.

COLOURS OF BARE PARTS. Iris dark brown. Bill fleshy red, paler and yellower at base, blackish at tip. Orbital skin and cere, orange-yellow — redder during breeding season. Legs and feet orange-yellow to orange-red; claws pale fleshy horny.

221. Lesser Kestrel. *Falco naumanni* Fleischer

Falco naumanni Fleischer, 1818, in Lauro & Fisher's 'Sylvan', Jahrb. for 1817–18, p. 174 ('scarce visitor to southern Germany and Switzerland')

Falco cenchris var. *pekinensis* Swinhoe, 1870, Proc. Zool. Soc. London: 442

(Near Peking, China)

Baker, FBI No. 1745, Vol. 5: 66

Plate 29, fig. 4 and Plate 30, fig. 2

LOCAL NAMES. Unrecorded.

SIZE. Pigeon ±; length c. 34 cm. (13 in.).

FIELD CHARACTERS. A small dainty, rather gregarious migratory falcon.

Male (adult). Above, head, neck, lower back, rump, and tail ashy grey, the last with a broad black subterminal band and white tip. Mantle unspotted vinous brick-red, brighter looking than in Kestrel. Below, pale to deep rufous with round black spots on breast and flanks; absent in old birds. In overhead flight very pale wings and tail with black borders diagnostic.

Female. Above, pale rufous, cross-barred with black. Below, pale vinous-buff densely streaked on breast and spotted on abdomen with blackish. Indistinguishable from ♀ Kestrel (q.v.) except on a clear view with binoculars when *whitish*, instead of *black*, claws diagnostic in all phases.

Young (immature). Like ♀, but generally greyish on head and greyer on tail.

STATUS, DISTRIBUTION and HABITAT. Status uncertain. Apparently rare winter visitor; perhaps more correctly an irregular through passage migrant to E. Africa like Redlegged Falcon, a few stragglers remaining behind. Sight records and specimens obtained between November and April as follows: Punjab (Ambala, Delhi), U.P. (Lucknow), Bihar (Dinapur), Orissa (Balasore), Bengal (Calcutta), Assam (Dibrugarh, Naga Hills, NE. Cachar), Manipur, Maharashtra (Sholapur c. 17°43'N., 75°56'E., 'flock of several hundred'; Ahmednagar c. 19°8'N., 74°48'E., 'flock c. dozen' — both in January (C. S. Davidson), Madras (Coonoor — Nilgiris), Maldive

¹ For dropping subspecies *pekinensis* see Ripley, *Synopsis*, 2nd edition.

362

FALCONIFORMES

again March (Benson 1951, *Ibis*, 93: 467–8). Significantly there seem to be no records in NW. India, and none either from the northern Arabian Sea or across in Sudan or Egypt, thus supporting the hypothesis that a large proportion of the migrants traverse southern peninsular India in a NE.–SW. trend. However, from a flock of about 100 encountered by him in April near Mecca (c. 21°26'N., 39°49'E.) Meinertzhagen is inclined to believe that some mass migration almost certainly takes place over Arabia, at least in spring, when also incredible numbers pass north in central Kenya, possibly veering eastward somewhere about the Equator. Many observed by him and SA (presumably this race) migrating northward with Lesser Kestrels in N. Afghanistan, 24 April (*Ibis*, 1938: 701).

Falco vespertinus amurensis

■ Breeding range ▨ Wintering range

GENERAL HABITS. During migration stop-overs keeps in large flocks, or swarms, of several hundred (or thousand) strong, often in company with Lesser Kestrels (*Falco naumanni*). The birds mill around in the air at sunset, diving and darting at winged insects some 50 to 100 metres above open fallow or grazing land, occasionally descending to skim along the bushes, or settle on trees in clusters. Roosting in like manner after dark, preceded by a good deal of circling around the foliage canopy in the manner of bee-eaters. Sometimes hovers like kestrel when hunting. Said to be very good eating, and much prized by Cacharis, as well as in East Africa.

FOOD. Locusts, grasshoppers, beetles, winged termites, etc. hawked in the air; sometimes picked off the ground in a swoop.

VOICE and CALLS. A shrill screaming accompanies the settling-in process, continuing more or less through the night.

BREEDING. Mainly extralimital; casually in N. Cachar. Season, April–May. Nest, of sticks, usually a disused one of magpie etc., in trees in open

364

FALCONIFORMES

Islands, December ('probably an annual winter visitor' — Phillips 1963). Affects open savannah country and cultivation.

Extralimital. 'Breeds from Turkestan eastward to Manchuria and N. China, exact limits not known. Migrates to India and occasionally to E. Africa' (Peters).

MIGRATION. Large flocks, obviously on mass migration, observed in Orissa and Deccan during January. No other visual or ringing data.

GENERAL HABITS. Very similar to Kestrel (222), q.v., but much more gregarious. Hovering very distinctive. Carries body raised 45° instead of horizontally as kestrel, beating wings backward and forward instead of up and down (Mountfort 1962, *Portrait of a River*: 118). A large (migratory?) swarm of 300+ birds observed by SA on 8 January (1950) in Orissa (Balasore c. 21°30'N., 87°0'E.) preparing to roost at sunset in a lone leafy tree standing amidst fallow fields. Flying in a rabble around the foliage canopy like bee-eaters before retiring. Perching thickly like swallows along adjacent telegraph wires looking remarkably like house crows in distant silhouette in the falling dusk. Not known whether the swarm moved on next day, but for several days subsequently odd birds were met with scattered far and wide over the surrounding country.

FOOD. Mainly insects; perhaps more insectivorous than Kestrel. Stomachs of specimens examined were crammed exclusively with grasshoppers (Orthoptera), beetles (Coleoptera), and mole-crickets (*Gryllotalpa* sp.). Once a centipede (*Scalopendra*).

VOICE and CALLS. Not recorded.

BREEDING. Extralimital. Nests in holes in walls of buildings etc.; tends to be colonial, several pairs nesting close to one another. Also utilizes old stick-nests of crows or magpies. Eggs, 3 to 5 smaller and richer-coloured replicas of those of Kestrel.

Wing formula of (A) Kestrel (*Falco tinnunculus*). Outer visible primaries: 1st and 2nd notched on inner web and 2nd and 3rd emarginated on outer; 1st always considerably shorter than 3rd. (B) Lesser Kestrel (*Falco naumanni*). 2nd notched on inner web, 3rd not emarginated on outer web, 1st usually longer and only occasionally shorter than 3rd.

FALCONS

365

MUSEUM DIAGNOSIS. Differs from Kestrel in wing formula (see diagram); in male having the brick-red mantle *unspotted*, and lores and feathers next the bill rufous v. white or creamy white. Claws in both sexes *pale yellow* instead of black. Nominate race *naumanni* (Europe, W. Asia) usually has less grey in median and lesser wing-coverts, but this character variable. For details of plumage see Baker, loc. cit.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	222-244	16-17	c. 32-35	142-156 mm.
Two adults measured in the flesh:				
		(from skull)		
♂	250	20	34	161 mm.
♀	241	20	34	146 mm.

Both in body moult and very fat, 8 January (SA).

COLOURS OF BARE PARTS. Iris deep brown. Bill bluish horn, yellowish at base, blackish at tip; cere and orbital skin orange-yellow. Legs and feet bright chrome yellow; claws paler.

FALCO TINNUNCULUS Linnaeus

Key to the Subspecies

	Page
Colour of upperparts paler..... <i>F. t. tinnunculus</i>	365

Colour of upperparts darker, more heavily barred..... <i>F. t. interstinctus</i>	367

222. European Kestrel. *Falco tinnunculus tinnunculus* Linnaeus

Falco Tinnunculus Linnaeus, 1758, Syst. Nat., ed. 10, 1:90

(Europe, restricted type locality, Sweden, *apud* Hartert)

Baker, FBI No. 1740, Vol. 5: 61

Plate 29, fig. 6 and Plate 30, fig. 4

LOCAL NAMES. *Karontia*, *Koruttia*, *Khermutia*, *Narzinak* ♂, *Narzi* ♀ (Hindi); *Thondälä muchi göddä*, *Thondälä doshi gödu* (Telugu); *Ting kyi* (Lepcha); *Cherupallu* (Malayalam).

SIZE. Pigeon ±; length c. 36 cm. (14 in.).

FIELD CHARACTERS. A small, slender falcon with pointed wings and rather rounded tail remarkable for its habit of hovering stationary in one spot for many seconds at a time — 'hanging in the air'.

Male (adult). Above, crown, nape, and sides of neck ashy grey finely streaked with blackish. A blackish cheek-stripe. Mantle bright brick-red with pear-shaped black spots. Rump, upper tail-coverts, and tail grey, the last tipped with white and with a broad black subterminal bar. Below, vinous-buff streaked on breast and spotted on abdomen and flanks with blackish.

Female. Above, including crown and nape, pale rufous, cross-banded on back with black. Rump and tail normally tinged with grey. Below, paler than in male and with the markings denser and browner. Also slightly larger.

Young (immature). ♂ like ♀, but soon acquiring a good deal of grey in tail, and grey rump and upper tail-coverts. (Completely blue-grey tail at c. 15 months' moult — Ticehurst.)

FALCONS

367

or small birds. Specifically recorded: locusts, grasshoppers, mole-cricket (*Gryllotalpa*), beetles (Coleoptera), winged termites. Above tree-line in Garhwal (c. 4500 m. alt.) mainly a single grasshopper (*Anaptygus* sp.) and a lizard (*Lacerta* sp.). Birds: crag martin (*Hirundo rupestris*), warbler (*Scotocerca inquieta*), painted bush quail (*Coturnix erythrorhyncha*) and lark (sp.?). Mammals: field mice, voles (*Microtus* spp.).

VOICE AND CALLS. As above. No others recorded in India.

BREEDING. Season, in the W. Himalayas April to June. Nest, of twigs, roots, rags, and rubbish placed in a hole or crevice, or on the ledge of an inaccessible cliff; rarely in the wall of a ruined building. Occasionally a disused nest, e.g. of magpie or crow, utilized. Eggs, 3 to 6, oval, pale pinkish or yellowish stone-colour, profusely speckled and blotched with various shades of red. Average size of 100 British eggs 39.73 × 31.77 mm. (Witherby). Baker gives for 68 eggs (apparently this race and *interstinctus* mixed) 39.3 × 31.6 mm. Eggs laid at least at two-day intervals, sometimes three and even four incubation period 27-29 days (Witherby). Both sexes incubate, but chiefly female.

MUSEUM DIAGNOSIS. Differs from Lesser Kestrel in wing formula (see diagram under 221). Brick-red mantle of male spotted with black. Claws black in both sexes v. pale yellow. For details of plumage see Witherby 1939, 3: 28-31; Baker, loc. cit.

MEASUREMENTS of nominate European birds:	Wing	Bill (from cere)	Tarsus	Tail
♂ ♂	230-252	13-15	37-41	150-173 mm.
♀ ♀	235-267	—	—	— mm. (Witherby)

Of Indian specimens including breeding birds from W. Himalayas:

	Wing	Bill (from skull)	Tarsus	Tail
23 ♂ ♂	231-258	19-22	36-46	154-175 mm.
17 ♀ ♀	241-270	20-22	36-43	158-183 mm. (SA, HW)

COLOURS OF BARE PARTS. Iris brown. Bill slaty blue, black at tip, yellow at gape and base; cere and orbital skin yellow. Legs and feet yellow to orange-yellow; claws black.

223. East Himalayan Kestrel. *Falco tinnunculus interstinctus* McClelland

Falco interstinctus McClelland, 1840 (1839), Proc. zool. Soc. London, pt. 7: 154 (Assam)

Falco tinnunculus japonensis Ticehurst, 1929, Bull. Brit. Orn. Cl., 50:10 (New name for *Falco tinnunculus japonicus* Temminck & Schlegel, 1844 in Siebold, Fauna Jap., Aves, 2, pl. 1 and 1B (Japan) nec *Falco japonicus* Gmelin)

Baker, FBI No. 1741, Vol. 5: 62

Plate 12, fig. 5

LOCAL NAMES. As for 222.

SIZE. Same as the European Kestrel.

FIELD CHARACTERS. Indistinguishable from European Kestrel with certainty in winter when their ranges overlap. See Museum Diagnosis.

FALCONIFORMES

366

STATUS, DISTRIBUTION and HABITAT. Breeds in W. Pakistan (N. Baluchistan, NW. Province, Punjab) and India in the W. Himalayas (Ladakh, Kashmir, Himachal Pradesh) between c. 700 and 3300 metres alt. Commonly observed (non-breeding) above tree-line up to c. 5500 m. No direct evidence as yet of breeding in E. Himalayas or Assam. If found, racial identity will need establishing. Winters throughout both Pakistans, Nepal (up to at least 2700 m.) and all India — plains and up to the highest peninsular hills — its numbers vastly augmented by extralimital migrants, and overlapping with the other races. Also winters in Ceylon, Andaman, Laccadive and Maldivé islands. Affects open grassland, hill and plain: also cultivation and semi-desert.

Extralimital. Also breeds in the Palaearctic Region, in Europe roughly from between latitude 60° and 70°N. and eastward through the Ural Mountains and W. Siberia to Tarbagatai and Altai; southward to N. Africa and east through most of W. Asia to Mongolia and the Amur. Winters south of these areas including the Indian subcontinent.

MIGRATION. Seen in the plains (non-breeding localities) in winter, between September/October and March/April. No ringing or other precise data. Visual records of earliest and latest dates of arrival and departure vitiated by uncertainty in racial identification. In N. Baluchistan (Chagai) northward migration (of nominate race) observed in progress in April (Christison, JBNHS 43: 484); near Kabul and in N. Afghanistan (race?) between 13 April and 11 May (Meinertzhagen, *Ibis* 1938: 702). From the fact of single birds (same individuals?) frequently found roosting in the selfsame spots winter after winter — e.g. a particular niche or cornice in a ruin — the species probably 'home true' to its winter quarters.

GENERAL HABITS. Usually met with singly in well staked-out feeding territories, perched on the selfsame mound, bush or telegraph pole day after day on the lookout for creeping prey, bobbing its head up and down to focus on some movement in the grass, pouncing to the ground from time to time and returning with the victim to its base. But the kestrel's most characteristic method of hunting, in which it surpasses all other birds of prey employing similar tactics, is its hovering. As it quarters its feeding territory, 30 metres or so above, the bird suddenly stops dead in its flight face to wind, poising stationary in mid-air for many seconds at a time on rapidly vibrating wing-tips and fanned-out tail to investigate the ground below. On further suspicion the bird drops a step lower, finally pouncing silently on the quarry and bearing it away in its claws. In a strong headwind seems to enjoy remaining effortlessly suspended aloft, as on some invisible wire, for minutes together (once timed 5 minutes +, SA) with no movement except an almost imperceptible spreading and narrowing of the tail and tilting of wingtips, the bird often drifting backwards with the current. In hovering flight body held horizontally, not tilted to wind as in Lesser Kestrel, q.v. In the breeding season pairs engage in spectacular aerial display around their nesting cliffs, stooping and darting at each other, zooming upward with the wind currents and eddies, and hovering prettily on vibrating wings (quite distinct from normal hovering) to the accompaniment of a shrill *ki-ki-ki* or *tii* ... *wee*.

FOOD. Chiefly insects, frogs, lizards, small rodents, and rarely nestlings

FALCONIFORMES

368

STATUS, DISTRIBUTION and HABITAT. Status uncertain. Only circumstantial evidence of breeding in Eastern Himalayas and hills south to Manipur. Breeding birds from NW. Himalayas, assigned by Baker as *interstinctus* (*Modification*, 4: 41), shown by Ticehurst (*Ibis* 1923: 262) and Whistler (JBNHS 38: 420-1) not to differ from nominate race. Therefore, as presently known, only a winter visitor to the Eastern Himalayas (west at least to Nepal); Assam, Manipur, E. Pakistan (Sylhet, Chittagong), eastern India (Orissa), S. India (Coimbatore, Kerala). Also to Ceylon, and Andaman Islands (Biswas). But dispersal and numerical status imperfectly known due to great variability in the species, difficulty of discrimination and wide overlapping of the races in winter.

Extralimital. Breeds in Japan, NE. China, SE. Tibet, east Central Asia and Szechuan. Winters in India, Burma, (Indochinese countries?), SE. China.

GENERAL HABITS, FOOD, VOICE. As in 222.

BREEDING. Chiefly extralimital, but said to breed in Cachar, Assam (Baker, JBNHS 11: 404). Nest, eggs, etc. as in nominate race.

MUSEUM DIAGNOSIS. Differs from the nominate race in both sexes being more heavily barred above. Also has a bright foxy red phase not found in *F. t. tinnunculus*.

MEASUREMENTS. The range covers that of the nominate race. Three recent specimens from Nepal and Sikkim measure:

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂ ♂	235-252	20-21	—	153-169 mm.
1 ♀	260	22	41	179 mm. (BB, SA)

Weight 3 ♂ ♂ 173-185, 1 ♀ 150 gm. (BNHS).

COLOURS OF BARE PARTS. As in 222.

224. Indian Kestrel. *Falco tinnunculus objurgatus* (Baker)

Cerchus tinnunculus objurgatus Baker, 1927, Bull. Brit. Orn. Cl., 47: 106 (Ootacamund, Nilgiris, S. India)

Baker, FBI No. 1744, Vol. 5: 65

LOCAL NAMES. As for 222.

SIZE. European Kestrel ±.

FIELD CHARACTERS. Like the European Kestrel (222) but slightly smaller. Both sexes more brightly and richly coloured generally, with very rufous underparts. Not always distinguishable from other races. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Breeds in the Western Ghats complex from Khandesh south to Kanyakumari, including the Nilgiri, Palni, and associated hills; the Shevaroy Hills and possibly other portions of the Eastern Ghats. Breeds also in Ceylon (hills of the Central Province). Winter dispersal not properly known.

GENERAL HABITS, FOOD, VOICE. As in 222.

BREEDING. Season, January to March in the peninsular hills (c. 1200-2500 m.); March to June in Ceylon (c. 1000-1440 m.). Nest, a sketchy pad

FALCONS

369

of straw, etc. in a cleft or hole in a precipitous cliff, usually inaccessible. Eggs, 3 to 6, indistinguishable from those of the nominate race, q.v. Average size c. 38 × 30 mm. (Baker).

MUSEUM DIAGNOSIS. Adult ♂ differs from the nominate race in the upperparts being a deeper more sooty brick-red, lacking the characteristic faint grey wash or bloom. Top of head duller, darker grey, or even streaked rufous-brown as in ♀. Grey tail usually faintly barred. Underparts well tinged with rufous, the markings on central flanks of a somewhat different character. Adult ♀ richer brick-red above, heavily barred. Underparts differ from nominate race in same way as in ♂.

MEASUREMENTS.

	Wing	Bill (from skull)	Tail
16 ♂♂	221-242	c. 21-22	145-163 mm.
17 ♀♀	234-258	c. 22-23	145-175 mm. (SA, HW)

COLOURS OF BARE PARTS. As in 222.

APPENDIX

3a. Rednecked Grebe. *Podiceps grisigena* (Boddaert)

Colymbus grisigena [sic] Boddaert, 1783, Tabl. Planch. Enlum.: 155

(No locality. France. Witherby 1912)

Plate 1, fig. 5

SIZE. Domestic duck—; length c. 45 cm (17 in.).

FIELD CHARACTERS. In winter grey and white, rather similar to Great Crested Grebe (3). Distinguished from it by smaller size, thicker neck, absence of white eye-stripe, black of crown extending down to eye level. Sides of head dusky grey diffusing into white of throat and breast, the two colours not sharply demarcated as in 3. Base of bill yellow. Sexes alike. For summer plumage see Witherby, 4: 93.

STATUS, DISTRIBUTION and HABITAT. Rare (?) winter visitor. Sight-recorded twice in Pakistan—Bahawalpur, January 1967 and Salt Range, September 1967 (JBNHS 64: 555; 65: 773).

Extralimital. Breeds in the northern Palearctic; winters south to the Mediterranean, N. Africa and Iran.

37a. Western Purple Heron. *Ardea purpurea purpurea* Linnaeus

Ardea purpurea Linnaeus, 1766, Syst. Nat., ed. 12, 1: 236

('Oriente', restricted to France)

CHARACTERS. Differs from *manilensis* in being darker, more slaty-less greyish on scapulars and mantle. Elongated feathers of crop more buffy. Underparts more variegated with chestnut. Field identification difficult.

STATUS, DISTRIBUTION and HABITAT. Winter visitors to Pakistan (Baluchistan)—Titchhurst, JBNHS 32: 91, Christison, ibid. 43: 486.

APPENDIX

371

4 General plumage cinnamon-brown. Wing- and tail quills blackish.

Head and neck downy, buff.

In overhead flight: Body cinnamon, streaked darker. Under wing-coverts cinnamon; rest of wings blackish Fulvous

202a. Andaman Dark Serpent Eagle. *Spilornis elgini* (Blyth)

Haematomis elgini Blyth, 1863, Ibis: 118 (South Andaman Island)

Plate 20, fig. 12 and Plate 21, fig. 6

LOCAL NAME. Unrecorded.

SIZE. Kite—; length c. 50 cm. (20 in.).

FIELD CHARACTERS. Like 196 but much smaller and very dark chocolate-brown both above and below. Chin and throat blackish, rest of underparts largely ocellated with white but without adjoining black spots.

Young (immature). Head white, with dark centres to feathers of crown. Face and throat streaked darker. Breast finely barred with dusky and dark brown. Wings more profusely spotted with white than in adult.

STATUS, DISTRIBUTION and HABITAT. Common resident. Andaman Is., ecologically separated from co-existing 200. Affects inland forest clearings, hillsides covered with scattered trees, etc.

GENERAL HABITS. Largely as in 196 and other Serpent Eagles.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	344-368	36-38	c. 81-84	215-241 mm.
		(from feathers)	(once 75)	(Baker)

COLOURS OF BARE PARTS. Iris bright yellow. Bill pale horny, bluish horny or fleshy, darker on culmen; cere, lores and orbital region lemon-yellow or bright yellow. Legs and feet yellow.

104. Garganey or Bluewing Teal. *Anas querquedula* Linnaeus

MIGRATION. Two recent aberrant records are: (1) First-year male ringed in Rajasthan (Bharatpur) 14.xii.1971, recovered in Italy (Viterbo, 42°22'N., 11°37'E.) 25.iii.1973—c. 7600 km. WNW. (2) Adult male ringed in Tamil Nadu (Tanjavur, 10°18'N., 79°51'E.) 22.ii.1971, recovered in Nigeria (near Kano, 12°00'N., 8°30'E.) ?iii.1973—c. 7700 km. almost due west.

128a. Andaman Blackcrested Baza. *Ariceda leuphotes andamanica* Abdulali & Grubb

Ariceda leuphotes andamanica Abdulali & Grubb, 1970, J. Bombay Nat. Hist. Soc. 67(2): 137-8 (Wrightmyo, South Andaman Island)

LOCAL NAME. Unrecorded.

SIZE. Pigeon ±; length c. 33 cm. (13 in.).

FIELD CHARACTERS. Like 127, but with the underparts unbarred. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. As yet known only from South Andaman Island.

Ecology unrecorded; presumably as of 127.

BREEDING. On 9 April 1969, when collected, the specimens (a pair) had somewhat enlarged gonads (♂ 12mm., ♀ 3mm.) and from their behaviour appeared to be interested in breeding.

MUSEUM DIAGNOSIS. Differs from 127 as follows: (1) Blackish rufous band on upper breast much thinner, (2) this followed by only a single chestnut band in male, and by only two bands in female; rest of underparts unbarred, (3) unbarred portion of lower breast more intense rufous.

MEASUREMENTS

	Wing	Tail
1 ♂	223	130 mm.
1 ♀	224	127 mm. (HA)

Field key to the commoner large vultures (adults)

- General plumage black. Naked head and legs red.
In overhead flight: Broad oval white patches on thighs King
- General plumage greyish black. Head and neck naked, brown.
Lower back white.
In overhead flight: Under wing-coverts white; rest of wings, and body, blackish Whitebacked
- General plumage isabelline buff, contrasting with black wing and tail quills. Head and neck naked, black.
In overhead flight: Body and under wing-coverts isabelline; rest of wings blackish Longbilled

Order GALLIFORMES

(For anatomical details see Stresemann, 1927-1934, *Aves*: 754; Witherby, 1941, 5: 208-9; Baker, 1928, 5: 279-80.)

Family MEGAPODIIDAE: Megapodes

Contains birds closely related to the pheasants, junglefowl, etc. (Fam. Phasianidae), many of whose natural characters they share. Remarkable for their reptile-like nesting habits, laying their eggs in holes in the ground or in scraped-together mounds of sand and humus, leaving them to hatch by the heat of the sun and/or decomposition of the vegetable matter. Young pass through natal down stage within egg; born with full juvenal plumage and able to fly and fend for themselves. Confined chiefly to the Australasian Region, only a single genus and species occurring within our limits in the Nicobar Islands.

(For Ontogeny and Evolution of the family see George A. Clark, Jr, 1964, *Pestilla* 78: 1-37.)

Genus MEGAPODIUS Gaimard

Megapodius Gaimard, 1823, Bull. Gen. Univ. Annon. Nouv. Sci. 2: 450

Type, by subsequent designation, *Megapodius freycinet* Gaimard

Bill moderate. Nostrils large, oval, longitudinally elongate. Legs and feet very large and powerful; tarsus in front broadly scutellated. Claws long and straight; hindclaw longest. Wings short and rounded: 5th primary (as.) longest; 1st subequal with 10th; secondaries as long as primaries. Tail short and rounded; of 12 feathers. Sexes alike. Represented by one species in two races within our limits, only in the Nicobar Islands.

MEGAPODIUS FREYCINET Gaimard

Key to the Indian Subspecies

Paler in colour, wing 228-250 mm.....*M. f. nicobariensis*
Darker in colour, wing 215-230 mm.....*M. f. abbotti*

225. North Nicobar Megapode. *Megapodius freycinet nicobariensis* Blyth

Megapodius nicobariensis Blyth, 1846, Jour. Asiat. Soc. Bengal 15: 52
(Nicobar Islands)

Baker, FBI No. 1994, Vol. 5: 437

Plate 32, fig. 18

LOCAL NAME. *Kongah* (Nicobars).

SIZE. Domestic hen —; length c. 43 cm. (16 in.).

FIELD CHARACTERS. A terrestrial brown bird like a jungle-hen with conspicuously large feet. Above, including wings and tail rufescent brown

Below, only chin and foreneck greyish brown without any grey tinge.

STATUS, DISTRIBUTION and HABITAT. Resident. Fairly common in the Nicobar group of islands lying north of the Sombbrero Channel except Chowra and Car Nicobar where not yet recorded, and Great and Little Nicobar occupied by the next race *M. f. abbotti*, q.v. According to Seymour-Sewell (JBNS 28: 982) occurs (subspecies?) also in the Cocos Is. north of the Andamans, and possibly, on circumstantial evidence, in the Little Andamans. These claims need confirming. Affects undergrowth in dense forest fringing the sandy shores of the islands above spring tide high-water mark.

GENERAL HABITS. Keeps in pairs or in fairly large parties or droves of adults and young mixed, including quite small chicks, running about and feeding in undergrowth like junglefowl, and calling noisily to one another. Partly nocturnal. Is a fast runner, and when disturbed trusts to its legs for escape rather than wings although capable of strong flight. Will sometimes take shelter up in the branches of trees like junglefowl.

FOOD. Land snails, seeds, vegetable matter, insects, etc. In the stomach of a specimen shot on Tillanchang I., Hume found sand, fragments of quartz, and specimens of *Scarabus plicatus* and one of *Helicina zelebori*. Of the former the largest was about three-quarters of an inch long and contained the animal (SF 2: 72). Newly hatched chicks grew up in captivity entirely on termites (JBNS 12: 21).

VOICE and CALLS. Contact calls: a loud cackling note syllabilized by Davison as *kuk-a-kuk-kuk* repeated quickly several times. V. Ball (SF 1: 82) mentions 'a peculiar guttural crow reminiscent of the croaking of bull frogs which may be represented by the syllables *kiouk, kiouk, kok, kok, kok*, etc. *ad infinitum*'.

BREEDING. Season, not definite; more or less throughout the year. Nest, a mound of scraped-together sand, leaves and vegetable matter up to 1.5 metres high and 10 metres or more in circumference usually built inside forest a few metres from the edge of the sandy shore above high-tide mark. Eggs. Number laid by each hen not ascertained. They are long ellipses in shape and enormous for the size of the bird, the weight of six being more or less equal to that of the layer. Colour: some shade of pink when newly laid, changing as incubation progresses to dull buff or ochre-brown, and eventually to uniform dull whitish. Average size of 84 eggs 82.6 × 52.3 mm. (Baker). Said to be excellent eating when fresh. The eggs are laid at intervals of several days each, possibly by several females in the same mound since as many as 20, in all stages from quite fresh to almost hatching, have

MEGAPODES

3

been dug out from a single mound. Evidently the egg is first deposited on the mound and then a hole dug by the parent into which it is rolled and covered up to a depth of a metre or more and a half. The eggs are incubated by the heat generated by the decomposing humus. Period of incubation not known. The fully developed precocious chick kicks itself out of the egg and out of the mound like a turtle hatching, and is capable of running strongly and flying when only a few hours old. It fends for itself independently of its parents from the time it is born. The breeding biology of this megapode is very imperfectly known. It is also not known whether the bird is monogamous, or polygamous, or promiscuous.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.

Chick (size of quail). 'Uniform snuff brown all over, everywhere densely feathered, even about the throat and neck, and with the feathers of the forehead and back of the neck much longer, *actually* and not merely *relatively*, than in the adult; no bare space in front of or round the eye, no tail developed, only a large bunch of fur-like feathers, but the wings large, strong, and well-formed, the bill very short. One such bird measured 5.5 inches [c. 14 cm.] in length and had a wing of 4 inches [101.5 mm.]; tarsus 1.1 [c. 26 mm.]; bill at front [exposed culmen ?] 0.3 [c. 5 mm.]' (Hume, SF 2: 277).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	228-250	c. 23.5-26	c. 59-68	69-88 mm.

Weight: ♂ 21-34 oz. (595-964 gm.); ♀ 30-36 oz. (850-1021 gm.) (Baker)

COLOURS OF BARE PARTS. Iris light to dark brown; eyelids red. Skin of lores, sides of head and neck showing through cherry-red to bright brick-red or mauve-pink. Bill greenish- or yellowish horny, paler along commissure. Legs and feet greenish horny, darker in front and more red or brick-red on the back.

226. South Nicobar Megapode. *Megapodius freycinet abbotti* Oberholser

Megapodius nicobariensis abbotti Oberholser, 1919, Proc. U.S. Nat. Mus. 55: 401
(Little Nicobar Island)

Baker, FBI No. 1995, Vol. 5: 439

LOCAL NAME. *Kongah* (Nicobars).

SIZE. About the same as the last.

FIELD CHARACTERS. A brown ground bird like a jungle-hen with conspicuously large feet. Similar to but somewhat darker than 225 (see Museum Diagnosis).

STATUS, DISTRIBUTION and HABITAT. Great and Little Nicobar Islands lying south of the Sombbrero Channel.

GENERAL HABITS, BREEDING, etc. Not different from the preceding subspecies. 4 eggs each taken from two separate mounds by B. B. Osmaston average 83.1 × 50.8 mm. (Baker).

MUSEUM DIAGNOSIS. Darker than *M. f. nicobariensis* above and below, the primaries especially being darker on the outer webs and contrasting less with the inner webs.

MEASUREMENTS. ♂ ♀ Wing 215-230 mm.

COLOURS OF BARE PARTS. As in 225.

Family PHASIANIDAE: Pheasants, Partridges, Quails, etc.

Comprises the so-called 'Game Birds' which have formed a valuable food resource for man from earliest times, and of which the domestic fowl is the most familiar representative. The family is characterized by its terrestrial habit with stout unfeathered legs for progress on ground; hind tarsus usually furnished with one or more pointed spike-like spurs or blunt protuberances, in the male only or in both sexes. Hallux or hind toe always present *contra* Turnicidae (Bustard-Quails). Unlike megapodes, claws short, blunt, and very strong for scratching the ground for food. Wings short and rounded: first primary (as.) more or less equal in length to the last (10th). Contour feathers with well-developed aftershaft.

The majority lay their eggs on the ground in open scrapes with no or scanty lining. Young nidifugous; born covered with down and able to run about within a short time of hatching out.

x c. 1

largely deep chestnut, broadly streaked with whitish on abdomen and flanks. Under tail-coverts chestnut, streaked with black and tipped with whitish. Sexes alike.

Young (first year). Above, mottled dull brown and buffy white with conspicuous white shafts showing on scapulars and innermost secondaries, particularly in flight. Below, mottled pale brown and buffy white, with white streaks on breast and flanks.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident and common though local, in a narrow altitudinal zone between c. 3000 and 5000 metres along the entire Himalayas from NW. Pakistan through Nepal, Sikkim and Bhutan to our extreme NE. Frontier. Seldom descends as low as 2500 m. and that only in very severe winters. Affects alpine pastures, open hillsides above the tree-line covered with grass, lichens, ferns and rhododendron bushes with scattered snow patches. Its characteristic facies is less bare and stony than the Snowcock's, q.v.

Extralimital. Afghanistan, S. Tibet, W. China.

GENERAL HABITS. Keeps in family parties of 6 to 8, adults and young, or coveys of up to 20 birds or more. When flushed rises silently straight up for a metre or two but with a great whirring and clapping of wings, flying away fast and strongly, the covey scattering. Where not much persecuted, tame almost to the point of stupidity, allowing themselves to be approached and fired at again and again till the entire covey may be wiped out. This trait, in conjunction with their palatability, is doubtless responsible for the considerable decline in their numbers in parts of their west Himalayan range.

FOOD. Lichen, moss, seeds and vegetable shoots, along with which a quantity of grit is swallowed. Presumably insects are also taken.

VOICE AND CALLS. Breeding call very similar to that of the grey partridge of the plains (A. E. Osmaston). A low whistle of alarm when covey approached, frequently repeated in a shriller tone when approached closer (R. Meinertzhagen).

BREEDING. Season, as so far recorded, May to July. Nest, a scrape on the ground under cover of a rock or bush sometimes well lined with moss and leaves, at other times practically without lining. Usually well concealed, but the cock bird rather gives it away by calling and strutting about in its vicinity (S. L. Whympers). Eggs, 3 to 5, or possibly 6, smaller replicas of those of the Snowcock — glossless pale clear buff or yellowish buff to dirty dark grey-buff, finely freckled and blotched with reddish all over. Average size of 50 eggs 54.6 x 35.4 mm. (Baker). Period of incubation and share of the sexes unknown. Male believed to be monogynous and to assist in tending the chicks.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Genus *LERWA* Hodgson

Lerwa Hodgson, 1837, Madras Jour. Lit. Sci. 5: 300

Type, by monotypy and tautonymy, *Perdix lerwa* Hodgson

Contains a single Himalayan species with no races. Wing short but pointed; second primary (as.) usually longest, 1st and 3rd being subequal and only slightly shorter. Secondaries comparatively long reaching to within c. 25 mm. of wing tip. Tarsus short, feathered for over half its length in front. Tail of 14 feathers, slightly rounded at end. Sexes coloured alike, but male has a well-developed spur on hind tarsus with sometimes a second incipient one.

227. Snow Partridge. *Lerwa lerwa* (Hodgson)

Perdix lerwa Hodgson, 1833, Proc. Zool. Soc. London, pt. 1: 107

(Northern region of Nepal)

Baker, FBI No. 1993, Vol. 5: 433

Plate 32, fig. 14

LOCAL NAMES. *Lerwa* (Bhutea); *Janguria* (Kumaon); *Quoir* or *Kur monal* (Garhwal); *Guldbi bhair*, *Teriltar* (Bashahr); *Bāyf ka titār* (Kulu); *Biju* (Chamba); *Pārahāt* (Hazara).

SIZE. Partridge +; length c. 38 cm. (15 in.).

FIELD CHARACTERS. A gregarious close-barred high-altitude partridge with bright red legs and bill. Above, closely barred black and white. Below,

8

GALLIFORMES

Chick (in down). Above, chestnut-brown, a blackish mark down the centre of the back and on the thighs. Centre of crown and nape, round the eye, and posterior cheeks velvety black; remainder of head, throat and sides of neck soft silvery white. Below, pale buff to chestnut buff.

There is a striking similarity in the downy chick to that of the Blood Pheasant (*Ithaginis cruentus*). Only in the former the tarsus is feathered for half its length and the bill black; in *Ithaginis* the tarsus is bare throughout and bill orange-yellow (Meinertzhagen, 1927, *Ibis*: 625 and coloured plate).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	180-205	18-20	38-40	118-138 mm. (Baker)

Weight 16 oz. (454 gm.) to 22 oz. (c. 624 gm.) once 25 oz. (c. 709 gm.) — Hume.

COLOURS OF BARE PARTS. Iris brownish red or blood red. Bill bright coral red. Legs and feet orange-red to deep red, deepest and brightest in the breeding season.

Genus *AMMOPERDIX* Gould

Ammoperdix Gould, 1851, Bds. Asia 6(3): pl. 4, 5, and text. Type, by subsequent designation, *Perdix heyi* Temminck (Reichenbach, 1853 (1852), Av. Syst. Nat. 28)

Tail of 12 feathers, short, not exceeding half length of wing. Wing rounded, 3rd or 4th primary (as.) longest; 1st, 2nd, 5th and 6th graduated. Tarsi strong and fairly long, without spurs, but male occasionally has a small knob or incipient spur on one or both legs. Bill with a distinct cere, brighter in colour than rest of bill. Sexes differently coloured.

Represented by one species in West Pakistan.

228. Seesee Partridge. *Ammoperdix griseogularis griseogularis* (J. F. Brandt)

Perdix griseogularis J. F. Brandt, 1843, Bull. Acad. Imp. Sci. St. Petersb., Physico-Math. Cl. 1: col. 365 (Transcaspia and Persia; restricted type locality, Persia apud Hartert, 1921, Vög. pal. Fauna 3: 1916)

Baker, FBI No. 1975, Vol. 5: 405

Plate 32, fig. 13

LOCAL NAMES. *Siru* (Baluchi); *Seesee* (Sind, Punjab); *Tihu* (Persian); *Kukia* (Attock, Campbellpur).

SIZE. Partridge —; length c. 26 cm. (c. 10 in.).

FIELD CHARACTERS. A small sandy grey-brown, concealingly desert-coloured partridge. Male. Head and foreneck ashy grey. A white band from lores through eye and ear-coverts ending posteriorly in a rufous patch, bordered above and below by black lines. The black line above (supercilium) broader and stretching from across forehead backward to nape. Outer tail-feathers conspicuously chestnut. Underparts pinkish buff, horizontally streaked on flanks with black and chestnut. Orange bill, yellow legs.

x c. 1

PHEASANTS, PARTRIDGES, QUAILS

9

Female. Sandy grey like male but without the grey head and black-and-white bands, and with no dark streaks on flanks.

STATUS, DISTRIBUTION AND HABITAT. Resident and locally common in West Pakistan — Baluchistan, NW. Frontier Province, Punjab (Salt Range), and Sind (Kirthar Hills). Affects dry stony bare or lightly-scrubbed foothills up to about 2000 metres elevation (normally much lower), broken up by rocky outcrops and bluffs of sun-baked mud and nullahs and ravines. Also the edge of scattered cultivation in the smaller valleys.

Extrelimital. Iran to Afghanistan, north to Bokhara.

Ammoperdix griseogularis

Distributional range 1 *A. g. griseogularis* (228).
2 *A. g. ter-meuleni* (RE).

GENERAL HABITS. Keeps in coveys of 20 birds or more, collecting in larger numbers to drink at water-holes. Very active in the early mornings and at dusk, sheltering from the midday heat in crevices and fissures — in Baluchistan often in the *karez* pits or openings to the underground water-channels. More often seen abroad at midday during the cold season. Astonishingly agile on its legs, sprinting away at great speed over boulders and rough broken ground, flying only when suddenly come upon or hard pressed. Abundant in the remoter areas and refreshingly tame and confiding where not persecuted, often seen running about like domestic chickens on the sites of deserted villages and encampments whence the herdsmen have moved to higher pastures in spring, pecking at horse- and mule-dung for food, and dust-bathing on the paths. When flushed on a hillside the birds invariably fly downhill, the wings producing the characteristic high-pitched squeaking *see-see* noise, as of a badly oiled bearing, which has given the bird its name. They provide good sport with the gun, but due to their concealing coloration in the broken terrain they frequent, and the habit

GALLIFORMES

10

of taking refuge in fissures when winged, are often difficult to retrieve without the aid of a dog. The superiority of their flesh over that of the chukor was already recorded in the Emperor Jehangir's Memoirs in the 17th century.

FOOD. Seeds and vegetable shoots, and doubtless also insects. Whistler found stomachs of specimens fully crammed with the small serrated trefoil-like leaves of *Trigonella occulta* Del. which grows sparsely in their stony habitat.

VOICE AND CALLS. A soft *chuck-chuck* uttered as contact note between members of a covey. On approach of breeding season male said to call at all hours of the day from an exposed rock or suchlike situation, like chukor but with a different note (not intelligibly described). The loud onomatopoeic double whistle produced by the wings is wrongly described as its call by Baker. The birds utter an alarm note when flushed which also needs proper description.

BREEDING. Season, March to June, chiefly April and May. *Nest*, a mere scrape in the ground, sometimes sparsely lined with grass and a few feathers, either sheltered under a rock or unprotected in the open. Nests have been recorded on the cornice of a deserted building and on the roof of a temporarily unoccupied house! *Eggs*, 8 to 16 (once 28!) pointed broad ovals, fairly glossy, creamy white or ivory-white to pale buff in colour, unmarked. Average size of 70 eggs 34.8 × 25.5 mm. (Baker). The male is believed to be monogynous, but SA has observed a wild cock paying assiduous court to two hens a couple of metres from each other, first running round one with the wing on that side drooped and trailing, and then round the second female in the same way. Males are pugnacious and, in the wild state, fight fiercely in the breeding season. They are, however, less prized by fanciers as fighting birds than the chukor.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	123-139	c. 11-12.5	32-34	60-68 mm.
♀♀	123-133	11-12	31-33	59-62 mm. (Baker)

Weight (♂♂) 7 to 8 oz. (c. 198-227 gm.) — Hume.

COLOURS OF BARE PARTS. Iris bright yellow, orange, orange-brown, dull red, or light brown. Bill orange, dusky on culmen, in some orange horny; cere orange or orange-red (brownish in non-breeding season). Legs and feet dingy wax yellow, greenish yellow, or dusky yellow; claws pale brown.

Genus TETRAOGALLUS J. E. Gray

Tetraogallus J. E. Gray, 1832, in Hardwicke's Ill. Ind. Zool. 2(11), pl. 46. Type, by monotypy, *Tetraogallus nigellii* J. E. Gray (not *Lophophorus nigelli* Jardine & Selby) = *Tetraogallus himalayensis* G. R. Gray

Contains the Snowcocks superficially like gigantic Grey Partridges. Wing rounded: first primary (as.) about equal to 6th; second primary longest. Tail well graduated, equal to about two-thirds of the wing. Tarsus short, feathered at the base and armed with a spur. A naked space behind eye. Sexes alike or differing slightly.

Genus confined to the mountains of central Asia from Asia Minor to western China.

229. Tibetan Snowcock. *Tetraogallus tibetanus tibetanus* Gould

Tetraogallus tibetanus Gould, 1854 (1853), Proc. Zool. Soc. London, pt. 21: 47 (Tibet, type from Ladakh)

Baker, FBI No. 1990, Vol. 5: 429

Plate 34, fig. 8

LOCAL NAMES. *Utar utar* (Turki); *Hailik* (Mongol); *Garmo* (Tangut).

SIZE. Large domestic hen +; length c. 51 cm. (20 in.).

FIELD CHARACTERS. A stout, dumpy, high-altitude game bird reminiscent of a huge, overgrown Grey Partridge. *Above.* Head and neck dark grey; sides of forehead, ear-coverts, and throat white. Back largely sandy grey and blackish grey, finely vermiculated and streaked with buff. Rump, upper tail-coverts, and central tail-feathers rufous; rest of tail blackish brown with rufous tips. A conspicuous white wing-patch (on secondaries). *Below,* largely white: throat and upper breast unmarked, followed by a grey band separating them from rest of underparts which are broadly streaked with black, the streaks broadest on flanks and lower abdomen. Reddish legs. Sexes only differing slightly.

Young (immature). *Above,* paler; white supercilium more conspicuous than in adult. *Below,* chin and throat white; no distinct pectoral band. Breast grey mottled with brown and buff. Abdomen and flanks white without the black streaks.

STATUS, DISTRIBUTION AND HABITAT. Resident in the western Himalayas (Ladakh and Rupshu) up to c. 5800 m. elevation in summer, down to between 4000 m. and 3000 m. in winter or still lower under heavy snowfall. Meinertzhagen (*Ibis* 1927: 629) never met with it in the same range of hills in eastern Ladakh as *T. himalayensis*. Affects alpine pastures with snow patches, stony sparsely grass-covered ridges, etc. above tree-line.

Extrelimital. Pamirs, and W. Tibet from Kashgar and Yarkand to Nanda Devi (Peters).

GENERAL HABITS, FOOD, VOICE AND CALLS. Not markedly different from those of the better known Himalayan Snowcock, *Tetraogallus himalayensis*, q.v. According to F. Ludlow, it has calls of three different kinds: (1) a subdued chuckling which gradually becomes louder and louder until it reaches a kind of climax, (2) a whistle, and (3) a call strangely reminiscent of that of the Curlew.

GALLIFORMES

12

Tetraogallus tibetanus

Distributional range 1 *T. t. tibetanus* (229). 2 *T. t. centralis* (231).
3 *T. t. aquilonifer* (230). 4 *T. t. tschimenensis* (RE).
5 *T. t. przewalskii* (RE). 6 *T. t. henrici* (RE).

BREEDING. Season, May to July. *Nest* and *Eggs* (4 to 7) as in Himalayan Snowcock. Average size of 16 eggs 63.8 × 44.1 mm. (Baker).

MUSEUM DIAGNOSIS. For detailed description of plumage see Baker, loc. cit.; for coloured illustration of chick in down, Meinertzhagen, *Ibis* 1927, pl. 15; for a note on moult, D. Marien, 1951, *Amer. Mus. Novit.*, No. 1518: 18.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	255-276	28-32	62-65	170-192 mm. (Baker)

COLOURS OF BARE PARTS. Iris hazel. Bill corneal yellow; nostrils magenta to dull carmine. Orbital region orange. Legs and feet bright pale vermillion; claws horn to orange-vermillion (Meinertzhagen).

230. Sikkim Snowcock. *Tetraogallus tibetanus aquilonifer* R. & A. Meinertzhagen

Tetraogallus tibetanus aquilonifer R. & A. Meinertzhagen, 1926, Bull. Brit. Orn. Cl. 46: 99 (Interior of Sikkim)

Baker, FBI No. 1992, Vol. 5: 432

LOCAL NAMES. *Hrak-pa* (Shutca); *Lephia kengmo* (or *kengmo* (South Tibet).

SIZE AND FIELD CHARACTERS. As for 229.

STATUS, DISTRIBUTION AND HABITAT. Resident. The Nepal and Sikkim Himalayas to western Bhutan between c. 4500 and 5500 m., descending somewhat lower in winter. Affects alpine pastures and bare rocky sparsely scrubbed ridges above tree-line—Tibetan plateau country.

EXTRALIMITAL. Adjacent parts of southern Tibet.

GENERAL HABITS etc. As in 232, q.v.

BREEDING. Not specifically recorded.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS, AND COLOURS OF BARE PARTS AS IN 229.

231. Central Tibetan Snowcock. *Tetraogallus tibetanus centralis* Sushkin

Tetraogallus tibetanus centralis Sushkin, 1926, Bull. Brit. Orn. Cl. 47: 37

(Tang-la Pass, Tang-la Range, central Tibet)

Baker, FBI No. 1991, Vol. 5: 430

LOCAL NAMES. Not recorded.

SIZE AND FIELD CHARACTERS. As for 229.

STATUS, DISTRIBUTION AND HABITAT. Resident. Abor and Mishmi Hills in the North East Frontier Agency tract, from c. 3500 metres up. Affects rocky stony hillsides, gorges and sparsely scrubbed ridges above tree-line.

EXTRALIMITAL. Northeastern and central Tibet.

GENERAL HABITS etc. As in 232, q.v.

BREEDING. Season, April to August, chiefly May and June. Nest, a natural or scraped hollow among stones and boulders or under the shelter of a rock, usually lined with dead leaves and grass; according to Baker and his correspondents 'invariably placed on the leeward side of a hill, often within a few yards of the crest'. Eggs, normally 4 to 6, sometimes 7, like those of the Himalayan Snowcock (232), apparently somewhat more heavily spotted at the smaller than the larger end. Average size of 140 eggs 62.6 × 43.2 mm. (Baker). Cock believed to be monogynous, not assisting in incubation but keeping watch near the nest and giving loud whistle of alarm on approach of danger. Two or three hens with their newly hatched broods reported joining together in one party.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

MEASUREMENTS

Wing ♂♂ 270-280; ♀♀ 260-270 mm. (Sushkin).

COLOURS OF BARE PARTS. As in 229.

232. Himalayan Snowcock. *Tetraogallus himalayensis himalayensis* G. R. Gray

Tetraogallus Himalayensis G. R. Gray, 1843 (1842), Proc. Zool. Soc. London: 105 (Himalayas). New name for the bird figured in Jardine & Selby, Ill. Orn., pl. 141 as *Lophophorus nigelli* not *L. nigelli* id., op. cit., pl. 76

Baker FBI No. 1989, Vol. 5: 426

Plate 34, fig. 9

LOCAL NAMES. *Kulla*, *Lupu*, *Baera* (W. Nepal); *Huinwal* (Kumaon); *Jer monal* (hills N. of Mussooree); *Leep* (Kulu); *Galaond* (Chamba); *Gleund* (Kangra); *Kübbk*, *Gura kákov*, *Rám chákör* (Kashmir); *Kübbk-i-dára* or *kouk-i-zárren* (Persian, Afghanistan).

without a single wing-beat, the wind whining through the pinions. They are noisy birds, continually uttering clucking calls as they feed, and shrill cackles of alarm when flushed, as well as on the wing.

FOOD. Chiefly bulbous roots and tubers, and green vegetable matter including grass shoots, along with which a good deal of grit is swallowed. *Artemisia* leaves, *Ephedra* berries and heads of a rye-like grass (Kociz).

VOICE AND CALLS. In breeding season cock particularly noisy. He utters a loud prolonged penetrating whistle or pipe of 4 (or 5) notes rising in scale and repeated with great persistence from a rock or mound. It has rather the cadence of the Common Green Pigeon's call and can be readily imitated to decoy the birds. Another call, described by B. B. Osmaston, begins with *kuk*, *kuk* repeated about a dozen times, gradually quickening and rising in scale 'until the last high-pitched notes follow each other so rapidly as to remind one of the acceleration of a ping-pong ball'.

BREEDING. Season, April to June. Nest a scratched-out hollow usually unlined, among stones and boulders quite in the open or under shelter of a ledge of rock. Normally on the leeward side of a hill, protected from the prevailing wind and rain. Eggs, 5 to 7, rarely 8, fine-textured, broad to long ovals, varying from pale yellowish stone to rich reddish buff, scantily scattered over with small blotches and specks of red-brown, characteristically more numerous at the smaller end. Average size of 68 eggs 65.4 × 45.4 mm. (Baker). Incubation believed to be by female alone, period (in incubator) 27-28 days. Incubating female has two brood-patches, one on either side between the thighs. 'In breeding season females get badly mauled by the cock, the crown often being quite bare of feathers and the skin bruised and red' (Meinertzhagen). Cock evidently monogynous. When courting he pursues the hen in a crouching position with his tail held vertically in the air (A. E. Osmaston). His neck ruff and tail are expanded, displaying the white under tail-coverts prominently. He then walks slowly round the hen with lowered head. At intervals he makes a dash for a rock or mound which he ascends, throws his head well back and gives his wild 5-noted whistle (Meinertzhagen).

MUSEUM DIAGNOSIS. See Key to the Species; for details of plumage Baker, loc. cit.; for a note on moult, D. Marien, 1951, *Amer. Mus. Novit.*, no. 151B: 17.

CHICK (in down). 'Upper parts stone grey richly variegated, with black tips and subterminal pale buff markings, making no definite pattern. Head very pale creamy buff, tipped with black and having four black lines from base of bill (1) along the side of the crown, (2) over the eye, (3) beneath the eye, and (4) as moustachial streak, all more or less blending behind the eye and ear-coverts. Underparts white, greyish white on breast and flanks. Legs and feet horny yellow, bill black, iris olive-brown' (Ticehurst). For coloured illustration see Meinertzhagen, *IBU* 1927: pl. 15.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	280-312	28-33	62-64	173-193 mm.

(Baker)

Weight ♂♂ 4 to 6½ lb. (c. 1.80-3 kg.); ♀♀ 3 to 4 + lb. (1.36-1.80 + kg.). COLOURS OF BARE PARTS. Iris hazel; bill olive horn-brown. Legs and feet dull vermilion; post-orbital region vermilion shading to orange (Meinertzhagen).

SIZE. Large domestic hen +; larger than 229. Length of ♂ c. 72 cm. (28 in.).

FIELD CHARACTERS. Like 229, reminiscent of a gigantic Grey Partridge, largely grey, white, chestnut and black streaked and vermiculated plumage. The white throat, separated by a broken chestnut collar from the dark grey underparts, and white under tail-coverts, are diagnostic points. In overhead flight against a bright sky, trailing edge of wings translucent white.

STATUS, DISTRIBUTION AND HABITAT. Resident. Western Himalayas—Kashmir, Ladakh, montane Punjab, Himachal Pradesh, Garhwal, Kumaon, western Nepal—between 4000 and 5500 metres altitude in summer, descending to 2400 m. or lower in severe winters. Like the Tibetan Snowcock affects steep alpine pastures near the snow line and bare stony ridges above the limit of tree growth.

EXTRALIMITAL. Tian Shans, Pamirs, and eastern Afghanistan.

Tetraogallus himalayensis

■ Distributional range x *T. h. himalayensis* (232).
a *T. h. grombezenskii* (RE). 3 *T. h. koslowi* (RE).

GENERAL HABITS. Usually keeps in pairs, or parties of 3 to 5, though coveys of over 20 birds frequently observed. The birds shoot down the hillsides in the early morning to drink, and slowly work their way upwards feeding as the day warms up, scratching the ground and digging vigorously with their stout bills. They hardly ever fly uphill or flap their wings in flight except just before alighting. When alarmed the bird invariably runs uphill with a waddling goose-like gait, its coloration blending to perfection with the barren environment. The partly erected tail is jerked now and again in the moorhen manner, flashing the white under coverts. It mounts a rock before taking off, plummeting at great speed straight down a steep hillside or round its contours or across a ravine, often travelling long distances

MISCELLANEOUS. One of the less attractive peculiarities of the Snowcock as a game bird is the strong and disgusting stench it often emits within only a couple of hours of being killed, possibly due to some food it has eaten. This however in no way affects the flavour of its flesh, which is excellent. Its high-altitude domicile and the rugged steepness of the ground it frequents call for considerable stamina and soundness of limb in hunting the bird.

Genus *TETRAOPHAPSIS* Elliot

Tetraophasis Elliot, 1871, Monogr. Phasian. 1: xix, pl. 21 and text. Type, by original designation and monotypy, *Lophophorus obscurus* J. Verreaux

Bill stout; edge of upper mandible overhanging lower. Wing rounded: 4th to 6th primaries (as.) subequal and longest, 4th or 4th and 5th slightly longer. First primary between 8th and 9th. A tuft of silky down-like feathers under the wing. Tail of 18 feathers, rather long, rounded, about three-quarters length of wing. Tarsus stout; of male with one spur, of female without. Otherwise sexes alike.

Only two forms known, from Tibet and China, of which one enters the fringe of our territory in NE. Assam.

233. Pheasant-Grouse. *Tetraophasis szechenyi* Madarász

Tetraophasis Szechenyi Madarász, 1885, Zeitschr. f. ges. Orn. 2: 50, pl. 2

(Szi-tschuan = Szechwan or eastern Tibet)

Not in Baker, FBI

Plate 34, fig. 5

LOCAL NAMES. *Kwa-kwa-dzi k'uling* (Tibetan); *Hsi-ue-tzu* (Chinese).

SIZE. Length c. 64 cm. (25 in.).

FIELD CHARACTERS. A large, plain coloured pheasant of the size and shape of the Koklas (*Pucrasia*). Above. Crown brownish grey narrowly streaked with black. Hindneck and upper back dark brown; lower back and rump grey, the feathers narrowly edged darker. Below. Chin and throat rust coloured (fawn). Upper breast dark grey, rest of underparts browner grey; feathers of lower plumage edged with rusty, and with rusty and chestnut spots. Outer tail-feathers with black-and-white tips. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Common in eastern Tibet, only just entering our northeastern border in the Upper Subansiri and Siyom drainage areas of NEFA (the North East Frontier Agency). Affects rocky ravines with plenty of cover, in fir forest and rhododendron scrub in the alpine zone between c. 3350 and 4600 metres altitude.

EXTRALIMITAL. E. Tibet and SW. China in provinces of Szechuan and Yunnan' (Peters).

GENERAL HABITS. Keeps in family parties of 4 to 6 birds. When disturbed in forest seeks refuge in trees where it 'freezes' and becomes difficult to detect. When flushed in open country where it has frozen on the observer's approach, it rises with a whirr of wings and shoots downhill into the nearest forest with the speed of a Koklas.

FOOD. Crop contents examined by Ludlow consisted of small roots, bulbs, and green leaves.

VOICE AND CALLS. According to Ludlow, has a loud harsh series of notes difficult to describe. On the whole a quieter bird than *Crossoptilon*, which inhabits the same biotope and is very noisy.

PHEASANTS, PARTRIDGES, QUAILS

17

BREEDING. Not recorded within our limits, and little known. Ludlow found chicks in E. Tibet in late May, June, and July, and Schäfer in August, indicating that season much protracted.

[Good accounts from E. Tibet by E. Schäfer (*Jour. Orn.*, 1934, 82(4): 490-2, and Sonderheft, 1938: 82); also F. Ludlow (*Ibis*, 1944: 382-3).]

MUSEUM DIAGNOSIS. For details of plumage see Hartert, E., 1921-22, Vog. pal. Fauna 3: 1895-6.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
2 ♂♂	216-226	32-34.5	—	142-151 mm.
3 ♀♀	203-221	28.5-32	51 (1)	129-133 mm.

(R. M. de Schauensee)

COLOURS OF BARE PARTS. Iris chestnut-brown. Bill blackish. Legs and feet reddish brown.

Genus *ALECTORIS* Kaup

Alectoris Kaup, 1829, Skizz. Entw.-Gesch. Eur. Thierw.: 180, 193. Type, by monotypy, *Perdix petraea* auct. not of Gmelin = *Perdix barbara* Bonnaterrae

Contains partridges of moderate size with red legs and almost uniform upper plumage, but with the flanks boldly barred with black. Wing short and rounded: first primary (as.) equal to 5th or 6th; 3rd primary longest. Tail of 14 feathers slightly rounded, equal to about two-thirds length of wing. Tarsus long and well developed; armed in male with a small spur. Otherwise sexes alike.

Genus well represented throughout Europe, N. Africa and W. and C. Asia.

*ALECTORIS CHUKAR*¹ (J. E. Gray)

Caccabis kakelik korovikovi Zarudny, 1914, Orn. Mitt. 5: 55

(Mountains of Birdjan, eastern Persia, Persian Baluchistan)

Baker, FBI No. 1973, Vol. 5: 404

LOCAL NAME. *Kākā* (Persian, Baluchi).

SIZE AND FIELD CHARACTERS. As of 236, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. Common in West Pakistan (Baluchistan) and Sind (Kirthar Range and outlying spurs) between c. 1000 and 3500 m. elevation. Affects barren rocky hillsides and ravines sparsely

¹ Cf. Watson, G. E., 1962, *Ibis* 104: 353-67; *Evolution* 16(1): 11-19.

PHEASANTS, PARTRIDGES, QUAILS

19

down sides of neck to meet in a gorget, or 'necklace', on upper breast enclosing the buffy to glistening white cheeks, chin and throat. Crimson bill and legs. Sexes alike; female somewhat smaller and lacking the spur on tarsus.

Young (immature). Dull brownish grey. Upperparts spotted with white; underparts dirty brownish white with faint brown bars. Head rufescent brown. Tail grey with mottled bars of black and white, the outer feathers tinged with rufous.

(For downy chick see Museum Diagnosis.)

STATUS, DISTRIBUTION AND HABITAT. Resident. Throughout the western Himalayas between c. 1200 and 5000 metres elevation, east to central Nepal, excluding the ranges of 234 and 235, q.v. Also Punjab Salt Range. Affects barren, stony sparsely scrub-covered hillsides, boulder-strewn ravines, and the neighbourhood of terraced-cultivated river valleys.

GENERAL HABITS. Normally keeps in parties of 4 or 5 birds to steep bare hillsides with a scanty sprinkling of *Rubus*, *Berberis*, and such-like scrub, and often in the neighbourhood of terraced cultivation. Coveys of 50 or more, adults accompanied by young of the year, are not uncommon in autumn and winter when the birds descend from the highest levels. Several coveys may collect together to drink at the few and far-between springs and water-holes in the barren hills an hour or two after sunrise, or to feed in the freshly sown wheat and barley fields, gradually working their way up the flanking hill-slopes as the day gets warmer. They are very fast and strong on the wing, but the flight is not sustained. When flushed, a covey scatters, the birds sticking to the contours of the hillside wherever possible and invariably flying downhill with great velocity. They afford excellent sport with the gun, but the steep and rugged nature of the terrain makes their pursuit an exhausting business. The only chance of making a decent bag is to get the birds driven over in the neighbourhood of the drinking-places where they concentrate. They then give a large variety of shots as they sweep the contours or hurdle through space high overhead across a ravine from a high spur to lower ground. Dr Ticehurst records that in a good year three guns shot 700 birds in two mornings in this way in Baluchistan. They are excellent for the table.

FOOD. Bulbous roots, grain, and green vegetable matter including shoots of grass, wheat and barley; also insects, especially termites. A quantity of grit is always taken with the food.

VOICE AND CALLS. The cock has a rattling gamey crow uttered from an exposed rock or other eminence in the early morning and late evening with a particularly challenging ring in the breeding season. It is a loud chuckling, far-reaching, *kāk-kāk-kāk*, *kāwāk-kāk*, *kāwāk-kāk*, *kāwāk-kāk*, etc., reminiscent of something between the calls of the Grey Partridge and the Guineafowl. To Hume's ear the call sounded as 'I'm here, I'm here; who's dead, who's dead; oh lor, oh lor'.

An interesting study, 'Voice and Social Behaviour of the Chukar Partridge', has been made on captive as well as wild birds in the areas of their introduction in the U.S.A. (Stokes, A. W., 1961, *The Condor* 63(2): 111-27). Fourteen different calls have been classified based on their association with alarm, social contact, agonistic, and sexual situations. The one here described

18

GALLIFORMES

dotted with stunted grass and bushes. Occasionally small numbers in thick juniper forest in northern Baluchistan (Ticehurst).

Extralimital. 'Eastern Persia from lat. 37°30'N. southward' (Peters).

GENERAL HABITS, FOOD, VOICE, etc. As in 236.

BREEDING. Season, May-June. Nest and Eggs as in 236. Average size of 50 eggs 39.0 × 29.3 mm.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Breast generally a clearer purer grey than in *A. c. chukar*.

MEASUREMENTS. Wing ♂ ♀ 140-156 mm. (Baker); 148-164 mm. (Ticehurst).

COLOURS OF BARE PARTS. As in 236.

235. *Northern Chukor*. *Alectoris chukar pallescens* (Hume)

Caccabis pallescens Hume, 1873, in Henderson & Hume, *Lahore to Yarkand*: 283

(Karbu, Ladakh)

Baker, FBI No. 1974, Vol. 5: 404

LOCAL NAMES. *Chukōr* (Hindi); *Keklik* (Turki); *Kāko* (Kashmiri); *Zarker* (Pushtu).

SIZE AND FIELD CHARACTERS. As of 236, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident at altitudes between c. 1500 to 4000 metres from about the Wakhan region of Afghanistan (lat. c. 37°N.) south through Chitral, Gilgit, and Baltistan to N. Kashmir and Ladakh where it merges with 236, replacing it in the drier portions. Affects bare stony hillsides and ravines, and the neighbourhood of terraced cultivation.

Extralimital. Eastern Turkestan and Yarkand.

GENERAL HABITS, FOOD, VOICE, etc. As in 236.

BREEDING. Season, from about beginning of May to end July. Nest and eggs as in 236. Full clutch 8 to 14. Average size of 36 eggs 43.6 × 31.7 mm. (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. The palest of the three forms occurring in Indian limits.

MEASUREMENTS. Wing ♂ ♀ 158-172 mm. (Baker).

COLOURS OF BARE PARTS. As in 236.

236. *Chukor Partridge*. *Alectoris chukar chukar* (J. E. Gray)

Perdix Chukar J. E. Gray, 1830, in Hardwicke's Ill. Ind. Zool. 1(2): 54 (India. No exact locality given but Srinagar in Dehra Dun district, U.P. (not Kashmir)

accepted as the type locality by Hellmayr, 1929, Field Mus. Nat. Hist. publ., Zoology Ser., 17: 136)

Baker, FBI No. 1972, Vol. 5: 402

Platē 32, fig. 16

LOCAL NAMES. *Chukōr* (Hindi); *Kāko* (Kashmiri); *Chākrū* (Chamba).

SIZE. Grey Partridge +; length c. 38 cm. (15 in.).

FIELD CHARACTERS. A large sleek and plump pinkish grey-brown partridge with rufous tail and conspicuous rib-like bars on flanks in 'buff' and black. A black band running across forehead back through the eyes and

20

GALLIFORMES

fits what is classed the commonest 'rally call'. Throughout the year this rally call serves to reunite scattered birds; during the breeding season it is an aggressive call to advertise a dominant male and to repel intruders. The paper¹ also discusses pair formation, courtship, and various behaviour patterns.

BREEDING. Season, early April to mid July depending on altitude. Nest, a scrape or hollow in the ground under shelter of a rock or bush, or at the base of a grass tussock on rugged hillsides. Sometimes without lining at other times lined with leaves, bents, and rubbish. Eggs normally 7 to 12, but up to 20 have been found in a single nest, possibly the product of two hens. Pale yellowish or greyish stone colour or *café-au-lait* with light reddish freckles scattered all over the surface. Average size of 250 eggs 43.0 × 31.4 mm. (Baker). Believed to be monogynous and most of the incubating to be done by the hen.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for subspecies, Key.

Chick (in down). 'A broad band from bill over crown to nape chestnut, outlined in dark brown; from base of bill a broad creamy white superciliary streak surmounting a narrow dark brown one. On the dorsum a broad median chestnut band, and on each side of it a narrow creamy white streak. Wings and back of thighs girdled brown and cream. Underparts creamy grey; a short dark brown moustachial streak from base of bill' (Ticehurst).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	146-180	19-21	41-52	78-105 mm.

— (Baker)

Weight ♂♂ 19-27 oz. (c. 540-765 gm.); ♀♀ 13-19 oz. (c. 370-540 gm.) — Hume.

COLOURS OF BARE PARTS. Iris brown, yellowish or orange; eyelids (rim) coral-crimson. Bill coral red to crimson, dusky on culmen and near nostrils. Legs and feet coral red to crimson; claws and spur dusky brown.

MISCELLANEOUS. Has been introduced into every state in the U.S.A. including Alaska and Hawaii on a fairly large scale, principally since 1935. The bird has established itself successfully in ecologically suitable areas in 11 or 12 of the states. It breeds freely, and under scientific management withstands considerable hunting pressure, having now become a favourite game bird with American sportsmen.

Taken young and hand-reared chukor become exceedingly tame, moving freely about the house following the inmates and boldly attacking strangers and stray dogs. Cocks are highly pugnacious. Chukor fighting is a popular public sport on high days and holidays in NW. Pakistan and India, and considerable wagers change hands over the mains.

Genus *FRANCOLINUS* Stephens

Francolinus Stephens, 1819, in Shaw's Gen. Zool. 11(2): 316. Type, by tautonymy, *Francolinus vulgaris* Stephens = *Tetrao francolinus* Linnaeus

Wing short and rounded, about one-quarter to one-third longer than tail: 3rd or 4th primary (as.) longest, 5th and 6th a little shorter. Tail of 14 feathers. Legs

¹ See also another by the same author, 'Sexual and agonistic behaviour in the Chukar Partridge (*Alectoris graeca*)'. *Animal Behaviour* 11(1): 121-34, 1963.

PHEASANTS, PARTRIDGES, QUAILS 21

stouter and longer than in *Perdix*, furnished with a spur in the male, sometimes very small or rudimentary. Sexes alike in some species, dimorphic in others.
Genus well represented in tropical Africa and Asia.

237. South Persian Black Partridge. *Francolinus francolinus henrici* Bonaparte

Francolinus henrici Bonaparte, 1856, Compt. Rend. Acad. Sci. Paris 42: 882 (Sind) Baker, FBI No. 1977, Vol. 5: 410

LOCAL NAMES. *Kāro tīlār* (Sind); *Taru* (Pushtu); *ṣ Sijhṣghwar*, *ṣ Shānz* (Baluchi).

SIZE AND FIELD CHARACTERS. As of 238, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident. West Pakistan — Las Bela (?), Sind, Chitral (to c. 1200 m. alt.). More abundant in Upper Sind than in Lower. Affects grass and tamarisk jungle bordering canals and cultivation.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of 238.

BREEDING. Season, much protracted: March to May, with evidently a second burst from August to October. Nest and eggs as in 238. Average size of 30 eggs 39.0 × 31.7 mm. (Baker).

MUSEUM DIAGNOSIS. Both sexes much paler than 238, but with under tail-coverts of male darker chestnut than in *F. f. asiæ* and normally with no trace of barring.

Chick (in down). 'Upperparts pale creamy buff, from base of bill down centre of crown a broad chocolate-brown line; a short narrow line behind eyes, a long narrow one over the eyes, and one from base of bill below the eyes, brown; three broad parallel brown lines on dorsum, and a broken one over thighs. Underparts cream white; wings creamy buff, mottled with brown' (Ticehurst).

This description is of a chick of *F. f. arabistanicus* (= *henrici*).

MEASUREMENTS. Wing ♂♂ 148-163; ♀♀ about 150 mm.

COLOURS OF BARE PARTS. As in 238.

PHEASANTS, PARTRIDGES, QUAILS 23

the darker Assam race *melanotos* becomes noticeable), Punjab, U.P., Bihar, West Bengal. Roughly south to a line from Deesa (Gujarat) to Gwalior (Madhya Pradesh), thence through Sambalpur to the Chilka Lake in Orissa (lat. c. 20°N.). Up to c. 2000 metres altitude in Nepal and to c. 2500 m. in the Simla area; normally below c. 1200 m. Affects well-watered tracts — high grass and tamarisk jungle bordering rivers and canals with alternating patches of cultivation, especially millets and sugarcane. Tea gardens and their environs form favourite haunts in the Himalayan foothills.

GENERAL HABITS. Keeps singly or in scattered pairs and parties of 3 to 5. Leaves thicker cover to feed in the more open crops and grassland chiefly in the morning and late afternoon, sauntering about at the edge of cover tail slightly cocked as in the moorhen — a peculiarity seldom observed in the Grey Partridge. Rests and roosts in thick cover of tall grass clumps or sugarcane fields and not up in branches of trees like Grey Partridge, though often mounting into them for calling. Flushes readily except where much harried when it trusts to its legs for escape, running ahead of the hunter or line of beaters, breaking cover with a loud whirr of wings only when near the end of a field, and flying away swiftly and strongly with rapid wingbeats punctuated with glides. Seldom flies high except when breaking back overhead in a beat, and usually not more than 300 or 400 metres before alighting again and continuing to run on. When walked up with a line of beaters the birds provide excellent sport with the gun. They are very good eating but rather dry to the taste.

FOOD. Omnivorous. Grass and weed seeds, cereal grains, shoots, leaves, tubers, fallen berries and wild figs (*Ficus*), and larvae and insects of all kinds, particularly termites and their eggs, and various coleoptera and orthoptera; once a small mouse (Emperor Jehangir's Memoirs); in the neighbourhood of villages often also human excreta. (For specific analyses of stomach contents see Mason & Lefroy, 1912, Mem. Agri. Dept. India, Entom. Ser. 3: 235-43. Also Faruqi, Gardiner Bump *et al.*, 1960, Jour. Bom. nat. Hist. Soc. 57(2): 354-62.)

VOICE AND CALLS. A cheery high-pitched *chik* (or *click*)... *check-check-kerayek* uttered by the cock from a termite mound, branch or other eminence particularly in the morning and evening far into the dusk, but at all hours of the day during the breeding season. The call is a curious blend of the harsh and the musical and has a peculiar far-reaching and ventriloquist quality. It is repeated at intervals of 15 seconds or so, several birds answering one another from all directions. It has been phonetically rendered in many variants, as *Shtr-dārem-shākrāk* ('I have milk and a little sugar') by the Mogul emperor Babar, as *Sūbhān-tīrī-gūdrāt* ('Omnipotent, thy power') by U.P. Muslims, and as *Lekān-pīz-dārāk* ('Garlic, onion, ginger') by more down-to-earth gourmets! The spirited call, with neck upstretched, ends with an up-and-down waggle of the tail.

BREEDING. Season, very protracted: March to October, varying somewhat in different parts of its range. Nest, a shallow depression scraped in the ground and lined with grass. Placed amongst the roots of tall plumed grass tussocks and bushes, or in tamarisk scrub, grassland or millet fields, sometimes well-concealed, sometimes in absurdly exposed situations. Eggs, 6 to 9 (in Sind usually 4 — T. R. Bell), fine textured, very broad ovals sometimes

Plate 31, fig. 1

LOCAL NAMES. *Kāla teetār* (Hindi); *Tetra*, *Kālo tetra* (Garhwal); *Kais teetār* (Nepal).

SIZE. Grey Partridge ±; length c. 34 cm. (13 in.).

FIELD CHARACTERS. A plump, stub-tailed game bird.

Male. Largely jet black, scalloped, spotted and barred above with white and fulvous. The glistening white cheek-patches, chestnut collar, jet black underparts with chestnut belly and under tail-coverts are further pointers.

Female. Above, more or less like male but paler and browner, with no white cheek patches or chestnut collar, only a dull chestnut patch on nape. Below, chin and throat buffy white; rest of underparts and flanks wavyly barred and scalloped black and white. Vent and under tail-coverts chestnut.

Young (immature). Like richly coloured female but with the supercilia blackish and cheeks white. Rufous nuchal patch darker. Breast black profusely spotted with white.

STATUS, DISTRIBUTION AND HABITAT. Resident. Kashmir and northern India along the foothills to central Nepal (eastward of which merging with

24 GALLIFORMES

pointed at the small end; coloured from yellowish olive to warm olive-brown or sienna-brown. Average size of 100 eggs 37.8 × 31.3 mm. (Baker). Cock monogynous. Incubation by hen alone; period 18-19 days.

MUSEUM DIAGNOSIS. Darker than *F. f. henrici*, paler than *F. f. melanotos*. For details of plumage see Baker, loc. cit.

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	145-168	c. 22-26	c. 45-50	77-110 mm.
♀♀	138-167	—	—	—

Weight ♂♂ 10-20 oz. (c. 283-566 gm.); ♀♀ 8-17 oz. (c. 227-482 gm.). — Hume. Average weight of birds trapped near Delhi in January (1962): 19 ♂♂ 17 oz. (c. 482 gm.); 18 ♀♀ 15 oz. (c. 424 gm.). — G. Bump.

COLOURS OF BARE PARTS. Iris brown or hazel-brown. Bill black or dark horny brown; tip of lower mandible whitish. Legs and feet reddish brown to orange-red or brick-red; claws black or horny brown.

Chick (in down). Undescribed, but see 237.

[An experiment is currently in progress by the U.S. Government's Fish and Wildlife Service to introduce Indian francolins as game birds into certain ecologically equivalent areas in N. America. In this connexion the Special Scientific Report — Wildlife No. 81, 1964, entitled 'A Study and Review of the Black Francolin and the Gray Francolin' by Gardiner & Janet W. Bump is an informative and instructive document.]

239. Assam Black Partridge. *Francolinus francolinus melanotos* Hume

Francolinus melanotos Hume, 1888, Stray Feathers 11: 305

(Sylhet, Cachar, Garo and Khasi Hills, and the Assam Valley)

Baker, FBI No. 1978, Vol. 5: 411

LOCAL NAMES. *Tetri sordī*, *Mecheñteri* (Assam); *Urenbi* (Manipur); *Dao chinn* (Cachar); *Imui jirip* (Kacha Naga); *Voh chinee* (Mikir).

SIZE AND FIELD CHARACTERS. As of 238, q.v.; much darker.

STATUS, DISTRIBUTION AND HABITAT. Eastern Nepal, through Bhutan duars and Assam, Manipur, and East Pakistan; up to c. 2000 metres altitude. Affects the vast stretches of tall grassland on alluvial river banks in the foothills of the Himalayas, and the Surma and Brahmaputra valleys.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 238.

BREEDING. Season, April to July/August varying locally with break of rains or firing of the grass. Nest, a shallow scrape with a slimy pad of grass and leaves, occasionally quite well made, placed close to an ant-hill or bush on the edge of tall grassland or a *bheel*. Eggs, 4 to 6 like those of the Indian race. Average size of 150 eggs 37.0 × 31.5 mm. (Baker). Some birds believed to have two successive broods.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Both sexes considerably darker than *F. f. asiæ*. Male. Above, feathers centred very dark, almost blackish brown, with the paler edges narrow and dark rufous. White bars on posterior upperparts also very narrow. Below, the white spots oval instead of round, becoming still longer-shaped on lower breast. Under tail-coverts unbarred deep chestnut. Female. Breast more heavily barred with black than in Indian birds.

PHEASANTS, PARTRIDGES, QUAILS

25

Chick (in down). Markings similar to those described for *henrici* q.v. 'but the whole coloration so much darker that one would hardly suppose the two to belong to one species' (Ticehurst).

MEASUREMENTS. Wing ♂ ♀ 143-155 mm. (Baker).

Weight ♂ ♂ 10-20 oz. (c. 285-570 gm.); ♀ ♀ 8-17 oz. (c. 228-480 gm.). — Hume.

COLOURS OF BARE PARTS. As in 238, but legs and feet very bright deep red in breeding season.

FRANCOLINUS PICTUS (Jardine & Selby)

Key to the Subspecies

		Page
A	Paler; bright, pale rufous below.....	<i>F. p. pallidus</i> 25
B	Darker; dull, earthy rufous below.....	<i>F. p. pictus</i> 27
C	Darkest; heavily marked with black below.....	<i>F. p. watsoni</i> 27

240. Northern Painted Partridge. *Francolinus pictus pallidus* (J. E. Gray)

Perdix hepburnii var. *pallida* J. E. Gray, 1831, in Gray & Hardwicke, III. Ind. Zool 1(8): pl. 55 (Odyore = Udaipur)
Baker, FBI No. 1980, Vol. 5: 414

LOCAL NAMES. *Titūr*, *Chitūr* (Bombay); *Kala titūr* (Marathi).

SIZE. Grey Partridge; length c. 31 cm. (12 in.).

FIELD CHARACTERS. Rather like a female Black Partridge. *Above*, brownish black spotted, scalloped, and finely barred with white. Supercilium and face pale chestnut. No chestnut collar in male or nuchal patch in female as in Black Partridge. *Below*, black heavily spotted with white; centre of abdomen and vent rufous. Throat chestnut in male, whitish (usually but not always) in female; otherwise sexes more or less alike, both without spurs.

When flying away from observer, white-spotted plumage, black outer tail-feathers and rich rufous in the typically cambered wings are diagnostic points.

Young (immature). Like female, with black arrow-shaped marks on the pale buffy flanks and lower breast.

STATUS, DISTRIBUTION and HABITAT. Resident, subject to local movements governed by food supply and water; spreading out widely in the monsoon when both abundant. South of range of Black Partridge in Gujarat (excepting Kutch), southern Uttar Pradesh and northern Madhya Pradesh, chiefly low and plateau country. Believed to hybridize with Black Partridge where their ranges meet. On the whole affects drier facies than Black Partridge, but better watered than the thorny xerophytic habitat of the Grey.

Keeps to undulating grassland and cultivation bordered and interspersed with patches of scrub jungle and bushes (such as *Calycopteris*, *Diospyros* and *Zizyphus*) and with vegetation-bordered streams and water channels between the hummocks.

GENERAL HABITS. Almost invariably met with in scattered pairs; sometimes family parties of parents and 3 or 4 grown young, not in coveys. Like the Black Partridge active in the early mornings and late afternoons, retiring

241. Southern Painted Partridge. *Francolinus pictus pictus* (Jardine & Selby)

Perdix picta Jardine & Selby, 1828, III. Orn. 1: sig. G, pl. 50 (Bangalore, India)
Baker, FBI No. 1979, Vol. 5: 412
Plate 31, fig. 4

LOCAL NAME. *Kakra kozhi* (Tamil).

SIZE and FIELD CHARACTERS. As of the northern race, 240 q.v. Darker. (See Museum Diagnosis.)

STATUS, DISTRIBUTION and HABITAT. Resident, shifting locally with conditions of rainfall and drought. The Peninsula north to the range of 240 — roughly lat. 20°N. which, for convenience, may be arbitrarily fixed as the boundary between the races. Individual specimens from this area difficult to assign racially. Does not occur in the evergreen hygrophytic tracts of Kerala and Mysore. Affects semi-moist undulating grassland intermixed with scrub and cultivation, as described under 240.

GENERAL HABITS, FOOD, VOICE, etc. As in 240. In the Bombay area the staple food between November and January is paddy gleaned in the stubbles, with a greater proportion of insects thereafter. Of the latter the following identified in stomach contents: black ants (*Camponotus* sp.), the beetles *Aulacophora foreicollis* and *Pseudobolaps mellyi*, and the bug *Aspongopus janus* (H. Abdulali, 1964, JBNHS 61(2): 449).

BREEDING. As in 240.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Difference in shade of rufous of abdomen and vent obvious only in series; individual specimens often impossible to place racially.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	132-148	c. 24-27	c. 40	66-89 mm. (Baker)

Weight ♂ ♀ 8.5 to 12.7 oz. (c. 242-340 gm.). — Hume.

COLOURS OF BARE PARTS. As in 240.

242. Ceylon Painted Partridge. *Francolinus pictus watsoni* Legge

Francolinus Watsoni Legge, 1880, Birds of Ceylon 3: 745 (Wellemade, Ceylon)
Baker, FBI No. 1979 (part), Vol. 5: 412

LOCAL NAMES. *Ussa watawā*, *Piri kakkulā*, *Maṇa kakkulā* (Sinhala); *Kaṭṭi-ṭi* (Tamil).

SIZE and FIELD CHARACTERS. As of 240; much darker.

STATUS, DISTRIBUTION and HABITAT. Resident; endemic in Ceylon. Affects *pāna*-grass, scrub and bracken country in the foothills (and up to about 1200 m. elevation) of the Dry zone only in Uva Province (Henry). 'Now (1952) very scarce on the pānans or grasslands of the Uva hills, but still fairly plentiful in the "park country" of the adjoining lowlands around Bibile and Nilgala' (Phillips).

GENERAL HABITS, FOOD, VOICE, etc. As of 240, q.v.

26

GALLIFORMES

into cover during the heat of the day, except in cloudy, overcast and drizzly weather. Shares with Black Partridge the peculiarity of carrying its tail partly cocked as it runs about. Is an inveterate skulker and, particularly where much harried, will frequently squat in cover till almost trampled by a line of noisy beaters, breaking back immediately they have passed on. Will often lie low in a bush even in spite of prolonged and seemingly futile beating. Normally rises with a loud whirr of wings, but on such occasions will usually sneak out noiselessly when search abandoned, and dash to safety, leaving the hunter nonplussed. Roosts in trees as well as on the ground in forms canopied by arching grass.

FOOD. Cereal grains mostly gleaned in stubbles, weed and grass seeds, tender shoots of grass and crops and other green matter, berries and drupes (e.g. *Zizyphus*); termites and other insects and their eggs and larvae. Around villages often also human excreta. A quantity of grit always present in stomachs.

VOICE and CALLS. Normally more silent than Black Partridge. In breeding season a high-pitched, rather ventriloquistic *click* . . . *cheek-cheek-keray* very similar to that of the Black, almost indistinguishable from it. Calls from a tree stump, mound, or other elevated station once every 20 seconds or so, frequently for over 15 minutes at a stretch. Usually answered by another bird in the distance. After a bout of challenges from one perch, flies off to another 50 or 100 metres away for a further session, returning thereafter to the original stance or to a third one in the neighbourhood to resume calling; thus doubtless effectively patrolling its breeding territory. When calling the neck is merely stretched up and forward (not vertically), this unaccompanied by any drooping, expanding, erecting or jerking of wings or tail. Whether female also calls, as asserted by some locals, unproven, but two calling birds in breeding season were observed to have whitish throats as in female!

BREEDING. Season, normally commences with the break of the SW. monsoon rains in June and continues till September or October, but in central India April, May, and June have also been reported (Whitehead, 1911, JBNHS 21: 168). Nest, a scrape or slight hollow in the ground, sparsely lined with grass and leaves; usually in standing crops or sugarcane fields, or in a patch of grass and scrub jungle. Eggs, 4 to 8, normally up to 6, very like those of the Black Partridge — some shade of olive-brown. Average size of 29 eggs 35.7 × 29.5 mm. (Baker). Cock believed to be monogynous; incubation by hen alone; period unrecorded.

MUSEUM DIAGNOSIS. See Key to the Subspecies; for details of plumage Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
5 ♂ ♂	140-149	23-26	37-45	65-68 mm.
5 ♀ ♀	140-151	21-24	41-46	64-69 mm. (SA)

Wing ♂ ♀ 131-146 mm. (Baker).

COLOURS OF BARE PARTS. Iris orange-brown. Bill dark brown to black; base and gape horny white. Legs and feet brownish orange (yellow in immature); claws horny brown.

28

GALLIFORMES

BREEDING. Curiously enough no nest yet taken in Ceylon, but from circumstantial evidence probably breeds between March and June. A specimen collected on 18 February already showed slightly enlarged gonads (SDR).

MUSEUM DIAGNOSIS. See Key to the Subspecies. Differs from nominate *pictus* in much darker brown tint of upperparts with spotting on back of neck and white edging of mantle and scapulars much reduced. Underparts also much more heavily marked with black, being in the female more definitely barred than in south Indian birds.

MEASUREMENTS and COLOURS OF BARE PARTS as in 241.

243. Burmese Francolin. *Francolinus pintadeanus phayrei* (Blyth)

Perdix Phayrei Blyth, 1843, Jour. Asiat. Soc. Bengal 12(2): 1011 (Arrakan)
Baker, FBI No. 1981, Vol. 5: 415
Plate 31, fig. 3

LOCAL NAME. *Kabo wenbi* (Manipur).

SIZE. Grey Partridge +; length c. 33 cm. (13 in.).

FIELD CHARACTERS. Heavier head and thicker neck distinguish it from Black Partridge in silhouette.

Male. *Above*, crown dark brown bordered longitudinally on each side by a rufous-brown band. A broad white band along side of face from lores through ear-coverts, bordered above and below by narrower black bands, the upper continuing across the forehead. Rest of upperparts black spotted with white, with some dull chestnut about the wing shoulders. Lower back and rump (black) and upper tail-coverts (greyish brown) finely barred with white. *Below*, chin and throat white; rest black heavily spotted with white, the spots increasing in size to coalesce as bars on lower abdomen. Under tail-coverts pale chestnut.

Female. *Above*, sides of head buff with broken brown superciliary and cheek stripes. Rest of upperparts largely brown with pale ill-defined spots, bars, and vermiculations. *Below*, largely buff, closely barred with blackish on foreneck and upper breast, decreasing towards abdomen and thigh-coverts. Under tail-coverts dull chestnut.

Young (immature). Like female but duller. Neck and back pale-streaked; eye-streak and moustachial streak absent or obsolete.

STATUS, DISTRIBUTION and HABITAT. Resident and common in SE. Manipur State, in the Kabaw and Manipur Valleys. (For particulars of specific localities within the area see Higgins, 1934, JBNHS 37: 93.) Affects low oak scrub in the foothills, and grassy openings in Dipterocarp forest in undulating country. Common in drier localities.

Extremities. Arakan, Pegu, eastern Burma south to N. Tenasserim, Shan States, Yunnan, eastern Indochinese countries from Tonkin to Cambodia, Hainan Island (Peters). The nominate race in SE. China.

GENERAL HABITS. Keeps singly or in scattered twos and threes; not in flocks or coveys, though sometimes many in the same neighbourhood. Is a stronger flier than Black Partridge but an inveterate skulker and difficult to dislodge from cover without a dog; thus often heard than seen. When

flushed will sometimes take refuge in a high tree till the trouble has passed. Less widely distributed in Manipur than the Black (*F. f. melanotus*), but shares with it the same facies wherever found.

FOOD. Seeds, shoots, and insects.

VOICE AND CALLS. Uttered from tree-stump or branch up to c. 3 m. high. An unusually resonant (for partridge) five-noted challenge apparently given throughout the year, mostly in the early mornings and at dusk when several birds may be heard calling simultaneously. Particularly vociferous during the breeding season. Call variously rendered as *Ke kai, ke kai, ke karr* (Baker), *Kai kai, kee kai, kee kurr* (Swinhoe) and *Kak kak kurich, ka ka* (Wardlaw-Ramsay). These renderings give little idea of the call itself, but some indication of the rhythm, the last according to Higgins being the nearest. The call is adequately expressed by the words 'Do be quick papa' (Wickham).

BREEDING. No record from within Indian limits. Season (in Burma) March to September. Nest, like that of the Black Partridge, a scrape lined with grass at the foot of a thick bush in scrub-and-bush jungle. Eggs, 3 to 7, commonly 4 or 5, warm cream colour, sometimes faintly tinged with olive. Average size of 84 eggs 35.3 × 28.7 mm. (Baker).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	132-151	23-25	c. 42-44	c. 60-70 mm. (Baker)

Weight 10-14 oz. (c. 284-397 gm.).

COLOURS OF BARE PARTS. Iris reddish brown to dark brown; eyelids dull greenish or livid green. Bill black, horny at base of lower mandible. Legs and feet orange-yellow to yellowish or reddish brown, much brighter in breeding season; paler and more yellow in female.

244. Baluchistan Grey Partridge. *Francolinus pondicerianus mecranensis* Zarudny & Härms

Francolinus (*Ortygornis*) *pondicerianus mecranensis* Zarudny & Härms, 1913, Orn. Monatsb. 21: 53 (Valley of the Rud-i-Sarbas river, Persian Baluchistan). Baker, FBI No. 1985, Vol. 5: 422

LOCAL NAMES. *Achho teetar* (Sind); *Tauzarai* (Pushtu); *Kapinja* (Baluchi).

SIZE AND FIELD CHARACTERS. As of 246, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. West Pakistan (Baluchistan to c. 1200 m. alt.); western Sind; N.W.F. Province; west of Indus river. Affects stony semi-desert country with sparse thorn scrub bordering dry ravines etc., especially in the neighbourhood of cultivation.

246. South Indian Grey Partridge. *Francolinus pondicerianus pondicerianus* (Gmelin)

Tetrao pondicerianus Gmelin, 1789, Syst. Nat. 1(2): 760 (Pondicherry, India)

Francolinus pondicerianus ceylonensis Whistler, 1941, Ibis: 319 (Mluppaikkadavai, northern Ceylon)

Baker, FBI No. 1983, Vol. 5: 419

Plate 31, fig. 2

LOCAL NAMES. *Sāfed utār* (Hindi); *Gowjal hākki* (Kannada); *Kawanga* (Telugu); *Kendri*, *Kauthāri* (Tamil); *Kōchi kōta* (Malayalam); *Ussa watuwā* (Sinhala); *Chittār* (Marathi).

SIZE. Half-grown village hen ±; length c. 33 cm. (13 in.).

FIELD CHARACTERS. A squat, stub-tailed game bird largely greyish brown, rufous and chestnut above, mottled, barred, and vermiculated with buff and black. Below, pale buff and rufous, narrowly cross-banded on fore-neck and upper breast and finely pencilled or vermiculated on abdomen and flanks with black. A prominent yellowish rufous throat patch enclosed within a blackular loop. Tail largely chestnut, particularly conspicuous when bird flying away from observer. Sexes alike, but cock somewhat larger with a sharp spur, occasionally double, on each leg.

Young (immature). Like adult but with less rufous on forehead. Throat-patch paler, its enclosing black border obsolete.

STATUS, DISTRIBUTION AND HABITAT. Resident. Southern peninsular India south of range of 245, and Ceylon (NW. coastal islands and Jaffna peninsula). Affects dry undulating plains and eroded plateau country with xerophytic thorn scrub, especially in the neighbourhood of villages and scattered cultivation of jowar, bajra, lentils and other dry-season crops.

Was introduced in the Andaman Islands in 1890 where it has since established itself in fair strength in the Port Blair neighbourhood.

GENERAL HABITS. Met with in pairs and family parties or coveys of 4 to 8 birds sauntering about with a jaunty upright carriage, digging and scratching the ground with bill and feet in fallow fields, pecking at cattle dung for food, or dust-bathing on cross-country earth tracks. On alarm the covey scurries off, running swiftly from bush to bush, surreptitiously squatting in ones and twos in different thickets. They are very fast on their legs and loth to take wing unless hard pressed. While individuals will rise with an explosive whirr of wings when approached, and scatter in different directions, others will keep dodging from bush to bush till out of danger. Flight swift with rapid beats of the short cambered wings alternated with spurts of gliding; seldom high up in the air except when breaking back over a line of beaters. After a short flight of 50 or 100 metres the bird alights, continuing to run immediately on touching down so that on approaching the bush wherein it apparently took cover the observer finds it mysteriously vanished, only to be seen running on a long way ahead. Roosts at night in pairs or

x c. 1

Extralimital. Southern Afghanistan, southern Iran, eastern Arabia (Muscat) (Peters).

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the nominate race (246). BREEDING. Season, March to May. Nest and eggs as in 246. Average size of 81 eggs 34.0 × 26.0 mm. (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. Chestnut in upperparts very pale, less in extent, confined chiefly to scapulars and wings. Throat-patch white or whitish; surrounding white spaces broader and whiter than in the other races. Breast only faintly tinged with ochraceous.

MEASUREMENTS. Wing ♂♂ 141-149; ♀♀ 137-139 mm. Bill (from feather) 19-23 mm. (Baker).

COLOURS OF BARE PARTS. As in 246, somewhat paler.

245. North Indian Grey Partridge. *Francolinus pondicerianus interpositus* Hartert

Francolinus pondicerianus interpositus Hartert, 1917, Novit. Zool. 24: 288 (Oudh) *Francolinus pondicerianus prepositus* Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 31 (Kotla, Kangra dist., Punjab)

Francolinus pondicerianus paganus Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 31 (Sihor, Saurashtra)

Francolinus pondicerianus tilar Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 31 (Ramanujanj, Surguja) Baker, FBI No. 1948, Vol. 5: 421

LOCAL NAMES. *Teetar*, *Rām teetar*, *Sāfed teetar*, *Gōra teetar* (Hindi); *Jirufti* (Punjab); *Khyr* (Bengal); *Tauzarai* (Pushtu).

SIZE AND FIELD CHARACTERS. As of 246, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. Eastern Sind, E. Punjab, Rajasthan and northern India east to Bihar and W. Bengal. From the Himalayan terai south to a line of what may be called 'subspecific or racial balance'—from Poona to Kakinada. Affects dry open grass and thorn-scrub country in the neighbourhood of villages and cultivation, up to c. 500 metres altitude.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the nominate race (246).

BREEDING. Season, chiefly March to September, but nests locally and sporadically in other months also. Nest and eggs as in 246. Baker gives average size of 90 eggs as 32.4 × 25.6 mm., therefore slightly smaller than that of *F. p. pondicerianus*!

MUSEUM DIAGNOSIS. See Key to the Subspecies. More grey less brown than the south Indian (nominate) race. Bars on upperparts very pale fulvous, almost white on scapulars and inner secondaries. Throat-patch creamy white rather than ochraceous. Lower parts paler; breast less rufous.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	144-160	23-29	36-45	80-94 mm.
♀♀	134-146	23-26	37-46	79-91 mm. (SA)

COLOURS OF BARE PARTS. As in 246.

family groups up in small thorny trees, or squatting on the ground within dense thorn bushes such as *Capparis* or *Zizyphus*. When flushed by a dog will often take refuge up in a thorny tree. When much harried will squat tight in a thicket and refuse to leave despite noisy shouts and stone-throwing. To escape a trained falcon SA has seen one dive into a thorn bush and refuse to budge even when bush set alight and itself all but roasted alive!

FOOD. Weed seeds, cereal grains, shoots of grass and crop plants, berries and drupes (e.g. *Lantana*, *Zizyphus jujuba* and *oenoplia*, and *Capparis aphylla*) and insects (e.g. grasshoppers, termites, maggots); on village outskirts commonly human excreta. Among unusual food items is recorded a snake (*Boiga trigonata*) c. 18.5 cm. long (Soman, 1962, JBNHS 59(2): 653). For seasonal analyses of crop contents of N. Indian birds see Faruqi, Bump, et al., 1960, JBNHS 57(2): 277-300. Can subsist for long periods without drinking where dew available. Often seen miles away from water without apparent need for commuting to it like sandgrouse.

VOICE AND CALLS. Commonest call of cock commences with two to four subdued clucks or chuckles rising in intensity, followed by a ringing, high-pitched, spirited challenge — *kāteetar kāteetar kāteetar* etc. quickly repeated. Normal call of female a high-pitched monosyllabic *tee tee* repeated several times; also a musical *kila kila kila* similar to one of the cock's calls but softer. A third, less challenging call also commonly heard — *katerla katerla katerla* — is evidently the combined duetting of a mated pair. Alarm call of both sexes: a very sharp high-pitched agitated *kirr . . . kirr . . . kirr* (i as in sit) characteristically uttered when bird flushed off nest or when leading small chicks. For details of the various calls see Himmatsinhji, 1959, JBNHS 56(3): 632-3.

BREEDING. Season, in the Peninsula more or less throughout the year, principally April to September; in Ceylon c. April to July. Nest, a scrape in the ground lined with grass and leaves, under a clod, tuft of grass or bush in a ploughed field or in open scrub jungle. Eggs, 4 to 8 or 9, broad ovals, pale buff in coloration. Average size of 100 eggs 34.5 × 26.1 mm. (Baker). Cock monogynous. Incubation solely by hen; period 18-19 days. Chicks tended by both parents. A brood observed attended by 3 adults (SA).

MUSEUM DIAGNOSIS. Throat-patch yellowish rufous v. creamy or whitish in the other two races. See Key to the Subspecies; for details of plumage Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	142-161	22-24	44-46	81-91 mm.
♀♀	142-146	21-23	41-42	(Baker)

Weight (subspecies ?) ♂♂ 9-12 oz. (c. 255-340 gm.); ♀♀ 7-11 oz. (c. 200-312 gm.)—Hume.

COLOURS OF BARE PARTS. Iris hazel-brown. Bill dusky plumbeous, paler and fleshy at base. Legs and feet dull red.

MISCELLANEOUS. Cocks very pugnacious and largely kept by fanciers as fighting birds. A strain reportedly found in Andhra (?) and known as 'Hyderabad teetar' is claimed to be considerably larger, heavier, and more robust than normal birds and most highly prized. Partridge fights are a popular sport in many parts of the country and large sums of money change

PHEASANTS, PARTRIDGES, QUAILS

33

hands on the bouts. When taken as chick and hand-reared, becomes exceedingly tame, following its master about like a dog, calling at his command, and coming over long distances when summoned.

Is hardy, adaptable, and a prolific breeder and has recently been introduced by the U.S.A. Department of the Interior, Fish and Wildlife Service as an exotic game bird into ecologically equivalent semi-desert areas of the southwestern States, where it bids fair to succeed. For details of the experiment see 'A Study and Review of the Black Francolin and the Gray Francolin' by Gardiner & Janet Bump. Special Scientific Report — Wildlife No. 81, 1964.

Illicit wholesale year-round netting and trapping for urban markets has decimated local Grey Partridge populations in many areas in recent years.

247. Swamp Partridge or Kyah. *Francolinus gularis* (Temminck)

Perdix gularis Temminck, 1815, Pig. et Gall. 3: 401, 731 (Vicinity of Calcutta)
Francolinus gularis ridibundus Koelz, 1954, Contrib. Inst. Regional Exploration,
No. 1: 31 (Kalnahi, U.P.)
Baker, FBI No. 1982, Vol. 5: 417
Plate 31, fig. 5

LOCAL NAMES. Kyah, Khyr, Kajjah (Bengal); Bhil titri (N. Bihar); Koi, Koi sorai, Koiira (Assam); Bheel tetar, Gul tetar (Cachar and Sylhet); Hoi koli (Plains Miri).

SIZE. Grey Partridge +; length c. 37 cm. (15 in.).

FIELD CHARACTERS. A large and conspicuously long-legged partridge. Above, crown and nape brown; supercilium and a broader band below eye through ear-coverts buff. Upperparts brown with rufous-brown patches; transversely barred with buff as in Grey Partridge. Tail largely chestnut with pale tips. Below, chin, throat and foreneck rusty red. Rest of underparts brown with broad white longitudinal streaks edged with black. Under tail-coverts pale rufous. Sexes alike, but male with a spur on each leg.

STATUS, DISTRIBUTION AND HABITAT. Resident. Terai and alluvial north Indian plains from W. Nepal and Uttar Pradesh through N. Bihar, W. Bengal and Assam, East Pakistan (Sylhet, Chittagong, Sunderbans (part)). Affects heavy kra and nal grass (*Arundo karka* Roxb.) jungle in low-lying swampy tracts subject to seasonal flooding adjacent to the larger rivers of the Ganges and Brahmaputra systems. Exceptionally found on the Cherrapunji plateau, c. 1200 m. altitude.

Owing to draining of the *chaurs* and swamps in many of its terai habitats, the species is becoming scarce where formerly abundant.

GENERAL HABITS. Keeps in pairs or coveys of 5 or 6 birds to swampy ground, wading about through mud and shallow water. Where water too deep for this, clammers up the reed stems like Purple Moorhen (*Porphyrio*) and makes its way thus to reach drier ground. Is a confirmed runner and difficult to flush except with elephant or line of beaters. Rises clumsily with a flutter and whirr, with loud chuckles and cackling, unlike other francolins, but flies swiftly and strongly. Roosts in thorny trees growing in swampy grass jungle and on brookdown reeds in flooded areas. Cocks very pugnacious; fighting like game cocks but using bills more than spurs. Many

PHEASANTS, PARTRIDGES, QUAILS

35

of 16 feathers in *P. hodgsoniae*, 18 in some other species. Tarsus strong, bare, without spur. Sexes alike.

The genus extends throughout the Palaearctic Region, only one species just entering our limits.

PERDIX HODGSONIAE (Hodgson)

Key to the Subspecies

Nuchal collar broad and dark chestnut in colour.....*P. h. hodgsoniae*
Nuchal collar narrow and of paler chestnut-yellow.....*P. h. caraganae*

248. Ladakh Partridge. *Perdix hodgsoniae caraganae* R. & A. Meinertzhagen

Perdix hodgsoniae caraganae R. & A. Meinertzhagen, 1926, Bull. Brit. Orn. Cl. 46: 86
(Shushal, 15,000 ft, Eastern Ladakh)
Baker, FBI No. 1988, Vol. 5: 425

LOCAL NAME. Chak pa (Ladakh).

SIZE AND FIELD CHARACTERS. As for 249, q.v.

STATUS, DISTRIBUTION AND HABITAT. Resident at high elevations, c. 4250–5200 metres. Ladakh (Pangkong Lake, Takhum, Puga, Shushal, Polakonka Pass), and Kumaon (near Gangotri). Affects Tibetan Gorse (*Caragana*) patches along the shores of Pangkong Lake and in most valleys of eastern Ladakh. Also similar facies in high Kumaon.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the nominate race, 249. 'Difficult to flush, but if driven to the end of the patch in which they live, they will sit close. When they rise they make very much the same noise as the English Partridge' (Meinertzhagen).

BREEDING. Meinertzhagen found a clutch of 11 fresh eggs near Shushal, c. 4575 m. on 13 June, and took oviduct eggs from specimens collected on 7th and 17th June.

MUSEUM DIAGNOSIS. See Key to the Subspecies. Generally paler than *P. h. hodgsoniae*, with the dark brown markings of upperparts replaced largely by chestnut markings.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 249.

249. Tibetan Partridge. *Perdix hodgsoniae hodgsoniae* (Hodgson)

Saefa Hodgsoniae Hodgson, 1857, Jour. Asiat. Soc. Bengal 25: 165 and pl. (Tibet)
Baker, FBI No. 1986, Vol. 5: 423
Plate 32, fig. 17

LOCAL NAMES. Saefa (E. Tibet); Rhakpa (C. Tibet); Che tra (Kongo Tibet); Rare uch (Nepal).

SIZE. Grey Partridge; length c. 31 cm. (12 in.).

FIELD CHARACTERS. A high-altitude partridge reminiscent of the familiar Grey of the plains. Above, head patterned with prominent white eyebrows running across chestnut forehead; chestnut ear-coverts with a black cheekpatch below. A dull chestnut collar at base and sides of hindneck.

34

GALLIFORMES

shot birds carry more or less heavy scars about neck and breast — evidence of encounters with rials.

FOOD. Omnivorous: weed seeds, grain, shoots of mustard, paddy and other crops, and insects. Baker found tiny shellfish in the crop of one. Feeds in and on the edge of marshes and neighbouring cultivation, particularly sugarcane fields. Comes out to feed in the open in the mornings and evenings in paddyfields, especially when the crop is ripening.

VOICE AND CALLS. 'A loud *kau-care*' (R. L. Fleming). 'An occasional loud *qua, qua, qua* ascending in tone' (A. E. Osmaston). 'A rather harsh *chuckeroo chuckeroo chuckeroo*' (Tickell), preceded by several chuckles and croaks as if bird clearing its throat in preparation. Pattern of crowing rather similar to that of Grey Partridge to which it seems more closely related than to Black. When calling stands very erect with neck upstretched.

BREEDING. Season, February to May — chiefly March and April. Nest, usually well-built pad of weeds and rank grass c. 5–10 cm. thick and c. 20–30 cm. across with a deepish hollow for the eggs. Placed a few centimetres above water or mud level on brookdown reeds etc. in dense undergrowth and cane brakes on partially submerged islets; occasionally on drier edges of swamps. Eggs, 4–5, or 6, shaped like other francolins', bright pale buff or stone colour with small reddish freckles and blotches all over, or chiefly at larger end. Average size of 48 eggs 39.4 × 30.0 mm. (Baker).

Cock believed to be monogynous. Incubation only by hen; period unrecorded.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick in down undescribed. When two months old 'got white arrow-shaped streaks bordered with brown on the breast, and the feathers of the back were barred and crossed with buff; also the throat became a pale rufous' (Ingis, of chicks hatched in captivity. JBNHS 28: 287).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	162–186	c. 21–23	c. 60–70	101–127 mm. (Baker)

Weight ♂ c. 18 oz. (510 gm.), ♀ somewhat less (Hume).

COLOURS OF BARE PARTS. Iris brown, crimson-brown or crimson; eyelids dull livid green or plumbeous-green. Bill black, horny white at tip. Legs and feet orange-yellow to dull red; redder in male, and brighter in both sexes in breeding season. Male with short blunt spurs; female sometimes with rudimentary ones.

MISCELLANEOUS. Much favoured as a fighting bird in parts of Assam, large sums of money being wagered on mains between champion cocks. Many fighting birds hand-reared from eggs incubated and hatched in a cloth tied round human owner's body for the necessary warmth and kept so day and night throughout the incubation period, a practice now apparently dying out.

Genus PERDIX Brisson

Perdix Brisson, 1760, Orn. 1: 26, 219. Type, by tautonymy, *Perdix cinerea* Brisson = *Tetrao perdix* Linnaeus

Wing rounded: first primary (as.) between 7th and 8th in length, 4th primary usually longest. Tail very slightly graduated, rather more than half length of wing;

36

GALLIFORMES

Upperparts buffy grey barred with blackish on upper back, vermiculated on lower. Lateral tail-feathers largely chestnut. Below, underparts white, unmarked on chin and throat, barred with black on breast, more broadly with chestnut-brown on flanks. Lower abdomen and under tail-coverts buff. Scapulars, tertiaries, and wing-coverts narrowly streaked and barred with buff. Sexes alike.

Young (immature). Above, without any blue-grey tinge, and chestnut absent everywhere. Crown, cheeks and ear-coverts dark brown with white apical spots. Below, dull earthy buff with pale striations and indefinite narrow blackish bars.

STATUS, DISTRIBUTION AND HABITAT. Just crosses the Tibetan border into northernmost west-central and central Nepal, and Sikkim; possibly also in the NEFA area. Locally not uncommon; in summer between c. 3600 and 5600 m. altitude, in winter generally below 4000 m. but rarely as low as 2800 m. Affects typical Tibetan plateau country and rocky hillsides with scattered furze bushes (*Caragana spinosa*) and dwarf juniper and rhododendron scrub. Found in grass and bush cover about crops and yak pastures in the Tsangpo valley.

Extralimital. Adjoining portions of the Tibetan plateau.

GENERAL HABITS. Keeps in coveys of 10 to 15 birds. Usually not very wild; reluctant to fly, trusting to its legs for escape. Coveys 'explode' with a whirr of wings when flushed, the birds scattering in ones and twos in different directions, shrilling and gliding downhill like chukor whenever they have the choice. The coveys break up into pairs for breeding in March/April.

FOOD. Seeds, shoots, roots of moss (?), and presumably insects.

VOICE AND CALLS. Normal call, uttered mostly in the mornings and evenings, a rattling *Scherrreck* — *scherrreck* etc. (Schäfer). When flushed and going off a shrill *chee, chee, chee, chee, chee* (Fleming), presumably the same as has been described by Bailey as exactly like the creaking of the lid of a (wicker) lunch basket.

BREEDING. Within our limits apparently recorded only in Ladakh (*caraganae*). Season, May to July. Nest, a scrape in the ground under a boulder or bush, lined with grass; about 20–22 cm. in diameter and hardly large enough to hold a full clutch. Eggs, normally 8 to 10 (rarely up to 14); long ovals — proportionately longer than any francolin's — dark brownish buff sometimes tinged with olive. Average size of 150 eggs 37.6 × 27.2 mm. (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies; for details of plumage, Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	155–165	c. 15–17	c. 40–43	c. 86–91 mm. (Baker)
♀ ♀	149–155 (Kinnear)			

Weight c. 1 lb. (c. 450 gm.) — Hodgson.

COLOURS OF BARE PARTS. Iris brown or red-brown; orbital skin deep velvety crimson in breeding season, dull reddish crimson at other times. Bill pale horny green. Legs and feet pale greenish brown.

Genus *Coturnix* Bonaparte

Coturnix Bonaparte, 1791, Tabl. Encycl. Méth. Orn., pt. 1: 87, 216.

Type, by tautonymy, 'Caille' = *Tetrao coturnix* Linnaeus

Exallfactoria Bonaparte, 1856, Compt. Rend. Acad. Sci. Paris 42: 881. Type, by tautonymy, *Tetrao chinensis* Linnaeus (*Coturnix exallfactoria* Temminck in synonymy) Small partridge-like birds with short and rounded to comparatively long and pointed wings correlated with sedentary or migratory habit. Tail short, of 8 to 12 soft feathers. Bill small and slender. Tarsus strong, of moderate length, unspurred. Toes 4 contra 3 in *Turnix* (Button Quails). Sexes differing slightly in coloration; in one Indian species markedly so.

The genus occurs in the Palearctic, Ethiopian, Oriental, and Australasian Regions. Three species in India, one chiefly migratory, two more or less sedentary.

Baker, FBI No. 1950, Vol. 5: 372

Plate 32, fig. 6

LOCAL NAMES. *Baltr*, *Bādā baltr*, *Ghāgus baltr* (Hindi); *Baltr*, *Balra* (Sind); *Kurak*, *Srapok* (Baluchistan); *Bhatri* (Bengal); *Gundri* (Orissa); *Daobui kashiba* (Cachar); *Bota sorāi* (Assam); *Soibol* or *Sorbol* (Manipur); *Lovca*, *Bādā ganga*, *Gurganj* (locally in Maharashtra); *Barli*, *Sipale hākki* (Mysore); *Gogari yelichi* (Telugu); *Kāta* (Malayalam).

SIZE. Partridge —; length c. 20 cm. (8 in.).

FIELD CHARACTERS. A plump and squat pale brown partridge-like bird with conspicuous buff spear-shaped streaks and irregular mottling and barring of reddish brown and black above in both sexes.

Male. *Below*. Chin and a line down centre of throat black. Two dark bands (sometimes indistinct) curving up from base of throat to ear-coverts. Breast rufous-buff with glistening pale buff shaft-streaks; flanks brown longitudinally streaked with black; rest of underparts creamy white.

Female. *Below*. Chin and throat creamy buff; breast spotted with blackish.

Young (immature). Like female; somewhat duller.

hill (c. 2300 metres) near Mussooree (U.P.) on a moonlit night in April, the birds sweeping close over his head with the sound of rushing wind, uttering their unmistakable call.

GENERAL HABITS. Usually keeps in pairs, not coveys like Bush Quail, but numbers may concentrate in a patch where feeding is good. Thus in NW. Pakistan and Kashmir, particularly in spring when most crops have been harvested and only a few are still standing, hundreds may be put up from a single field by walking through. When flushed, the bird rises almost vertically for a few feet with the typically partridge whirl of wings and a squeaky whistling note flying low on rapidly vibrating wings straight and fast for a couple of hundred metres before dropping into the crops again. A peculiarity repeatedly observed, and cashed in on by experienced sportsmen, is that when two birds a few metres apart rise more or less simultaneously and are flying away in the same direction, sooner or later one will try to cut across the other. If fire is withheld till the right moment it is often possible to secure both birds with the same shot (*experio credo*).

Large bags are made in NW. India (e.g. Punjab) at the appropriate seasons by walking the fields with a line of beaters. Fifty couple in a morning to a single gun is nothing exceptional especially where the birds have been previously decoyed into the neighbouring fields with the aid of a caged call-bird, as is frequently done.

FOOD. Paddy, millets, and other grain, grass- and weed seeds, and insects — ants, caterpillars, beetles, aphids, etc. Grubs of *Hypera variabilis* have been identified in stomach contents (Husain & Bhalla, 1937, JBNHS 39: 841).

VOICE AND CALLS. A loud clear whistling note followed rapidly by two short ones, popularly described as 'a very liquid *Wet-mi-lips*'. Uttered chiefly in the morning and evening, and sometimes also during the night. A squeaky whistle when flushed.

BREEDING. *Season*, in India overall March to July varying with locality; most commonly March and April. *Nest*, a scrape in the ground practically without lining; sometimes lined with scanty leaves and grass. Usually well concealed in standing crops or grassland. *Eggs*, 6 to 11 and even 13, but usually 6 to 8. Variable in colour, from yellowish buff to deep yellowish brown or reddish brown, speckled and blotched with some shade of dark or chestnut-brown. Average size of 100 Indian eggs 29.7 × 22.8 mm. (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. For description of plumage Baker, loc. cit.; for more details Witherby, 1941, 5: 252-4.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	110-115	14-16	c. 26-27	31-38 mm.
♀♀	107-116	14-16	26-30	36-44 mm. (SA, HW)

Wing ♂♀ 100-117 mm. (Baker).

Weight ♂♀ 3.60-4.60 oz. (c. 86-120 gm.).

COLORS OF BARE PARTS. Iris bright hazel to deep brown. Bill bluish, greyish, or brownish horny darker on tip and culmen. Legs and feet pale fleshy to fleshy brown.

STATUS, DISTRIBUTION and HABITAT. Partly resident, partly winter visitor. Breeds in both Pakistans, Kashmir (up to c. 2500 m. alt.) east through Bihar and W. Bengal, south at least to Madhya Pradesh (Hoshangabad) and southern Maharashtra (Satara). Breeding in Manipur, *vide* Baker, not confirmed. Birds collected there in winter are intergrades with *C. c. japonica* (Higgins, JBNHS 37: 299). Strongly augmented by influx of migrants from outside in winter and then spreads out over our entire area south to Kanyakumari. Very abundant locally, but numbers variable year to year. In great numbers in Nepal Valley mid October to mid December (Scully). Affects standing crops (e.g. cotton, young wheat, gram, millets, lucerne), paddy stubbles, and grassland, chiefly in flat and undulating country.

Extralimital. 'Breeds in Europe from lat. 65°N. south to the islands in the Mediterranean Sea, and in N. Africa. In W. Asia east to Lake Baikal, from lat. 61°N., south to Asia Minor, Persia, Afghanistan and India to the Deccan. Winters in northern tropical Africa to Senegal, Lake Chad and Somaliland, in Arabia, and the plains of India' (Peters).

Coturnix coturnix

Black numerals = Winter
1 *C. c. coturnix* (250). 2 *C. c. japonica* (251).

MIGRATION. No ringing data. Recorded observations indicate that passage, both inward and outward, takes place through northwest Pakistan (Chitral, Peshawar, Kohat, Kurram, etc.) in autumn (September-October; even end August) and spring (end of March to early May). Evidently this is the main through migration route, the birds dispersing east and south in the Peninsula after arrival, and concentrating in the northwest again for return migration in astonishingly large numbers. They travel during the night in successive flocks of 30 to 40 or 100 or in enormous swarms of many thousand strong. One such was observed by Hume standing on top of Benog

MISCELLANEOUS. Highly relished as a delicacy throughout its overall range, and hundreds of thousands, or millions, netted and shot for food year after year all along the migration routes since early historical times. That the world population does not show any marked decline notwithstanding is an indication of the bird's extraordinary fecundity and resilience to predation pressure.

Quail are also very extensively netted for the market particularly in parts of W. Pakistan and northwestern India although in some states commercial netting is now prohibited by law. The birds are kept alive in darkened underground pits for fattening and served up as required. In Hume's day, i.e. in the last quarter of the 19th century, quails were available at Re. 1 to Rs. 2.50 per hundred, and even until before the last war (1938) 16 to 24 to the rupee was quite a fair price.

Much prized in W. Pakistan and N. India as a fighting bird. Large prices are paid for champion cocks and considerable wagers are won and lost on the mains. As part of the conditioning and training the owner constantly carries his bird about in one hand and dances it on the palm of the other, the bend-stretch of the legs being believed to strengthen them for the bouts.

251. Japanese Grey Quail. *Coturnix coturnix japonica* Temminck & Schlegel

Coturnix vulgaris japonica Temminck & Schlegel, 1849, in Siebold, Fauna Jap., Aves: 103, pl. 61 (Japan)

Baker, FBI No. 1951, Vol. 5: 374

LOCAL NAMES. *Sorbol* (Manipur); *Bota sorāi* (Assam).

SIZE and FIELD CHARACTERS. As of 250; not distinguishable from it unless in the hand. (See Museum Diagnosis.)

STATUS, DISTRIBUTION and HABITAT. Winter visitor in small numbers to Assam south of Brahmaputra river. Birds collected in Manipur in winter are intergrades with the nominate race.

Extralimital. Breeds in Sakhalin and the Japanese islands. In winter to S. China, Siam, Indochina, Formosa, Hainan (Peters).

MIGRATION. No data.

HABITS and FOOD. Nothing specifically recorded as different from 250. VOICE and CALLS. According to Przevalsky the Japanese race easily distinguished from nominate (250) by its voice. Call notes of male in spring described as consisting of 'some deep hollow sounds, several times repeated in quick succession'. This call does not appear to be known in the Grey Quail unless it be the same as the 'faint *gurr-gurr-gurr*', not unlike the purring of a cat' quoted from Naumann in Witherby (5: 251), which is apparently only a subdued and secondary call.

BREEDING. Extralimital; not different from 250.

MUSEUM DIAGNOSIS. Male differs from male of nominate *coturnix* in having no black on chin and throat and no upcurving black bands. These parts and sides of head light brick-red. Upperparts more brightly coloured than in 250. Elongated winter feathers of malar region and throat replaced in spring (breeding plumage) by rounded short red feathers.

PHEASANTS, PARTRIDGES, QUAILS 41

Female also has feathers of cheeks and chin long and pointed forming a regular little beard in winter. In spring difficult to distinguish from female *C. c. cornix*. For details of plumage see Hartert, 1921-2: 1943.

MEASUREMENTS. Wing ad. ♂ 98-102; ♀ 100-106 mm. (Hartert).

COLOURS OF BARE PARTS. As in 250.

MISCELLANEOUS. Has been domesticated in Japan as a table delicacy, for its meat and eggs, within the last 50 years or so by selection from quails formerly kept for song. Quail-breeding is now a flourishing minor industry. The birds are kept perpetually under artificial light like battery hens, and with special feeding and care, good females lay from 250 to 300 eggs per year. They begin to lay when only 35-60 days old, and continue non-stop for 8-12 months thereafter. For details and techniques see Yoshimaro Yamashina, 1961, JBNHS 58(1): 216-22.

252. **Blackbreasted or Rain Quail.** *Coturnix coromandelica* (Gmelin)

Tetrao coromandelicus Gmelin, 1789, Syst. Nat. 1(2): 764 (Coromandel Coast)

Baker, FBI No. 1952, Vol. 5: 375

Plate 32, fig. 8

LOCAL NAMES. *China bātēr* (N. India); *Chinagā bātēr* (Gujarat); *Chānak* (Nepal); *Kādai* (Tamil); *Chinna yellichē* (Telugu); *Pun watuwā*, *Wil watuwā* (Sinhala); *Kāta* (Malayalam). Generally not distinguished from Grey Quail except by professional netters.

SIZE. Grey Quail —; length c. 18 cm. (7 in.).

FIELD CHARACTERS. Very similar to Grey Quail (250) q.v., but smaller. Male with dark marks on face and throat more jet-black contrasting strongly with white cheeks. Upper breast black (sometimes also centre of abdomen). Flanks boldly black streaked.

Female indistinguishable from female 250 except on smaller size. For identification in the hand see Key to the Species.

STATUS, DISTRIBUTION and HABITAT. More or less restricted to the Indian subregion. Resident and nomadic or locally migratory during SW. monsoon, spreading out widely over otherwise parched areas with availability of grass cover and food. Practically all India and both Pakistans. Chiefly plains, but also peninsular hills and up to c. 2000 m. in the Himalayas. Occasional winter visitor to Ceylon. Affects grass-and-scrub jungle, open moist grassland, standing crops, and paddy stubbles, etc.

Extralimital. Burma, including the Shan States.

GENERAL HABITS. Keeps singly or in scattered pairs — only rarely 5-8 together — and nowhere found in such large concentrations as Grey Quail in spring and autumn though local populations, e.g. in south India, tend to swell somewhat by seasonal influx from other areas. Exact nature and extent of such movements unknown. Habits and food similar to those of Grey Quail; is more partial to grass seeds and millet.

VOICE and CALLS. Distinct, and unmistakable for that of 250 — a double-noted musical *which-which*, *which-which*, etc. repeated every half-second or so in runs of 3 to 5 calls. Uttered by male chiefly in early mornings and late evenings, but throughout the day in cloudy overcast weather; also

PHEASANTS, PARTRIDGES, QUAILS 43

Young male with no blue along forehead. Underparts duller slaty blue, barred with black on sides of head and neck. Chestnut of abdomen restricted to centre, or wanting.

STATUS, DISTRIBUTION and HABITAT. Resident; widely but sparsely and patchily distributed, in small numbers. Evidently with some nomadic movements dependent on rainfall; described in some areas as monsoon visitor. Occurs roughly east and south of a line from Bombay to Simla. Commoner on the eastern side of the subcontinent, viz. N. Orissa, Bihar, W. Bengal, E. Pakistan — perhaps commonest in Assam and Manipur. Baker's statement that it is a common breeding bird in Kerala ('Travancore and the Malabar coast') to Bombay is certainly not true today. Plentiful in Ceylon (lowlands and hills to c. 1800 metres up). Chiefly plains, but in suitable facies also up to c. 2000 m. in the S. Indian hills. Affects swampy grassland and grazing grounds at the end of the rains, and occasionally snipe marshes. Also heavy grass along roadsides, in secondary scrub on abandoned cultivation, on the edges of paddyfields, and in tea gardens at the foot of the hills in Assam.

Extralimital. East to SE. China and south through the Malay Peninsula, Siam, and Indochina; Hainan and Formosa. Introduced into Mauritius and Réunion (Peters).

MIGRATION. No definite data.

GENERAL HABITS. More partial to wetter terrain than any other quail. Keeps in pairs or small family parties. Usually flushes singly dropping into the grass after a short flight and difficult to put up a second time without a dog. Believed to have a strong scent: 'My spaniel always used to get very keen when they were about' (Cyril Hopwood, Burma).

FOOD. Chiefly grass seeds and millets; also small insects especially termites.

VOICE and CALLS. A soft *tir-tir-tir* when flushed. In Malaya another call, not often heard, described as 'a weak peeping whistle not unlike the call of the Great Eared Nightjar (*Eurostopodus*)', also reminiscent of one of the Plaintive Cuckoo (*Cacomantis*)' — G. C. Madoc. 'Cock occasionally utters a tiny crow resembling a miniature imitation of the brain-fever bird's note' (F. Finn).

BREEDING. Season indefinite, and variable in different areas: in Assam principally June to August; in S. India March-April; in Ceylon recorded as May, August-September, and December-January. Nest, a natural hollow or scrape in the ground lined sparsely with leaves and grass, or without lining, placed in a clump of short grass close to thicker cover. Eggs, 4 to 8, normally 5 to 7, glossy broad ovals usually well pointed at the small end; pale grey or green drab, pale olive-yellow or olive-clay colour to rich sienna brown. Many finely but sparsely stippled and speckled with black all over. Average size of 100 eggs 24.5 × 19.0 mm. (Baker). Cock evidently monogynous. Incubation by hen alone; period c. 16 days. Both parents tend the young.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for subspecies see Key.

Chick (in down). 'The whole body and head, above and below, brown with the following exceptions which are buff: coronal streak and a streak on either side of

42 GALLIFORMES

sporadically during moonlit nights in the breeding season. A short squeaky whistling note when flushed.

BREEDING. Season, overall March to October, straggling into December, varying with locality and moisture conditions. Nest and eggs similar to those of Grey Quail, the latter merely smaller. Average size of 150 eggs 27.4 × 20.8 mm. (Baker). Cock monogynous. Only the hen incubates; period 18-19 days. Both parents tend young.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	93-96	12-14	23-26	29-32 mm.
♀♀	90-97	12-14	23-27	28-31 mm. (SA, HW)

Baker gives Wing ♂♀ 83-92 mm.

Weight ♂♀ 2.2-3 oz. (c. 64-85 gm.) — Hume.

COLOURS OF BARE PARTS. Iris hazel to deep brown. Bill black (breeding) or horny black, paler at base (non-breeding and immature). Legs and feet fleshy or fleshy grey (more pink in breeding season).

MISCELLANEOUS. Cock rated by some as a better fighting bird than the larger Grey Quail.

COTURNIX CHINENSIS (Linnaeus)

Key to the Subspecies

Paler; back of male not suffused with blue-grey and having pale shaft-stripes *C. c. chinensis*

Darker; back of male suffused with blue-grey and having no pale shaft-stripes *C. c. trinkutensis*

253. **Bluebreasted Quail.** *Coturnix chinensis chinensis* (Linnaeus)

Tetrao chinensis Linnaeus, 1766, Syst. Nat., ed. 12, 1: 277 (China and the Philippines = Nanking, China, ex Edwards)

Baker, FBI No. 1948, Vol. 5: 369

Plate 32, fig. 4

LOCAL NAMES. *Khair butai*, *Kanli* (Nepal); *Gobal butai* (Oudh); *Gurru* (Bengal); *Daobui majungbi* (Cachar); *Sorbol* (Manipur); *Pandara wutuwā* (Sinhala).

SIZE. Grey Quail —; c. 14 cm. (5½ in.).

FIELD CHARACTERS. A diminutive dark quail with bright yellow legs and the sexes very differently coloured.

Male. Above, forehead, supercilium and sides of neck slaty blue, Rest of upperparts brown as in Grey Quail, streaked, mottled, and barred with buff, reddish brown and black. Below, throat and upper breast with bold black and white marking of Grey Quail pattern. Lower breast and flanks slaty blue; abdomen and under tail-coverts rich chestnut.

Female. Like female Grey Quail but breast and flanks barred with blackish instead of being longitudinally streaked.

44 GALLIFORMES

the crown; tips of the wings, sides of the head, chin and throat. The brown of the underparts is rather paler than that above, and is somewhat dusty in tint' (Baker).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	65-78	10-11	20-22	c. 25 mm.
♀♀	66-67	—	—	— (Baker)

Weight 1½ to 2 oz. (c. 43-57 gm.). 1 ♀ (Ceylon) 36 gm. — SDR.

COLOURS OF BARE PARTS. Iris ♂ bright vermilion-red to deep crimson, rarely a bright vinous pink; ♀ brown. Bill black, the edge, gape, and gonys slaty. Legs and feet bright yellow, soles paler; claws brownish.

MISCELLANEOUS. 'Far superior to Grey Quail as a table delicacy' (J. C. Higgins, Manipur).

254. **Nicobar Bluebreasted Quail.** *Coturnix chinensis trinkutensis* (Richmond)

Excalfactoria trinkutensis Richmond, 1902, Proc. U.S. Nat. Mus. 25: 310 (Trinkut Island, Nicobar group)

Baker, FBI No. 1949, Vol. 5: 371

LOCAL NAME. *Mul* (Car Nicobar).

SIZE and FIELD CHARACTERS. As of the nominate race (253), q.v., but see Key to the Subspecies.

STATUS, DISTRIBUTION and HABITAT. Resident. The Nicobar group of islands: Car Nicobar, Trinkut, Camorta. Possibly also others not yet explored.

GENERAL HABITS, FOOD, VOICE, etc. Nothing specifically recorded as different from 253.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Male. Adult differs from *C. c. chinensis* in being much darker generally. Back suffused with the slaty blue of the breast, and the pale shaft-streaks absent or obsolete.

Female darker and more richly coloured than in 253. Ground colour of upperparts grey rather than brown. Underparts completely barred.

MEASUREMENTS. ♂♀ Wing c. 70; bill (from feathers) c. 10 mm.

COLOURS OF BARE PARTS. As in 253.

Genus PERDICULA Hodgson

Pardicula Hodgson, 1837, Bengal Sport. Mag. 9: 344. Type, by original designation, *Pardicula rubicola* Hodgson = *Perdix asiatica* Latham

Cryptoplectron Streubel, 1842, in Ersch & Gruber, Allg. Encycl., sect. 3, 16: 291.

Type, by monotypy, *Coturnix erythrophyna* Sykes

In many respects closer to Partridges than Quails though of small size like latter. Bill short and thick; culmen very convex. Wing short, rounded: first primary (as.) equal to 8th; fourth primary longest. Tail of 12 feathers, of about half length of wing. Tarsus as long as middle toe with claw and armed with a short blunt spur.

Genus peculiar to the Indian subregion.

PHEASANTS, PARTRIDGES, QUAILS 45

Key to the Species		Page
A	First primary equals eighth	1
B	First primary equals tenth	2
1	Inner webs of primaries brown throughout	45

	Upper surface slaty grey with black bars and spots	53

PERDICULA ASIATICA (Latham)

Key to the Subspecies

A	Upperparts brown blotched with blackish; buffy shaft-streaks of scapulars contrasting with rest of plumage	45
B	Upperparts darker; buffy shaft-streaks of scapulars reduced in extent so that these parts do not contrast so strongly with the rest of the plumage	48
C	Upperparts paler, more sandy brown	47
D	Upperparts with deep reddish tint	48
E	Upperparts paler than A with no reddish tint; chin and throat dark chocolate-brown (contra chestnut)	341

255. Jungle Bush Quail. *Pardicula asiatica asiatica* (Latham)

Pardicula asiatica Latham, 1790, Index Orn. 2: 649 (Maharatta region, India)
Baker, FBI No. 1953, Vol. 5: 377

Plate 32, fig. 11

LOCAL NAMES. *Louwa* (Hindi); *Vana laura* (Gujarat); *Juhar* (Manbhum); *Auriconnai* (Santal); *Girza pitta* (Telugu); *Kari louwa* (Kannada); *Vari kada* (Malayalam).

SIZE. Grey Quail —; c. 17 cm. (6½ in.).

FIELD CHARACTERS. A squat and plump little partridge-like bird.

Male. Above fulvous-brown, streaked and mottled with black and buff. A prominent buff-and-chestnut supercilium stripe from forehead and down sides of neck. Below white, closely barred with black. Chin and throat bright chestnut.

Female. Above like male. Below, pale pinkish rufous with bright chestnut throat-patch as in male. (See also Museum Diagnosis.)

Young (immature). Paler; less rufous more brown overall and finely streaked above and below with creamy white.

STATUS, DISTRIBUTION AND HABITAT. Resident. Gujarat (excepting Kutch), Maharashtra (excepting S. Konkan), Madhya Pradesh, Bihar, Orissa, Andhra, Madras, Mysore. Boundaries between the races not properly worked out. Plains and up to c. 1250 metres in the hills especially around terraced cultivation. Affects grass-and-scrub jungle and open secondary forest in deciduous biotope, seldom entering standing crops.

The species absent in Sind, W. Rajasthan, E. Pakistan, and Assam.

GENERAL HABITS. Keeps in coveys of 6 to 20. When resting in daytime or roosting at night the birds form themselves into 'squares', squatting

PHEASANTS, PARTRIDGES, QUAILS 47

Weight 2-2.85 oz. (c. 57-82 gm.) — Hume.

COLOURS OF BARE PARTS. Iris light to orange-brown. Bill horny- or slaty black, greyer on lower mandible and base of commissure. Legs and feet dull yellowish or dusky orange; claws brownish flesh colour.

256. Punjab Jungle Bush Quail. *Pardicula asiatica punjaubi* Whistler

Pardicula asiatica punjaubi Whistler, 1939, Bull. Brit. Orn. Cl. 59: 76 (Ambala, Punjab)
Baker, FBI No. 1953 (part), Vol. 5: 377

LOCAL NAME. *Louwa* (Hindi).

SIZE AND FIELD CHARACTERS. As of 255, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. Kashmir, Punjab, Himachal Pradesh, Uttar Pradesh. Plains and up to c. 1200 metres elevation. Affects dry scrub-and-bush country.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of 255.

BREEDING. Season, mainly August through October. Nest and eggs as in 255.

MUSEUM DIAGNOSIS. Differs from the nominate race (255) in its markedly paler coloration. Male (adult). Above, paler, more sandy brown with conspicuous pale barring on rump, upper tail-coverts, and tail. Dark blotching on scapulars and tertiaries less extensive and conspicuous. Below, black bars, as a rule, narrower and so not appearing quite so black.

Female (adult). Upper plumage similarly paler; the dark blotching of the scapulars and tertiaries less extensive.

First-winter birds and even the juveniles are similarly paler.

Chick (in down). From base of bill over crown, down centre of back to tail, a broad chestnut band edged on each side with dark brown; outside this from base of bill a broad ochraceous supra-orbital stripe reaching nape and surmounting a narrow dark brown supercilium stripe; ear-coverts and a short moustachial streak dark brown. Rest of upperparts dappled rusty brown and light brown; underparts ochraceous-grey (Tiechurst).

Young (immature). Sexes alike. A broad band down the centre of the crown brown, edged with blackish brown; a broad fulvous-white supercilium from the lores to the posterior edge of the ear-coverts; cheeks and ear-coverts dark brown with whitish shaft-streaks. Upper plumage warm sandy brown, the feathers of the hind-neck, upper back and wing-coverts with conspicuous fulvous shaft-streaks and broken blackish bars, the shaft-streaks becoming broader on the scapulars and the bars becoming black patches on their inner webs. Primaries dark brown mottled and streaked with sandy fulvous; secondaries, tertiaries, and tail warm sandy brown with fulvous shafts and mottled, speckled and barred with fulvous and blackish brown. Lower plumage vinous buff, the chin, throat and breast with shining white shaft-streaks.

This juvenile plumage seems to be moulted rather gradually during the first winter, giving place to the respective adult male and female plumages. As in other game birds the outer two or three juvenile primaries, more pointed in character than those that will succeed them, are apparently retained to the first post-nuptial moult, but they are not always easy to recognize (Whistler).

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 255.

46 GALLIFORMES

bunched together under a bush all facing outward. The covey suddenly 'explodes', rising with a great whirr of wings when almost trodden upon and dispersing in all directions. These explosions are apt to prove disconcerting when one is tensely tracking dangerous game such as a wounded tiger in forest! The birds drop in the undergrowth after a short flight, and the covey soon re-unites with the aid of the soft whistling rally calls. The coveys troop down to drink in the mornings and evenings in more or less single file, and shift from one feeding ground to another in like manner, using the same little paths or tunnels formed in the matted and bent-over grass day after day. Cocks pugnacious in breeding season.

As a game bird it usually forms a minor but useful supplement to the small game shooter's mixed bag. Though not difficult to bring down with a shotgun they can account for an unwarranted number of misses by the fluster they cause by exploding when least expected, and the failure of the sportsman to fix his eye on one bird at a time when so many are simultaneously scurrying off in different directions. To those familiar with the American Bobwhite Quail this habit will be very reminiscent.

FOOD. Grass- and weed seeds, bajra and other millets, lentils (moong), and small insects especially termites. A quantity of grit usually found in stomachs. Sometimes springs up a couple of inches to pluck grass or millet seeds from a growing culm, a number of birds together thus engaged presenting a comical sight.

VOICE AND CALLS. Rallying call when a covey has got scattered: a soft musical whistling *whi-whi-whi-whi* etc. by members from different directions. In breeding season cocks constantly challenge with harsh grating notes as of drongos 'arguing' at the onset of their breeding season: *chee-chee-chuck, chee-chee-chuck*, etc.

BREEDING. Season, not well defined; ranges between August and April. Nest, a shallow scrape in the ground lined with grass, at the base of a grass tussock in scrub jungle. Eggs, 4-8 creamy white. Average size of 140 eggs (mixed races and possibly also including eggs of *P. argoondah*) 25.4 x 19.5 mm. (Baker). Cock believed to be monogynous. Hen only incubates; period 16-18 days.

MUSEUM DIAGNOSIS. This (nominate) race is a dark, blackish-looking bird quite clearly differentiated from the red birds (*vidali*) found below the Western Ghats in South Konkan, as well as from the grey or sandy coloured bird (*punjaubi*) found in other parts of the Indian range of the species.

Some adult females have a faint indication of black and white barring on lower throat and breast. This is not to be confused with the truly black-and-white feathers found irregularly on juvenile males which have moulted some of their juvenile feathers.

For description of chick in down and juvenile plumage see under *P. a. punjaubi*. Comparative stages of *P. a. asiatica* differ from it only in being a darker, blackish brown in tone, emphasizing the subspecific difference between it and *punjaubi*.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂ (ad.)	81-88	13-17	24-30	34-41 mm.
♀♀ (ad.)	80-88	13-16	23-31	32-41 mm. (SA, HW)

48 GALLIFORMES

257. Konkan Jungle Bush Quail. *Pardicula asiatica vidali* Whistler & Kinnear

Pardicula asiatica vidali Whistler & Kinnear, 1936, Jour. Bom. nat. Hist. Soc. 38: 686 (Kelsi, South Konkan)
Baker, FBI No. 1953 (part), Vol. 5: 377

LOCAL NAME. *Louwa* (Marathi).

SIZE AND FIELD CHARACTERS. As of 255, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. Malabar coast from about Bombay south to Mallapuram (Malabar dist., Kerala) and Kodaikanal, Palni Hills. Plains and up to c. 1500 m. elevation. Affects dry scrub-and-bush country. Race in S. Kerala needs confirming. Exact boundaries between the races not properly worked out.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of 255.

BREEDING. Season not well defined. Practically all months; perhaps more concentrated between July and February. Nest and eggs as in 255.

MUSEUM DIAGNOSIS. Both adult and immature birds differ from the nominate race (255) in the deep reddish tinge of the whole upper plumage, which is even more particularly marked on the crown. In adult males, moreover, the black barring of the lower plumage is broader than in nominate *asiatica*.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 255.

257a. Tamil Nadu Jungle Bush Quail. *P. a. vellorri**

258. Ceylon Jungle Bush Quail. *Pardicula asiatica ceylonensis* Whistler & Kinnear

Pardicula asiatica ceylonensis Whistler & Kinnear, 1936, Jour. Bom. nat. Hist. Soc. 38: 686 (Cocoawatte, Ceylon)
Baker, FBI No. 1953 (part), Vol. 5: 377

LOCAL NAMES. *Pandara waturu*, *W'il waturu* (Sinhala); *Kudai* (Tamil).

SIZE AND FIELD CHARACTERS. As of 255, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Endemic. Resident in the low-country Dry zone. Fairly plentiful in a small area of grassy jungle country to SE. of the Uva hills, bounded roughly by the Mahaweli-ganga to the NE., the foothills of the Uva ranges and the Kumbukkan river in the SW. Occasional in the low hills round Passara (Phillips).

GENERAL HABITS, FOOD, VOICE AND CALLS. As of 255.

BREEDING. Season, 'about March and April' (Phillips). Nest and eggs as in 255.

MUSEUM DIAGNOSIS. Upper plumage of both sexes much darker throughout than in the nominate race (255); the black blotching and pale shaft-streaks of the scapulars reduced in extent so that these parts do not contrast so strongly with the rest of the plumage. The chestnut throat-patch is also far darker than in *P. a. asiatica*.

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 255.

259. **Rajasthan Rock Bush Quail.** *Perdica argoondah meinertzhageni* Whistler*Perdica argoondah meinertzhageni* Whistler, 1937, Bull. Brit. Orn. Cl. 58: 19 (Nasirabad, Rajputana)

Baker, FBI No. 1954 (part), Vol. 5: 379

LOCAL NAME. *Louwa* (Hindi).

SIZE AND FIELD CHARACTERS. As of 260, q.v. See Key to the Subspecies, and Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. From Hariana (SE. Punjab) and Uttar Pradesh across Rajasthan and N. Gujarat to Kutch and Saurashtra, and east to western and northern Madhya Pradesh. Affects stony, sparsely thorn-scrubbed country in semi-desert facies.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of 260.

BREEDING. Season extends practically throughout the year but more general between September/October and January/February. Nest and eggs as in 260. MUSEUM DIAGNOSIS. Differs from the nominate race (260) in being much paler in coloration. The barring on the lower plumage of the male is less heavy in appearance, as the black bars are individually narrower.

Chick (in down): Crown and nape brown, barred with black, the feathers of the forecrown with pale shafts; supercilium extending beyond ear-coverts pale creamy fulvous; ear-coverts and cheeks mixed buffy brown and dark brown. Remainder of upper plumage earthy brown the feathers speckled and broadly barred with black, and with fulvous shaft-streaks, these markings becoming obsolescent on the rump and upper tail-coverts. Primaries, secondaries, tertiaries and tail warm sandy brown, barred and freckled on both webs with brownish black, the tertiaries with broad fulvous shaft-strips and black blotches on the inner webs. Chin vinous-buff; remainder of lower plumage fulvous-buff, the throat, breast, and to a less extent the flanks, barred with blackish brown, the feathers with white shafts.

Young (immature). The juvenile plumage of *P. argoondah* differs from that of *P. asiatica* in one most marked detail. Instead of being roughly unicolorous below with shining white streaks, the throat and breast are barred with blackish, thereby superficially resembling the adult male. This explains why in this species one meets numbers of immature females which seem to have a mixture of male and female feathers below. The warm vinous-buff of the female underparts is, in these birds, mixed with barred black-and-white feathers which are remnants of the juvenile plumage. On the other hand in *asiatica* the birds with mixed vinous-buff and black and white barred underparts are young males exchanging the vinous-buff juvenile plumage for the adult black and white bars. Thus, in the case of *argoondah* the black and white bars are juvenile feathers; in the case of *asiatica* they are adult feathers.

The distinction is interesting and important, and essential to an understanding of the two species (Whistler).

MEASUREMENTS AND COLOURS OF BARE PARTS. As in 260.

LOCAL NAMES. *Louwa* (Hindi and Marathi); *Lauwaka* (Telugu); *Sinna kâda* (Tamil). Commonly not differentiated from Jungle Bush Quail, and names indiscriminately used for both.

PHEASANTS, PARTRIDGES, QUAILS

51

SIZE AND FIELD CHARACTERS. As of 260, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. East-central Mysore, lat. c. 14°N. (Chitaldrug district). Extent of range not known. Affects stony laterite and moorum, scraggy grass-covered country, where its coloration matches the soil remarkably.

GENERAL HABITS, FOOD, VOICE AND CALLS. Nothing specifically recorded as different from 260.

BREEDING. Season, Nest, and Eggs. Not recorded; presumably as in 260. Specimens in breeding condition taken in January.

MUSEUM DIAGNOSIS. Male (adult). Whole upper plumage, wings, and tail bright brick-red, agreeing with the colour of the forehead in the nominate race (260). Forehead and a line above the buff supercilial streak unmarked; rest of upper plumage irregularly barred with black and dark brown, and streaked and mottled with buff as typical of this species. Lower plumage similar to that of *P. a. argoondah* (260), but slightly warmer in tint; washed with brick-red on flanks, lower abdomen and under tail-coverts.

Female (immature). Upperparts as in ad. ♂ (above), but dark barring largely absent; the buff shaft-streaks terminate in triangular buff spots, more conspicuous on mantle, scapulars, and tertiaries. Lower plumage warm buff tinged with brick-red, the throat and breast irregularly barred with dark brown.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
2 ♂♂ ad.	80-85	13-14	23-27	38-41 mm. (HW, SA)

COLOURS OF BARE PARTS. As in 260.

(Karli Valley, North Konkan)

Baker, FBI No. 1955, Vol. 5: 381

Plate 32, fig. 7

LOCAL NAMES. *Kokni-louwa* (Hindi); *Kâdai* (Tamil); *Meni kâda* (Malayalam).

SIZE. Grey Quail —; length c. 18 cm. (7 in.).

FIELD CHARACTERS. A dark but brightly coloured quail with conspicuous deep red bill and legs diagnostic even in flight.

Male. Above, olive-brown finely streaked with white and boldly spotted or blotched with black. A narrow white band running backward from forecrown down sides of blackish head and nape. Below, a conspicuous white throat-patch bordered by a narrow black loop. Rest of underparts chestnut, mottled boldly with black and white on flanks.

♂, x c. 1

GALLIFORMES

50

SIZE. Grey Quail —; c. 17 cm. (6½ in.).

FIELD CHARACTERS. A squat and plump quail.

Male easily confusable with Jungle Bush Quail (255) except for absence of buff supercilial stripe, and dull brick-red instead of bright chestnut throat-patch.

Female distinguished from 255 chiefly by absence of red throat-patch. Chin whitish. Throat and underparts warm vinaceous- or pinkish buff.

STATUS, DISTRIBUTION AND HABITAT. Resident. Peninsular India from about Berar south through the Deccan to Madras. How much further south not known. Affects dry stony scrub-and-bush country.

Exact boundaries between the races not properly worked out, nor the exact status of the species *P. asiatica* and *P. argoondah inter se*. In many areas their distributions overlap, but on the whole this species will be found in drier and stonier facies than *P. asiatica* which prefers thicker-scrubbed country and open deciduous forest.GENERAL HABITS, FOOD, VOICE AND CALLS. Nothing specifically recorded as different from *P. asiatica* except habitat preference.BREEDING. Season, undefined, practically throughout the year, varying with locality. Principal months March-April and August to November. Nest, as of Jungle Bush Quail, a scrape in the ground lined with grass, at the base of a thorn bush or grass tussock, or under protection of a rock. Eggs, 4 to 8, generally 5 or 6, creamy white, indistinguishable from those of 255. Average size of 100 eggs (mixed races and possibly also including eggs of *P. asiatica*) 25.6 × 20.1 mm. (Baker). Cock believed to be monogynous. Hen alone incubates; period 16-18 days.MUSEUM DIAGNOSIS. In the species *asiatica* inner webs of the primaries in adults unmarked; in *argoondah* barred or mottled with fulvous in most (but not all) specimens. This character must therefore be used with great caution, particularly since the juvenile primaries in both species are normally marked on the inner web.Young (immature). For description see under race *meinertzhageni* (259).Chick (in down). Undescribed. Presumably as of *meinertzhageni*, q.v.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	82-89	13-16	25-27	44-47 mm.
♀♀	82-86	14-16	24-25	40-47 mm.
		(from skull)		(SA)

Weight 6 ♂♂ 60-74 (av. 66); 4 ♀♀ (av. 60-25) gm. — BNHS.

COLOURS OF BARE PARTS. Iris light to orange-brown. Bill horny or slaty black, greyer on lower mandible and at base of commissure. Legs and feet dull yellowish or dusky orange; claws brownish flesh colour.

261. **Mysore or Laterite Rock Bush Quail.** *Perdica argoondah salimalii* Whistler*Perdica argoondah salimalii* Whistler, 1943, Jour. Bom. nat. Hist. Soc. 44: 208 (Marikanive, Mysore)

Baker, FBI No. 1954 (part), Vol. 5: 379

LOCAL NAME. *Kempha louwa* (Kannada).

GALLIFORMES

52

Female. Upperparts more or less as in male. Head and throat dull rufous lacking the white throat-patch and head stripe. Underparts rufous, lightly blotched with black on flanks.

STATUS, DISTRIBUTION AND HABITAT. Resident. The Western Ghats strip of country from about Khandala south through Kerala, including the associated hill ranges in Coorg, Mysore, and adjoining Salem district of Madras (Shevaroy Hills), between c. 600 and 2000 metres elevation. Affects tall grass and broken foothills country interspersed with cultivation; also thin scrub on open hillsides along the edge of forest in moist-deciduous biotope.

GENERAL HABITS. Similar to the other Bush Quails (255, 260). Keeps in coveys of 6 to 15 birds which troop out to feed in the open patches in the mornings and evenings, then also commonly seen dusting themselves on the sides of jungle paths and cart tracks. When flushed, the covey scatters in all directions, the birds tumbling into the undergrowth after a short flight. They begin their rally calls to each other almost at once, and soon work their way back through the bushes to re-unite.

FOOD. Grass- and weed seeds, grain, shoots, and small insects, especially termites. A quantity of grit is swallowed with the food.

VOICE AND CALLS. A short whistle like that of Grey Quail when flushed. Rally calls: very soft whistles, something like those of *Perdica asiatica* in runs of about two seconds' duration, repeated every couple of seconds or so, 'rising gradually till it reaches a certain pitch which note is repeated a few times and then dies down more rapidly. This is also the female's usual call' (A. M. Primrose). It is syllabified as *tu-tu-tu-tu-tu-tu-tu* (Davison), and has a curious ventriloquistic quality. Breeding call of cock a pleasant triple note *kirikee, kirikee*, etc. The birds can be readily decoyed by means of caged call birds or an imitation of their calls, the approaching bird answering the challenge every few yards as he advances.

BREEDING. Season not well defined, variable locally, and covering most months of the year. Nest, a scrape in the ground, sometimes lined with a little grass; placed at the root of a bush or grass clump. Eggs, 4 to 7 and up to 10; creamy buff to café-au-lait with a fair gloss, indistinguishable from those of the Jungle Bush Quail. Average size of 140 eggs 25.4 × 19.5 mm. (Baker). Male evidently monogynous. Incubation by female alone; period 16-18 days. Both parents tend the young. The chicks fly at a very early age, even when still down-clad mites scarcely bigger than bumble-bees.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for subspecies Key. Chick (in down) inadequately described. 'With three stripes of a light cream colour extending down their backs' (Miss Cockburn, Nilgiris).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	81-87	14-16	23-25	40-44 mm.
♀♀	81-86	14-16	c. 24	33-45 mm.
	(once 92)			(SA, HW)

Weight ♂♀ 2.4 to 3.1 oz. (c. 70-85 gm.) — Hume.

COLOURS OF BARE PARTS. Iris light yellow-brown or hazel-brown. Bill, legs and feet deep red; in young birds duller red or brownish red.

PHEASANTS, PARTRIDGES, QUAILS 53

263. Northern Painted Bush Quail. *Perdica erythrorhynchos blewitti* (Hume)

Microperdix Blewitti Anonymous = Hume, 1874, *Stray Feathers* 2: 512 (Raipur) Baker, FBI No. 1956, Vol. 5: 382

LOCAL NAMES. *Sirsee lowra* (Mandla, Balaghat, Chanda—Madhya Pradesh); *Huker* (Bengal); *Huker gindri* (Santahali).

SIZE. Grey Quail —; length c. 16 cm. (6½ in.).

FIELD CHARACTERS. As for 262, q.v. See Key to the Subspecies, and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident in an area north and east of the range of the nominate race (262), viz. eastern Maharashtra (Bhandara, Chanda dists.), eastern Madhya Pradesh (Mandla, Balaghat, Bastar dists., etc.), Bihar, Orissa, and W. Bengal. Affects forest tracts and scrub jungle in low hilly deciduous biotope, up to c. 1000 metres elevation.

GENERAL HABITS, FOOD, VOICE and CALLS. As of 262. 'During the season of courtship the male utters a single loud note often repeated' (R. Thompson).

BREEDING. Season, extended and ill defined as in 262, *Nest and eggs* similar to those of *P. e. erythrorhynchos*.

MUSEUM DIAGNOSIS. Male distinguished from 262 by much broader white sincipital band (i.e. on front part of head, between forehead and crown), narrower black forehead, and black on chin being absent or obsolete. Brown greyish wash on breast stronger and coming lower down. More white on feathers of flanks.

Female paler and duller than ♀ 262.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	76-84	13-14	c. 26	39-44 mm. (Baker)

Weight ♂ ♀ 1.85 to 2.3 oz. (c. 50-70 gm.) — Hume.

COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet coral red.

Upper surface faintly marked with black.....*P. m. inglisii*

264. Assam Painted Bush Quail. *Perdica manipurensis inglisii* (Ogilvie-Grant)

Microperdix inglisii Ogilvie-Grant, 1909, *Jour. Bom. nat. Hist. Soc.* 19: 1 and pl. (Goalpara, Assam) Baker, FBI No. 1958, Vol. 5: 384

LOCAL NAME. *Kāla goondri* (Goalpara, Assam).

SIZE. Grey Quail ±; length c. 20 cm. (7½ in.).

FIELD CHARACTERS. As for 265, q.v. See Key to the Subspecies.

PHEASANTS, PARTRIDGES, QUAILS 55

shoots sprouting, in the early morning and late afternoon. In flight and behaviour a typical bush quail.

FOOD. Grass seeds, wild lentils, ants and other insects.

VOICE and CALLS. Described from a captive female as 'a clear, softly whistled *whit-it-it-it-it*, each *it* slightly higher in tone till they tend to run into one another at the end. Repeated 3 or 4 times, becoming louder and higher each time' (Powell Connor).

BREEDING. Little known. Apparently only a single nest so far taken (13 May) on a grassy plateau surrounded by evergreen forest on the Manipur-Cachar border — a hollow scraped in the ground among grass roots. It contained 4 eggs exactly like those of *Perdica erythrorhynchos* (262) but whiter. They measured c. 30 × 24 mm.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	80-86	14-15	c. 25-26	45-52 mm.

Weight ♂ ♀ 2½ to 2½ oz. (c. 64-78 gm.) — Baker.

COLOURS OF BARE PARTS. Iris dark brown or hazel. Bill dark grey, yellowish at base. Legs and feet orange-red to deep vermillion; claws light brown.

MISCELLANEOUS. Claimed by one experienced sportsman (J. C. Higgins, Manipur) to be better for the table than any other game bird, surpassing francolin, garganey teal or junglefowl in the delicacy of its all-white flesh.

Genus ARBOROPHILA Hodgson

Arborophila Hodgson, 1837, *Madras Jour. Lit. Sci.* 5: 303. Type, by monotypy '*Perdix olivacea* Latham' = *Perdix torquola* Valenciennes

Superficially typical partridges but differing from both *Francolinus* and *Perdix* in habits and important structural details. There is a supra-orbital row of bones in the skull extending from the lachrymal to the post-orbital process such as is found in the Tinamous of the Neotropical Region. Tarsus comparatively longer than in francolins, without spurs, about equal in length to middle toe with claw. Claws on anterior toes long and straight. Wing short and rounded: first primary (as.) between 8th and 10th in length; 4th and 5th primaries subequal and longest. Tail of 14 soft feathers equal to about half length of wing.

Foot, x c. 1

The genus, containing the Hill Partridges, ranges from the western Himalayas right across to eastern Assam and through the Indochinese and Indomalayan regions.

54 GALLIFORMES

STATUS, DISTRIBUTION and HABITAT. Resident; local and parochial. Northern W. Bengal (duars) and Assam north of Brahmaputra river, from about Jalpaiguri to Sadiya. Affects damp grassland and scrub jungle especially in nullahs, in moist-deciduous foothills country.

GENERAL HABITS, FOOD, VOICE and CALLS. As of 265.

BREEDING. Nothing recorded except that adults showed signs of breeding (Goalpara, Assam) in the beginning of March, and a fully fledged young one was obtained on 11 January (C. M. Inglis).

MUSEUM DIAGNOSIS. Male differs from the nominate race (265) in being rather paler and less boldly marked with black above and below.

Female. Paler and more grey than ♀ *P. m. manipurensis*, with the black markings on lower plumage less conspicuous.

Young (immature). Browner than adult but more heavily marked with black. Bill dark grey, pale at tip and base of lower mandible. Legs and feet flesh colour.

MEASUREMENTS as in 265.

COLOURS OF BARE PARTS. Iris brown. Bill dark grey, lighter and sometimes tinged with yellow at base. Legs and feet orange-red, somewhat paler on hind tarsus; claws light brown.

265. Manipur Painted Bush Quail. *Perdica manipurensis manipurensis* Hume

Perdica manipurensis Hume, 1881, *Stray Feathers* 9: 467 (Bases of the hills in the southeastern portion of the Manipur plain)

Baker, FBI No. 1957, Vol. 5: 383

Plate 32, fig. 9

LOCAL NAMES. *Lanz sorbol* (= 'trap quail'), *Sorbol amubā* (= 'black quail') — Manipur.

SIZE. Grey Quail ±; length c. 20 cm. (7½ in.).

FIELD CHARACTERS. Overall effect, especially underparts, reminiscent of a miniature Black Partridge.

Male. Above. Forehead and sides of face rufous-chestnut, with a fine white line through eye. Upperparts dark slaty grey barred throughout and boldly blotched in the scapular region with velvety black. Below, chin and throat rufous-chestnut. Neck and upper breast ashy grey spotted with black. Rest of underparts rufous-buff, greyer on flanks, each feather with a bold black cross formed by a shaft-streak and a broader transverse band. Under tail-coverts black spotted with white.

Female duller and paler with no rufous on head. Rufous of underparts replaced by pale greyish buff, particularly pale on centre of chin and throat.

STATUS, DISTRIBUTION and HABITAT. Resident. Manipur and the Assam hill ranges south of Brahmaputra river: Cachar, Khasi, Naga, etc., hills up to c. 1000 m. elevation. Chittagong Hill Tracts, Bangladesh. Affects moist tall elephant-grass covered areas; in the Manipur Valley sometimes bogs and swamps. Not very rare but easily passed over till its characteristic call learnt and recognized. Believed to be getting scarcer in Manipur since c. 1930 (J. C. Higgins).

GENERAL HABITS. Keeps in coveys of 5 or 6. Lives in tall grass, is shy, and therefore seldom seen. Comes out into burnt grass patches with new

266. Simla Hill Partridge. *Arborophila torquola millardi* (Baker)

Arboricola torquola millardi Baker, 1921, *Bull. Brit. Orn. Cl.* 41: 101 (Koteghar) Baker, FBI No. 1960, Vol. 5: 388

LOCAL NAMES. *Roli*, *Rām chakra* (Himachal Pradesh); *Purna*, *Bān tetār* (Hindi).

SIZE. Grey Partridge —; length c. 28 cm. (11 in.).

FIELD CHARACTERS. As for 267, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Himachal Pradesh and Punjab Himalayas, in Chamba, Kangra, Simla, etc. between c. 1550 and 3000 metres elevation, occasionally to c. 4000 m. Affects forest broken up by ravines and *khads* with heavy evergreen undergrowth.

GENERAL HABITS, FOOD, VOICE and CALLS. As of the nominate race (267).

Putative call described by Whistler (in the Simla hills c. 1800-2300 m. alt.) as 'a very gentle, melancholy, *poor* or *pheaw* — at closer quarters sounding more like *quaww*'. Heard throughout May, June and early part of July.

BREEDING. Season evidently, as in 267, April to June, the only nest recorded in this subspecies having the full clutch of 9 eggs completed on 2 May. Nest (in this case) a scraped-out hole in a bank, domed over with grass. Eggs. Average size of above clutch 44.0 × 32.2 mm. (Whistler).

MUSEUM DIAGNOSIS. Male (adult) differs from *A. t. torquola* (267) in having the chestnut of the crown less bright and darker. Breast paler, less pure grey, and tinged with ashy. Abdomen nearly always strongly suffused with rufous.

Female (adult) differs from ♀ 267 in having the chestnut of the throat much paler, and the breast paler and much more rufous-grey.

PHEASANTS, PARTRIDGES, QUAILS

57

Chick (in down), c. 1 day old. 'A broad band of chestnut from base of bill (where it is pinched in) to near the nape where it is 12.5 mm.; a broad buff supercilium extending down the side of the neck. A blackish brown streak from posterior corner of the eye broadening out over the ear-coverts. Back, to extremity of body, dark brown mottled lightly with red-brown. Side of body, including wing, mottled dark and lighter red-brown. Chin and throat pale buff. A band across breast dark brown mottled with buff and grey which also spreads along the flanks. Abdomen pale buff.

'Bill: upper and lower mandibles yellow except across the nostrils where it is horn. Legs and feet dusky yellow. Iris deep reddish brown' (A. E. Jones).

MEASUREMENTS. Wing ♂♂ 150-161; ♀♀ 144-155 mm. (Baker).

COLOURS OF BARE PARTS. As in 267.

267. **Common Hill Partridge.** *Arborophila torqueola torqueola* (Valenciennes)

Perdix torqueola Valenciennes, 1826 (1825), Dict. Sci. Nat., éd. Levrault, 38: 435 (Bengal)

Baker, FBI No. 1959 (part), Vol. 5: 386

Plate 31, fig. 6

LOCAL NAMES. *Pura*, *Bān tetār* (Hindi). Kumaon, Garhwal, Nepal, etc.); *Kohumbut* (Lepcha); *Pao-er* (Mishmi); *Dechui* (Cachar); *Duboi* (Nongowang, Assam).

SIZE. Grey Partridge —; length c. 28 cm. (11 in.).

FIELD CHARACTERS. A dumpy, short-tailed olive-brown partridge.

Male. *Above*. Crown and nape bright chestnut, the latter spotted with black. Narrow forehead and broad supercilium black. A black-spotted chestnut line under supercilium. Cheeks black. Ear-coverts bright chestnut. A ring of bare crimson skin round eye. Upperparts golden olive-brown finely barred or scalloped with black and broadly mottled with chestnut and black. *Below*, chin, throat and neck black, the last with white streaks. Breast grey, separated from foreneck by a white band. Rest of underparts grey and white, with broad chestnut streaks and white drops on flanks. Vent rufous-white with black bars. Under tail-coverts black and white.

Female. *Above*, similar but with the crown brown, streaked with black. *Below*, chin and throat rufous, spotted with black. Breast brownish, separated from throat by a chestnut instead of white band.

Young (immature) male like adult ♂ but with the supercilia absent or obsolete. No chestnut on flanks; only a little on wing-coverts. Underparts spotted with white from breast to vent.

STATUS, DISTRIBUTION and HABITAT. Resident. The Himalayas from Garhwal through Nepal, Sikkim, and Bhutan to extreme eastern Assam north of Brahmaputra river (NE. Frontier Agency Tract) from c. 1500 to 4000 metres elevation. Affects ravines, *khuds*, and hillsides where not too steep and clad in dense forest of *banj* oak (*Quercus incana*), laurel, and other evergreen trees and shrubs.

Extralimital. SE. Tibet.

GENERAL HABITS. Gregarious. Keeps in coveys of 5 to 10 birds in dense undergrowth, scratching for food amongst the rich mulch and humus on the forest floor. Trusts to its legs for escape, but when suddenly come upon

58

GALLIFORMES

or flushed by a dog, will fly strongly, manoeuvring dextrously through the maze of tree-trunks and other obstacles, and often take refuge up in a leafy branch. Roosts at night in trees, the covey sitting huddled together along a branch. Once flushed, and especially after being fired at, the bird difficult to flush a second time, either scuttling away through the undergrowth or lying low under leaves and bushes till danger has passed.

FOOD. Seeds, shoots, berries, insects, grubs, and tiny molluscs.

VOICE and CALLS. A single low mournful whistle, c. 1½ seconds long, repeated every two or three seconds, reminiscent of the awkward intake effort of a schoolboy learning to whistle. This repeated slowly two or three times and followed by a series of three to six mellow double whistles in ascending scale, vaguely reminiscent of the hawk-cuckoo. They have been rendered (SA) as *bobwhite*, *bobwhite*, *bobwhite*, or *do-eat*, *do-eat*, *do-eat* (first syllable short, second prolonged). Frequently one bird (♀?) leads off with a shrill continuous *kwikwikwikwik* etc. by way of invitation and accompaniment; a second (♂?) promptly joins in with the crescendo *bobwhite* calls, the duet ending rather abruptly when the climax is reached. The birds answer one another from different directions and are particularly vocal in the mornings and evenings.

BREEDING. *Season*, April to June/July, earlier at lower elevations, later at higher. *Nest*, from a rough scrape in the ground sparsely lined with grass, to a deeper cup well padded with same. Placed in dense ringal or scrub undergrowth in forest. *Eggs*, normally 3 to 5 but a clutch of 9 has been taken; pure china-white, glossy and with a fine texture. Average size of 60 eggs 40.6 × 31.9 mm. (Baker).¹ No other data on breeding biology recorded.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for Subspecies Key.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	144-160	c. 19-21 (from feathers)		
♀♀	c. 140-150	c. 21-23 (from skull)	c. 41-45	c. 60-80 mm. (SA)

COLOURS OF BARE PARTS. Iris brown to crimson-brown; orbital skin dusky pink to crimson-red. Bill dark brown to black. Legs and feet olive-brown to livid grey.

268. **Assam Hill Partridge.** *Arborophila torqueola interstincta* Ripley

Arborophila torqueola interstincta Ripley, 1951, Postilla, Yale Peabody Museum, No. 6: 1 (Mt Zephu, 93 miles E. of Kohima, eastern Naga Hills, Assam)

Baker, FBI No. 1959 (part), Vol. 5: 386

LOCAL NAME. *Inru whip* (Naga).

SIZE and FIELD CHARACTERS. As for 267, q.v. See Key to the Subspecies.

¹ Average size of 13 eggs in Brit. Mus. collection 43.6 × 33.3 mm. (Harrison & Parker, 1966, JBNHS 63: 749).

PHEASANTS, PARTRIDGES, QUAILS

59

STATUS, DISTRIBUTION and HABITAT. Resident. Assam south of Brahmaputra river, in the Upper Chindwin drainage area of the Naga Hills. Presumably also the Barail and higher hill ranges of north Cachar and north Manipur. Affects wet, temperate forest between c. 2200 and 2600 metres alt.

Extralimital. Upper Burma (Chindwin river drainage area).

GENERAL HABITS, FOOD, VOICE and CALLS. Nothing specifically recorded as different from 267. 'The birds were silent during our stay on the mountain [Mt Zephu at c. 2400 m.] in late November and early December, only occasional low calls being heard' (Ripley).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Differs from the nominate race, *A. t. torqueola*, in being more richly and darkly coloured, and more heavily barred.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 267.

269. **Kachin Hill Partridge.** *Arborophila torqueola batemani* (Ogilvie-Grant)

Arboricola batemani Ogilvie-Grant, 1906, Bull. Brit. Orn. Cl. 16: 63

(Tiddim, near Fort White, Chin Hills)

Baker, FBI No. 1961, Vol. 5: 389

LOCAL NAMES. *Wogam*, *Gam tong* (Kachin).

SIZE and FIELD CHARACTERS. As for 267, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION and HABITAT. Presumably this is the race that occurs in the hills of south Manipur. Needs verification.

Extralimital. Burma (Chin and Kachin Hills).

BREEDING. Not recorded in Indian limits.

MUSEUM DIAGNOSIS. Male (adult). Differs from the nominate race (267) in having the sides of the neck largely or entirely chestnut. Chin, throat, and neck more frequently marked with white. Chestnut on scapulars and inner secondaries darker, duller, and greater in extent.

Female similar to ♀ *A. t. torqueola* but generally more rufous on upperparts.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 267.

ARBOROPHILA RUFOGULARIS (Blyth)

Key to the Subspecies

Rufous throat with a band of black below..... *A. r. rufogularis*
No black band below rufous throat..... *A. r. intermedia*

LOCAL NAMES. *Pura* (Kumaon); *Kohumbut* (Lepcha); *Pokhu* (Dafla).

SIZE. Grey Partridge —; length c. 27 cm. (10½ in.).

FIELD CHARACTERS. A dumpy short-tailed olive-brown partridge like 267.

60

GALLIFORMES

Male. *Above*, forehead grey; crown olive-brown stippled with black. Long supercilia greyish white. Sides of face white, speckled with black except on white moustachial stripe running from lower mandible to below dark brown ear-coverts. Small naked red patch round eye. Upperparts golden olive-brown, spotted with black on rump and upper tail-coverts. Scapulars and wing-coverts chestnut with large grey and black drops. *Below*, chin, throat, and sides of neck (almost meeting in a collar behind) rufous, spotted with black. A broad band of ferruginous-red with a narrow black line below it separating foreneck from slaty grey breast. Anterior flanks slaty grey broadly streaked with deep orange-chestnut and with white drops; posterior flanks brown with black crescentic spots.

Female has fewer black spots on chin and throat, and more white drops on breast and abdomen.

Young (immature) male. Throat unspotted, much paler than in adult. Underparts smoky slate colour with numerous white spots scattered all over.

STATUS, DISTRIBUTION and HABITAT. Resident. Kumaon (U.P.) and through Garhwal, Nepal, Sikkim, and Bhutan east to the Mishmi Hills (Assam) between c. 1000 and 2400 m. elevation, optimally c. 1500-1800 m., sometimes descending to c. 700 m. in winter. Occupies a lower altitudinal zone than the species *torqueola*, but occasionally their ranges overlap at the seam. Affects dense secondary scrub on abandoned cultivation, and heavy undergrowth in evergreen hill forest.

GENERAL HABITS. Similar to those of 267. Keeps in coveys of 6 to 12 in non-breeding season. Usually not shy, but an inveterate runner and difficult to flush without a dog. Looks deceptively large, almost the size of hen kaleej when it flies in the open, but as small as quail when creeping through thickets.

FOOD. Weed-seeds, fallen berries, shoots, insects and grubs, and small molluscs.

VOICE and CALLS. 'A beautiful clear loud double whistle, a sound like *Wheee-who*, repeated constantly and slightly ascending in scale with each repetition. It is a very loud ringing cry and can be heard at a long distance even in heavy jungle where sound carries so short a way. It is uttered principally in the breeding season in the early mornings and evenings, and once heard can never be forgotten' (Baker). This call, however, is putatively attributed by J. C. Higgins (Manipur) to *A. atrogularis* (272). He adds that its repetition 2 or 3 times is followed by a series of 3 short sharp whistles *whu-whu-whu* in an ascending scale. A mournful descending whistle, commonly uttered in late afternoon. Occasionally given at close intervals, gradually increasing in frequency and working up in scale until a sort of climax is reached. This is apparently a threatening or territorial call indulged in by two birds approaching each other through forest, and climaxing when the rivals close together (Ripley).

BREEDING. *Season*, from c. April in the lower hills to end July in the higher ranges. *Nest*, a hollow scraped in the ground in undergrowth more or less well lined with grass and leaves, sometimes domed over with growing grass. *Eggs*, normally 4 or 5 (up to 8 recorded by Baker), china-white as in 267. Average size of 91 eggs in the Brit. Mus. collection 39.9 × 30.3 mm. (Harrison & Parker, 1966, JBNHS 63: 749). No other data available.

PHEASANTS, PARTRIDGES, QUAILS

61

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for subspecies Key. Chick (in down). Above, a broad reddish brown stripe on each side from the forehead passing above the eye, including the sides of the crown, to nape, the stripes of the two sides meeting anteriorly on the forehead. Ear-coverts and a distinct collar black; remainder of upper plumage chocolate-brown. Below, chin, throat and upper breast brownish cream; breast and flanks chocolate-brown, paler than in upper plumage; abdomen brownish cream (Biswas, 1960, JBNHS 57: 305). Young (first plumage). Above as in adult but duller, with crown vermiculated instead of spotted with black. Below, flanks vermiculated brown and black. Centre of breast and abdomen paler and whitish (Baker).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	138-149	18-19	40-44	50-56 mm.
♀♀	(126) 131-142			

(Baker, SDR, H. Stevens)

Weight ♂♀ 7-10½ oz. (c. 200-300 gm.) — Hume.

COLOURS OF BARE PARTS. Iris brown or red-brown; ocular skin pinkish red or dull crimson. Bill dark brown. Legs and feet pinkish red to dull coral-red; claws horny.

271. Arakan Hill Partridge. *Arborophila rufogularis intermedia* (Blyth)

Arboricola intermedia Blyth, 1856, Jour. Asiat. Soc. Bengal 24: 277 (Arrakan)
Arborophila rufogularis tenebrarum Koelz, 1954, Contrib. Inst. Regional Exploration, No. 1: 30 (Tura Mountain, Garo Hills)
 Baker, FBI No. 1963, Vol. 5: 391
 Plate 31, fig. 10

LOCAL NAMES. *Dao bui*, *Daobui yéghashi* (Cachar); *Inrui whip* (Naga); *Duboi* (Assam).
SIZE AND FIELD CHARACTERS. As for 270, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident; locally not uncommon, but rarely seen and its abundance difficult to detect till its call known. Assam east and south of Brahmaputra river, through Manipur, Mizo (Lushai Hills), and Chittagong Hill Tracts (East Pakistan). Affects dense undergrowth and shady nullahs in evergreen hill forest between c. 600 and 1800 metres elevation. In identical biotope as *torqueola* where their altitudinal ranges overlap.

Extralimital. Arakan Yomas, Chin and Kachin Hills of Burma.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the nominate race (270).

BREEDING. Season, overall April to August, chiefly May and June. Nest, the typical hollow scraped in the ground in dense evergreen undergrowth, lined either sparsely or thickly and compactly with grass and leaves; sometimes canopied by growing grass. Eggs, reportedly 3 to 6, china-white as of the genus. Average size of 150 eggs 39.2 × 29.8 mm. (Baker). Male evidently monogynous; does not incubate but assists in tending the chicks. Incubation period c. 20-21 days (Baker).

MUSEUM DIAGNOSIS. Male. Similar to *A. r. rufogularis* but spots on crown larger and a deeper black. Below spots on chin and throat so close together that

PHEASANTS, PARTRIDGES, QUAILS

63

and Chittagong Hill Tracts) from the foothills at almost plains level to c. 1500 metres elevation. Commoner below c. 750 m. than above. Affects wet undergrowth in less dense evergreen forest than *A. torqueola* or *A. rufogularis*, as well as bamboo jungle.

Extralimital. Upper Burma (Chin and Kachin Hills, Arakan).

GENERAL HABITS AND FOOD. As of 267 and 270, q.v. Gregarious. Keeping in pairs or scattered coveys of 5 to 8, flushing one at a time and only when almost underfoot, thereby giving the false impression of being solitary birds.

VOICE AND CALLS. 'Often heard, especially towards dusk — a rolling whistle *whew*, *whew* repeated many times, and winding up with a sharper and more quickly uttered *whew*' (Cripps). In breeding season 'a very beautiful, loud, clear double whistle audible at very great distances' (Baker). Both these presumably refer to the same thing. Cf. also Higgins under 270. Rally call: a very soft and mellow whistle from different directions when a covey is scattered.

BREEDING. Season, March-April at plains level, to June-July at higher elevations. Nest, a hollow scratched in the ground under scrub in grassland or bamboo jungle, usually well padded with grass and leaves. Eggs, overall 3 to 7; normal clutch 4 or 5. Rather glossy china-white as typical of the genus. Average size of 42 eggs in the Brit. Mus. collection 37.0 × 28.3 mm. (Harrison & Parker, 1966, JBNHS 63: 750). Other data on breeding biology not available.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	135-147	18-20	c. 42-44	c. 60-65 mm.
♀♀	126-130			

(Baker)

Weight ♂♀ 7-11 oz. (c. 200-312 gm.) — Hume.

COLOURS OF BARE PARTS. Iris brown or red-brown. Bill ♂ black, ♀ dark brown. Orbital and gular skin bright pink; brilliant deep red in breeding season. Legs and feet ♂ dull orange to bright orange-red, or red in breeding season; in ♀ dull wax yellow to same tinged with red.

273. Redbreasted Hill Partridge. *Arborophila mandellii* Hume

Arborophila Mandellii Hume, 1874, Stray Feathers 2: 449 (Bhutan Duars)
 Baker, FBI No. 1966, Vol. 5: 395
 Plate 31, fig. 8

LOCAL NAME. *Pao-er* (Chulikatta Mishmi).

SIZE. Grey Partridge —; length c. 28 cm. (11 in.).

FIELD CHARACTERS. A typical dumpy hill partridge.

Male and Female. Above, crown and nape dull chestnut-brown. Dark grey supercilial stripes from eyes continued behind to meet on upper hindneck. A small white moustachial streak. Lower hindneck (all round) and upper back reddish chestnut with black spots. Rest of upperparts olive, spotted and narrowly scalloped with black. Below, chin and throat pale olive-chestnut separated from deep chestnut upper breast by a double gorget of

62

GALLIFORMES

these parts appear almost black. Lower margin of rufous throat meeting slaty grey of breast without any intervening black line. Abdomen generally paler slate.

Female like that of 270, but with no black band below chestnut throat. More black-spotted on chin and throat, but less densely than in male.

Young (immature). Like adult but with breast, abdomen and flanks profusely spotted with white. Chin and throat rather rufous. Legs, orbital and gular skin dull yellowish.

Young (in first plumage). Above like adult but duller. Crown vermiculated rather than spotted with black. Below, flanks vermiculated with brown and black. Centre of breast and abdomen paler and whitish.

Chick (in down). Above, bright chestnut-brown. Supercilium and cheeks pale buffy brown; a dark brown line from eye dividing the two. Below dingy white.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	138-148	c. 18-19	c. 37-42	52-60 mm.
♀♀	134-143			

(Baker)

Weight ♂♀ 12-13 oz. (c. 340-370 gm.) — Hume.

COLOURS OF BARE PARTS. Iris brown; orbital and gular skin red. Bill black, reddish at gape. Legs red; claws horny. In breeding season the reds much brighter and more vivid.

272. Whitecheeked Hill Partridge. *Arborophila atrogularis* (Blyth)

Arboricola atrogularis Blyth, 1850, Jour. Asiat. Soc. Bengal 18(2): 819
 (Assam, Sylhet, and Arrakan)

Arborophila atrogularis rupchandi Koelz, 1953, Jour. zool. Soc. India 4: 155
 (Bhutan at Menoka, Assam)
 Baker, FBI No. 1965, Vol. 5: 393
 Plate 31, fig. 7

LOCAL NAMES. *Peura* (Sylhet); *Duboi*, *Dubore* (Assam); *Sán batii* (Chittagong); *Daobui*, *Daobui yéghashi* (Cachar); *Inrui whip* (Naga).

SIZE. Grey Partridge —; length c. 28 cm. (11 in.).

FIELD CHARACTERS. A dumpy short-tailed olive-brown forest partridge.

Male and Female. Above, forehead and supercilium grey; crown olive-brown; nape rufous, broadly spotted with black. A black line below supercilium from lores to above cheeks. Cheeks white, running behind into rufous buff ear-coverts. Upperparts light olive-brown stippled and barred with black. Scapular region barred and mottled with black and rufous. Below, chin, throat, and foreneck black diffusing through black-and-white into grey of breast and flanks. Flanks grey, without any chestnut marks but with white drops posteriorly. Centre of abdomen whitish. Under tail-coverts rufescent, edged with white, spotted with black.

STATUS, DISTRIBUTION AND HABITAT. Resident. Assam (Dibrugarh dist., Dafia, Miri, Mishmi hills), and south of Brahmaputra river in the Khasis and all along the Valley to the western slopes of the Garos. Also Naga Hills, Manipur, Mizo, Tripura, and adjoining East Pakistan (Sylhet, Tippera,

GALLIFORMES

64

black and white. Lower breast to vent grey marked on flanks with chestnut and white. Under tail-coverts olive with white spots and rufous mottling.

STATUS, DISTRIBUTION AND HABITAT. Resident. Sikkim and Bhutan duars, and Assam hills north of Brahmaputra river east through NEFA. Occupies an altitudinal zone between c. 350 and 2450 metres, possibly somewhat higher. Affects dense undergrowth in evergreen forest.

Extralimital. Presumably SE. Tibet.

GENERAL HABITS, FOOD. Nothing specifically recorded.

VOICE AND CALLS. Putatively a loud, rich, long-drawn *quic* followed by a series of ascending double notes leading to a climax. Similar in pattern to call of *A. torqueola* (267), but distinct (SA).

BREEDING. The only reliably known nest was taken at c. 2400 m. alt. in Sikkim on 3 June. It contained 4 fresh eggs measuring about 43 × 33 mm. (Baker). No other data available.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Feathers of upper back and interscapular region finely barred with black. Lower margin of rufous throat sharply demarcated from breast by a black line with a white one above it. See also Key to the Species.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	133-145	19-20	43-45	56-58 mm.

PHEASANTS, PARTRIDGES, QUAILS

65

SIZE. Grey Partridge +; length c. 35 cm. (14 in.).

FIELD CHARACTERS. A comparatively long-tailed rufous-brown partridge. Above, crown and nape rufous-brown. Face rufous-buff with a broad rufescent white supercilium to nape, and a broad dark rufous-brown (or blackish) line below it behind eye. Upperparts grey-brown, broadly streaked with chestnut and spotted with blackish chestnut in scapular region; vermiculated with grey-brown on lower back, rump, and tail. Wing quills chestnut-brown. Tail barred brown and buff. Below, chin, throat, and foreneck rufous-buff. Breast chestnut, spotted and streaked with white and grey. Rest of underparts buff, with large black heart- or half-moon shaped spots except on centre of abdomen and vent. Sexes alike.

STATUS, DISTRIBUTION and HABITAT. Resident. Assam hills south of Brahmaputra river from above Margherita in Lakhimpur through Patkai, Naga, Cachar, Khasi, Jaintia, Garo, and Mizo (Lushai) hills, and Manipur. East Pakistan (Sylhet, Chittagong Hill Tracts). Affects open scrub jungle bordering rice fields and pastureland in foothills country, sometimes venturing a few miles out in the adjacent plains. In Manipur in low oak and willow scrub along banks of streams, mixed with elephant grass and *Rubus* thickets, etc. Partial to patches of a wild cardamom-like plant (known as *pulleri* in Manipuri and *tirapāt* in Assamese — *Alpinia* sp.) in which large numbers usually found. Normally at low elevations, but sometimes ascending to c. 2000 metres. In spite of its substantive name not predominantly restricted to bamboo forest.

Extralimital. Burma (Chin Hills, northern Arakan Yomas).

GENERAL HABITS. Keeps in coveys of 5 or 6, presumably old birds and their last brood, which break up into pairs about March. Cocks thereafter very noisy, flying up every now and then with a flutter of wings to a mound or tree stump from early dawn, crowing challenges two or three times, then dropping to earth. The birds come out in the open morning and evening to scratch for food, seldom straying far from water (streams etc.). Flight recorded as diagnostically different from that of Black Partridge found in the same terrain, often side by side. Flushes when almost trodden on, flies a few metres and tumbles suddenly into the tall grass. Occasionally takes refuge in trees.

FOOD. Buds, shoots, seeds, grain, berries, and insects (grasshoppers, crickets, termites, ants, grubs, etc.).

VOICE and CALLS. Crow of cock somewhat 'similar to call of Black Partridge but less shrill and high pitched: *Che-chirree-che-chirree, chirree, chirree, chirree*'. Another observer (J. C. Higgins, Manipur) finds this chatter more like *Pishup, pishup, pishup, pishup*, and so on indefinitely. According to P. F. Wickham (Burma) it sounds 'as if most of the covey were shouting, and like the English partridge they generally "scream" a bit when put up by dogs or walked up by the guns'. Apparently the female also utters 'discordant squawks' in the nature of crowing.

BREEDING. Season, chiefly March through May. Nest, a scrape in the ground padded with grass and leaves, placed in scrub, bamboo jungle or grassland. Eggs, 4-6, creamy buff to deep warm buff, unspotted, fine textured and hard-shelled. Average size of 200-eggs 40.2 × 29.6 mm. (Baker). Cock believed to be monogynous, taking no part in incubation but helping to tend the young. Hen a close sitter; period of incubation 18-19 days.

275. Red Spurfowl. *Galloperdix spadicea spadicea* (Gmelin)

Tetrao spadiceus Gmelin, 1789, Syst. Nat. 1(2): 759 (Madagascar, ex Sonnerat, error = India)

Baker, FBI No. 1940, Vol. 5: 358

Plate 31, fig. 11

LOCAL NAMES. *Chhōti jūngli mūrghi* (Hindi, Madhya Pradesh); *Chākotri, Kōkātri, Kāstoor* (Marathi); *Chakharā* (Gujarati); *Sarava kozhi* (Tamil); *Terra kodī, Jita kodī* (Telugu).

SIZE. Grey Partridge +; $\frac{1}{2}$ grown village hen —. Length c. 36 cm. (14½ in.).

♂, × c. 1

FIELD CHARACTERS. A reddish brown, longer tailed partridge-like bird.

Male. Above, crown dark brown, paler and greyer on face and neck. Upperparts rufous-chestnut with black and rufous vermiculations and greyish brown scalloping. Below, rufous chestnut scalloped with greyish brown. Chin whitish brown. 2 to 4 pointed spurs on each leg. A naked brick-red patch round eye.

Female. Above, forehead sandy brown; crown and nape blackish brown. Upperparts greyish or sandy with rufous tinge, finely barred with black. Below, chin and throat whitish. Breast and flanks pale rufous-chestnut, spotted with black. A naked reddish patch round eye. One or two pointed spurs on each leg.

Young (immature). Male like adult female but more richly and deeply coloured, with more black in proportion to buff and rufous.

STATUS, DISTRIBUTION and HABITAT. Resident. Uttar Pradesh and West Nepal terai. Widely scattered over peninsular India south of the Gangetic Plain in Gujarat (north to c. Palanpur), Madhya Pradesh, southern Bihar, Orissa, Maharashtra, Andhra, Madras (including Nilgiris), Mysore (including Coorg) and northern Kerala (Wynaad). Affects stony, scrubbed foothills country and bamboo jungle cut up by watercourses and overgrown with brushwood in dry- and moist-deciduous biotope, normally below c. 1000 metres altitude. In S. India, quite numerous in coffee estates and lantana patches, even close to villages.

GENERAL HABITS. Keeps in pairs or small parties of 3 to 5 to scrubby undergrowth in broken country scratching amongst the mulch for food. Is shy and wary and a great skulker, oftener heard than seen, scuttling away on the least alarm, dodging from cover to cover, generally running uphill whenever it has the choice. Very fast on its legs, and reluctant to fly except when hard pressed. Roosts at night in trees and will also take refuge in the leafy branches of one when suddenly come upon. Seldom flies far and usually only to 'hedge-hop', thus placing more thickets between itself and the observer and continuing to run again as soon as it touches down, tail open fanwise and carried partly erect. Very parochial; addicted to favourite beats where may be found day after day. Overgrown ruins of jungle forts

66

GALLIFORMES

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	141-156	18-20	c. 44-47	85-112 mm. (Baker)

Weight ♂♂ 10-14 oz. (c. 285-400 gm.); ♀♀ c. 12 oz. (c. 340 gm.) — Hume.

COLOURS OF BARE PARTS. Iris hazel or yellow-hazel. Bill dark horny brown, paler at tip and on lower mandible. Legs and feet greenish brown; claws bluish. Spurs whitish horny.

MISCELLANEOUS. As a game bird provides excellent sport if walked up with beaters and a couple of dogs. It is plentiful within its range, easily flushed, and has a quick getaway and straight and strong flight. Best season's bag recorded in Manipur 128 birds (1928-9). Best day's bags to 2 guns, 20, 23, and 27 birds along with other small game (J. C. Higgins).

Genus GALLOPERDIX Blyth

Galloperdix Blyth, 1844, Jour. Asiat. Soc. Bengal 13(2): 936, note.

Type, by monotypy, *P. spadiceus* = *Tetrao spadiceus* Gmelin

Contains the Spurfowl, exactly midway between junglefowl and partridge in appearance; like a small hen but with a partly ridge-like tail, i.e. not laterally compressed. Wing short and rounded: first primary (as.) shortest, 5th or 6th longest or subequal. Tail of 14 feathers, slightly graduated, about two-thirds to three-quarters length of wing. Tarsus long and strong, with 2, 3, or sometimes 4, spurs on each leg in male; 1 or 2 in female. No wattle or comb as in junglefowl (*Gallus*), but a patch of brick-red naked skin round eye, much brighter in breeding season. Sexes dimorphic.

Genus endemic to peninsular India and Ceylon.

68

GALLIFORMES

are favourite haunts. The birds usually rummage under low thorn thickets, seldom venturing out into the open except on forest paths, and edge of harvested fields bordering forest, in the early mornings and evenings.

FOOD. Seeds, tubers, berries and drupes (e.g. *Zizyphus* and *Lantana*), land molluscs, and insects, especially termites. A quantity of grit is usually swallowed.

VOICE and CALLS. A loud cackling *kuk-kuk-kuk-kukaak* like domestic hen after she has laid an egg when suddenly come upon and flushed. The cock has a peculiar chuckle-like crow — a quick-repeated rattling *k-r-r-r-kwek, kr-kr-kwek, kr-kr-kwek*, etc. reminiscent of the calls of a guineafowl. Its Marathi name *Kōkātri* is distantly onomatopoeic.

BREEDING. Season, overall January to June varying with local conditions, but eggs may be found practically throughout the year. Nest, a shallow depression scraped in the ground in dense bamboo or scrub jungle, sometimes sparsely lined with leaves and grass. Eggs, commonly 3 to 5, buff coloured, very like small eggs of the village *mūrghi*. Average size of 44 eggs 40.4 × 29.5 mm. (Baker). Cock monogynous. Does not incubate but assists in tending the young. Period of incubation unknown. Hen timid, readily deserting nest and eggs on disturbance. When brood of chicks disturbed, both parents become quite distracted, floundering about as though in *extremis*, while chicks freeze and become completely invisible among the dead leaves.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for subspecies Key. A feature unrecorded in published descriptions is the tuft of somewhat elongated feathers on crown in both sexes, often raised into a crest in life.

Chick (in down). Undescribed.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
13 ♂♂	153-165	22-26	43-52	120-143 mm.
9 ♀♀	140-160	21-26	43-46	105-123 mm. (SA, HW)

Baker gives Wing ♂♂ 145-166; ♀♀ 134-163 mm.

Weight ♂♂ 11-16 oz. (c. 284-454 gm.) — Wm. Davison, Mysore.

COLOURS OF BARE PARTS. Iris yellow-brown to hazel-brown: naked orbital skin brick-red in ♂, duller red in ♀. Bill horny brown, reddish at base, paler on lower mandible. Legs reddish brick or reddish brown, sometimes with a greenish tinge; spurs horny.

276. Aravalli Red Spurfowl. *Galloperdix spadicea caurina* Blanford

Galloperdix spadicea var. *caurina* Blanford, 1893, Fauna Brit. Ind., Bds. 4: 107

(Mt Abu, Southern Rajputana)

Baker, FBI No. 1942, Vol. 5: 361

LOCAL NAME. *Chhōti jūngli mūrghi* (Hindi).

SIZE and FIELD CHARACTERS. As for 275, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Aravalli Hills in southern Rajasthan (Sirohi, Udaipur). Common about Mt Abu; most plentiful

PHEASANTS, PARTRIDGES, QUAILS

69

between c. 450 and 900 m. elevation. Intergrades with the nominate race around Hathidhara in Banaskantha (Gujarat). Birds from Asirgarh in Madhya Pradesh (c. 21°30'N., 76°20'E.) much greyer and closer to this form (D'Abreu, JBNHS 35: 219). Affects scrub and bamboo foothills jungle. GENERAL HABITS, FOOD, VOICE AND CALLS. As of the nominate race (275). BREEDING. Season, May and June recorded, but probably also other months. Nest and eggs as in 275.

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Male. Above, chestnut centres to feathers much paler; grey margins (scalloping) wider. Below, much paler than 275.

Female. Above, black barring almost absent. Below, chestnut much paler, the scalloping paler grey; black markings greatly reduced.

MEASUREMENTS as quoted by Baker from G. King, Wing 154-173 mm. Whether *aurina* is in fact larger than the nominate race, as thus suggested, needs confirming. COLOURS OF BARE PARTS. As in 275.

277. Travancore Red Spurrow. *Galloperdix spadicea stewarti* Baker

Galloperdix spadicea stewarti Baker, 1919, Bull. Brit. Orn. Cl. 40: 18

(Ancichardi, Travancore)

Baker, FBI No. 1941, Vol. 5: 360

LOCAL NAMES. Mullan kōzhi (Malayalam); Saravō kōzhi, Chākūtti kōzhi (Tamil). SIZE AND FIELD CHARACTERS. As for 275, q.v. See Key to the Subspecies and Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Kerala excluding Wynaad. Common. Affects lantana scrub on abandoned forest clearings, undergrowth in bamboo forest, etc. in moist-deciduous biotope: foothills and up to c. 1250 metres elevation.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the nominate race (275).

BREEDING. Season irregular: January to April, and September-October recorded, but probably also breeds in other months excepting those of the heaviest monsoon (June-August). Nest and eggs indistinguishable from those of the nominate race, the latter averaging slightly larger and paler. Average size of 36 eggs 41.3 × 30.4 mm. (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies.

Male. Above bright chestnut-rufous with the pale scalloping absent or obsolete. Vermiculations on lower back entirely absent; on rump and upper tail-coverts almost so. Below, chestnut very rich, extending to vent.

Female. Above and below, much more richly and brightly coloured than in 275.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
6 ♂♂	153-164	22-25	49-55	116-136 mm.
2 ♀♀	148-150	20-21	41(1)	91-118 mm. (SA)

Baker gives Wing ♂♂ 145-161; ♀♀ 148-150 mm.

COLOURS OF BARE PARTS. As in 275. Legs and feet sometimes salmon-pink or orange-coral; claws and spurs horny brown.

PHEASANTS, PARTRIDGES, QUAILS

71

FOOD. Seeds, tubers, berries and drupes (e.g. *Zizyphus oenophia*, *Lantana*, *Ficus* spp.), tiny land molluscs, and insects — especially termites. Also flowers of *Mowia* (*Basia latifolia*) in season.

VOICE AND CALLS. Male when flushed utters 'a curious bubbling, half-scolding clucking note' (Pitman). Male has 'a fine cackling sort of call very fowl-like' (Jerdon). 'A peculiar loud *chur, chur, chur*, rapidly repeated, anything but fowl-like' (Blewitt)!

BREEDING. Season overall January to June, principally February to early May. Possibly also in other months locally, e.g. August in the Deccan (Sparrow). Nest, a scrape in the ground lined with grass and leaves, placed deep under a boulder or root, or on a bed of dry bamboo leaves in the heart of a clump, usually well concealed. Eggs, 3 or 4, sometimes 5, pale buff, very like small eggs of the country fowl. Average size of 25 eggs 40.9 × 29.3 mm. (Baker). As in *G. spadicea* both parents tend the brood assiduously and indulge in distraction display to lead off the intruder from the 'frozen' and perfectly camouflaged chicks. Incubation evidently by female alone; period unknown.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit. Coloration on wings of adult males very variable, and apparently unconnected with age. In some examples amount of metallic green on wing-coverts so great that the chestnut is visible only on their outer half (viewed *en masse*), and even then a considerable part of the feathers is glossy green. In other examples wing-coverts practically all chestnut with the metallic green confined to inconspicuous tips on many of the feathers. There is similar variation in amount of metallic green of scapulars and central back, but in all cases the white spotting on these persists.

Chick (in down). Above, light chestnut-rufous; darkest on head and a broad dorsal line. Below, dull pale earthy brown, more chestnut on throat, breast, thighs, and vent.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
8 ♂♂ ad.	148-167	22-25	40-45 (4 msd.)	111-129 mm.
8 ♀♀ ad.	132-157	21-23	36-44 (3 msd.)	99-128 mm. (SA, HW)

Baker gives Wing ♂♂ 144-161; ♀♀ 138-159 mm.

Weight ♂♂ 9-10 oz. (c. 255-285 gm.); ♀♀ 8-9 oz. (c. 226-255 gm.) — Hume.

COLOURS OF BARE PARTS. Iris hazel brown. Bill horny brown, paler at chin. Legs and feet greyish olive-brown; claws and spurs horny brown. Spurs in ♂ 1 to 3, generally 2 on each leg, sometimes 3 on one 2 on the other. In ♀ generally 1 on each leg.

279. Ceylon Spurrow. *Galloperdix bicalcarata* (J. R. Forster)

70

GALLIFORMES

278. Painted Spurrow. *Galloperdix lunulata* (Valenciennes)

Perdix lunulata Valenciennes, 1825, Dict. Sci. Nat., ed. Levaillant, 38: 446 (Bengale)
Baker, FBI No. 1943, Vol. 5: 362

Plate 31, fig. 13

LOCAL NAMES. *Askal*, *Kainjer* (Orissa); *Hutkah* (Gondi); *Kalkodi* (Tamil); *Jittu kōdi* (Telugu).

SIZE. Grey Partridge; length c. 32 cm. (12½ in.).

FIELD CHARACTERS. A partridge-like bird distinguished from francolins by longer tail and very distinctive coloration.

Male (adult). Above, forehead and crown metallic greenish black, stippled with white elongate drops. Sides of head, and neck all round, black with broader white spots. No crest or bare orbital skin as in *G. spadicea*. Upperparts chestnut marked with black-bordered white eye-spots or ocelli; replaced by fine black stippling, or absent, on lower back. Scapulars and some wing-coverts metallic green. Tail blackish, faintly glossed with green. Below, breast and anterior abdomen buff, with triangular black stippling. Posterior abdomen, flanks, and under tail-coverts chestnut, the former with black-edged white spots, the last black-tipped.

Female (adult). Above, forehead, supercilia and sides of head dark chestnut. Crown black with chestnut shaft-stripes. A chestnut-buff moustachial stripe from gape. Upperparts including wings dark brown tinged with olive. Below, chin, throat, and cheeks buff, mottled with chestnut. Rest of underparts olivaceous brown, paler and yellower on breast.

Young (immature) male like adult female but duller. Above, much freckled and barred with dull black and rufous-brown. Below, more earthy brown and much freckled with buff.

STATUS, DISTRIBUTION AND HABITAT. Resident. Continental and peninsular India south of the Gangetic Plain, roughly south of the rivers Sindh (in Gwalior dist., M.P.), Yamuna (Jumna) and Ganga (Ganges). Not in Rajasthan or Gujarat or in the coastal strip west of the Western Ghats. Commoner in the central and eastern parts of the Peninsula than western. Range largely overlaps and/or jigsaws confusingly with that of *G. spadicea*, but as a rule this species more addicted to drier rockier foothills and broken terrain covered with dense, impenetrable thorn scrub (e.g. *Anogeissus*, *Acacia*, *Mimosa*, *Bridelia*) and bamboo jungle, up to c. 1000 metres elevation. Partial to grassy hill crests and ridges in such.

GENERAL HABITS. Keeps in pairs or family parties of 3 to 5, or 6. Is even a greater skulker than Red Spurrow. Extremely reluctant to fly unless really hard pressed or fired at while scuttling through the undergrowth — then only to 'hedge-hop' a few yards over the thickets and continue sprinting immediately on alighting. After this, almost impossible to flush a second time, the bird taking refuge in some hole or fissure of rock and refusing to budge in spite of much din and beating of bushes. Very swift on its legs, clucking as it runs on disturbance, with tail spread and partly erect, hopping from rock to rock on a steep hillside with agility. Thus the best way to shoot them is to walk along the crest of a scrub-covered ridge with a beater about 20 yards below on either side. On disturbance the bird will invariably run uphill to the open ridge and then launch in the air to hurl itself down the opposite slope offering fairly easy shots.

72

GALLIFORMES

SIZE. Grey Partridge + or half-grown village fowl. Length c. 34 cm. (13½ in.).

FIELD CHARACTERS. 'The cock with his white-spangled black foreparts and dark chestnut hindparts, is unmistakable' (G. M. Henry).

Male (adult). Above, forehead, crown, nape and hindneck black with white shaft-stripes; naked red orbital skin. Rest of upperparts black and chestnut with white shaft-stripes and elongated spots. Lower back and rump chestnut, finely vermiculated with black. Upper tail-coverts and tail black. Below, chin white; throat and sides of head white, streaked with black. Sides of breast, and flanks, black broadly streaked with white. Breast and anterior abdomen white; posterior abdomen and under tail-coverts blackish with whitish spots.

Female (adult). Crown blackish; forehead and sides of head paler; naked orbital skin red, chin whitish. Rest of plumage above and below dull chestnut, vermiculated with black except on breast.

STATUS, DISTRIBUTION AND HABITAT. Species endemic to Ceylon. Resident. Locally distributed in the forests throughout the Wet zone, in parts of the Eastern and Uva Provinces (Dry zone), and in the hills to c. 2000 metres (Phillips). Not uncommon in the more densely forested parts of its range both in the low country and the hills.

GENERAL HABITS. Nothing recorded as specifically different from the Indian species.

FOOD. Seeds, fallen berries, termites and other insects, and predominantly *Strobilanthes* ('nillu') seeds in flowering years.

VOICE AND CALLS. 'A peculiar ringing cackle consisting of series of three-syllabled whistles, each series on a higher note than the preceding one and the last dropping suddenly to the starting note: *yuhuhu, yuhuhu, yuhuhu, yuhuhu, yuhuhu, yuhuhēyū*. This cackle is uttered by the male and is replied to by other males in the neighbourhood in similar strains, so that for some minutes at a time, and several times during the morning, the welkin rings with their music' (G. M. Henry).

BREEDING. Season, during the northeast monsoon — November to March; also occasionally July to September. Nest, as in the Indian species, a slight scrape in the ground under shelter of a rock or bush. Eggs, normally 2, but up to 5 recorded; cream or warm buff in colour, exactly like those of a village hen. Average size of 18 eggs 40.6 × 29.7 mm. (Baker). Cock monogynous and very pugnacious.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick at first 'clothed in rather uniform dark brown down. Each sex quickly develops its distinctive plumage, but the white streaks and spots of the young male are relatively fewer and larger than in the adult' (G. M. Henry).

MEASUREMENTS

73

Weight ♂ 11-13 oz. (c. 312-368 gm.); ♀ 7-10 oz. (c. 200-312 gm.) — Hart.
 COLOURS OF BARE PARTS. Iris brownish yellow or brownish red; orbital skin red, paler in ♀. Bill, legs, and feet red, paler in ♀. Males usually with two spurs on each leg, the upper one longer. In the two males measured by Whistler upper spurs 16 and 27.5 mm.; lower 13 and 17.5 mm., respectively. Most females have one or two spurs on both legs; in some they are missing on one leg.

Genus *OPHRYSIA* Bonaparte

Ophrysia Bonaparte, 1856, *Compt. Rend. Acad. Sci. Paris* 43: 414. Type, by original designation and monotypy, *Rollulus superciliosus* J. E. Gray

Very little known and correct taxonomic position equivocal. Wing short: first primary (as.) shorter than tenth; fifth or sixth longest. Tail of 10 feathers, well rounded, nearly equal to wing in length; this feature reminiscent of *Galloperdix*. Bill short and stout, rather as in *Ithaginis* or *Perdix*. Tarsus short but strong. Plumage long, lax and lanceolate, being in these respects similar to the Blood Pheasants (*Ithaginis*). Forehead feathers bristle-shafted and stiff as in *Ithaginis* and *Perdix*. Sexes dimorphic.

Contains a single species known only from the Kumaon Himalayas, now apparently extinct.

280. Mountain Quail. *Ophrysia superciliosa* (J. E. Gray)

Rollulus superciliosus J. E. Gray, 1846, *Knowsley Menagerie*, I: 8, pl. 16

(India = Mussoorie)

Baker, *FBI No.* 1939, Vol. 5: 356

Plate 32, fig. 12

LOCAL NAMES. Not recorded.

SIZE. Grey Partridge —; length c. 25 cm. (10 in.).

FIELD CHARACTERS. A smallish relatively long-tailed slaty brown partridge with conspicuous red bill and feet.

Male. Above, face black with a white patch in front of eye and another behind. Forehead and prominent broad supercilium white, bordered above and below with black. Crown greyish brown streaked with black. Upperparts dark slaty olive-brown streaked with black. Wings browner and lighter. Below, chin and throat black, bordered by a conspicuous white looping band from cheeks; under tail-coverts black, barred with white. Rest of underparts like back.

Female. Above, face pinkish grey. A small white eyebrow, and white patch in front and behind eye as in male. A broad black band on either side of crown. Upperparts including wings, cinnamon-brown broadly black-streaked on nape and neck, and with triangular black spots on back and the rest. Below, pale vinaceous-brown streaked with chestnut and black from lower throat down. Flanks and vent vermiculated with brown and black.

STATUS, DISTRIBUTION AND HABITAT. Status unknown. Not recorded anywhere extraliminally. Presumably once endemic; now most probably extinct. Was known only from the Western Himalayas between c. 1650 m. (Jharipani above Dehra Dun) and c. 2100 metres elevation — Banog, Badiraj behind Mussoorie, and Sher-ka-danda near Naini Tal. Last specimen procured at

281. Nepal Blood Pheasant. *Ithaginis cruentus cruentus* (Hardwicke)

Phasianus cruentus Hardwicke, 1821, *Trans. Linn. Soc. London* 13(1): 237

(Mountains of Nepal)

Baker, *FBI No.* 1936 (part), Vol. 5: 352

LOCAL NAMES. *Chilime*, *Chilmili*, *Seremin*, *Selmung* (Nepal).

SIZE. Domestic fowl; length c. 46 cm. (18 in.).

FIELD CHARACTERS. Male, a brightly, almost gaudily coloured large partridge-shaped bird, overall grey above, apple-green below, streaked with yellow, with a full mop-like crest. A bright red naked orbital patch bordered by black. Forehead black; chin and throat crimson. Upper breast splashed with crimson ('blood stains'). Crimson splashes also on wing shoulders, upper and lower tail-coverts, and in tail.

Young male less brilliantly coloured, with red bill. Orbital skin and cere fleshy grey.

Female. Overall bright rufous-brown, finely vermiculated. Forehead, face, and throat light ochre or rufescent cinnamon, contrasting strongly with ashy grey crest and nape.

STATUS, DISTRIBUTION AND HABITAT. Resident. Common and abundant in the High Himalayas in central and eastern Nepal seasonally up and down with the snowline between c. 3600 and 4300 metres altitude; occasionally somewhat lower in severe winters. Affects steep pine forest, dwarf rhododendron, and dense ringal bamboo and juniper scrub, often interspersed with snow patches.

GENERAL HABITS. As a species found at higher elevations, even in winter, than any other Himalayan pheasant. Gregarious; usually in coveys of 5 to 10, sometimes up to 30 and more. A swift and strong runner with an upright partridge-like carriage, loth to take wing even after a member of a covey has been shot at. Like all mountain partridges, invariably runs uphill and flies downhill. Feeds in the open patches, scratching the ground like domestic fowl, often digging deep into the snow with its short, stout, grouse-like bill. Tame and fearless to the point of stupidity, the members of a covey coming out inquisitively to a fluttering companion that has been shot, and allowing bird after bird to be killed by the ambushed hunter.

FOOD. Almost exclusively moss, fern and pine shoots, and lichens.

VOICE AND CALLS. Rallying call of scattered covey: a long, high-pitched squeal something like a kite's. 'A short monosyllabic note of alarm' (Blanford).

BREEDING. Little recorded in wild state beyond Hodgson's statement that the loose nest of grass and leaves is placed on the ground in grass and bushes. Season, April-May. Several observers have noted parents (various races) accompanied by small chicks in June and early July. Eggs, 5 to 12, pinkish buff profusely speckled and blotched with rich brown. Incubation

74

GALLIFORMES

the latter place in 1876 since when thorough combing of its known habitats and others of identical ecology has failed to rediscover the bird. In all less than a dozen specimens (actually 10) exist in world museums, and its biology is completely unknown.

GENERAL HABITS. Was found in coveys of 5 or 6 in patches of long grass and brushwood on steep hillsides. Flew reluctantly when almost trampled on, heavily and for short distances, soon pitching into the grass again.

FOOD. Grass seeds; probably also insects and berries.

VOICE AND CALLS. Contact note when covey feeding: 'low, short, quail-like'. Alarm note when disturbed: 'a shrill whistle'.

BREEDING. Unknown.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS of the 5 examples in the British Museum:

	Wing	Tail
3 ♂♂	85, 86, 93	76, 78, (damaged) mm.
2 ♀♀	87, 91	64, 65 mm.
		(SA)

Bill (from feathers) 11.5; tarsus 29 mm. (Baker).

COLOURS OF BARE PARTS. ♂ Bill coral red; legs and feet dull red. ♀ Bill dusky red, lower mandible brightest; legs dull red; eyelids black with a small white spot at the corner' (Hutton).

Genus *ITHAGINIS* Wagler

Ithaginis Wagler, 1832, *Isis von Oken*, col. 1228. Type, by monotypy, *Phasianus cruentus* Hardwicke and *Phasianus gardneri* Hardwicke

(The former is the ♂, the latter the ♀ of the same bird.)

Of Delacour, J., 1951, *The Pheasants of the World*, London. (Genera of pheasants.)

Plumage generally very soft and lax, the feathers lanceolate in shape. A soft, mop-like crest in both sexes. Wing short and rounded: first primary (as.) shorter than or nearly equal to tenth; fifth and sixth primaries about equal, and longest. Tail long, of 14 graduated feathers. Tarsi long and stout, furnished with several spurs in the male; reduced to knobs in female. Bill short, stout and curved, very grouse-like in character, reminiscent also of *Perdix*. A small naked orbital patch. Sexes markedly dimorphic.

Only a single High Himalayan species within our limits.

GALLIFORMES

Ithaginis cruentus

■ Distributional range within Indian limits 1 *I. c. cruentus* (281).
 2 *I. c. affinis* (282). 3 *I. c. tibetanus* (283). 4 *I. c. kuseri* (284).

Other races extralimital E. of 4, and N. to c. 38°.

period 29 days (Delacour). Male apparently monogynous in aviaries, but in wild state two cocks (race *tibetanus*) assiduously attending on a single hen have been observed by Sheriff (Ibis 1944: 381) on three separate occasions and according to local Tibetans the species is both polygynous and polyandrous.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; Delacour: 50. Chick (in down). 'Loral and malar streaks, circle around eye, large infra-auricular spot and line extending backward around the nape, centre of crown and wide nuchal band brownish black; remainder of head, throat and neck pale grizzled grey; lower neck and entire body dull rufous, with slender black tips, except on underparts, where the rufous is paler and purer' (Delacour).

Close similarity with chick of Snow Partridge (*Lerwa lerwa*) stressed by Meinertzhagen (Ibis, 1927: 625 and coloured pl. xv). In *Ithaginis* chick tarsus bare throughout, bill orange-yellow; in chick of *Lerwa* tarsus feathered for half its length, bill black.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	193-214	c. 22-23	c. 72-77	164-178 mm.
♀♀	190-195	—	—	—
				(Baker)
♂♀	194-228	11	66-76	164-178 mm.
		(from nostril)		(Delacour)

Weight ♂♂ 1 lb. 1 oz. to 1 lb. 4 oz. (c. 482-568 gm.).

The spurs in ♂ vary from 1 to 3 and are not always the same on both legs.
COLOURS OF BARE PARTS. ♂: Iris yellowish brown; orbital skin bright scarlet of salmon-crimson. Bill horny black, scarlet on cere, edges of base of lower mandible, and gape. Legs, feet, and spurs scarlet like orbital skin; claws horny black. Soles of feet very bright orange-crimson. ♀: Iris brighter yellowish brown; orbital patch, smaller and paler than in ♂. Bill horny brown at base, orange-red at tip. Legs, feet, claws, and soles as in ♂. No spurs.

MISCELLANEOUS. The plumage has a musty repulsive odour even when bird freshly killed. Stuart Baker considered its flesh 'excellent for the table', but even with the locals it ranks as greatly inferior to other pheasants. Meinertzhagen feelingly described it as 'disgusting'. The flavour no doubt varies with the nature of the food upon which the bird has been chiefly subsisting at the time.

282. Sikkim Blood Pheasant. *Ithaginis cruentus affinis* Beebe

Ithaginis cruentus affinis Beebe, 1912, Zoologica 1: 191 (British Sikkim)
Baker, FBI No. 1936 (part), Vol. 5: 352
Plate 35, fig. 5

LOCAL NAMES. Same, Semo, Soomong pho (Lepcha).

SIZE AND FIELD CHARACTERS. As for 281, q.v. See Key to the Subspecies

STATUS, DISTRIBUTION AND HABITAT.

Resident. Common. Sikkim and western Bhutan, between c. 2600 and 4600 metres altitude; down to c. 1500 metres in exceptionally severe winters. Its contact zone with the race *tibetanus* (283) evidently lies in the Jo Dürshi or Black Mountain range in central Bhutan which forms the watershed between the Manas and the Sankosh rivers (Ludlow, *Ibis* 1937: 499). Affects steep, *Abies* forest, dwarf rhododendron, and

x c. 1/2

dense ringal bamboo and juniper scrub near the snow-line.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the nominate race (281).

BREEDING. Nothing specifically recorded as different from Nepal birds.

MUSEUM DIAGNOSIS. Compared with the Nepal Blood Pheasant (281), male *affinis* has the forecrown without crimson; the throat with a little crimson but black showing through it; crimson on breast much reduced; a little more green on the flanks. The absence of crimson on the outer tail-feathers, as mentioned in Beebe's original description, does not always apply. Female *affinis* less grey on crest and nape than in 281.

No size difference between the Nepal and Sikkim populations.

MEASUREMENTS of Sikkim specimens:

Wing: 21 ♂♂ ad. 196-220 (aver. 209.4); 12 ♀♀ ad. 187-205 mm. (aver. 195.0) mm. (SA).

COLOURS OF BARE PARTS. As in 281.

probably, is the most sporting weapon to use, for Kuser's Blood Pheasant is only a shade wilder than a barn-door fowl' (F. Ludlow, *Ibis* 1944: 382).

BREEDING. A nest with 3 fresh eggs recorded at c. 3000 m. altitude in the Upper Dibang Valley, end April. In a depression in the ground under a bamboo (F. M. Bailey).

MUSEUM DIAGNOSIS. Male. Differs from *I. c. tibetanus* (283) in the still greater extent of red and black colours. Forehead, throat, and breast almost pure crimson-red. Supercilia, ear-coverts, sides of head, and neck, wholly black. A broad black band (gorget) between red of throat and of breast.

Female, similar to *tibetanus* but slightly darker and redder, often washed with red on breast. Face and cheeks bright reddish brown (Delacour).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	197-210	c. 19	55-60	147-171 mm.
♀♀	184-190	—	—	—

COLOURS OF BARE PARTS. Iris yellow or light brown; orbital skin yellow, tinged with orange behind eye. Bill black, with scarlet cere and nostril. Legs and feet scarlet; claws dark brown; spurs black-tipped or all black (Baker).

Genus TRAGOPAN Cuvier

Tragopan Cuvier, 1829, Règne Anim., nouv. éd., 1: 479. Type, by monotypy, *Meleagris satyra* Linnaeus

Contains the so-called Horned Pheasants, with the shape, proportions and carriage of partridges and a great deal of resplendent crimson in the plumage of the males.

Wings rounded: first primary (as.) shortest; 4th and 5th subequal and longest. Bastard wing (alula) well-developed. Tail of 18 feathers steeply graduated, more or less equal to wing in length. Bill short and stout; feathers of forehead almost reaching to nostril. Legs very powerful; armed with a short blunt spur on tarsus. An occipital crest of lengthened feathers in male, and two long subcylindrical brightly coloured fleshy horns, one above each eye, erected in courtship display. A brilliantly coloured and patterned apron-shaped gular wattle or bib fully developed in breeding season, also expanded in display. Sides of head and throat naked and brightly coloured in all species except *T. satyra* (286), in which they are thinly feathered.

The genus ranges throughout the Himalayas from Kashmir to eastern China, four species occurring within our limits.

Key to the Species

	Shoulder of wing tinged with crimson..... <i>T. satyra</i>	82

283. Tibetan Blood Pheasant. *Ithaginis cruentus tibetanus* (Baker)

Ithaginis [sic] *tibetanus* Baker, 1914, Bull. Brit. Orn. Cl. 35: 18 (Sela Range, 13,000 ft, above Tawang, eastern Bhutan-Tibet boundary [= NEFA])
Baker, FBI No. 1938, Vol. 5: 355

LOCAL NAME. Seri (Tibet).

SIZE AND FIELD CHARACTERS. As for 281, q.v. but with forehead crimson instead of black. (See Key to the Subspecies and Museum Diagnosis.)

STATUS, DISTRIBUTION AND HABITAT. Resident. 'Extremely common in eastern Bhutan in summer from 11,000 to 14,500 ft' (c. 3350 to 4400 metres — Ludlow, *Ibis* 1937: 499). Also in Kameng (and Subansiri?) Frontier Division of NEFA. Moves altitudinally with the seasons; in autumn and winter down to c. 2750 m. Its western boundary is probably the Jo Dürshi or Black Mountain range in central Bhutan between the 90th and 91st meridian — the watershed of the Manas and the Sankosh rivers. Affects dwarf rhododendron scrub near the snow-line.

Extralimital. Adjacent parts of SE. Tibet.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the nominate race (281).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Male. Above, crest greyer, less white than in 281; posterior ear-coverts grey and white. Feathers of forehead and face, above and below the eyes, red instead of black. Rectrices whitish grey. Below, feathers of breast with much more red, as in *kusuri* (284).

Female. Resembles *I. c. cruentus*, but darker and more strongly vermiculated below. Similar also to *I. c. kusuri* (284) but a shade more rufous and with the shaft-streaks on the underside more pronounced. Some females show scarlet feathers on the throat and sides of head.

MEASUREMENTS. ♂ Wing 197; bill (from feathers) 17.7; tarsus 59.7; tail 176.5 mm. (Baker).

COLOURS OF BARE PARTS. Bill black; orbital skin apparently orange; legs brilliant crimson-red, soles paler, claws black (Baker).

284. Mishmi Blood Pheasant. *Ithaginis cruentus kusuri* Beebe

Ithaginis kusuri Beebe, 1912, Zoologica 1: 190 (Yunnan)
Baker, FBI No. 1937, Vol. 5: 354

LOCAL NAMES. Chiku (Mishmi); Siri, Selo (Tibet).

SIZE AND FIELD CHARACTERS. As for 281, q.v., but with forehead crimson instead of black. (See Key to the Subspecies and Museum Diagnosis.)

STATUS, DISTRIBUTION AND HABITAT. Resident. Abor and Mishmi Hills of Siang and Lohit Frontier Divisions, NEFA, between c. 2500 and 4500 metres altitude. Its western boundary with *tibetanus* (283) lies somewhere between the 92nd and 93rd meridians (Ludlow, *Ibis* 1944: 381). Affects the rhododendron scrub zone to its highest limit.

Extralimital. SE. Tibet east to Yunnan (Shweli-Salween divide).

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the nominate race (281). 'It is one of the loveliest, stupidest, tamest and most unappetising game birds I have ever shot. We got specimens with our catapults, and this,

	Page
a General tint paler and more buff; black markings fewer.....	82
..... <i>T. satyra</i>	
General tint darker and black markings predominating.....	84
..... <i>T. blythii</i>	

285. Western Horned Pheasant. *Tragopan melanocephalus* (J. E. Gray)

Phasianus Melanocephalus J. E. Gray, 1829, in Griffith, Anim. Kingd. 8 (Aves, 3): 29 (Almorah, India)
Baker, FBI No. 1932, Vol. 5: 345
Plate 34, fig. I

LOCAL NAMES. Jewar (Garhwal); Jaghi, Jaghi (Bashahr); Sing monal (NW. Himalayas); Jigurana ♂, Budal ♀ (Kulu, Mandi, Suket); Fulgar ♂, Fulgeri ♀ (Chamba); Sonālu ♂, Solāle ♀ (Kashmir).

SIZE. Large village hen; length c. 71 cm. (28 in.).

FIELD CHARACTERS. Male. A brilliantly coloured, white-spotted red and black giant partridge. Above. Crown black, with recumbent red-tipped occipital crest. Face naked bright red. Upperparts including wing-coverts and tertiaries finely vermiculated buffy grey and black, and with round black-bordered white spots or ocelli. Neck (all round) red. Tail mottled buff and black, with irregular black bars and tips. Below, naked throat deep blue; foreneck and upper breast bright light red. Rest of underparts black, ocellated with white and irregularly smeared with red; flanks and abdomen mottled with brown and black.

Female. General effect grey instead of rufous-brown as in ♀ *T. satyra* (286). Above brownish grey; head and neck tinged with rufous, rest of upperparts irregularly streaked and spotted with black and white. Below, vermiculated grey and dark brown, spotted with fulvous on throat, and broadly streaked and sploshed with white on the paler and greyer abdomen and flanks.

Young (immature) male like female, but the marks below more rounded, less spatulate in shape. At an older stage also like female 'but larger, lighter on the legs, with a variable amount of black on the head and of red on the neck, and a number of white spots, surrounded with black, on the upper back and underparts' (Delacour).

STATUS, DISTRIBUTION AND HABITAT. Resident. From Swat in northern West Pakistan (Duber Valley, W. of Indus R., c. 73°E.), through Kashmir, the Punjab Himalayas and Himachal Pradesh to Garhwal and Kumaon (?) seasonally between c. 1350 (winter) and 3600 metres altitude; normally breeding above c. 2400 m. Affects dense undergrowth of rue and ringal bamboo in hill forest.

GENERAL HABITS. More or less common to the genus. Seen singly or in pairs, sometimes small family parties in non-breeding season. In out-of-the-way places where comparatively free from persecution sometimes feeds in company with Chir, Kaleej, and Koklas pheasants in open glades or forested hill slopes, particularly whence the snow has just melted. Normally very shy and wild; skulking away through thick undergrowth on the least

Tragopan

- Range within Indian limits 1 *T. melanocephalus* (285).
 2 *T. satyra* (286). 3 *T. blythii molesworthi* (287).
 4 *T. blythii blythii* (288). 5 *T. temminckii* (289).

disturbance or flying up and concealing itself most effectively in densely foliated branches of trees where it also roosts at night. Like all Himalayan pheasants difficult to observe in wild state. Most details of its biology obtained from captivity in which it thrives well and breeds freely given adequate care and facilities. Stages of the cock's bizarre but beautiful display thus described by Delacour (loc. cit.: 60). (1) Struts round hen with wing on near side lowered and partly spread, shoulder on far side raised, slanting upper part of body towards her for better exhibition. This is the manoeuvre common to the domestic cock and all other pheasants. (2) Rushes suddenly with partly spread wings, with or without erection of horns or expanding of throat-wattle (bib). (3) Stops suddenly with most of the lower plumage fluffed out. The half-spread wings move slowly up and down, with wrist-edges well out from body and tips pressed inward and downward; head and neck shaken spasmodically until the horns and wattle are spread out to their utmost. The lappet is expanded and retracted with astonishing ease and rapidity. The bird soon reassumes a normal posture, walks off, picks up food, only to start displaying again in a moment.

FOOD. Largely fresh leaves, e.g. of oak (*Quercus*), sometimes taken up in the trees; shoots of ringal bamboo, roots, seeds, acorns, berries and insects.

VOICE AND CALLS. When alarmed a succession of wailing cries not unlike those of a young lamb or kid: *wa, wa, wa*, each *wa* uttered slowly and distinctly at first, and more rapidly as the bird is hard pressed and about to

PHEASANTS, PARTRIDGES, QUAILS

83

♂, x 6.3

of crest. General plumage, above and below, rich orange-crimson, olive-brown on back and rump, sprinkled all over with round black-bordered white spots or ocelli. Shoulder of wing crimson; rest of wing dark brown mottled with buff; tail black.

Female. Above rufous- or ochreous-brown, vermiculated, barred and blotched with black and buff. Pale shaft-stripes on crown. Shoulder of wing tinged with crimson. Below, chin and throat whitish; breast and abdomen like back but paler, mottled with large ill-defined whitish shaft-spots. Tail rufous-brown, irregularly barred with black and buff.

Young (immature) ♂ like female, but less richly coloured. When assuming adult plumage presents a patchy appearance with red and ocellated feathers distributed irregularly on underparts.

STATUS, DISTRIBUTION AND HABITAT. Resident. Garhwal, Nepal, Sikkim, Bhutan and adjoining parts of NEFA. Western and eastern limits, as presently known, roughly the Alaknanda river in Garhwal (c. 79°30'E.) and 'Darrang' north of Brahmaputra river, in Assam. (More likely somewhere in the Kameng Frontier Division [Mon Yul area ?] where the altitudes and biotope are more appropriate.) Affects oak, deodar and rhododendron forest in *khuds* and on steep hillsides with scrubby undergrowth and ringal bamboo, between c. 2400 and 4250 metres elevation; down to c. 1800 metres in severe winters.

GENERAL HABITS AND FOOD. As of 285, q.v. Stomachs of 13 birds from Lachung (Sikkim) examined by Meinertzhagen in December all contained a leaf and a fern believed to be *Diplazium* and *Polypodium*.

VOICE AND CALLS. 'A loud pitched *wak* repeated several times' (H. Stevens). 'An arresting loud *kye, kye, kye* like the bleating of a goat kid' (SA). Each bleat repeated at appropriate intervals.

BREEDING. Little known in the wild state. *Season*, apparently May-June. *Nest*, an untidy jumble of sticks placed up in the branches of a tree in forest. *Eggs*, 2 to 4 (?) reddish buff, freckled all over with deeper brick-red. Size c. 65 x 42 mm.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Above, 'Side of head and supercilium dirty buffish white, dark-tipped on ear-coverts; crown from bill ferruginous. Upperparts ferruginous-brown with darker tips and paler bases, but no distinct pattern. Tail ferruginous. Below, chin and throat buffish white; rest of underparts same, with faint dark tips and tinged with rust on sides and on thighs' (Tiechurst).

MEASUREMENTS. Wing 15 ♂♂ ad. 260-277 (aver. 268.5 mm.); 7 ♀♀ ad. 216-245 (aver. 229.5 mm.). — (Schäfer, Stevens, SA).

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	245-285	14-16	85-95	250-345 mm.
♀♀	215-235	11	66	195 mm. (Delacour)

take wing. On approach of breeding season ♂ calls at intervals throughout the day, more often at dusk and daybreak (every 5 or 10 minutes, sometimes longer) from the bough of a tree or other elevated position such as a fallen tree-trunk or boulder. Similar to alarm-call but much louder and a single energetic, far-carrying *wa* at a time, not unlike the bleating of a lost goat. This curious cry has also been described as 'something between a kid's bleat and the cry of a wild goose' (Hume & Marshall).

'The love-call of the male tragopan [apparently the genus] is a resounding and far-reaching *way! waah! oo-ah! OO-aaaah!*' (Delacour).

BREEDING. Poorly known in the wild state. *Season*, mentioned as June. *Nest*, of sticks with grass lining either on the ground in thick undergrowth, e.g. of ringal bamboo, or in a tree: 'about 10 ft from the ground' being recorded. *Eggs*, in captivity 3 to 6, laid every other day; pale buff to reddish brown feebly freckled with dark brown, averaging c. 63 x 42 mm. in size. Cock monogynous; assists in tending the chicks. Incubation entirely by hen; period about 28 days.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Like that of *Tragopan satyra* (286) q.v., but greyer.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	255-290	17-20	78-97	220-250 mm.
♀♀	225-250	15	65	190-200 mm. (Delacour)

Weight ♂♂ 4 lb. to 4 lb. 12 oz. (c. 1.80-2.15 kg.). — Baker; ♀♀ 2 lb. 12 oz. to 3 lb. (c. 1.25-1.40 kg.). — Whistler.

COLOURS OF BARE PARTS. ♂ Iris brown. Bill black, tip horny. Bare skin of face bright red with lines of small blue spots below eyes. Throat [naked] deep blue; cheeks blue-green; lappet purplish blue down centre, pink on margins, with pale blue indentations. Fleishy horns blue. Legs pink to whitish grey, according to season (Delacour).

The lappet, when not in use, shrivels up and becomes quite insignificant.

286. Crimson Horned Pheasant or Satyr Tragopan. *Tragopan satyra* (Linnaeus)

Meleagris Satyra Linnaeus, 1758, Syst. Nat., ed. 10, 1: 157

(Bengal, ex Edwards, pl. 116, error = Nepal!)

Baker, FBI No. 1931, Vol. 5: 343

Plate 34, fig. 2

LOCAL NAMES. *Lungi* (Hindi, Garhwal, Kumaon); *Monal* (Nepal); *Omo*, *Bop* (Bhutes); *Tarhyak* (Lepcha); *Chamling* (Tibet).

SIZE. Village hen; length ♂ c. 68 cm. (27 in.), ♀ c. 59 cm. (23 in.).

FIELD CHARACTERS. Male. Head, recumbent crest, and a loop round the deep blue semi-naked throat-patch, black. A crimson streak on either side

² or Darjeeling dist., Bengal? See Birwas, 1960, JBNHS 57: 360, footnote.

Tail proportionately longer than in other tragopans.

Weight ♂♂ 3 lb. 8 oz. to 4 lb. 10 oz. (1.60-2.10 kg.); ♀♀ 2 lb. 4 oz. to 2 lb. 10 oz. (c. 1-1.20 kg.). — Hume.

COLOURS OF BARE PARTS. ♂ Iris brown. Bill black. Bare skin of throat dark blue; lappet blue in middle, pale green on margins, with four or five triangular scarlet patches on each side. Fleishy horns blue. The lappet extends to a length of 100 mm. and the horns to 75 mm. during display. Legs pink.

♀ Iris brown; orbital skin bluish. Bill horn brown. Legs whitish grey (Delacour).

TRAGOPAN BLYTHII (Jerdon)

Key to the Subspecies

Males

Paler; red of the breast forming a very broad gorget.... *T. b. blythii*
 Darker; red of the breast forming a very narrow gorget only.....
 *T. b. molesworthi*

287. Tibetan Greybellied Tragopan. *Tragopan blythii molesworthi* Baker

Tragopan blythii molesworthi Baker, 1914, Bull. Brit. Orn. Cl. 35: 18

(Dengon La, 8000 ft, Tibet)

Baker, FBI No. 1934, Vol. 5: 349

LOCAL NAME. *Bop* (Tibet).

SIZE. Village hen; length ♂ c. 68 cm. (27 in.).

FIELD CHARACTERS. As of the nominate race (288) q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. Rare. Apparently only three specimens known. Eastern Bhutan (where it overlaps the range of *T. satyra*) and presumably adjoining parts of NEFA east to the Mishmi Hills, from c. 1800 to 3300 metres elevation. Reported to keep to the thickest scrub and ringal undergrowth in high forest, and very hard to get a glimpse of though not shy (Col. J. Chatterton).

Extralimital. Adjacent parts of SE. Tibet.

GENERAL HABITS AND FOOD. As of the nominate race.

VOICE AND CALLS. Brig. A. L. M. Molesworth, who obtained the type specimen, says 'it was sitting in a clump of bamboos making a noise like a leopard' (!).

BREEDING. Unknown.

MUSEUM DIAGNOSIS. Male, differs from ♂ of the nominate race (288) in having the entire upperparts darker, the maroon ocelli browner, and the buff vermiculations narrower and less distinct; the white spots smaller though equally numerous. Below, red of breast confined to a comparatively narrow gorget descending only a short way below the neck on to the breast. Rest of lower parts much paler grey than in *blythii*, the light centres scarcely distinguishable from the surrounding parts of the feather.

Female, differs from ♀ of the nominate subspecies in having the whole upper plumage darker, the blackish marks being larger and deeper coloured, the grey-brown markings much deeper grey and less brown, ear-coverts sub tipped rufous, rufous-centred cheek-feathers, rump and upper tail-coverts greyer and not

PHEASANTS, PARTRIDGES, QUAILS 85

quite so reddish in general tone. On the underside, the rufous edges of feathers of breast and abdomen deeper' (Biswas, 1968, JBNHS 65: 216-17 and coloured plate).

MEASUREMENTS

♂ Wing 250; bill ('from front') 19; tarsus 76, middle toe and claw 76; tail 195 mm. (Baker).

♀ (in flesh) Wing 232; bill (from skull) 33; tail 155 + mm. (Biswas).

COLOURS OF BARE PARTS. ♂ unrecorded; presumably as in the nominate race. ♀ Iris dark brown, edges of eyelids lemon yellow. Maxilla black but brown at base; mandible very pale horny. Legs and feet brownish horny; claws horny; pads white' (Biswas).

288. Greybellied Tragopan. *Tragopan blythii blythii* (Jerdon)

Cerionis Blythii Jerdon, 1870, Proc. Asiat. Soc. Bengal: 60 (Hills at the head of the Assam Valley, i.e. Henema, Naga Hills, Assam)

Tragopan blythii rupchandi Koelz, 1954, Contrib. Inst. Regional Exploration No. 1: 29 (Blue Mountain, Lushai Hills)

Baker, FBI No. 1933, Vol. 5: 347

Plate 34, fig. 5 (There should not be any blue adjoining the yellow gular patch as shown.)

LOCAL NAMES. *Hur huria* (Assam and Miri); *San sorai* (Assam, Sadiya); *Gnu* (Angami Naga); *Aghah* (Sema Naga); *Aogho* (Chang Naga); *Chingtho* (Kuki).

SIZE. Village hen; length ♂ c. 68 cm. (27 in.), ♀ c. 59 cm. (23 in.).

FIELD CHARACTERS. A large oversized partridge, the male with much brilliant red in plumage, and conspicuous white ocelli on back.

Male. *Above*, forehead, crown, a patch down either side of neck, and feathers round the naked orange-yellow face, black. Broad supercilia to nape, hindcrown, neck, upper back, and wing shoulders bright crimson. Rest of upper plumage brown, tinged with red and contrastingly marked with numerous white and maroon ocelli. *Below*, feathers round the naked yellow gular patch, black. Adjacent upper breast bright crimson followed by smoky grey lower breast and belly, the feathers centred paler grey. Flanks and thighs mottled black and buff and splashed with crimson as on vent.

Female. Rather like ♀ *T. satyra*, but paler. *Above*, black narrowly barred, blotched and stippled with rufous and vermiculated with buff. Tail paler and more rufous. *Below*, mottled, stippled and spotted with dark brown, rufous, and greyish white. Centre of abdomen, and vent, more uniform grey.

Young (immature) male like female but acquiring red on the neck at the first spring moult.

STATUS, DISTRIBUTION AND HABITAT. Resident, but like other pheasants moving up and down altitudinally with season and supply of favourite foods. Assam south of the Brahmaputra river, in the Patkai, Naga, and Barail hill ranges south through Manipur and Mizo (Lushai Hills) from c. 1800 metres up. Affects thick undergrowth in heavy evergreen forest.

Extralimital. The Chin Hills and adjacent mountain ranges of western and northern Burma.

GENERAL HABITS, AND FOOD. As of 285, q.v.

PHEASANTS, PARTRIDGES, QUAILS 87

Rest of underparts light brown with large whitish shaft-spots and black blotches.

Young (immature) male. Like female, but larger, with some black and red on the head, and red on neck and upper breast.

STATUS, DISTRIBUTION AND HABITAT. Resident. Luhit Frontier Division of NEFA (Mishmi Hills, Upper Dibang and Tsangpo valleys, etc.), between c. 2100 and 3500 m. altitude. The Subansiri-Manas watershed postulated as the dividing line between this species and *T. satyra* which occurs on the East Bhutan frontier (F. Ludlow, *Ibis* 1944: 379). Like the other tragopans affects thick undergrowth in evergreen forest on steep hillsides.

Extralimital. Adjacent mountains of SE. Tibet; N. Yunnan, Szechuan, Shensi and Hupch; NE. Burma (Chin Hills etc.).

GENERAL HABITS, FOOD, VOICE AND CALLS. Largely as in 285, q.v. Little known in wild state. Apparently even more unsocial than other tragopans, and very arboreal. Usually seen solitary, and never more than 2 or 3 together. In uninhabited regions, common and very tame (F. M. Bailey).

BREEDING. Not authentically known. Eggs (in captivity) comparatively small for the genus, averaging 54 × 40 mm.; buff, speckled and freckled with brown (Delacour).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'Lores and crown bright rufous-green, changing to darker chestnut-brown on back and tail-tuft; circle round eye, sides of head, and ear-coverts bright pale fulvous-rufous; below pale dull fulvous' (Baker). 'Differs mostly from *satyra* in being smaller' (Delacour).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	225-265	15-16	70-80	185-230 mm.
♀♀	220-225	15	70	175 mm.

Weight ♂ c. 3½ lb. (1.60 kg.) — F. M. Bailey.

COLOURS OF BARE PARTS. ♂: Iris brown. Bill black, tip horny. Bare face and chin bright blue. Horns greenish blue. Lappet dark blue spotted all over with pale blue and eight arrow-shaped scarlet marks on each side. Legs pinkish to reddish. ♀: Iris brown. Bill horny. Orbital skin bluish. Legs fleshy grey (Delacour).

Genus LOPHOPHORUS Temminck

Lophophorus Temminck, 1813, Fig. et Gall. 2: 355. Type, by monotypy, *Lophophorus refulgens* Temminck = *Phasianus impejanus* Latham

Face more or less naked and highly coloured. Bill long and greatly curved, upper mandible much overlapping lower at the tip as well as along edges. Tarsi and feet very powerful and heavy, the former feathered above and with a short shiny spur. Wing much rounded: first primary (as.) shortest; fifth and sixth coequal and longest. Tail of 18 feathers, shorter than wing, fairly rounded; flat as in partridge, not laterally compressed as in junglefowl.

The genus contains heavily built dumpy Himalayan pheasants shaped like snow-cock but distinguished by the highly refulgent plumage of the males. Two species occur within our limits.

86 GALLIFORMES

VOICE AND CALLS. 'A very loud challenging *gnau, gnau* by the male' (R. S. Bedi, in *epist.*). Displaying cock utters a 'gock . . . gock . . . gock' repeated often, punctuated by short pauses; reminiscent of 'roar' of Great Pied Hornbill but much softer. Two cocks answer each other from the distance, the second joining in soon after the first begins. These 'challenges' and 'counter-challenges' are kept up for some time (Gerd Heinrich, Mt Victoria).

BREEDING. No authentic record in wild state. Eggs (in captivity) pale buff, finely and lightly freckled and spotted with brown, averaging 58.5 × 44 mm. (Delacour). Clutch size ?

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Similar to *T. satyra*, but lighter in colour.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	260-265	c. 10	82-94	180-220 mm.
♀♀	230-245	—	—	—

(Baker)

Bill from skull of a ♂ collected by SDR in the Naga Hills measured 25.5 mm. He remarks that the measurement given by Delacour (op. cit., 1951: 68) as 15 mm. is presumably for nostril to tip rather than culmen, as stated. In view of this, Baker's 'c. 10 mm.' seems even more misleading.

COLOURS OF BARE PARTS. ♂ Iris brown. Bill horny brown. Bare face golden yellow. Horns light blue. Lappet yellow, bordered with blue. Legs pink or reddish. ♀ Iris brown. Bill horny. Orbital skin yellowish. Legs fleshy brown (Delacour).

One spur on each leg in ♂ up to c. 190 mm. long and of a 'bright azure blue colour' in life (*vide* G. Damant in Hume, SF 7: 473).

289. Temminck's Tragopan or Chinese Crimson Horned Pheasant.

Tragopan temminckii (J. E. Gray)

Satyra Temminckii J. E. Gray, 1831, in Hardwicke's Ill. Ind. Zool. 1(9): pl. 50. (No locality; the type in the British Museum is from 'China' = Szechuan *epud* Baker, 1928, Fauna, 5: 350.)

Baker, FBI No. 1935, Vol. 5: 350

Plate 34, fig. 4

LOCAL NAMES. *Bop* (Tibet); *Oua oua ky*; *Ko ky*, *Kiao ky*, *Sin triou ky*, *Tso-chi* (Chinese).

SIZE. Village hen; length c. 64 cm. (25 in.).

FIELD CHARACTERS. Male. *Above* and *below* bright crimson like *Satyr* *Tragopan* (286), with round black-bordered pearl-grey spots or ocelli on upperparts. Head, borders of face, and loop round throat-patch similarly black. Differs from 286 chiefly in having the face naked bright cobalt blue in addition to the throat patch, and large triangular (or diamond-shaped) pearl-grey spots replacing white ocelli on underparts.

Female. *Above*, rufous to greyish brown strongly mottled with blackish, with whitish arrow-shaped marks. Tail like back, but with the markings forming irregular bars. *Below*, chin and throat whitish, with black lines.

88 GALLIFORMES

Key to the Species

	Males	Females	Page
A	Crest composed of feathers with naked shafts and spatulate ends.		88
B	Crest composed of short curly feathers.		90
		Females	
A		Lower back buff barred with black.	88
B		Lower back and rump pale earthy-white with narrow bars of brown.	90

290. Impeyan or Himalayan Monal Pheasant. *Lophophorus impejanus* (Latham)

Phasianus impejanus Latham, 1790, Index Orn. 2: 632 (India = Sikkim, type locality fixed by Meinertzhagen, 1952, Bull. Brit. Orn. Cl. 72: 85)

Lophophorus chambanus Marshall, 1884, *Ibis*: 421, pl. 10 (Chamba)

Baker, FBI No. 1928, Vol. 5: 335

Plate 34, fig. 6

LOCAL NAMES. *Sunāl*, *Suna mūrgh* ♂, *Hām* ♀ (Kashmir); *Nilgur* (Chamba); *Munāl*, *Nil* ♂, *Karēri* ♀ (Kulu); *Munāl*, *Char munāl*, *Ratia kauran*, *Ratnal*, *Railap* (NW. Himalayas); *Datiya* (Kumaon and Garhwal); *Dāngān*, *Dafī* (Nepal); *Fo é-t* (Lepcha); *Chamdong* (Bhutea, Sikkim); *Pia padir* (Mishmi); *Būp* (Bhutanes).

SIZE. Large domestic hen +; length c. 72 cm. (28 in.).

FIELD CHARACTERS. A stout, dumpy Himalayan pheasant. *Above*, refulgent metallic, bronze-green, purple, and blue with a large white rump-patch and crest of wire-like spatula-tipped metallic green feathers. Tail cinnamon-rufous, short, broad, more or less square-cut. *Below*, velvety jet black. When flushed, the wild ringing shrieks, the chestnut wings and the broad white rump-patch are diagnostic.

♂, × c. 1

Female. Brown, mottled and streaked with paler and darker brown, with a short tuft on head and white throat. In flight looks brown with much white in tail.

Young (immature) male. Like female, but more mottled with black above, and with black and rufous below. Older juveniles have some black spots on throat and occasionally a few metallic feathers on upperparts.

PHEASANTS, PARTRIDGES, QUAILS

89

STATUS, DISTRIBUTION and HABITAT. Resident. The Himalayas between c. 2600 and 5000 m. altitude from eastern Afghanistan through NW. Pakistan, Kashmir, Punjab, Himachal Pradesh, Kumaon, Garhwal, Nepal, Sikkim to about the eastern frontier of Bhutan. Somewhere between c. 92° and 93°E. long. it meets the species *L. sclateri* (291) (vide Ludlow, *Ibis* 1944: 376). Affects high oak, rhododendron, and deodar (*Cedrus deodara*) forest interspersed with open glades and sheep pastures, and precipitous hillsides with grass and weeds growing on the narrow ledges.

Lophophorus

Range within Indian limits

- 1 *L. impejanus* (290).
2 *L. sclateri* (291).

GENERAL HABITS. Keeps singly or in parties of 3 or 4 consisting of a cock and two or three hens, or all of the same sex, which dig for food vigorously with their powerful bills on the edge of alpine pastures often in deep snow. When flushed, rises with a loud flutter of wings, the bird invariably planing steeply downhill with wild ringing cries. When suddenly come upon in forest, especially if accompanied by small chicks, it flies up with much cackling into the thickly foliated branches of a deodar or pine tree and freezes, the sober-coloured hen in particular then becoming astonishingly obliterated. In courtship the cock droops his chestnut wings, spreads out and erects his tail like a turkey cock, jerking it up over the back from time to time as he struts around the seemingly unconcerned hen. A variant of the 'dance' observed as follows: Cock and hen scratching and feeding on flat terrace on hillside. Hen uttered her 'call note' (?) several times. Upon this the cock, feeding some little distance away, ran to her with wings raised high above the back, tail spread, neck- and body-feathers fluffed out, displaying refugence of plumage in the morning sun to best advantage. He thus moved quickly to and fro in front of her for a few seconds while she stood quietly

* See Appendix

PHEASANTS, PARTRIDGES, QUAILS

91

FIELD CHARACTERS. Male. Very like the Himalayan Monal (290), but somewhat duller and less refulgent, and without crest; the crown covered with short curly or frizzled metallic blue-green feathers instead. White of rump much more extensive and including upper tail-coverts. Tip of tail broadly white making the cinnamon appear like a wide band across white tail.

Female. Similar to ♀ 290 but with rump and upper tail-coverts conspicuously pale greyish white. Tail black, broadly tipped with white and with some narrow whitish bars.

Young (immature). See under Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. NEFA east of c. the 92nd-93rd meridians (where it meets *L. impejanus*, vide Ludlow, *Ibis* 1944: 376), through the Kameng, Subansiri, Siang, and Lohit Frontier Divisions, between c. 3000 and 4000 metres altitude. Affects silver fir (*Abies*) forest with dense rhododendron undergrowth.

Extralimital. Contiguous parts of SE. Tibet, eastward to NE. Burma and Yunnan.

GENERAL HABITS. As of Himalayan Monal (290), q.v. Very parochial, occupying the same haunts day after day (Cranbrook). 'Very noisy in the evenings. When chased by dog refused to fly until nearly caught, when they would fly into a tree and remain there while the dog barked below. Our dog actually caught one' (F. M. Bailey).

FOOD. As in 290. Among crop contents specifically mentioned are 'Polygonum seeds and heads of some thistle or hard-headed flowers' (Cranbrook).

VOICE and CALLS. Alarm calls described as shrill, harsh, rather plaintive, 'a mixture between that of a peacock and a guinea-fowl'—a single cry uttered repeatedly by a sentinel from an overlooking rock on a steep hillside (Cranbrook). A wild ringing whistle like that of *L. impejanus* but 'distinct in tone' (F. Ludlow).

BREEDING. Unknown. Males collected by Ludlow on 14 May all had enlarged testes c. 25 mm. in length. One female with a large-yolk ovarian egg; another with a large incubation patch.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Young (immature) male. Described from a specimen collected by F. Kingdon Ward at the Tsangpo Po-Tsangpo confluence c. 2700 metres altitude (Feb. 1924): 'Differs from adult female in the darker colour of the mantle, the paler, more white colour of the lower back, rump and upper tail-coverts and in the greater amount of cinnamon on the tail-feathers which colour is entirely absent from an adult (♀) from the Tsangpo, but present in slight frecklings in a bird from the Mishmi country and figured in *Proc. Zool. Soc.*, 1879, pl. ii. The upper side of this young male is narrowly barred with faint cinnamon bands instead of frecklings. On the breast and neck the black feathers of the adult are beginning to appear and a few metallic feathers to show on the head' (N. B. Kinnear, 1934, JBNHS 37: 367).

MEASUREMENTS

	Wing	'Culmen'	Tarsus	Tail
♂	317	38	73	223 mm.
♀	280	32	71	185 mm.

Middle toe and claw ♀ 75 mm.

(Delacour)

F. Ludlow's specimens gave: Wing 4 ♂♂ 298-303; 2 ♀♀ 285-287 mm.

90

GALLIFORMES

looking on; then abruptly closed his wings and tail, turned about, and ran back to his feeding place (G. S. Rodon, JBNHS 12: 573). The cock also indulges in a spectacular courtship flight, leaping straight up into the air from a steep hillside, moving slowly with wings held high above line of back, tail partly spread and the white rump conspicuously displayed.

FOOD. Grass- and flower seeds, roots, tubers, shoots, berries (e.g. *Cotoneaster microphylla*), and insects and their larvae, dug up often from under deep snow.

VOICE and CALLS. Call- and alarm notes a wild, ringing whistle reminiscent of the Curlew. Usually uttered from a rock on a precipitous slope, after which the bird planes steeply down the *khud*-side to another perch often far below.

BREEDING. Season, April to June. Nest, a scrape in the ground under shelter of a rock or fallen tree-trunk in undergrowth on a steep hillside, hidden by grass or ferns, etc. Eggs, 4 to 6 pale yellowish or reddish buff, freckled and spotted with reddish brown. Average size of 74 eggs 63.5 × 44.9 mm. (Baker). Incubation period unrecorded. Cock apparently polygynous, but its biology in the wild state very little known.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Crown dark rufous; a short line back from base of culmen, lores, three short lines on the face, ear-coverts and sides of the occiput black; eye-brows and facial area buff; mantle and wing-down grizzled rufous, back and rump chocolate, with two pairs of lateral buff lines, the outer pair often partly merged with the ventral colouring; loreal line buffy cream; chin and throat smoky white; sides of throat darker; remainder of underparts dirty buffy white, flanks darker' (Delacour).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail	Crest
♂♂	289-320	c. 50-54	c. 70-80	215-235	75-88 mm.
♀♀	259-287	—	—	—	—

(Baker)

Middle toe and claw: ♂ 71, ♀ 77 mm. (Delacour).

Weight ♂♂ 4 lb. 6 oz. to 5 lb. 4 oz. (c. 1.98-2.38 kg.); ♀♀ 4 lb. to 4 lb. 12 oz. (c. 1.80-2.15 kg.) — Hume.

COLOURS OF BARE PARTS. ♂ Iris brown; circumorbital skin bright azure to almost royal blue. Bill horny blackish with a greyish white band (c. 3 mm. wide) along both edges of culmen. Legs and feet olive-brown, each scale on tarsus and toes finely margined with black; soles of feet greenish brown; claws and spurs horny black. ♀ Circumorbital skin paler blue; ridge of culmen more brown less black. Otherwise as in ♂.

291. Sclater's or Mishmi Monal Pheasant. *Lophophorus sclateri* Jerdon

Lophophorus sclateri Jerdon, 1870, *Ibis*: 148 (Mishmi Hills)

Baker, FBI No. 1929, Vol. 5: 337

Plate 34, fig. 7

LOCAL NAMES. *Tratta*, *Poa padoi* (? Mishmi); *Pui di* (Chulikatta Mishmi); *Piddi* (at Pachakshiri).

SIZE. As of 290.

* See Appendix

92

GALLIFORMES

Width of white tips of central tail-feathers (in 2 cases) 19.5 and 22.5 mm. In Mishmi birds upper tail-coverts clear and unstreaked white, whereas birds from Yunnan appear to have more black central streaks on the feathers (SDR).

COLOURS OF BARE PARTS. ♂ Iris brown. Bill horny orange-yellow, darker at tips. Facial area bright blue. Legs greenish brown. ♀ Bill yellowish. Legs and feet brown. Spurs often present (Delacour).

Genus CROSSOPTILON Hodgson

Crossoptilon Hodgson, 1838 (Oct.), Jour. Asiat. Soc. Bengal 7: 864. Type, by monotypy and tautonymy, *Phasianus crossoptilon* Hodgson

Contains large heavy pheasants about the size of the Monal with the ear-coverts prolonged and sticking out behind the head like two small horns or ears whence their popular name of 'Eared Pheasants'. Sides of head naked, covered with bright red papillae. Wings rounded and cambered as typical of the Phasianidae: first primary (as.) short; 5th and 6th equal and longest. Tail compressed, of 20-24 very broad feathers at base, with the webs very soft, broad and decomposed, the long central drooping ones reminiscent of ostrich plumes. Legs powerful, with short blunt spurs on tarsi of male. Sexes alike in coloration; male slightly larger.

As presently known, only one species and race enters the fringe of our northern limits in NEFA.

292. Elwes's Eared Pheasant. *Crossoptilon crossoptilon harmani* Elwes

Crossoptilon harmani Elwes, 1881, *Ibis*: 399, pl. 13 (Eastern Tibet, about 150 miles east of Lhasa)

Baker, FBI No. 1930, Vol. 5: 339

Plate 34, fig. 10

LOCAL NAME. *Cha-nga* (Tibet).

SIZE. Large domestic hen +; about that of Monal Pheasant. Length c. 72 cm. (28 in.).

FIELD CHARACTERS. Overall ashy blue-grey with broad laterally compressed tail, the longer arching disintegrated central feathers reminiscent of ostrich plumes. Above, sides of head naked, deep scarlet. Crown from forehead to nape velvety black. Elongated ear-tufts (coverts) projecting beyond, and a band across nape white. Upperparts deep ashy grey, darker (blackish) on neck, paler on rump and upper tail-coverts. Tail metallic blue-black glossed with green, blue, and purple. Below, chin and throat white contiguous with the nape-band and forming a ring. Rest of underparts ashy grey, deep and glossy on breast, white down centre of foreneck and abdomen. Sexes alike in coloration; male larger.

STATUS, DISTRIBUTION and HABITAT. Very plentiful wherever found. Extreme northern fringes of the Siang, Subansiri, and Lohit (?) Frontier Divisions of NEFA, normally between c. 3000 and 5000 metres altitude; rarely as low as 2400 m. Affects the edges of grassy hill slopes abutting on rhododendron and juniper scrub.

Extralimital. Contiguous parts of SE. Tibet north of the main Himalayan axis from c. long. 91°33' in the Tsangpo valley and c. 92°30' in the Subansiri basin eastward to the Salween valley (c. 31°N., 95°30'E.) where it apparently meets the nominate race (Ludlow, *Ibis* 1944: 378).

PHEASANTS, PARTRIDGES, QUAILS

93

GENERAL HABITS. Keeps in flocks of 5 to 10 birds to dwarf rhododendron jungle whence they come out to feed in the grassy clearings in the morning and evening. Reluctant to fly. When disturbed invariably scurries uphill and into the nearest bushes, and almost impossible to flush without the aid of a dog. It then flies up into a tree if available, otherwise shoots downhill and for considerable distances. Where unmolested becomes astonishingly tame, coming to monasteries in the remotest areas to be fed by the lamas, and even eating out of their hands.

FOOD. As of the Monal — seeds, shoots, roots, tubers, fallen berries (e.g. of mountain ash) in autumn; also insects and their larvae.

VOICE AND CALLS. Uttered chiefly in the early mornings. Loud, harsh and distinctive, resembling that of a guinea-fowl but much louder and more resonant; clearly audible from over a mile away and a sure indication of the presence of the bird in a locality even when not seen. Also has a single note like a heron's squawk (Ludlow).

BREEDING. Only a single doubtful record within Indian limits of eggs brought to Stuart Baker by local Abors in the Mishmi Hills (26 May). In SE. Tibet Ludlow found three nests. One (23 May) placed under a fallen fir tree, was composed of bark and rotten pulp of the tree and lined with moss. It contained 9 cream coloured, unspotted eggs averaging 55.5 × 42.0 mm. in size. (Eggs 'greyish green' vide Delacour.) F. M. Bailey found broods of newly hatched chicks in SE. Tibet on 18 July, about which time also a larger chick was obtained. Male evidently monogynous.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (c. 14 days old). 'Crown velvety black; upper plumage dull black changing to dark ashy grey on the rump and upper tail-coverts; the wings are vermiculated with reddish bars, and the coverts have broad reddish shaft-streaks. White on the head as in the adult, the ear-tufts showing distinctly. Upper breast and flanks black, the feathers centred and edged fulvous. Lower breast and abdomen dirty white, vent and under tail-coverts dull ashy grey tipped with white. Tail-feathers blue-black glossed with blue, showing green in some lights (Baker). 'Iris brown; bill horn coloured, paler below; legs reddish brown' (Bailey).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀ ad.	292-331	c. 40-44	87-93	457-559 mm.
Spur short, c. 15-20 mm.				(Baker)

COLOURS OF BARE PARTS. Iris brown to orange-brown. Bill light reddish horny. Naked facial skin scarlet. Legs and feet scarlet.

Genus *LOPHURA* Fleming

Lophura Fleming, 1822, Philos. Zool. 2: 230. Type, by monotypy, *Phasianus ignitus* [Shaw]

Gennarus Wagler, 1832, Isis von Oken, col. 1228. Type, by monotypy, *Phasianus nycthemerus* Linnaeus

Cf. Delacour, J., 1949, *Ibis*: 188-220.

Contains the Kaleej and Silver Pheasants, most closely allied to junglefowl in morphology and behaviour. Wing rounded: first primary (as.) short; 2nd equal to 9th or 10th in length; 5th and 6th primaries longest. Tail compressed, 'roof-shaped';

PHEASANTS, PARTRIDGES, QUAILS

95

Male. Above black, glossed with steel blue, the rump feathers broadly edged with white. Tail glossy black and brown, of broad arching sickle-shaped feathers. Long white hairy recumbent crest; naked scarlet face. Below, chiefly brownish grey; the feathers pointed or lanceolate on breast. Female, chiefly reddish brown with pale scaly markings (scalloping); recumbent crest brown, naked patch round eye scarlet. Tail black, not arching or pointed; central feathers rufous-brown with pale vermiculations. (For immature, and downy chick, see Museum Diagnosis.)

STATUS, DISTRIBUTION AND HABITAT. Resident. Western Himalayas from east of the Indus river through part of the NW. frontier districts of W. Pakistan, southern Kashmir (outer lower slopes of Pir Panjal), Punjab, Himachal Pradesh, Garhwal and Kumaon to c. 83°30'E. long. in west-central Nepal (near Baglung — Fleming). Affects all kinds of forest (sal, oak, spruce, rhododendron, etc.) with heavy scrub undergrowth. Partial to the neighbourhood of water and terraced cultivation, between c. 400 m. in the foothills and 3600 metres. Descends somewhat lower from the highest elevations in severe winters.

Lophura leucomelana

Range within Indian limits

1 *L. l. hamiltonii* (293).

2 *L. l. leucomelana* (294). 3 *L. l. melanota* (295). 4 ? *L. l. moffitti* (298).

5 *L. l. lathamii* (296). 6 *L. l. williamsi* (297).

94

GALLIFORMES

of broad arching sickle-shaped feathers in the male. Bill strong; of moderate size. Face naked, brightly coloured, the skin covered with tiny papillae. Tarsi stout, armed with a long sharp spur on each leg in male, exceptionally also in female. Sexes dimorphic: female without elongated sickle-shaped feathers in tail.

Within our limits only one species, in 5 (or 6) races, occurs in the Himalayas and Assam hills, ranging eastward through Burma and the Indochinese subregion to S. China and Hainan Island.

293. **Whitcrested Kaleej Pheasant.** *Lophura leucomelana hamiltonii* (J. E. Gray)

Phasianus Hamiltonii J. E. Gray, 1829, in Griffith's Anim. Kingd. 8 (Aves, 3): 27 (India; the type probably came from Nepal, vide N. B. Kinnear, in litt.) Baker, FBI No. 1918, Vol. 5: 320 Plate 35, fig. 4

LOCAL NAMES. *Kaleej*, *Kükera*, *Kalesur* ♂, *Kälä mürghä* ♂, *Kaleri* ♀ (Hindi); *Köla* (Himachal Pradesh).

SIZE. Domestic fowl; length c. 65-73 cm. (25-29 in.).

FIELD CHARACTERS. An obvious first cousin of domestic and jungle fowl.

96

GALLIFORMES

GENERAL HABITS. Keeps in pairs or small family parties which come out to feed in the open in the early mornings and afternoons, on kutch forest tracks and firelines, and in freshly sown fields. In foothills country frequently found in association with Red Junglefowl to which its behaviour and general ecology are very similar. Like the junglefowl too it is a strong flier and gives good sport with the gun, both species often getting up in the same beats. Roosts at night in trees, several birds clumped together along a branch.

FOOD. Grain, seeds, shoots, insects and their larvae, and small reptiles. In crops of specimens in Garhwal the following identified: acorns of *bej* oak (*Quercus incana*) minus outer husk, ripe fruits of *Pyrus pashia* and *Rosa moschata*, green stems of *Viscum japonicum*, pods of *Desmodium tiliacifolium*, bulbs of *Dioscorea* sp., and ripe seeds of *Nyctanthes arbor-tristis*; in the vicinity of travellers' *parāos* (camp sites) and habitations, human excreta (A. E. Osmaston).

VOICE AND CALLS. The crowing is described as 'a loud whistling chuckle or chirrup'. In breeding season male makes a peculiar drumming noise like shaking or flapping a thick piece of cloth in the wind, 'produced partly by rapid vibrations of the wings and partly by the vocal organs' (A. E. Jones). Both sexes cluck in soft undertone when scratching among the thickets for food. When flushed gives vent to a series of guinea-pig-like squeaks and chuckles (Whistler).

BREEDING. Season, between March and June varying with altitude. Nest, a crude collection of leaves and rubbish in a shallow scrape in the ground under shelter of an overhanging tuft of grass or ringal bamboo, or stone, on a jungly hillside. Eggs 6 to 9, and up to 15, pale cream or buffy white to warm reddish buff, very similar to eggs of domestic fowl. Average size of 100 eggs 49.5 × 37.0 mm. (Baker). Incubation entirely by hen; period 24-25 days. Uncertain whether in the wild state cock monogynous or polygynous. Observations in support of both have been recorded. Courtship display of the characteristic pheasant pattern: the cock struts round a hen in a half-circle with the wing on near side expanded and drooped, the opposite one being slightly raised at the elbow to slant the back towards the hen, who usually seems quite uninterested.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'Head and upper back chestnut with a dark line from eye to nape as in all species of the genus. Upperparts dark brown with two broad lateral whitish buff bands. Underparts whitish. Wing mottled brown and buff. Legs reddish flesh.

'Young (immature). Dark brown, the head more rufous; ear-coverts blackish. Upper plumage freckled with black, each feather with a subterminal black and a terminal rufous-buff border. Underparts lighter, the feathers with a terminal whitish spot' (Delacour).

As in all subspecies of *leucomelana* young cocks assume adult plumage in their first year.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	225-250	23-30	75-80	230-350 mm.
♀ ♀	203-215	20-25	65-70	205-215 mm. (Delacour)

PHEASANTS, PARTRIDGES, QUAILS 97

Weight ♂♂ 2 lb.-2 lb. 6 oz. (910-1080 gm.); ♀♀ 1 lb. 4 oz. to 2 lb. 4 oz. (564-1024 gm.) — Hume.

COLOURS OF BARE PARTS. Iris brown or orange-brown. Bill greenish white, dusky at tip. Orbital skin vermilion to crimson with slight black feathering. Legs and feet livid white to pale olive-brown or slaty brown.

294. **Nepal Kaleej Pheasant.** *Lophura leucomelana leucomelana* (Latham)

Phasianus leucomelanos Latham, 1790, Index Orn. 2: 633 (India, restricted type locality Nepal, *apud* Baker, 1928, op. cit.: 322)

Phasianus Nipalensis Hodgson, 1827 (Dec.), Quart. Oriental Mag. Rev. and Regist. 8, (Sci.): 44 (Nepal)

Gemmaeus fockelmanni Ghigi, 1913, Riv. ital. Ornitol. 2: 192 (no locality)

Cf. Rand, A. L., & Fleming, R. L., 1952, Fieldiana, Zool., 41: 62 Baker, FBI No. 1919, Vol. 5: 322

LOCAL NAMES. *Kalik kaleej* (Parbutia); *Rehabo* (Nepal).

SIZE. Domestic fowl; slightly smaller than 293. Length c. 60-68 cm. (23-26 in.).

FIELD CHARACTERS. Male. Like Whitecrested Kaleej (293) but with the crest glossy blue-black. Above, lower back, rump, and upper tail-coverts glossy blue-black the feathers narrowly (v. broadly) edged with white. Wing-coverts with more white than in 293. Below, chin and foreneck darker and more glossy; rest of underparts more whitish.

Female differs from ♀ 293 in being redder and more richly coloured, the grey feathers of the underparts conspicuously dark centred and producing a scaly or scalloped effect. Naked orbital skin scarlet as in male.

STATUS, DISTRIBUTION AND HABITAT. Resident. Nepal from about the Ghaghra river (c. 81°15'E.) eastward to about the Arun (c. 87°15'E.), but range imperfectly known; from c. 400 metres in the foothills to c. 3660, the last being the highest elevation recorded (Khumbu, E. Nepal. May — Biswas). Fairly common in the mountains surrounding the duns and Nepal valley. Affects forest with heavy scrub undergrowth; partial to the neighbourhood of water and terraced cultivation. Reportedly occupying a higher zone in Nepal than Red Junglefowl.

[An enigmatical record (specimen ♂, December 1924 (JBNHS 30: 917) from Mussooree, U.P. (c. 30°25'N., 78°0'E.) — possibly an escape from some Maharaja's local pheasantry?]

GENERAL HABITS. As of 293, q.v. 'At end of March cocks collect in open places and challenge other cocks. They make the most extraordinary noises, and appear to dance round in circles. Usually 3 or 4 cocks dancing and fighting, with half a dozen or more hens nearby' (Mrs Proud). More details lacking.

BREEDING. Season, c. April through June; information meagre. Eggs. Seven vicariously collected from two clutches described by Baker as warm buff in colour and varying in size from 46.1 × 27.7 mm. to 53.0 × 39.0 mm. A cock observed in company with two hens and about a dozen tiny chicks (Mrs Proud). Suggesting polygyny?

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

PHEASANTS, PARTRIDGES, QUAILS 99

a 'whistling *psee-psee-psee-psee* unlike anything expected from a pheasant' (M. D. Lister).

BREEDING. Season, March to May. Nest, a scrape in the ground lined with dry grass and bamboo leaves, amongst dense undergrowth in gullies, etc. Eggs, 6 or 7, buff coloured, glossy broad ovals. Average size of 61 eggs 48.7 × 37.3 mm. (Baker).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

♂ Wing 215-240; tail 238-300 mm. (Delacour).

A series collected by Ernst Schäfer in Sikkim gives: Wing 6 ♂♂ 233-248 (aver. 238.7); 6 ♀♀ 211-222 (aver. 215.0) mm. — Stresemann.

Weight ♂♂ 2 lb. 6 oz. to 2 lb. 12 oz. (c. 1080-1150 gm.); ♀♀ 1 lb. 14 oz. to 2 lb. 4 oz. (c. 848-1025 gm.) — Hume.

COLOURS OF BARE PARTS. Iris hazel to orange-brown. Orbital skin scarlet-crimson. Bill greenish horny, black at base, paler at tip. Legs and feet slaty or greenish brown.

296. **Blackbreasted Kaleej Pheasant.** *Lophura leucomelana lathamii* (J. E. Gray)

Phasianus lathamii J. E. Gray, 1829, ex Griffith, Cuvier, Anim. Kingd. 8 (Aves, 3): 26 (Sylhet)

Gallopharis Horsfieldii G. R. Gray, 1845, Gen. Bds. 3: 498, col. pl. 127 (no locality) Baker, FBI No. 1921, Vol. 5: 324

LOCAL NAMES. *Mathura* (Chittagong, Tippera, Goalpara); *Modira* (Sylhet and Cachar Plains); *Dorik*, *Dirrik*, *Dürüg* (Garó Hills); *Drodip* (Cachari); *Dorik* (Dibru-garh); *Vohtep* (Kuki); *Inruitip* (Naga); *Wäba* (Manipur); *Läko* (Bhutan).

SIZE. Same as 294; length c. 60-68 cm. (23-26 in.).

FIELD CHARACTERS. Male resembles Nepal Kaleej (294) but breast entirely black glossed with steel blue and purple, the feathers rounded not lanceolate. Upperparts glossy blue-black with purple sheen, except for broad white fringes, or crescentic barring, on lower back and rump as in 294. Higher on the legs, with the black crest more upright, and tail shorter and straighter.

Female. 'Differs from *melanota* (295) in its more upright crest, its shorter tail, with central rectrices very finely and inconspicuously streaked with black, which appears plain chestnut, its buffy brown throat, the narrower and usually paler borders to the feathers which are rather indistinct on the mantle, and the longer legs' (Delacour).

Young (immature) male like female, as above, but generally darker with contrasting white or pale buff edging to the feathers. 'Cocks take two or even three moults before acquiring the full plumage' (Baker).

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Eastern Bhutan, Assam hills north of Brahmaputra river (NEFA), Garo, Khasi, Cachar, Naga and Patkai Hills; Manipur, Sylhet, Chittagong (E. Pakistan). From c. 100

98 GALLIFORMES

Chick (in down). 'Head chestnut, paler on the forehead and behind the eye; a dark streak from the eye down the neck; centre of back chocolate-brown with broad lateral bands of pale buff; sides dull chestnut; chin and throat yellowish white, remainder of lower parts pale yellowish grey' (Baker).

According to Delacour immatures and downy chicks as in 293, but slightly richer in colour.

MEASUREMENTS

Wing 7 ♂♂ 216-236 mm. (aver. 227.5); 7 ♀♀ 198-211 (aver. 206) mm. Bill (from forehead) ♂♂ c. 35-37 mm.; tarsus ♂♂ 75-80; tail ♂♂ c. 250-305 mm.

Weight ♂♂ 1 lb. 12 oz. to 2 lb. 8 oz. (c. 795-1140 gm.) — Hume.

COLOURS OF BARE PARTS. As in 293.

295. **Blackbacked Kaleej Pheasant.** *Lophura leucomelana melanota* (Hutton)

Euplocamus melanotus 'Blyth' = Hutton, 1848, Jour. Asiat. Soc. Bengal 17(2): 694, in text (Darjeeling)

Baker, FBI No. 1920, Vol. 5: 323

LOCAL NAME. *Kar rhyak* (Lepcha).

SIZE. Same as 294; length c. 60-68 cm. (23-26 in.).

FIELD CHARACTERS. Male. Above, glossy black with violet, green, and purple reflections, the feathers scalloped with velvety black. White shafts of feathers conspicuous only on blue-black mantle. Crest and tail somewhat shorter than in 294. Below, chin and throat blackish brown paling towards breast. Feathers of breast long and lanceolate, white with brown bases producing a broadly streaked effect. Centre of abdomen and vent brown. Under tail-coverts and thighs blackish.

Female similar to Nepal Kaleej (294) but darker richer brown with narrow whitish scalloping. Crest and upper back brighter chestnut than male.

STATUS, DISTRIBUTION AND HABITAT. Resident. Eastern Nepal from about Arun river c. 87°15'E. long. (Mai khola or valley) eastward through Darjeeling district and Sikkim to about the Mo Chu or Sankosh (Gadadhar) river in W. Bhutan c. 89°45'E. long.; between c. 100 metres in the foothills and c. 2700, chiefly c. 600 to 1800 m. Affects densely overgrown steep gullies on the hill slopes; partial to thick cover in the proximity of running water and terraced cultivation.

GENERAL HABITS. As of 293, q.v., and Red Junglefowl. Pairs or small parties come out to scratch for food at the edge of forest clearings, freshly sown fields, and jungle tracks, in the mornings and evenings.

FOOD. As in 293. Among food items specified by Gammie (Sikkim) are tops of several nettles and ferns, and fruit, especially of *Polygonum molle* and the yellow raspberry, *Rubus flams*.

VOICE AND CALLS. When suddenly alarmed and taking wing a sharply repeated *koorchi koorchi koorchi*. In breeding season, when two rival cocks advance towards each other a threatening *koor koor* followed by 'attacking note' *waak waak*. Sometimes answering each other's calls in the jungles (Gammie). One flushed by dog and flying away downhill, as usual, emitted

100 GALLIFORMES

to 2600 metres elevation. Affects dense undergrowth in forest; partial to gullies in the neighbourhood of water and cultivation.

Extremal. Eastward to Irrawaddy river, south through NW. Chin Hills and northern Arakan to c. Akyab.

GENERAL HABITS. As of the other kaleejes, e.g. 293. Is a swift and obstinate runner and almost impossible to flush without a dog unless suddenly surprised. Thus affords poor sport with the gun although perhaps is just as difficult to shoot on the ground as it scurries through the undergrowth giving only fleeting glimpses of itself between bushes and the snappiest of snapshots. Active during mornings and evenings; rests during midday up on low bough of a tree.

FOOD. Like other kaleejes, omnivorous. Bamboo seeds, fallen figs of the various wild *Fici*, and white ants are favourite items. Has been observed darting to and fro picking up winged termites emerging from the ground, and even fluttering up a few feet in the air after them in ungainly sorties. Small snakes and lizards also recorded, as well as human excreta near habitations — lumber camps etc.

VOICE AND CALLS. Contact call between members of a scattered feeding party in cover, a low clucking *kurr-kurr-kurrchi-kurr* (Baker). Male crows, particularly in breeding season, from roosting perch in tree in the evening soon after ascending, and early morning before descending to feed. Unlike junglefowl, usually silent during the day. Challenges rival cocks by 'quickly and repeatedly beating together the tail above his back, and also by beating the wings against his ribs. In the former case the sound is very loud and sharp, lasting a second or two. When drumming against sides noise much lower and softer, and continued for some seconds or even minutes' (Cripps). The duration as described seems rather exaggerated, but the details are obviously of the 'cloth-flapping' drumming as in 293, q.v.

BREEDING. Season, February to October, chiefly April-May and July-August. Nest and eggs as in 293, q.v., and the other kaleejes. Cock evidently monogynous and assists in tending the young. But according to another reliable observer (F. N. Betts), cock invariably accompanied by two and sometimes three hens! ('Progressive polygyny'?). Incubation by female alone. Period 20-21 days (Baker); 23-24 days (Delacour).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'Head chestnut with black coronal streak; a dark chestnut streak from the eye, below which the buff is paler; median body-stripe rich chestnut-brown; sides and underparts of body ashy or ashy buff with an ill-defined chestnut band on the breast' (Baker).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	211-253	34-40	76-96	210-295 mm.
		Crest c. 76 and up to 90 mm.; spurs up to c. 25 mm.		
♀♀	203-230	33-35	68-76	190-228 mm.
				Weight ♂♂ 2 lb. 4 oz. to 3 lb. 12 oz. (c. 1025-1700 gm.); ♀♀ c. 715-750 gm. (Baker, SA)

COLOURS OF BARE PARTS. As in other races. Legs and feet plumbeous or brown, sometimes with pinkish tinge. Spurs sometimes pale jade colour.

297. Williams's Kaleej Pheasant. *Leptura leucosticta williamsi* (Oates)

Gallus williamsi Oates, 1893, Man. Game Bds. India, pt. 1: 342
(Kalewa, Chin Hills, Upper Burma)
Baker, FBI No. 1922, Vol. 5: 326

LOCAL NAMES. *Yit* (Burmese); *Rak* (Arakan).

SIZE. Same as 294; length c. 60-68 cm. (23-26 in.).

FIELD CHARACTERS. Resembles *L. l. lathami* (296) in shape, q.v.

Male. *Above*: Crest black; head, neck, back and mantle grey (caused by numerous tiny bars and vermiculations of white or buffy white on a black background). Lower back, rump and upper tail-coverts black, boldly barred with white as in *lathami*. Tail black with narrower white barring. *Below*, completely black.

Female. Very like *q. lathami* but paler [in this like *q. hamiltonii* (293)] with the central pair of rectrices chestnut, the others black or nearly black irregularly barred with white.

Young (immature) and Chick (in down). Unknown.

STATUS, DISTRIBUTION AND HABITAT. Not yet recorded in our limits but possibly extending into SE. Manipur and Mizo (Lushai Hills) from the contiguous Chin Hills area.

Extralimital. 'The Chin Hills, Lower and Upper Chindwin north to Niva and Wawabin, and Eastern Manipur (?); south to the north-eastern parts of the Arakan Yomas' (Delacour).

GENERAL HABITS. In the Chin Hills recorded in non-breeding season in parties of up to 20 males and females together, affecting open forest mixed with bamboo in the proximity of water. In this facies its lighter plumage is as concealing as the darker coloration of the other kaleejes in the sombre evergreen cover they frequent.

FOOD, VOICE AND CALLS. Nothing recorded as different from other races.

BREEDING. Unrecorded within our limits.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS. Wing ♂ 223-247; ♀ 206-220 mm. (Delacour).

COLOURS OF BARE PARTS. As in 296.

298. Moffitt's Kaleej Pheasant. *Leptura leucosticta moffitti* (Hachisuka)

Gallus moffitti Hachisuka, 1938, Bull. Brit. Orn. Cl. 58: 19 (No locality)
Not in Baker, FBI

LOCAL NAMES. Unrecorded.

SIZE. Same as 294; length c. 60-68 cm. (23-26 in.).

FIELD CHARACTERS. Male. Entirely black with steel blue reflections on the breast and upperparts. It has the black back of *melanota* and the black breast of *lathami*, but the breast feathers are lanceolate in shape with faint white shaft-streaks; in this character and in its general shape it stands nearer to *melanota* than to *lathami*. Soft parts as in *melanota*.

Female. Like *melanota* but the throat plain buff and the central rectrices finely peppered as in *lathami*, not vermiculated' (Delacour).

STATUS, DISTRIBUTION AND HABITAT. Unknown. Named from an aviary specimen of unknown provenance imported into California through a

Yara dāri kodi (Telugu); *Kāta kodi* (Tamil, Malayalam); *Nāra fā, Nāgāya, Nāg tē ja* (Bhutan); *Pazak chi, Tenziling* (Lepcha); *Kākhāri* (Bhutan); *Gera gōgār* ♂, *Kōrō* ♀ (Gond); *Ganga* (Orissa); *Dāro* (Cachar); *Yek* (Kuki); *Jera* (Kacha Naga).
SIZE. Domestic village fowl; length ♂ c. 66 cm. (26 in.); ♀ c. 43 cm. (17 in.).

FIELD CHARACTERS. Both sexes closely resemble the Game Bantam domestic breed.

Male. *Above*, chiefly glossy deep orange-red with long yellowish neck-hackles and similarly elongated lanceolate feathers on rump. Broad, laterally compressed metallic black tail with long arching sickle-shaped central feathers. *Below* chiefly blackish brown.

Female. *Above*, crown dull rufous. Forehead and supercilia bright chestnut continued below to meet in a loop on foreneck. Rest of upperparts reddish brown, finely vermiculated with buff and black. *Below*, pale-shafted light rufous-brown.

Young (immature) male. Neck-hackles less developed, paler, and more conspicuously black-centred.

For chick in down see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Outer Himalayas, chiefly foothills and terai but locally up to c. 2000 m. elevation, from northeastern West Pakistan through Kashmir eastward to Assam excluding easternmost NEFA (Mithun Hills, see *G. g. spadiceus*). Southward through ecologically suitable parts of Uttar Pradesh, Madhya Pradesh, Bihar, Orissa, West Bengal, Assam and E. Pakistan. Exact boundaries imperfectly known, but on the eastern side stretches south at least to the latitude of Rajahmundry (c. 17°N) on both banks of Godavari river (NE. Andhra). In the Mahadeo Hills and Mandla district of Madhya Pradesh both this and *G. sonneratii* occur together around the foot of Pachmarhi (c.22°30'N., 78°25'E.) and about half way up the ghat. Above this, and on the Pachmarhi plateau and surrounding hills, the Grey Junglefowl completely replaces the Red. Hybrids with *G. sonneratii* have been collected at Bheraghat in Madhya Pradesh. On the western side Jerdon, *flds* Blanford, recorded it in the Rajpipla Hills (western extremity of the Satpura Range in Gujarat) about a hundred years ago. More recently (1929) observed by a reliable naturalist (C. McCann) in the outliers of the W. Ghats near Bombay. Also reported from Khandala, W. Ghats (c. 18°45'N., 73°25'E.) and we have seen a cockerel artificially hatched from wild eggs allegedly collected in that area. Both the above localities are well within the range of *G. sonneratii*, and the Red Junglefowl must at best be extremely rare here. Crosses between the two species frequently occur in their narrow zone of contact. As first pointed out by Forsyth and repeatedly remarked since, its distribution in India by and large coincides in a striking way with that of the Sal tree (*Shorea robusta*) and the Swamp Deer (*Cervus duvaucelii*), although largely due to human interference the latter has now disappeared from many of its former habitats. This parallel contemporaneousness of ranges is graphically seen, e.g. in Madhya Pradesh where Teak (*Tectona grandis*) of the dry deciduous forests is replaced by Sal in the moist-deciduous and semi-evergreen eastern parts as the predominant tree species. The former biotope is occupied by the Grey, the latter by the Red Junglefowl. Affects moist-deciduous forest

Calcutta bird dealer in 1934. Has bred true in captivity. Only a single wild example (♂) so far obtained: Pe Chu valley, central Bhutan (c. 27°30'N., 90°E.), June 1965 (by K. S. Ranjitsinhji of Wankaner).

MUSEUM DIAGNOSIS. See Field Characters.

MEASUREMENTS. Wing 242, tarsus 72, tail c. 284 mm. (SA).

COLOURS OF BARE PARTS. Not recorded.

Genus GALLUS Brisson

Gallus Brisson, 1760, Orn. 1: 26, 166. Type, by tautonymy, '*Gallus*' = *Phasianus gallus* Linnaeus

Cf. Delacour, J., 1948, *Ibis*: 462-4.

Contains four species of the true junglefowl confined to the Indomalayan sub-region of which three occur within our limits, the fourth, *G. tenuis*, restricted to Java and neighbouring islands eastward. Males of all three Indian species furnished with a fleshy crest or comb, and two fleshy lobes or wattles hanging from each side of the throat. Wings rounded: first primary (as.) shorter than 10th; 5th primary longest. Tail sharply compressed laterally, of 14 feathers, the central ones greatly lengthened and with pliant shafts so that they droop in a graceful sickle-shaped curve. Feathers of neck (hackles) and of rump long and lanceolate. Legs long and powerful: tarsus longer than middle toe with claw and armed (in ♂) with a long and sharp spur.

No. 1: 29 (Koda, Kangra)
Baker, FBI No. 1903, Vol. 5: 295
Plate 35, fig. 6.

LOCAL NAMES. *Jāngli mūngli, Bān mūngli, Lāl mūngli* ♂, *Jāngli mūngli, Bān mūngli* ♀ (Hindi, N. India, Bengal); *Lāl rām kāmāda* (Marathi); *Bān kākār* (Assam);

Range within Indian limits 1 *G. g. nungli* (299).
2 *G. g. spadiceus* (300). 3 *G. sonneratii* (301). 4 *G. leucotis* (302).

Extralimital races E. and S. of 2.

and bamboo and scrub jungle interspersed with patches of cultivation and clearings, especially in hummocky foothills country.

GENERAL HABITS. Keeps in small parties usually a cock and 4 or 5 hens. Comes out in the open in the early mornings and late afternoons, to glean and scratch about for food, retiring into the surrounding undergrowth during the heat of the day. Very shy and wild, skulking away through the thickets on the least alarm. Commonly seen on cart-tracks or firelines running through forest, picking at cattle droppings or gleaning any grain that may have fallen from passing carts. When suddenly come upon the bird rises with a good deal of flutter and cackling, as characteristic of its domestic cousin, often flying up into the branches of a tree, sitting motionless and concealed among the foliage, and slipping away noiselessly when it feels the coast clear. They are fast fliers and afford good sport with the gun over dogs or when driven out by beaters, giving a wide variety of snap shots as they cross a fireline high above the forest canopy or hurtle through the tangle of shrubs and tree-trunks lower down. When flushed in a beat in tall forest and feeling cornered the bird 'chimneys' almost vertically in a series of remarkable zigzags, turning this way and that as it rises to escape through a gap in the leaf canopy high overhead.

FOOD. Grain of all kinds, shoots of grass and crops, tubers, fruits and berries (e.g. *Ficus* and *Zizyphus*), insects (especially grasshoppers and termites), grubs and maggots; occasionally lizards, and doubtless also small snakes, and human excreta near lumber camps, etc. Bamboo seeds highly prized, and large numbers of fowl will collect to feed where there is a flush. Has been observed to raise larger and earlier broods in years of abundant

PHEASANTS, PARTRIDGES, QUAILS

105

bamboo flowering. A quantity of grit is always swallowed with the food. In the Ruby Mines District rubies and elsewhere in Burma sapphires have been found in gizzards.

VOICE and CALLS. Crow of cock very similar to that of domestic Bantam, but somewhat shriller and with a more abrupt ending. Uttered principally at dawn and before sunrise, and also again before sunset while the birds are preparing to roost up in some tree or bamboo clump. It is usually prefaced by a noisy rapping of the wings against the sides and promptly answered by other cocks in the vicinity. Hens have the same range of alarm and conversational cackling and clucking notes as domestic fowls, but unlike the latter do not loudly advertise the laying of an egg.

The Mogul emperor Jehangir, after describing the Red Junglefowl¹ with his characteristic meticulousness, mentions a peculiarity overlooked by later writers. He says: 'One of the peculiarities of these birds is that if they are caught by the feet and turned upside down wherever they are taken they make no sound and remain silent contrary to the domestic fowl which makes an outcry.'

BREEDING. Courtship display characteristic of the family Phasianidae, as commonly seen in the domestic fowl: the cock fluffs out his feathers, expanding and stiffly drooping the wing on the side of the hen till it almost scrapes the ground, raising the closed wing on the opposite side at the shoulder so as to slant the back towards her and running round her in a semicircle with partly lowered head, then pivoting round to repeat the manoeuvre in the reverse direction. *Season*, mainly March to May; but odd clutches may be found from January to October. *Nest*, a scrape in the ground lined with dry grass and bamboo leaves amongst dense undergrowth in forest. *Eggs*, 5 or 6, very like those of the domestic fowl, varying in coloration from pale buff to pale reddish brown. Average size of 150 eggs 45.3 × 34.4 mm. (Baker). Cock apparently monogynous, but to some extent evidently also practising 'progressive polygamy'—not of the 'harem' type. Assists in tending the chicks (of the latest hen?). Incubation by hen alone; period 20–21 days.²

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'From base of bill through eyes and down sides of neck, a black line; over this a broad line of pale buffish brown; from base of comb down crown, neck, and dorsum to tail a broad black line outlined on dorsum by a creamy streak on each side; wings chestnut; breast and thighs pale buffish brown; rest of underparts creamy white' (Ticehurst, 1926. Described from a downy chick of *Gallus g. gallus*).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	203–244	18–22	c. 70–80	300–380 mm.
♀♀	177–196	—	—	145–165 mm.

Spur ♂ c. 25 mm., occasionally up to 50 mm. Small spurs sometimes present also in ♀.

¹ *Tuzuk-e-Jehangiri* or Memoirs of Jehangir written by himself between c. A.D. 1603 and 1627 and translated from the Persian in two volumes by A. Rogers and H. Beveridge, 2, 226.

² For further details of ecology and breeding biology see Collias, Nicholas E. & Elsie G. Collias, 1967, 'A field study of the Red Junglefowl in north-central India.' *The Condor* 69(4): 360–86.

Chanda dist.); *Rākhi rān kōmbā* ♂ (Marathi); *Jāngli murgā* (Gujarati); *Raan kōmbā* (Deccan); *Kattu kōzhi* (Tamil); *Tella ādāri kōdi* (Telugu); *Kēli, Kād kēli* (Kannada).

SIZE. Domestic fowl; length ♂ c. 60–80 cm. (24–32 in.), ♀ c. 46 cm. (18 in.).

FIELD CHARACTERS. General effect as of domestic fowl, but cock with distinctly longer tail.

Male (breeding). *Above*, white-streaked dark grey with glossy purple-black wing quills and long arching, sickle-shaped tail. Neck-hackles (forming a cape), upper back, and mantle, tipped or spangled with peculiar shiny orange or golden yellow sealing-wax like spots and streaks. No elongated lanceolate plumes on rump as in Red. *Below* blackish grey, broadly white-streaked on breast; uniform brownish grey on abdomen; tinged with rusty red on flanks.

In non-breeding plumage, neck-hackles and sickle-shaped rectrices replaced by shorter dull blackish feathers. Comb becomes much reduced.

Female. *Above*, crown and neck speckled brown, the feathers streaked and scalloped paler. Rest of upperparts finely mottled blackish brown and buff, and narrowly streaked with white. *Below*, chin and throat whitish. Rest of underparts white, boldly scalloped with black on upper breast. Normally without, rarely with rudimentary, exceptionally with well-developed spurs—once over 2.5 cm.

Young (immature) male like adult female but more rufous, more boldly blotched and barred; soon showing grey feathers. Tail black.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Species peculiar to peninsular India almost to the extreme south; not extending to Ceylon. South of a line roughly from Mt Abu (c. 24°30'N., 73°E.) in the west to Pachmarhi (c. 22°30'N., 78°25'E.) in Madhya Pradesh; thence to Polavaram (c. 17°15'N., 81°45'E.) in Andhra near the mouth of the Godavari river with local eastward extensions from it: thus southern Rajasthan, Madhya Pradesh, Andhra, Gujarat, Maharashtra, Madras, Mysore, and Kerala. Frequently hybridizes with Red Junglefowl in their zones of contact. Affects all types of forest from secondary dry-deciduous to moist-evergreen. Chiefly broken foothills country, commonly up to c. 1500 metres in the Satpura and Eastern and Western Ghats complex, and to the highest sholas, c. 2400 m., in the Nilgiris (Dodabetta) and Kerala ranges (Anaimudi peak). Partial to mixed bamboo jungle and the neighbourhood of forest villages and cultivation; in the south particularly to abandoned *tamrāga* clearings and neglected tea, coffee, and rubber plantations overgrown with lantana tangles.

GENERAL HABITS. Similar to those of the Red Junglefowl (299), q.v. Keeps singly or in pairs or small parties of 5 or 6, the sexes either mixed or segregated. Large numbers collect in areas of periodical food abundance such as where bamboos or *karrī* (*Strobilanthes* = *Karrīa*) are seeding. Usually very shy and timid. When emerging into the open to feed in the morning and late afternoon seldom strays far from cover, scuttling headlong into it with outstretched neck and drooping tail on the least suspicion. Where unmolested, however, becomes quite inured to human proximity, feeding around forest villages and in fields even while being ploughed. Such conditions unfortunately are fast disappearing. Roosts up in trees or

106

GALLIFORMES

Weight c. 2 to 3 lb. (910–1360 gm.)—Baker; ♂♂ 1 lb. 12 oz. to 2 lb. 4 oz. (c. 800–1020 gm.); ♀♀ 1 lb. 2 oz. to 1 lb. 10 oz. (c. 485–740 gm.)—Hume.

COLOURS OF BARE PARTS. ♂ Iris reddish brown or orange-red. Comb and wattles scarlet-crimson; lappets white or pinkish. Bill reddish at base; upper mandible brown, lower pale horn. Legs, feet and spurs slaty brown. ♀ Iris brown. Comb scarlet-crimson. Bill yellowish or pale fleshy at base; upper mandible brown, lower pale horn. Legs, feet and claws slaty brown.

MISCELLANEOUS. Rensch (1932) and others have deduced that Ind^a was the original centre of domestication, therefore the Indian species *Gallus gallus* and not *Gallus varius* of Java must be considered the true ancestor of the domestic fowl. Date of domestication uncertain, but evidently the junglefowl already figured as a domestic bird in the Harappa and Mohenjodaro civilizations c. 2500 B.C., and in Egypt and China as early as 1500–1400 B.C.

300. Burmese Red Junglefowl. *Gallus gallus spadiceus* (Bonnaterra)

Perdix spadicea Bonnaterra, 1791, Table Encycl. Méth. 1: 208 (Malacca)

Baker, FBI No. 1904, Vol. 5: 298 (= *G. barchia robinsoni*)

LOCAL NAME. *Tau kyat* (Burmese).

SIZE and FIELD CHARACTERS. As of 299, q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Eastern Mishmi Hills, NEFA. Affects undergrowth in moist-deciduous and semi-evergreen jungle, interspersed with patches of cultivation and clearings.

Extralimital. SW. Yunnan, Burma, Siam (except the eastern parts), N. Laos, Malaya, N. Sumatra (Delacour).

GENERAL HABITS, FOOD, VOICE and CALLS. As in the Indian race (299).

BREEDING. Nothing specifically recorded as different from 299. *Season* in the Mishmi Hills unrecorded; in Burma principal months for eggs March to May.

MUSEUM DIAGNOSIS. Male differs from *G. g. murghi* in having the upper plumage a deeper red with the neck-hackles less attenuated, less orange or yellow at the tips, and with the dark central streaks reduced. Ear lappets smaller, usually red or deep fleshy pink, not white or pinkish as in 299.

MEASUREMENTS and COLOURS OF BARE PARTS (excepting lappets) as in the Indian *G. g. murghi*.

301. Grey Junglefowl. *Gallus sonneratii* Temminck

Gallus Sonneratii Temminck, 1813, Fig. et Gall. 2: 246

(India = Eastern Ghats near Madras, restricted by Whistler & Kinnear, 1936, Jour. Bom. nat. Hist. Soc. 38: 682)

LOCAL NAMES. *Jāngli murgā* ♂, *Jāngli murgī* ♀ (Hindi); *Kōmri* (Mt Abu); *Gerra kūr* (Maria Goud); *Kātu kōzhi* (Malayalam, Tamil); *Parda kōmri* (Gondi,

108

GALLIFORMES

bamboo clumps, several birds perched together along a branch or arching culm.

FOOD. Grain, shoots of grass and crops, tubers, berries (e.g. *Zizyphus*, *Lantana*, *Streblus asper*) gleaned on the ground or plucked from low bushes, windfallen wild figs (*Ficus bengalensis*, *F. glomerata*, and other species) from underneath the trees, insects, especially grasshoppers and termites, and small reptiles (lizards, and doubtless snakes). Also fly maggots and human excreta (probably ingested with them) near human habitations. Bamboo and *Strobilanthes* seeds when cyclically available attract very large numbers of junglefowl to the seeding areas.

VOICE and CALLS. Crow of cock a curious halting, grating and rather unmusical *kūk-kā-kūrra-kūk* or *kūk-kāyā-kāyā-kūk*. It ends in a low *kyūkūn-kyūkūn* repeated slowly and softly and audible only at close range. Cocks (in breeding season only?) often indulge in a bout of all-round crowing before dawn, when still quite dark, which is joined in by others from far and near. After this there is a lull for a couple of hours till light enough for them to descend from the roosting perch, preceded by another round of crowing. In daytime the call is normally uttered from an ant-hill or fallen log, and usually prefaced by a loud rapping of the wings against the sides. A loud, bellicose, challenging *klick* . . . *kluck-kluck* repeated monotonously every few seconds from a more or less fixed position, maybe for over a quarter of an hour at a stretch, is sometimes emitted by a cock. Exact significance of these calls not understood. There is a sensible difference in timbre between the crow of Kerala birds and those from the Mt Abu area which, moreover, are somewhat paler in coloration.

BREEDING. *Season*, chiefly February to May, somewhat earlier in the south, but locally more or less throughout the year. *Nest* and *eggs* similar to those of the Red Junglefowl, the latter sometimes with a few dark freckles of brown or reddish brown. Normal clutch 3 to 5 or 6, though 6 to 10 have been recorded. Average size of 60 eggs 46.3 × 36.5 mm. (Baker).

Cock *apparently* monogynous, but evidently practising progressive polygyny, pairing with individual hens as they become physiologically mature. Incubation by hen alone; period 20–21 days.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'Similar to that of the Red Junglefowl but the lateral bands almost white and the sides and lower parts dull grey' (Baker).

Female (immature) in first feather plumage 'closely resembles adult ♀, but the shaft streakings of the upper plumage and the lanceolate markings of the lower are as a whole much less distinctly defined. The black stippling on the wings and tail also tends to coalesce into barring on the edges of the tertiaries and tail-feathers' (Whistler).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	220–255	32–36	70–80	314–390 mm.
♀♀	190–215	30–33	60–67	100–170 mm.

(Delacour & SA)

Weight ♂♂ 1 lb. 12 oz. to 2 lb. 8 oz. (790–1136 gm.); ♀♀ 1 lb. 9 oz. to 1 lb. 12 oz. (705–790 gm.)—Hume & Baker.

PHEASANTS, PARTRIDGES, QUAILS 109

COLOURS OF BARE PARTS. ♂ Iris dusky chrome-yellow or orange-brown. Bill yellowish flesh colour, dark horny brown on culmen. Comb and wattles bright crimson. Legs and feet yellow, or pale yellow and magenta; claws horny brown, spurs darker. ♀ Iris, bill and legs as in ♂. Rudimentary comb and bare facial skin brick-red or dull crimson.

MISCELLANEOUS. The spangled neck-hackles of the cock are much prized in the U.S.A. for making artificial flies for trout fishing. The lucrative demand resulted in large-scale smuggling abroad of these feathers by unscrupulous businessmen, and a serious depletion of Grey Junglefowl populations, particularly in some of the south Indian districts. Tightening up of Customs vigilance has helped to mitigate the vandalism, but only partially. Fortunately for its preservation, however, the species breeds freely in captivity, and it is to be hoped that before long this industry will be sufficiently developed in America to meet their local demand for hackles and relieve pressure on our indigenous wild stocks.

Among the many methods practised in the different parts of the country for capturing Grey Junglecocks, an unconvincing but nevertheless highly successful one is for a number of persons to throw a wide ring round a cock in fairly open scrub country and chase him to attrition from bush to bush. In his panic the bird evidently prefers to trust to his legs rather than fly, and is soon tired out and secured.

302. Ceylon Red Junglefowl. *Gallus lafayetii* Lesson

Gallus Lafayetii Lesson, 1831, *Traité d'Orn.*, livr. 7: 491 (Ceylon)
Gallus lafayetii xanthimaculatus Deraniyagala, 1955, Admin. Rept. of the Dir. Nat. Museums, Ceylon, for 1954, Pt. IV, Educ., Sci. & Art (E): E5 (Mankulam, N.P., Ceylon)
Baker, FBI No. 1906, Vol. 5: 300
Plate 35, fig. 8

LOCAL NAMES. *Weli kukkulā* ♂, *Weli kikkili* ♀ (Sinhala); *Kāthkōli* (Tamil).

SIZE. Domestic fowl; length ♂ c. 66-72 (26-28 in.) including long tail; ♀ c. 36 cm. (14 in.).

FIELD CHARACTERS. Male differs from Indian Red Junglecock chiefly in having the breast reddish orange instead of black. Feathers at base of naked throat rich violet-purple. Comb larger, crimson-red broadly centred by a yellow patch; shaped like an inverted pear in profile and only slightly crenated. Secondaries of wing purple-black instead of chestnut.

Female. Above chiefly rufous-brown and rufous-buff, finely vermiculated with black. Wings (primaries and secondaries) pale brown mottled with black and buff to produce several broad and distinctive black and buff bands. Below, upper breast, sides of lower breast, and flanks, vermiculated black and rufous-brown and streaked with rufous-buff. Rest of underparts largely black-streaked white.

Young (immature) cock resembles adult ♀ but has the black-centred yellow neck-feathers and upperparts mixed with red. Below: breast rufous-red, belly dull black (Delacour).

PHEASANTS, PARTRIDGES, QUAILS 111

brown. ♀ Iris olive-yellow. Bill dark brown above, yellowish below. Legs and feet brownish yellow.

Genus *PUCRASIA* G. R. Gray

Pucrasia G. R. Gray, 1841, List Gen. Birds, ed. 2: 79. New name for *Eulophus* Lesson 1836 (not of E. L. Geoffroy 1762). Type, by monotypy, *Satyra macrolopha* Lesson.

Head and face in both sexes fully feathered and with a well-developed occipital crest. In male two long tufts of metallic black plumes on either side of crest springing from above ear-coverts, erected in display. Wing less rounded than in most pheasants: 1st primary (as.) considerably shorter than 2nd; 2nd primary equal in length to 8th; 4th primary slightly the longest. Body feathers mostly lanceolate in both sexes. Upper tail-coverts almost as long as tail. Tarsus a little longer than middle toe and claw; armed with a spur in male. Sexes dimorphic in coloration.

Only one Himalayan species within our limits.

303. Chestnutmantled Koklas Pheasant. *Pucrasia macrolopha castanea* Gould

Pucrasia castanea Gould, 1855 (1854), Proc. Zool. Soc. London: 99 (Kafiristan)
Baker, FBI No. 1914, Vol. 5: 313

LOCAL NAMES. None recorded.

SIZE. Domestic fowl; length ♂ c. 58-64 cm. (22-25 in.); ♀ c. 52-56 cm. (20-23 in.).

FIELD CHARACTERS. As for the common Koklas (305), q.v., but neck all round, upper back, breast, and flanks chestnut, and middle of abdomen brownish black in male. Tail largely sooty black with practically no chestnut. For female see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Lower Chitral west of Kunar river in NW. Pakistan, the localities particularized being the Pattison and Arreth

110 GALLIFORMES

STATUS, DISTRIBUTION AND HABITAT. Endemic and peculiar to Ceylon. Locally plentiful in the jungles throughout the Island. Resident in all zones, from sea level to the highest mountains.

GENERAL HABITS. As of the Indian species (299), q.v. Very shy and wary in the neighbourhood of villages and roads, but tame and unafraid in remoter areas where unmolested.

FOOD. As in the Indian species, grain, weed-seeds, berries, insects (especially grasshoppers and termites), and small animals such as lizards. Bamboo and *Strobilanthes* seeds when available are particularly favoured.

VOICE AND CALLS. The cock's crow 'is a staccato, musical, ringing chick, *chaw-choyik* — the terminal *ik* being higher in scale than the rest. It is uttered with the head somewhat depressed and the beak jerked sharply up at each syllable' (Henry). This has also been aptly rendered as 'tek... *George Joyce*'. When challenging a rival the crowing is generally prefaced by a 'vigorous clapping of the wings together above the back (*sie*), from 3 to 4 claps' (Henry). This sound, easily imitated by slapping the trousered thighs, frequently lures a cock to the ambushed hunter and to his doom. Hen's cackle a high-pitched metallic *kwikkuk, kwikkukuk*... Besides these both sexes have a hard cackling *clock, clock* and a lower *chock, chock* (Delacour).

BREEDING. Commonly up to c. 1600 metres elevation. Season practically throughout the year, but chiefly December through April, and then again August-September. Nest, a bed of dry leaves in a scrape in the ground between the buttressed roots of a large forest tree, but more commonly up to 3 or 4 metres above in the fork of a tree-trunk, or on top of a broken stump, in cardamom jungle or other dense undergrowth. Eggs, normally 3 to 5 (up to 9 recorded), pale cream, peppered all over with minute light brown or purplish brown specks. More commonly thus stippled than in the Indian species. Average size of 48 eggs 46.3 × 34.5 mm. (Baker).

Crosses freely in captivity with both *Gallus gallus* and *G. sonneratii*, producing fertile hybrids.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Similar to *G. gallus* (299) but the markings darker; bands on sides of head and neck blackish (Delacour).

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
8 ♂ ad.	228-239	34-39	69-82	290-338 mm.
3 ♀ ad.	187-195	30-32	57-63	108-118 mm. (Whistler)

Delacour gives the range as:

	Wing	Tail
♂♂	216-240	230-400 mm.
♀♀	170-180	c. 110 mm.

Weight ♂♂ 1 lb. 12 oz. to 2 lb. 8 oz. (c. 790-1140 gm.) — Baker; ♀♀ 1 lb. 2 oz. to 1 lb. 6 oz. (c. 510-625 gm.) — Hume.

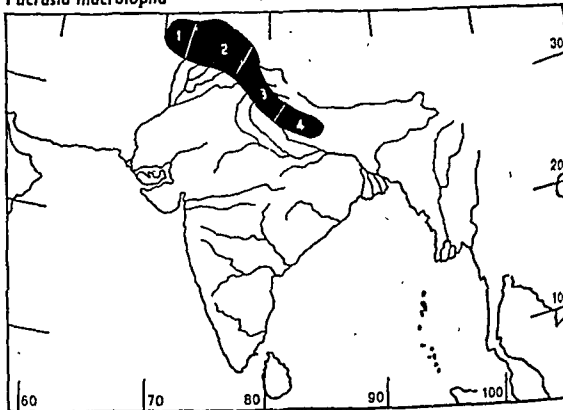

COLOURS OF BARE PARTS. ♂ Iris light golden yellow. Face, throat, and wattles livid or purplish red; comb bright red with large interior yellow patch. Bill brownish red, paler on lower mandible and tip. Legs and feet wax-yellow to pale yellowish

112 GALLIFORMES

valleys, and the valley behind Qila Drosh (H. T. Fulton, JBNHS 16: 61). Possibly also across the river in the southwestern portion of Hindu Rai range. Affects sides of wooded nullahs in oak (*Quercus*) and deodar (*Cedrus*) forest, from c. 1000 to 2300 m. altitude in winter, and up to c. 3400 m. in summer.

Extralimital. Adjacent mountain ranges of Kafiristan and Nuristan (Afghanistan).

Pucrasia macrolopha

Range within Indian limits 1 *P. m. castanea* (303). 2 *P. m. biddulphi* (304). 3 *P. m. macrolopha* (305). 4 *P. m. nipalensis* (306).

GENERAL HABITS, FOOD, VOICE AND CALLS. Little recorded; presumably as of 305. 'The call, usually uttered in the mornings, is a *kūk-ūrūk-ūrūk* very much resembling the call of the junglefowl but with a hint of the Black Partridge' (J. A. S. Roper, JBNHS 34: 1062). Another observer (Fulton) also remarks on the similarity of its call *kōk-kōk-kōk*... *kōk-kōk* to the crow of the Red Junglecock when heard in the distance. Particularly noisy during March and April.

BREEDING. Poorly known. Eggs are laid during May. The nesting site is usually placed on a ledge on some difficult piece of cliff towards the top of a nala' (Roper).

PHEASANTS, PARTRIDGES, QUAILS

113

MUSEUM DIAGNOSIS. For details of adult male plumage see Baker, loc. cit.

Female. 'Resembles *macrolopha*, but paler and greyer; general colour of the tail blackish brown not rufous-chestnut as in *macrolopha*; central tail-feathers greyish brown' (Delacour).

MEASUREMENTS.

♂ Wing c. 240; bill (from feathers) c. 25; tarsus c. 43; tail c. 178. Crest up to 104 mm.; spur c. 10 mm. (Baker).

Two birds obtained by Paludan in Afghanistan (Nuristan) measure ♂ Wing 252, tail 232 mm.; ♀ Wing 228 mm.

COLOURS OF BARE PARTS. Not recorded.

304. **Kashmir Koklas Pheasant.** *Pucrasia macrolopha biddulphi* Marshall

Pucrasia biddulphi Marshall, 1879, Ibis: 461 (Kashmir)

Pucrasia macrolopha bethelae R. L. Fleming, 1947, Fieldiana, Zool., 31: 93 (Manali) Baker, FBI No. 1912, Vol. 5: 312

LOCAL NAMES. *Plās* (Kashmir); *Kūtrōla* (Chamba).

SIZE. Domestic fowl; length ♂ c. 61 cm. (24 in.); ♀ c. 53 cm. (21 in.).

FIELD CHARACTERS. As of the common Koklas (305), q.v. See Key to the Subspecies, and Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident. Northern Kashmir south-east to Chamba (Himachal Pradesh) and Kulu (Punjab) north to the Rohtang Pass, from c. 2000 to 3400 metres altitude. Intergrades with *castanea* in the west and *macrolopha* in the east. Affects wooded slopes and nullahs in oak and conifer forest.

GENERAL HABITS, FOOD, VOICE and CALLS. As of 305.

BREEDING. *Season*, May-June. *Nest* and *eggs* as in nominate *macrolopha*. Average size of 28 eggs 50.9 × 37.8 mm. (Baker).

MUSEUM DIAGNOSIS. Male. Differs from *macrolopha* (305) in being slightly darker above, with the chestnut of the foreneck extending to hindneck. *Below*, chestnut underparts darker and more mixed with black; black edging to feathers of upper breast usually narrower.

Female has the black markings on outer tail-feathers in bars, not longitudinal streaks as in 305.

MEASUREMENTS and COLOURS OF BARE PARTS. As in 305. Baker gives for ♂♂ wing 233-249 mm.

305. **Koklas Pheasant.** *Pucrasia macrolopha macrolopha* (Lesson)

Satyra macrolopha Lesson, 1829, Dict. Sci. Nat., ed. Levrault, 59: 196

(Bengal, error = Almora Hills, Kumaon)

Baker, FBI No. 1911, Vol. 5: 310

Plate 35, fig. 1

LOCAL NAMES. *Koklās*, *Koklā* (Simla to Almora); *Pokrās* (Kumaon and Garhwal); *Khwookhtar* (Kangra).

SIZE. Domestic fowl; length ♂ c. 61 cm. (24 in.), ♀ c. 52 cm. (21 in.).

FIELD CHARACTERS. A medium-tailed Himalayan pheasant.

PHEASANTS, PARTRIDGES, QUAILS

115

in the ground roughly lined with sticks, leaves and grass, concealed under dense bushes or rocks. *Eggs* 5 to 7, though clutches of 8 and 9 have been recorded (Osmaston, Hume). Pale yellowish stone-colour or pale to rich deep buff, with spots, specks, and blotches of reddish brown. Average size of 68 eggs 51.3 × 37.5 mm. (Baker). Cock believed to be monogynous. Hen alone incubates; period 20-21 days. Chicks, as in most Phasianidae, able to fly in a very few days after hatching, while still little more than tiny balls of fluff.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	215-244	c. 24-29	c. 63-69	221-277 mm.
♀♀	180-218	—	—	172-195 mm.

Crest in ♂ up to 100 mm.; ear-tufts up to 120 mm.; spur 10-19 mm. (Baker).

Weight ♂♂ 2 lb. 8 oz. to 3 lb. 2 oz. (c. 1135-1415 gm.); ♀♀ 2 lb. 4 oz. to 2 lb. 8 oz. (c. 1025-1135 gm.) — Whistler.

COLOURS OF BARE PARTS. Iris dark brown. Bill horny brown to black sometimes tinged with greenish or purplish. Legs and feet dark bluish or purplish grey.

306. **Nepal Koklas Pheasant.** *Pucrasia macrolopha nipalensis* Gould

Pucrasia Nipalensis Gould, 1855 (1854), Proc. Zool. Soc. London: 100

(Nepal and Bhutan = Nepal)

Baker, FBI No. 1913, Vol. 5: 312

LOCAL NAME. *Pokrās* (Nepal).

SIZE. Domestic fowl; same as 305. Length ♂ c. 61 cm. (24 in.), ♀ c. 52 cm. (21 in.).

FIELD CHARACTERS. As for the common Koklas (305), q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION and HABITAT. Resident. From W. Nepal (where it intergrades with nominate *macrolopha*) eastward at least to long. 83°49'E. (Tukucha), an extension of c. 160 km. from Jumla whence Hodgson last reported it a hundred years ago. (R. L. Fleming, JBNHS 50: 661).¹ Complete absence of the species in the eastern Himalayas enigmatical, particularly as it reappears farther east in Yunnan and other parts of China, and Mongolia. Affects wooded nullahs and dense scrub-covered, often precipitous, hillsides in oak and conifer forest, between c. 2000 and 4500 m. altitude.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 305 and other races, q.v.

BREEDING. Unrecorded. Presumably same as 305.

MUSEUM DIAGNOSIS. 'Male. Differs from *macrolopha* [305] in having the feathers of the back, rump, sides, and flanks black, more or less edged with grey; wing-coverts black edged with buff or rufous; sides and back of neck, and upper rump black, strongly marked with chestnut; tail dark chestnut.

¹ Dr Biswas informs us that Jumla has always been a popular bird market to which live birds are brought for sale from long distances. Therefore the actual provenance of Hodgson's specimens is uncertain.

114

GALLIFORMES

♂, × c. 1

Male. *Above*, silver-grey streaked with black. Head fully feathered, metallic green. A brown recumbent occipital crest with long, metallic green horn-like tufts of plumes projecting behind on either side of it. A prominent white patch on either side of upper neck. Tail chestnut-brown, of medium length, pointed and wedge-shaped but not downcurving as in kaleej or junglecock. *Below*, largely deep bright chestnut.

Female. *Above*, mottled black-and-brown, finely streaked with buff. Crown chestnut-buff with shorter crest and no ear-tufts. *Below*, throat creamy white. Rest of underparts pale buff streaked with blackish, narrowly on breast broadly on posterior flanks. Under tail-coverts chestnut, spotted with white.

Chick (in down). Unknown.

STATUS, DISTRIBUTION and HABITAT. Resident. Southern Kashmir (Jammu), Himachal Pradesh, Kumaon and Garhwal to W. Nepal, between c. 1500 and 4000 metres; at the lower elevations in winter. Intergrades with *biddulphi* on the west and north, and with *nipalensis* on the east. Affects wooded ravines and steep hillsides, in oak and conifer forest with heavy scrub and ringal bamboo undergrowth.

GENERAL HABITS. As typical of most Himalayan pheasants; perhaps oftener met with singly or in pairs. Though not gregarious, several birds frequently haunting a particular hillside, and often the same forested nullah, day after day. Lies close in cover and difficult to flush without a dog. Rockets upwards when flushed and then shoots down the *khud* at great speed.

FOOD. Shoots, buds, tubers, leaves (e.g. of maidenhair and other ferns), berries, acorns, seeds, and insects.

VOICE and CALLS. Crow of cock, from which the species derives its popular name, a loud ringing but unmusical *kok-kok-kok... kokrās* (or *pokrās*). A variant has also been accurately rendered as *khwa-ka-kā*. Uttered principally in the early morning and evening, but also at other times of the day in cloudy overcast weather, and particularly in the breeding season. A number of cocks will 'explode' in a bout of crowing upon any sudden loud report such as the firing of a gun or a peal of thunder — a peculiarity reminiscent of the Peacock.

BREEDING. In courtship display the cock puffs out his body feathers, erects the long black ear-tufts with the brown crest between them, and struts about in the proximity of the hen. *Season*, April through June. *Nest*, a scrape

116

GALLIFORMES

'Female. Similar to *macrolopha* but redder all over; tail-feathers except the outermost, chestnut on the outer webs, blackish with white tips on the inner webs and with well-marked subterminal black bands' (Delacour). Plumage subject to much individual variation.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
1 ♂	229	27	62	203 mm.
1 ♀	212	29	55	166 mm.
3 other ♂♂	216, 226, 232 mm.			(R. L. Fleming)
Baker gives for ad. ♂♂	Wing 208-228, bill (from feathers) 23-26, tarsus c. 66, crest 68-91 mm.			

COLOURS OF BARE PARTS. As in 305.

Genus *CATREUS* Cabanis

Catreus Cabanis, 1851, in Ersch & Gruber, Allg. Encycl., sect. 1, 53: 221. Type, by monotypy, *Phasianus wallichii* Hardwicke

Closely allied to *Phasianus* but differing from it in the possession of a long narrow occipital crest of hair-like plumes. Wing rounded: 1st primary (as) shorter than 10th; 5th primary longest. Tail long and pointed, not compressed, of 18 feathers, the central pair very long, about four or five times the length of the outermost. Tarsus strong, armed with a well-developed spur in male; occasional and rudimentary in female. Sexes only slightly dimorphic.

Contains a single species confined to the western and central Himalayas.

307. **Chir Pheasant.** *Catreus wallichii* (Hardwicke)

Lophophorus (Phasianus) Wallichii Hardwicke, 1827, Trans. Linn. Soc. London 15: 166 (Almorah Hills)

Baker, FBI No. 1910, Vol. 5: 307

Plate 35, fig. 2

LOCAL NAMES. *Chihir*, *Chir* (Nepal, Kumaon, Garhwal); *Burehil*, *Heril* (hills north of Mussooree); *Chaman* ♂, *Chamani* ♀ (Kulu, Chamba); *Rehar* (Kashmir, in Pir Panjal and Kazing ranges); *Rehar* (Darg, NW, Pakistan).

SIZE. Large domestic fowl. Length ♂ c. 90-118 cm. (36-46 in.); ♀ c. 61-76 cm. (24-30 in.).

FIELD CHARACTERS. A long-tailed West Himalayan pheasant reminiscent of an English hen pheasant.

Male. *Above*, top of head and long narrow backward projecting crest blackish brown, edged paler. A bright crimson naked orbital patch. Upperparts chiefly buffy white and pale rusty, closely barred with black. Pointed tail buffy grey and chestnut, broadly barred with black and ashy grey. *Below*, chiefly buffy white, conspicuously barred on lower breast and flanks. Centre of abdomen blackish.

When planing down a hillside the general colour pattern, rounded wings, and partly open barred and graduated tail are strangely reminiscent of a gigantic Common Babbler (*Turdoides caudatus*).

♂ x 4/3

Female. Similar in general effect, but smaller with more chestnut in her underparts and facial patch brick-red rather than bright crimson. Young (immature). Like female but duller, less boldly marked and lacking the crest.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident, with practically no seasonal altitudinal movement. The Himalayas between c. 1400 and 3500 metres alt. from Hazara in NW. Pakistan through Kashmir, the Punjab, Himachal Pradesh, Garhwal, and Kumaon to at least the 84th meridian in west-central Nepal (Pokhara). Affects steep rugged hillsides in oak forest, covered with long grass and *Berberis* scrub, and cut up by wooded ravines and hollows.

Catreus wallichii

■ Distributional range

GENERAL HABITS. Keeps in coveys of 5 or 6 which feed on the open hillsides well hidden among the undergrowth. Is an extreme skulker with a marked predilection for running away uphill rather than taking to wing. Lies very close in cover and almost impossible to flush without a dog till almost trodden on, especially so after being once fired at. When flushed it usually hurtles down the *khud* at terrific speed with wings pulled in at the sides.

Genus SYRMATICUS Wagler

Sympticus Wagler, 1832, Isis von Oken, col. 1229. Type, by monotypy, *Phasianus reevesii* J. E. Gray

Long-tailed pheasants resembling *Catreus* in shape but without a crest. Wing rounded: 1st primary (as.) between 7th and 10th in length. Face bare in male, feathered in female. Tail not compressed; of 16 or 18 very long and strongly graduated feathers. Tarsi long and stout, armed with well-developed spurs in male, often showing as rudimentary knobs even in female. Sexes dimorphic.

Genus represented by only a single species and subspecies within our eastern limits.

308. Mrs Hume's Barredback Pheasant. *Sympticus humiae humiae* (Hume)

Callophapsis humiae Hume, 1881, Stray Feathers 9: 461 (Manipur)
Baker, FBI No. 1907, Vol. 5: 303
Plate 35, fig. 7

LOCAL NAMES. *Loiningkhai* or *nainungkhai* (i and n interchangeable — Manipur); *Nongin* (Chiru — a hill tribe in Manipur).

SIZE. Large domestic fowl; length ♂ c. 90 cm. (36 in.); ♀ c. 60 cm. (24 in.).

FIELD CHARACTERS. A long straight-tailed pheasant like the Chir but male much brighter coloured and lacking the crest. Above, head, neck (all round), and rump glistening steel blue, the last narrowly scalloped with white. Bare facial skin bright crimson. Back and mantle rich golden bay colour, scalloped with black. Conspicuous broad white bars on scapulars, and two narrower white ones on wing (white edging to coverts). Tail long, narrow-pointed, grey with several narrow chestnut-and-black cross bands. Below, chin, throat and foreneck glossy steel blue. Lower breast like back, changing to deep chestnut on abdomen and flanks.

Female. Above, head reddish brown, crown streaked with black. Bare red patch round eye much smaller than in ♂. Rest of upperparts chiefly sandy brown, streaked, mottled, and barred with black. Tail mainly chestnut, shorter and less pointed than ♂, the graduated rectrices broadly barred with black and tipped white. Below, chiefly sandy greyish brown and sandy rufous, sparsely black-spotted on upper breast, barred with pale grey on lower breast and flanks.

Young (immature) male like ad. female but duller.

STATUS, DISTRIBUTION and HABITAT. Rare and patchy; very little known. Manipur, Patkai, Naga, and Mizo (Lushai) hills, between c. 900 and 2000 m. elevation. Specific localities mentioned: *Manipur*. Ukhrul (25°N., 94°25'E.), just below c. 1800 metres; Heika, c. 1500 m.; valley of Thoubal river, a tributary of Manipur river, at c. 900 m.; Irang valley (Higgins, JBNHS 37: 89); *Naga Hills*. Manipur side of Kohima-Imphal valley south of Karong (25°18'N., 94°5'E.); hills south of Jessami village c. 50 km. ESE. of Kohima (25°40'N., 94°8'E.) (Ripley, JBNHS 50: 479). Affects mixed open forest interspersed with grass and bracken patches on steep rugged hillsides.

Extralimital. Contiguous parts of northern Burma, west of Irrawaddy river (Chin Hills etc.).

The covey usually remains loosely together when feeding, the birds rising more or less at the same time and giving the experienced hunter a chance to bring off a quick right and left. Silent during daytime but very noisy before retiring for the night; also before daybreak when still quite dark, prior to descending from the trees to feed.¹ The birds roost in company in patches of oak forest lining or overhanging gullies, their progress towards the sleeping places in the evening being betrayed by a series of clamorous squeaks and chuckles which must surely render them vulnerable to poachers and predators.

FOOD. Roots and tubers dug out of the ground, seeds and berries, and grain when available. Also insects and grubs. Reported not to eat grass or leaves like other pheasants, but Whistler has found leaves of rue in the crops of birds shot.

VOICE and CALLS. Crow, of both sexes, uttered early morning and at dusk, a distinctive loud and far-reaching *chir-a-pir*, *chir-a-pir*, *chir*, *chir*, *chirua*, *chirua*, and so on. In addition, various clucks and chuckles to express contentment, alarm and other emotions are also emitted.

BREEDING. Courtship display of cock of the lateral pattern as familiar in the jungle and domestic cocks and common to most Phasianidae. Season, principally late April to early June. Nest, a scrape or depression roughly lined with a few leaves and grass at the foot of a boulder on a rugged hillside in open oak or chir pine forest, usually well concealed by overhanging grasses etc. Eggs, 9-14, dull creamy white to pale grey-buff, sparsely and irregularly freckled and blotched with light reddish brown. Average size of 48 eggs 53.4 × 39.3 mm. (Baker). Cock evidently monogynous; assiduous in tending the young. Incubation by hen alone; period c. 26 days.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'Centre of crown chocolate-brown; a narrow black line from posterior corner of eye to ear-coverts, where it expands, and then, narrowing again, continues back down side of neck. Rest of head creamy buff, paling on lower face; lower neck and upper parts grizzled grey with dark chocolate shoulder spots; anterior half of wing and entire centre of back (which has two lateral lines of pale grey), chin and throat creamy white; remainder of underparts more greyish. This downy plumage is unlike that of any other pheasants, and more like certain partridges' (Delacour).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	235-270	25-29	74-78	450-580 mm.
♀♀	225-245	24-27	60-63	320-470 mm. (Delacour)

Weight ♂♂ 3 lb. 4 oz. to 3 lb. 12 oz. (c. 1475-1700 gm.); ♀♀ 2 lb. 12 oz. to 3 lb. (c. 1250-1360 gm.) — Whistler.

COLOURS OF BARE PARTS. Iris golden hazel to orange-brown; orbital skin ♂ bright crimson, ♀ duller or brick-red. Bill pale yellowish brown or pale bluish horny. Legs and feet plumbeous or greyish brown, sometimes fleshy brown.

¹ Delacour's statement based on Wilson that they usually sleep on the ground (p. 205) may be only partially true.

GENERAL HABITS, FOOD, VOICE and CALLS. Very poorly known. Published field notes scanty; not suggesting any significant difference from Chir (307). Alarm note a subdued muttering *buk-buk-buk-buk-buk* (G. Heinrich, Chin Hills). 'They rise with an easily recognisable chuckle' (Wickham, U. Burma). A distinctive clucking while running away through undergrowth (Blandy).

BREEDING. No authentic information since eggs mostly obtained vicariously through local tribals. Season, April and May. Nest and site apparently similar to Chir's. Eggs. Full clutch believed to be of 6 to 10, creamy to rosy white. Average size of 43 eggs (presumed authentic) 48.7 × 35.3 mm. (Baker). Incubation period and other details unknown.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	206-225	25-29	58-66	400-535 mm.
♀♀	198-210	20-25	55-60	c. 200 mm. (Delacour)

Weight ♂ '2 lb. 6 oz. (c. 1080 gm.); spur 8.3 to 17.7 mm.' (Baker).

COLOURS OF BARE PARTS. Iris brown to orange; orbital skin deep crimson. Bill greenish horny, darker on base and culmen, paler at tip. Legs and feet dull light brown. In ♀ smaller orbital patch red.

Genus POLYPLECTRON Temminck

Polyplectron Temminck, 1813, Fig. et Gall. 2: 363. Type, by monotypy, *Polyplectron chinquis* = *Pavo bicalcaratus* Linnaeus

Contains smallish pheasants reminiscent of spurfowl, of grey, grey-brown or buff plumage with metallic coloured eye-spots or ocelli on the wings and tail. First primary, (as.) shortest; 2nd shorter than 10th; 6th primary generally longest. Inner secondary almost as long as primaries. Tail of moderate length, of 20 to 24 graduated feathers much rounded, and fan-shaped when open; central rectrices considerably longer than the others. Sides of the face nearly or quite naked. Tarsi much longer than middle toe and claw; in males usually armed with two (sometimes one or three, sharp-pointed spurs on each. Sexes slightly dimorphic; female smaller, duller and with fewer ocelli.

Represented in the northeastern parts of our area by one species in two races.

POLYPLECTRON BICALCARATUS (Linnaeus)

Key to the Subspecies

General colour more buffy-brown,.....P. b. *bicalcaratus*
General colour more grey and less buff.....P. b. *bakeri*

309. Bhutan Peacock-Pheasant. *Polyplectron bicalcaratum bakeri* Lowe
Polyplectron bicalcaratum bakeri Lowe, 1925, Ibis: 477 (Bhutan)
Baker, FBI No. 1901, Vol. 5: 291

LOCAL NAMES. *Munaweer*, *Dyodahuk*, *Droderik* (Assam); *Droderung* (Garo); *Du dip*, *Dao dai dip*, *Mejoor* (Cachar); *Burumunui* (Kacha Naga); *Kaimdr* (Chittagong).

PHEASANTS, PARTRIDGES, QUAILS 121

SIZE. Domestic hen. Length ♂ c. 64 cm. (25 in.); ♀ c. 48 cm. (19 in.).
FIELD CHARACTERS. Male. *Above*, head and neck brownish buff with a short frowzy crest of upstanding hair-like feathers. Rest of upperparts mainly greyish brown spotted on back and finely barred on rump and upper tail-coverts with whitish. Mantle, wing-coverts, and tail 'studded' or 'embossed' with brilliant violet green-blue, white-rimmed eye-spots or ocelli, larger and more elongated near tips of rectrices. *Below*, chin and throat whitish. Rest of underparts like back, the whitish barring on breast and flanks more defined. On under surface of tail the ocelli show up as black spots.

Female. Similar but smaller, duller and with shorter tail. Crest-feathers less hair-like. Ocelli less brilliant on mantle feathers, obsolete on the shorter rectrices. Whitish on throat more extensive.

Young (immature) male. Like female.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Duars and normally up to c. 1200 m. alt. in Sikkim, N. Bengal (Darjeeling and Jalpaiguri dists.), Bhutan and adjoining NEFA in the Dafia Hills (Kameng and Subansiri Frontier Divisions). The birds of the Mishmi Hills, further east, are darker and may belong to an undescribed race. Occurs also in Assam hills in Lakhimpur district (Dibrugarh) and south of Brahmaputra river through Sylhet (E. Pakistan), Cachar, Nagaland and Manipur. Chittagong examples intermediate but closer to nominate *bicalcaratus* (310). Affects dense evergreen forest.

GENERAL HABITS. Rather reminiscent of Spurfowl. Keeps singly or in pairs. A great skulker and extremely swift on its legs, keeping to dense undergrowth and seldom giving a glimpse of itself. Difficult to find and almost impossible to flush even with a dog.

FOOD. Grain, seeds, berries, wild figs, insects, grubs, snails and other small animals. Bamboo seeds when available, and white ants are especially relished.

VOICE AND CALLS. A deep guttural *hoo* rapidly repeated about seven times, and soft chuckling notes (Baker). 'Commonest call *ok-kok-kok-kok* not unlike that of cock English pheasant' (Higgins). In captivity several calls described by Delacour (p. 287) among which 'a sort of warbling song as the cock fully displays to the hen', consisting of a long, continuous flow of little chirps, up and down in scale, rising and falling, and lasting several minutes until the hen has moved away.

BREEDING. Display of cock beautiful and spectacular. He begins by running round hen with tail partly fanned and wings spread and drooping. Presently he sinks low in front of her till his breast rests on the ground. The tail and wings are raised and fully spread out fanwise to flaunt the brilliant metallic ocelli, his head meanwhile partly hidden among the fluffed-out plumage. Hen usually seems uninterested during this performance, but sometimes she responds by an inferior display of a similar pattern, whereupon copulation takes place. Season, March to June—chiefly April and May. *Nest*. A shallow scrape or natural depression roughly lined with a few dry leaves, invariably well hidden under dense vegetation. *Eggs*, normally 2; rarely 3, 4, and even 5, pale cream colour to rich chocolate-buff, more

PHEASANTS, PARTRIDGES, QUAILS 123

Tail in both sexes of 20 feathers, long and graduated; normally concealed by the ocellated train in the male. Under tail-coverts downy as in Adjutant Stork. Wings rounded: first primary (as) shorter than 10th. Tarsus very long and strong, armed with a spur in the cock.

The genus is found in the Indochinese and Indomalayan subregions.

311. Indian Peafowl. *Pavo cristatus* Linnaeus

Pavo cristatus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 156

('India orientalis, Zeylona' = India)

Baker, FBI No. 1897, Vol. 5: 282

Plate 33, fig. 1

LOCAL NAMES. *Mūr*, *Manjūr*, *Mayūra* (Hindi); *Mayūr* (Bengali); *Mūr* (Sindhi); *Mūr* ♂, *Lāndār* ♀ (Maharashtra); *Manja* ♂, *Mania* ♀ (Orissa); *Mabja* (Bhute); *Mongyung* (Lepcha); *Moira* (Assamese); *Wāhong* (Manipur); *Dode* (Garo); *Mōyil* (Malayalam, Tamil); *Menūra* (Sinhala); *Nemāli* (Telugu); *Nārilu* (Kannada); *Mūr* ♂, *Dhāl* ♀ (Gujarat).

SIZE. Domestic turkey. Length ♂ c. 92–122 cm. (40–46 in.) without train, c. 2 to 2.25 metres in full plumage; ♀ c. 86 cm. (38 in.).

FIELD CHARACTERS. Familiar and almost universally known. The fan-shaped crest of spatula-tipped wire-like feathers together with the brilliant glistening blue neck and breast, and the sweeping metallic bronze-green train, boldly ocellated with purplish black-centred coppery discs or eye-spots, make the cock unmistakable. Lower back light bronze-green narrowly scalloped with black. Scapulars and outer surface of wings close-barred with black and buff. A good deal of chestnut in wings (primaries and their coverts).

Female. Somewhat smaller, similarly crested but without the sweeping train. *Above*, head and nape rufous-brown. Rest of upperparts brown, faintly mottled paler. *Below*, lower neck metallic green instead of blue; breast buffy brown glossed with green; abdomen buffy white. Primaries brown with no chestnut as in male.

Young (immature) male. Like adult female but with the primaries largely chestnut.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, locally up to c. 1800 m. elevation (rarely even 2000 m.) in the outer Himalayas and peninsular hills, practically throughout the subcontinent south and east of the Indus river, including Jammu and southern Kashmir. Eastward to about Lakhimpur district in Assam (c. 95°E.), thence south through Nagaland, Manipur, Mizo (Lushai Hills), and Chittagong west and south to the extreme tip of the Peninsula. Also indigenous and resident in Ceylon where locally plentiful in the low-country Dry zone. Introduced and now fairly established with a semi-feral status in parts of Sind (W. Pakistan), e.g. Hyderabad, Mirourkhas, Umarmot and Schwan areas. Very common and abundant

122

GALLIFORMES

or less stippled all over with white. Average size of 40 eggs 46.5 × 35.9 mm. (Baker).

Cock evidently monogynous. Incubation by hen alone; period c. 21 days. According to Baker, when the downy chicks begin to run about they generally keep close behind the mother under her tail, which is spread out like an umbrella over them.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). *Above*, dark chestnut with two faint darker streaks down the sides of the back with broad streaks of buff outside them. *Below*, pale buff; a dark spot on each wing (Baker).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	210–240	22–25	75–80	350–400 mm.
♀♀	175–215	18–20	65–70	230–255 mm. (Delacour)

Weight ♂♂ 1 lb. 4 oz. to 2 lb. (c. 568–910 gm.) — Baker.

COLOURS OF BARE PARTS. ♂ Iris white to pearl grey. Facial skin yellowish flesh colour, sometimes more reddish. Bill creamy flesh colour, black at tip and on culmen. Legs and feet dark slaty or greenish plumbeous to blackish. ♀ Iris brown, grey-brown, or grey. Facial skin dull flesh-coloured. Legs and feet paler than in ♂.

310. Burmese Peacock-Pheasant. *Polyplectron bicalcaratum bicalcaratum* (Linnaeus)

Pavo bicalcaratus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 156 (China, restricted type locality Tonkin or Yunnan vide Stresemann, 1952, Ibis 94: 510 = Yunnan)

Baker, FBI No. 1900, Vol. 5: 289

Plate 35, fig. 10

LOCAL NAME. *Katrār* (Chittagong, E. Pakistan).

SIZE. Domestic hen. Length ♂ c. 64 cm. (25 in.); ♀ c. 48 cm. (19 in.).

FIELD CHARACTERS. As for 309 q.v., see Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. Chittagong Hill Tracts, E. Pakistan. The birds here somewhat intermediate between the two races but closer to nominate *bicalcaratum*. Affects dense evergreen jungle; foothills and up to c. 1200 metres elevation.

Extralimital. Burma (Chin and Kachin Hills) east to W. Tonkin, south to S. Tenasserim, Thailand and central Laos.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 309.

BREEDING. Not specifically recorded within Indian limits. Same as in 309.

MUSEUM DIAGNOSIS. Differs from *bakri* (309) in both sexes being more brownish buff less grey in coloration. Most of the whitish markings are replaced by buff.

MEASUREMENTS AND COLOURS OF BARE PARTS as in 309.

Genus PAVO Linnaeus

Pavo Linnaeus, 1758, Syst. Nat., ed. 10, 1: 156. Type, by tautonymy, *Pavo cristatus* Linnaeus

Contains the familiar Peafowl distinguished by their erect occipital crest of feathers and the resplendent plumage of the cocks with greatly lengthened upper tail-coverts.

124

GALLIFORMES

in Gujarat and Rajasthan and locally wherever protected on religious or sentimental grounds. Introduced successfully also in the Port Blair area and elsewhere in the Andaman Is. In wild state affects moist- and dry-deciduous forest in the neighbourhood of streams. Where semi-feral, found in the precincts of villages and cultivation, in close association with man.

GENERAL HABITS. Keeps in small flocks or droves consisting usually of a cock and 3 to 5 hens. After the breeding season segregated parties of adult males and of females with their immature broods are more common. In the wild state the birds emerge cautiously into forest clearings, and ploughed or newly sown fields in the early mornings and late afternoons to scratch the ground for food. An hour or so after sunrise they troop down to the water to drink, tripping gingerly over the dry leaves, craning their necks at every step and peering inquisitively through the bushes with the utmost circumspection. The birds also drink at dusk before retiring to roost. They spend the heat of the day in impenetrable thickets of lantana and the like. Peafowl are possessed of phenomenally keen eyesight and hearing and are excessively wary and wide awake at all times, ducking their heads and slinking away through the undergrowth on the least suspicion. The cock's cumbersome-looking train, carried horizontally a few inches above ground, is apparently no impediment to swift progress through the thickest cover. The birds prefer to trust to their legs for escape, running one behind the other when driven by beaters, and seldom take to wing except when flushed by a dog or to cross some open river-bed or ravine. They rise with a loud flapping of wings, even an old cock with his long, heavy train rocketing almost vertically to clear the tree-tops. When properly launched they fly fast and strongly with rapid flaps and glides and dextrous twists and turns to avoid tree-trunks and other obstacles.

When surprised in the open with a brood of small chicks, the hen pulls out the family to safety with amazing adroitness, crouching low with neck outstretched to take full advantage of every little dip and unevenness in the ground for concealment as she swiftly makes for cover in a manner inconceivable for so large a bird.

Peafowl roost at night in tall trees; the jungle resounds with their loud and ugly *may-awee* calls at dusk and early dawn before the birds descend to feed. They often call from the roost also during the night, and the crashing of a tree or a sudden clap of thunder is sure to release an immediate burst of responsive caterwauling by all the cocks in the neighbourhood. Cocks are quick to detect the presence of the larger cats on the prowl and herald the marauders' progress through the forest with loud warning alerts which are taken up by other cocks and by langur monkeys.

FOOD. Omnivorous. Seeds, grain, lentils, groundnuts, tender shoots of crops, flower-buds, berries and drupes (e.g. *Carissa*, *Lantana*, *Zizyphus*), wild figs (*Ficus glomerata* and other species), centipedes, scorpions, lizards, small snakes (once c. 20 cm. long), insects (e.g. locust hoppers, beetles, caterpillars), worms and grubs have all been more or less regularly found in crops and stomachs. In and around villages also human excreta. In areas where it is semi-feral and abundant it is destructive to cereal and crops in the highest degree, and a veritable scourge to the small vying with the sacred monkeys in the work of devastation.

VOICE and CALLS. Normal 'crow' of cock a loud and harsh metallic trumpet-like *may-aw* shrieked several times, varying in pitch. Also a series of short, gasping screams *kā-ān . . . kā-ān . . . kā-ān* (or *cain . . . cain . . . cain* pronounced as in French) repeated 6 to 8 times rapidly with an inane pumping action of the head and neck, well likened to 'something between the screams of a hysterical old woman and the bray of a donkey'. Alarm call when suspicious and agitated a double-syllabled brassy *kōk-kōk* or *cain-kōk*, and variations of the same. This commonly uttered by a hen with neck-feathers fluffed out like a bottle brush and repeated intermittently for many minutes, especially when leading a brood of chicks.

BREEDING. The display or 'dance' of the cock consists of erecting and fully fanning out the ocellated train which is slightly tilted and arched forward. His half-open chestnut wings are drooped at the sides and go through a continuous shaking or quivering. In this posture he faces the hen (or hens), and with legs partly flexed struts and prances from one foot to the other in mincing steps as if stalking her — an action reminiscent of the holding manoeuvre, with arms stretched out, in the Indian game of *Āta-Pāta*. From time to time he goes through violent paroxysms of shivering the erected train, the quills producing a 'zizzing' sound, and thus slowly pivots round to exhibit his posterior — the greyish under tail-coverts and black rump surmounted by the radiating glistening white shafts of the fanned-out train. The hen usually appears completely unconcerned during all these amorous antics, but she occasionally responds with an inferior imitation of the cock's movements. (A cock once observed interrupting his full display to chase off a rival intruding too near the coterie.) *Season*, in the northern and central part of its range chiefly after the break of the rains in June, continuing through September; in southern India chiefly April and May; in Ceylon chiefly January to March. *Nest*, a scrape in the ground, sometimes unlined at others roughly so with sticks, grass, and leaves. Usually well concealed in thorny undergrowth (e.g. *Lantana*, *Zizyphus*). Semi-feral birds often nest in ancient forts and ruined buildings, and frequently even on the flat roofs of houses in a village. *Eggs*, 4 to 6, broad, blunt ovate pale cream or *café au lait* to buff in colour, with a finely pitted surface. Average size of 100 eggs 69.7 × 52.1 mm. (Baker). Cock progressively polygynous. Female alone incubates; period c. 28 days. An exceptional case of a cock incubating a clutch of 5 eggs by himself for a week until all the eggs gradually disappeared, is recorded by Yuvraj Shivraj-kumar of Jasdhan (1956, JBNHS 54: 464).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for a note on moult, Marien, D., 1951, *Amer. Mus. Novit.*, no. 1518: 20-1.

Chick (in down). 'Pale buff; a dark brown mark across the nape from one eye to the other; back darker rufous-brown; wing pale dull chestnut mottled with brown' (Baker).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail	Train
♂♂	440-500	40-44	140-155	400-450	1400-1600 mm.
♀♀	400-420	37-40	120-130	325-375	— mm.

(Delacour)

Weight ♂♂ 9 lb. to 11 lb. 4 oz. (c. 4-6 kg.); ♀♀ 6-9 lb. (c. 2.75-4 kg.) (Baker).

CRANES, RAILS, BUSTARD-QUAILS

FOOD. As in 311.

VOICE and CALLS. An equally far-carrying *āow-aw*, *āow-aw*, *āow-aw* uttered with head well raised up; sometimes actually while displaying. A peculiar *tak-tak-ker-r-r-r-oo-oo*, *ker-r-r-r-oo* while walking about in search of a companion that had been shot (H. C. Smith).

BREEDING. 'Dance' similar to that of 311. Copulation followed when a hen quietly approached an *ex parte* displaying cock. He gave a loud scream on seeing her, made a rush at her with drooping train, and held her down by the head with his bill. After the act she walked away, and he soon resumed strutting and showing off as before (C. M. Inglis). *Season*, chiefly January through April, but July to September also recorded. *Nest* and *eggs* as in 311, the latter — 3 to 6 in a normal clutch — indistinguishable from those of the Indian bird, but pointed eggs said to be commoner. Average size of 36 eggs 72.7 × 53.5 mm. (Baker). Cock progressively polygynous (or promiscuous?). Incubation by hen alone; period 26-28 days.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). *Above*, crown and a streak from occiput to near ear blackish brown; sides of head and throat lemon-yellow; occiput and rest of neck (all round) brownish buff, browner on hindneck; a dusky streak from nape to below ear-coverts. Back sepia-brown. Down on wings rufous-brown, feathers pale Indian red tinged with yellow and marked with black except at tip; markings on primaries lighter. Tail brown. *Below*, breast brownish buff; remainder of lower plumage pale lemon yellow; sides of thighs pale rufous-yellow. Iris greyish brown. Bill creamy yellow purer yellow above the nostrils, reddish in front of nail. Legs and feet yellow, reddish between the scutac in front of tarsus; claws pink; soles of feet yellower than the rest (Inglis).

A 14-day old chick flew on to the roof of a small house. Crest became noticeable 23 days after hatching. When a month old body feathers started appearing. Already at 1½ months the chicks began showing off. When 2½ months old they commenced getting metallic feathers on the back and sides of neck (Inglis).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail	Train
♂♂	460-540	42-45	160-170	400-475	1400-1600 mm.
♀♀	420-450	40-43	135-145	400-450	— mm.

(Delacour, for nominate race)

Weight ♂♂ 8½ to 11 lb. (c. 3.85-5 kg.) — Baker.

COLOURS OF BARE PARTS. Iris dark brown or hazel brown. Orbital skin bluish green; naked cheeks yellow to pale orange. Bill dark horny brown darker at tip, paler at base. Legs and feet dark grey-brown or horny brown; claws blackish.

Order GRUIFORMES

(For anatomical details see Stresemann, E., 1927-34, *Aves* (Turnices: 759, Ralli: 763, Helionithes: 765, Otides: 774, Grues: 772)

Baker, E. C. Stuart, 1922-30, *Fauna Brit. India* (Hemipodii, 5: 440, Grallae, 6: 1 [Fulicariae: 1, Grues: 48, Otides: 59])

Family TURNICIDAE: Bustard-Quails

Genus TURNIX Bonnaterrae

Turnix Bonnaterrae, 1791, *Tabl. Encyc. Méth., Orn.*, pt. 1: lxxxii, 5. Type, by a subsequent designation, *Tetrao gibraltarius* Gmelin = *Tetrao syloaticus* Desfontaines

COLOURS OF BARE PARTS. Iris dark hazel brown. Bare facial skin livid white. Bill dark horny, darkest along culmen and at tip. Legs and feet greyish brown to dark horny brown; claws blackish.

MISCELLANEOUS. The peacock is considered sacred in Hindu mythology as the vehicle of the god Kartikeya the son of Lord Shiva and his consort Parvati, and a brother of elephant-headed Ganesha. It is, besides, a subject of voluminous folklore throughout the country. For an account of its place in mythology and Sanskrit literature and poetry see Thaker, J. P., 1963, *Pavo* 1(1): 1-18.

The long ocellated feathers of the peacock's train are shed after the breeding season and picked up and collected in large quantities by villagers for export chiefly to Europe and America, and for being made up locally into fans and other gaudy gimcracks. The export has now been prohibited as a measure of protection for the species, a step perhaps unnecessary considering that the trade was almost entirely confined to dropped feathers available in marketable quantities only in areas where the birds are already well protected by sentiment and therefore abundant enough to make the collection of the feathers economically worth while. An average adult cock's full train contains about 200 + feathers (2 counted 206, 210).

In 1963 the peacock was officially designated as the National Bird of India.

312. **Burmese or Green Peafowl.** *Pavo muticus spicifer* Shaw & Nodder

Pavo spicifer Shaw & Nodder, 1804, *Nat. Misc.* 16: pl. 642. (India)

Baker, FBI No. 1898, Vol. 5: 284

Plate 33, fig. 2

LOCAL NAMES. *Pegu majūra* (Calcutta bird dealers); *Wahong* (Manipur).

SIZE. Same as Indian Peafowl (311), q.v.

FIELD CHARACTERS. Male readily distinguished from Indian peacock by overall green (v. blue) coloration. Crest upstanding, pointed (not fan-like), of lanceolate shot blue-green feathers. Bare facial skin blue and yellow. Neck and breast glistening bronze-green and purple finely scalloped with black. Train more tinged with copper-bronzy violet in certain lights.

Female. More or less similar to male but without train. Upper tail-coverts as long as tail, golden green cross-banded with pale rufous mottling.

Young (immature) male like adult female (above), but with the lower back greenish bronze instead of brownish black.

STATUS, DISTRIBUTION and HABITAT. Resident. North Cachar and Manipur (now very rare or almost extinct), Mizo (Lushai Hills), and Chittagong Hill Tracts (E. Pakistan); plains level to c. 1000 metres elevation. Recently recorded from Jalpaiguri district, W. Bengal, where possibly run wild from imported ancestors (Daniel, J. C., 1957, *J. Bengal nat. Hist. Soc.* 29: 11). Affects dense forest, keeping to the neighbourhood of streams and shifting cultivation.

Extralimital. Adjoining W. Burma, probably east to Irrawaddy river. **GENERAL HABITS.** As in the Indian bird. Owing to persecution, excessively shy and wild everywhere.

Contains small ground birds superficially very like true quail (to which they are only distantly related), but readily distinguished in the hand by the absence of the hind toe or hallux. Called Hemipodes or Bustard-Quail on account of the three-toed bustard-like foot. They differ from true quail also in the absence of a crop.

Family remarkable for its breeding biology. Females polyandrous, larger than males and more brightly coloured, sharing this reversal of the normal condition in birds with the Painted Snipe and a few other species. Widely distributed in the Old World. Represented by three species and several races in our area.

Key to the Species

LOCAL NAMES. *Ginwa louwa*, *Chhota louwa*, *Dābki* (Hindi); *Chhota bāūr* (Bengali); *Tura shimaj* (Mathura); *Tirra gūndri* (Santhali); *Libbia* (Purnea); *Darui* (Ratnagiri); *Chinna* or *Telladabba gūndla* (Telugu); *San gūndla* (Orissa); *Chhota sānvorī* (Assam); *Sorbil* (Manipur); *Daoduma kashiba* (Cachar); *Inrubuma gajeba* (Naga); *Tutu bāūr* (Sind).

SIZE. Bush Quail —. Length ♂ c. 13 cm. (5½ in.), ♀ slightly larger. **FIELD CHARACTERS.** An unmistakable quail and one of our tiniest game birds. Distinguished from the two other three-toed species by its smaller size and distinctly pointed little tail. *Above*, crown blackish brown with a whitish median line or 'centre parting'. Hindneck ferruginous scalloped with buff. Upperparts irregularly barred rufous and black. *Below*, white or whitish excepting breast which is brownish buff with black-and-chestnut spots on its sides.

Sexes more or less alike; female slightly larger. For young (immature) see Museum Diagnosis.

BUSTARD-QUAILS

129

STATUS, DISTRIBUTION AND HABITAT. Resident, but also seasonally nomadic in parts. From c. 2400 metres elevation in the outer Himalayas (including Nepal and Sikkim) southward through the Peninsula (hill and plain) to Kerala. In the west, Kutch, Rajasthan and Sind (in the last apparently a rains visitor), north to the Punjab Salt Range, at least to c. 72°E. Eastward it extends through the Assam Valley to Dibrugarh and Sadiya; also Khasi, Cachar, and Naga hills, Manipur, Mizo (Lushai Hills) ?, Tripura, and East Pakistan in Sylhet, Tippera and Chittagong, plains and hill tracts. Affects grass-and-scrub jungle bordering cultivation and grassland.

Extralimital. Burma (including Shan States). The species, in numerous other races, is found from S. Spain south and east through Africa to the Indochinese subregion, Formosa, Java, and the Philippines.

GENERAL HABITS AND FOOD. As of the genus; see under 318.

VOICE AND CALLS. 'Drumming' of female similar to 318, but softer and less loud. It is a remarkable mixture of a purr and a coo uttered with the plumage fluffed, the bird 'turning and twisting about in the same way as an old cock pigeon' (E. A. Butler).

BREEDING. Season ill defined. Practically all year but chiefly during the rains. *Nest*, as in 318—a scrape in the ground sparsely lined with grass, in scrub jungle. *Eggs*, normally 4, greyish white finely speckled and sometimes blotched with yellowish brown, reddish brown, or black—similar to those of 318. Average size of 60 eggs 21.3 × 17.3 mm. (Baker). Hen polyandrous; incubation and care of the young by cock alone. Period of incubation c. 12 days (10 according to locals in Cachar).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Young (immature). Above, reddish brown, becoming brighter rufous on the nuchal region, indistinctly barred with blackish brown and spotted with white, especially on wing-coverts. Below, breast paler buff than in adult, spotted with black.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	61-71	c. 10-11	c. 18-20	c. 31-37 mm. (Baker)
♀♀	73-75			

Weight ♂♂ 1½ to 1½ oz. (c. 36-43 gm.)

COLOURS OF BARE PARTS. Iris light yellow to straw colour. Bill plumbeous white to plumbeous. Legs and feet pale fleshy white to pale blue-grey.

TURNIX TANKI Blyth

314. Indian Yellowlegged Button Quail. *Turnix tanki tanki* Blyth

Turnix tanki Blyth, 1843, Jour. Asiat. Soc. Bengal 12: 180. No locality = Bengal, based on drawing by Buchanan Hamilton [Not *Turnix maculatus* Vieillot = synonym of *Turnix maculosa* (Temminck)]

Baker, FBI No. 2005, Vol. 5: 454

Plate 32, fig. 5

LOCAL NAME. *Lourea* (N. India); *Bâtér* (Bengal); bustard-quails usually not distinguished specifically.

SIZE. Bush Quail ±. Length ♂ c. 15 cm. (6 in.); ♀ slightly larger.

* See Appendix

BUSTARD-QUAILS

131

Affects grassland, preferably damp spots, intermixed with low scrub, and growing crops of millet etc.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the genus; see under 318. Sometimes associates closely with the Bustard-Quail (318), so much so that in one instance specimens of both species together were secured in the same shot! (SA). Has been frequently taken at lights at night (on migration?).

BREEDING. Season, March to November, but chiefly after the break of the SW. monsoon rains in June—particularly August and September. *Nest*, as in 318 a scrape in the ground in grassland, sometimes completely arched over by the growing grass, looking like a domed structure with a lateral entrance. *Eggs*, 4 in a normal clutch also similar to those of 318 in shape, coloration, and markings. Average size of 60 eggs 22.8 × 17.9 mm. (Baker). Female polyandrous with a breeding biology more or less identical with 318.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
♂♂	71-84	c. 14	c. 23	c. 26 mm.
♀♀	79-93	14-15	25-28	c. 30-40 mm. (Baker, SA)

eight ♂♂ c. 1½ to 1½ oz. (c. 36-43 gm.)—Hume.

COLOURS OF BARE PARTS. Iris pale straw colour to white. Bill fleshy white or euish white tinged with yellow at base; sometimes brownish on culmen. Legs, feet and claws yellow, sometimes with an orange tinge.

315. Burmese Yellowlegged Button Quail. *Turnix tanki blanfordii* Blyth

Turnix blanfordii Blyth, 1863, Jour. Asiat. Soc. Bengal 32: 80 (Burma and Arrakan, type from Thayetmyo)

Baker, FBI No. 2004, Vol. 5: 453 (= *maculatus*)

LOCAL NAMES. *Dooduma g-jao* (Cachar); *Irruhuma ghâhêrta* (Naga).

SIZE. Bush Quail ±. Length ♂ c. 16 cm. (6½ in.), ♀ slightly larger.

FIELD CHARACTERS. As for 314, q.v. Slightly larger and with barring on back somewhat more pronounced.

STATUS, DISTRIBUTION AND HABITAT. Resident (? or seasonal [winter ?] visitor): Assam south of Brahmaputra river, Nagaland, Manipur, Mizo (Lushai Hills), E. Pakistan ? up to c. 2000 m. elevation. Affects grassland intermixed with low scrub, and growing crops of millet etc.

Extralimital. Burma, Thailand, Yunnan, Cochinchina, Manchuria.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of the genus; see under 318.

BREEDING. Season, mainly May to August but odd nests more or less throughout the year. *Nest* and *eggs*, indistinguishable from those of 318, breeding biology in general identical. Average size of 100 eggs 25.5 × 18 mm. (Baker).

130

GRUIFORMES

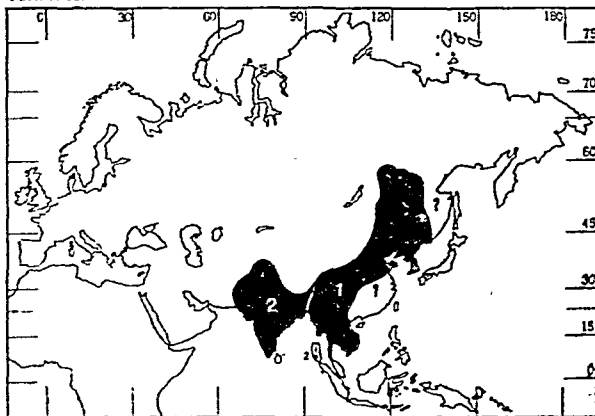

FIELD CHARACTERS. Male. Above, crown blackish mixed with rufous and buff, with a paler median line ('centre parting'). Supercilia and sides of head buff. Upperparts greyish brown, irregularly cross-banded and vermiculated with black (obsolete in old birds). Wing-coverts buff spotted with black. Below, chin and throat whitish. Rest of underparts pale buff, darker and rusty brownish on middle of breast, conspicuously black-spotted on sides of breast.

Female. Similar but slightly larger, and with a broad orange-rufous half-collar on back and sides of neck.

In flight, away from observer, this chestnut collar and whitish underparts are diagnostic. Both sexes distinguishable also by bright yellow legs and bill. (See fig. of very similar 315, Plate 23, facing p. 112.)

STATUS, DISTRIBUTION AND HABITAT. Resident (?) practically throughout the subcontinent from c. 1200 metres up in the outer Himalayas (locally c. 2000 m.) southward through the Peninsula, plain and hill, to Madras and Kerala; and from Sind and Kohat in W. Pakistan across to E. Pakistan and Assam north of Brahmaputra river. South of the Brahmaputra it is, according to Baker, replaced by the race *blanfordii* (315), but exact limits and

Turnix tanki

■ Distributional range 1 *T. t. blanfordii* (315). 2 *T. t. tanki* (314).

status of the two races hereabouts difficult to define. Evidently nomadic (or migratory?) in semi-desert areas, e.g. Punjab, Rajasthan, Sind and NW. Pakistan, its movements depending upon the rains and availability of suitable grass cover. Does not extend to Ceylon, but occurs in the Andaman Is. and more commonly Nicobars (Teressa, Camorta, Car Nicobar), apparently this race and not the Burmese *blanfordii* as might be expected.¹

¹ Three recent specimens from the Nicobars agree with the Indian population in size, but are described as 'much darker above with little or no rufous. The rufous collar of the ♀ is also much darker' (Abdulali, H., 1967, JBNHS 64(2): 158).

Baker, FBI No. 2000, Vol. 5: 448 (= *isabellinus*)

LOCAL NAMES. *Gûla*, *Gûdûra* (Hindi); *Gûla* (Bengal).

SIZE. Bush Quail \pm . Length σ c. 15 cm. (6 in.); ϕ slightly larger.
FIELD CHARACTERS. In general as for 318, q.v. See Museum Diagnosis.
STATUS, DISTRIBUTION and HABITAT. Resident. Lower Bengal in the 24-Parganas, Hooghly and Nadia districts. Possibly also the adjacent E. Pakistan districts of Khulna and Jessore. Intergrades with *taigoo* in southern Bihar and with *plumbipes* north of Nadia district (Bengal) and in southern East Pakistan. Affects grassland and scrub jungle, often entering compounds and jungly gardens on the outskirts of Calcutta city.

GENERAL HABITS, FOOD, VOICE and CALLS. Nothing specifically recorded as different from 318.

BREEDING. Season, apparently restricted to the monsoon months, June to September. Nest and eggs as in 318. Average size of 16 eggs 23.8 \times 19.1 mm. (Baker).

MUSEUM DIAGNOSIS. See Key to the Subspecies. As compared with *taigoo* (318), very pale, the general tint being more isabelline less rufous. White lines on upperparts very fine. Underparts rufous and dark in relation to upper.

MEASUREMENTS

Wing σ 77 mm., ϕ 83-84 mm. (Baker).

COLOURS OF BARE PARTS. As in 318 and the other races.

318. Indian Bustard-Quail. *Turnix suscitator taigoo* (Sykes)

Hemipodius Taigoo Sykes, 1832, Proc. Zool. Soc. London: 155 (Dukhun)

Baker, FBI No. 1998, Vol. 5: 447

LOCAL NAMES. Gūlu, Gūndlu, Gūndra, Sālu gūndra (Hindi); Kalada σ , Pared ϕ (Telugu); Ankadik σ , Kurung kadik ϕ (Tamil); Durwa (Ratnagiri); Karchakki (Kannada).

SIZE. Bush Quail \pm . Length σ c. 15 cm. (6 in.); ϕ slightly larger.
FIELD CHARACTERS. Superficially a typical little quail with a distinctive white eye. In flight, prominent pale buff patches on wing-shoulders are good pointers to its identity.

Male. Above. Crown dark brown with an indistinct pale central streak or 'parting'. Sides of head white, stippled with black. Rest of upperparts variegated rufous-brown, black, and white, with the wing-coverts boldly spotted with black and buff. Below, chin and throat whitish; rest of underparts rusty buff banded with black on foreneck and breast.

Female. Somewhat larger and more richly coloured. Above like male.

Below, rusty buff. Chin, throat, foreneck and centre of breast black; sides of breast and anterior flanks barred with black.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Resident (nomadic in the rains?). From Punjab in the west, the whole of continental and peninsular India south of the range of *plumbipes*, i.e. roughly south of 23°N. lat. Possibly also Sind in W. Pakistan whence not yet recorded. Plains level to c. 2500 m.

ϕ , x c. 1

elucidation. A detailed comparative study of the Indian bustard-quails (Turnicidae) is commended to field ornithologists.

MUSEUM DIAGNOSIS. See Baker, loc. cit., and Key to the Subspecies.

Chick in down (newly hatched). Above, dark chestnut-buff, with pale buff and black crescentic marks on back; a dark (blackish) coronal streak; a broad white line from lores through eye to nape; wings with a pale and a dark bar. Below, pale whitish buff; inside of thighs chestnut.

MEASUREMENTS

Plate 32, fig. 3

LOCAL NAMES. Bota wathad (Sinhala); Kādai (Tamil).

SIZE. Bush Quail \pm . Length σ c. 15 cm. (6 in.); ϕ slightly larger.

FIELD CHARACTERS. In general as for 318, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION and HABITAT. Race endemic in Ceylon. Common in all zones, lowlands and hills up to c. 1500 m. Affects grass and scrub country.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 318.

BREEDING. Season, practically throughout the year with two main flushes: January to March and July-August. Nest and eggs as in the Indian races but clutch size usually smaller — of 3 eggs instead of 4. One observer, T. S. U. De Zylva, records c/3 as common (CBCN, July 1978: 39). Average size of 47 eggs 23.3 \times 19.1 mm. (Baker).

MUSEUM DIAGNOSIS. As compared with *taigoo*, upperparts darker and duller brown, besides a rufous collar in female. Below, abdomen and vent a darker richer chestnut.

Family GRUIDAE: Cranes

(For morphology see Stresemann, 1927-34, Aves: 772-3; Baker, 1929, 6: 49; Witherby, 1940, 4: 449; Van Tine & Berger, 1959, p. 428.)

Key to the Genera

	Page
A Head and neck feathered throughout.....	<i>Anthropoides</i> 146
B Head and neck not feathered throughout.....	<i>Grus</i> 135

Genus GRUS Pallas

Grus Pallas, 1766, Misc. Zool.: 66. Type, by tautonymy, *Ardea grus* Linnaeus

In this genus of cranes crown bare in adults but sides of head and neck feathered excepting in the Sarus (*G. antigone*), which has almost the entire head and neck naked.

elevation. Replaced in Ceylon by the race *leggei* (319). Affects grassland and scrub jungle bordering villages and cultivation, and open light deciduous forest.

GENERAL HABITS. Though common and generally distributed, nowhere found so numerically concentrated as the true quails often are. Normally met with singly; occasionally pairs, rarely also small parties. Sedentary; haunting the same spots day after day. A great skulker, flushed with difficulty only when almost trodden on. Flies low in the typical quail manner but with a softer whirr of wings, and tumbles headlong into the tangled undergrowth after a short 'hedge-hopping' flight. When undisturbed, walks about quietly under the thickets, scratching and turning over the mulch for food. The presence of the birds in appropriate shrubbery is usually first revealed by the circular little scrapes dotted about in the mulch where they have been busily rummaging and dust-bathing.

FOOD. As in all other bustard- and button quails, grass- and weed seeds, grain, green shoots and small insects, e.g. termites and black ants. Among the last, *Camponotus compressus* has been identified. In captivity 'whole butterflies two inches across the wings' (F. Finn).

VOICE and CALLS. A loud drumming uttered by the pugnacious and polyandrous hen as a challenge to rival Amazons and in order to advertise her position to an eligible cock. The *dr-r-r-r-r-r-r* sounds very much like a two-stroke motorcycle engine in the distance. It runs for 15 seconds or more at a burst, and in the breeding season may be heard at all hours of the day and also through the night. It is usually prefaced by 3 or 4 deep, long-drawn *groos* (about 3 in two seconds) audible at closer range and reminiscent of the harsh timbre of the Red Turtle Dove (*Streptopelia tranquebarica*). There is also a more subdued but equally far-carrying booming call *hoon-hoon-hoon-hoon* (or *oof, oof, oof* — Inglis) sometimes heard for five seconds or more at a stretch. It is uncertain by which sex and under what conditions this is produced. Presumably it is the same call which Baker described as starting with the bird in a semi-erect sitting position 'but gradually lowering her breast to the ground with outstretched wings, and blowing herself out with each boom until she looked like a little feather balloon'.

BREEDING. Season, practically throughout the year, chiefly June to October. Nest, a scrape or depression in the ground in grassland, scrub jungle or crops, lined with grass and with the growing grasses arching over to form a bower, leaving a lateral entrance; sometimes the scrape is unlined. Eggs, almost invariably 4, greyish white profusely speckled and blotched with reddish brown or blackish purple; broad, obtuse ovals in shape with a highly glossed surface. Average size of 60 eggs 24.7 \times 19.4 mm. (Baker). Incubation period 13-16 days. Female polyandrous, evidently not promiscuous but practising successive polyandry. She battles with rival hens for the possession of a cock and does the courting. After the eggs are laid she loses interest and goes in search of a new mate. The cock settles down to incubate them and later rears the chicks all by himself. In this he displays great solicitude, indulging in the 'broken wing' trick and other diversionary antics when faced by would-be predators. How many clutches a hen lays in the course of a season has not been ascertained, and there are many other points in the accepted version of the breeding biology that need

Head and neck fully feathered in young of all species. Wings long and wide: 3rd primary (as.) usually longest; inner secondaries lengthened and considerably exceeding the primaries. Tail short, rounded to almost square. Tibia naked on lower half; toes short, strong, with short blunt claws. Sexes alike in plumage.

Cranes have exceptionally powerful, stentorian voices made possible by the specialized structure of the trachea or windpipe — abnormally lengthened, convoluted and coiled — which functions as a highly efficient resonating organ.

All the species in India are Palearctic migrants except the Sarus.

320. Eastern Common Crane. *Grus grus lilfordi* Sharpe

Grus lilfordi Sharpe, 1894, Cat. Bds. Brit. Mus. 23: 250 (Type locality fixed by Whistler & Kinnear, 1936, Jour. Bom. nat. Hist. Soc. 38: 695, Jhelum River near

Jalalpur, Punjab)

Baker, FBI No. 2034, Vol. 6: 50

Plate 7, fig. 10

LOCAL NAMES. Kūrinch, Kūrch (Hindi); Koonj (Sind); Kūlam, Kūlang (Deccan, Andhra).

SIZE. Goose \pm . Standing c. 140 cm. (c. 4½ ft) to top of head.

FIELD CHARACTERS. A large, tall stork-like grey bird with black flight-feathers and long neck and legs. Head and upper neck blackish with a dull red naked patch on nape. A prominent broad white band running from behind eye down sides of slaty-black upper neck. Tail concealed by a mass of drooping curly brownish grey plumes (elongated tertiaries). Sexes alike.

Young (immature). Overall rufous-isabelline due to the grey body-feathers being edged with this colour. Whole crown and neck clothed with rusty feathers. Residual traces of this plumage occasionally seen in some of our winter visitors.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, principally September-October to March-April. Commonest and most abundant in the northwestern parts of the subcontinent: Sind, Rajasthan, Gujarat, Punjab, Uttar Pradesh, diffusing eastward to Bihar, Orissa and West Bengal, and south through Madhya Pradesh and northern Andhra. Overflying Nepal Valley on migration but halting only in the Terai and duns. Occasionally straggling farther east and south, thus recorded near Lakhimpur and Cachar in Assam, and the Bombay Deccan to c. 18°N.

CRANES

137

lat. Doubtless straggles somewhat farther south exceptionally, but unrecorded from Mysore where the Demoiselle is a more or less regular winter visitor. Affects fields of winter crops, e.g. wheat and gram, sandy river-beds, etc.

Grus grus

■ Breeding range ▨ Winter
1 *G. g. grus* (RE).
2 *G. g. lilfordi* (320).

Extralimital. Breeds in Transbaikalia on Tarsi-nor (c. 43°20'N., 117°E.) and the Onon and Argun rivers; probably from the basin of the Yenisey eastward. Winters in China, Hainan I., and N. India (Peters); Burma (Smythies).

MIGRATION. No ringing data. Observations scanty but indicating arrival in NW. Pakistan in August-September directly overflying the Safed Koh Range of Afghanistan (c. 3800 m.) rather than its western shoulder which is considerably lower. Also large flocks overflying Kurram Valley, between 3rd week February and end of March but rarely halting (Rattray, Whitehead). Enormous numbers (possibly mixed with Demoiselle cranes) in long successive wavy lines and echelons, one upon another, also commonly observed on northward migration (SSE.-NNW.) flying at tremendous heights across the Great Rann of Kutch from the 2nd week of March, chiefly after forenoon when thermals available. The concourse of birds spirals upwards on the currents to greater heights then breaks up into V-shaped echelons or wavy diagonal lines, glides more or less horizontally for a mile or so, swirling up once more to regain height, and so on for as far as the eye can reach. Also recorded on northward migration in March through Baluchistan (Delme-Radcliffe) and over Lahore (A. J. Currie). Passage in smaller lots continues through April to at least mid May in the northernmost areas; then recorded over Dharmasala and the Dhola Dhar

CRANES

139

321. Blacknecked Crane. *Grus nigricollis* Przevalski

Grus nigricollis Przevalski, 1876, Mongol. i Strana Tangut 2: 135 (Koko-nor)
Baker, FBI No. 2036, Vol. 6: 52
Plate 7, fig. 9

LOCAL NAME. *Kuting* (Ladakh).

SIZE. Sarus crane (323) ±.

FIELD CHARACTERS. A tall grey bird like the Common Crane (320) but with black head and neck. Lores and entire crown naked and dull red instead of merely a nape patch. A small patch of white feathers below and behind eye instead of the broad white band down side of neck. Drooping curving plumes concealing tail black *contra* brownish grey in Common Crane. Sexes alike; female slightly smaller.

STATUS, DISTRIBUTION and HABITAT. Rare and very restricted: Ladakh (summer); Apa Tani valley, Subansiri Frontier Division, NEFA (winter), E. Bhutan (Biswas, November 1973). Affects high-altitude lake environs in Tibetan Plateau facies (c. 4300 to 4600 metres) in summer; open fallow paddyfields and swampy land (c. 1500 m. alt) in winter. No other records within our limits.

Extralimital. 'Breeds about the lakes of high central Asia from Ladakh to Koko-nor. Recorded in winter from Yunnan and Tonkin (= N. Vietnam)'—Peters.

MIGRATION. 'Every year (from time immemorial *vide* the local inhabitants) a flock varying between 20 and 40 birds arrives in the Apa Tani valley about mid-November and leaves again in a body about the end of February' (F. N. Betts, 1954, JBNHS 52: 605).

GENERAL HABITS. Reported to be very sedentary in the Apa Tani valley, never leaving its confines. Not molested by the local inhabitants and unafraid of them, but excessively shy of anyone not in tribal dress. The birds become restless before outward migration in February-March then suddenly bursting into choruses of trumpeting while feeding, first one bird then another, also starting to prance and caper.

FOOD. Only fallen grain recorded, but presumably as Common Crane's.

VOICE and CALLS. Loud and trumpet-like, resembling the Sarus Crane's but somewhat higher in pitch.

BREEDING. Courtship of same pattern as the Sarus's and other cranes' consisting of mutual bowing, prancing, leaping, posturing and trumpeting (see under 323). *Season*, chiefly May-July. Putative localities in Ladakh mentioned by B. B. Osmaston Tso Kar and Tso Moriri lakes (c. 4600 m. alt.) and swamps near Shushal (c. 4300 m.) in which neighbourhoods pairs were observed in summer, and two old nests found by Meinertzhagen. According to local Ladakhis, *vide* Meinertzhagen, the birds arrive in their breeding haunts c. last week in May, and leave again c. October. *Nest*, a huge and deep pad of vegetation on marshy ground. In the Manasarowar region of W. Tibet SA found a fresh egg laid directly on a spongy grass-covered semi-floating hump or 'islet' in a treacherous bog, 25 June. *Eggs*, 2 in a normal clutch, greenish grey or olive-grey with faint crude splotches of reddish brown all over, denser at the broad end. Average size of 12 eggs 101.2 × 64.1 mm. (Baker). Incubation period unknown.

MUSEUM DIAGNOSES. For details of plumage see Baker, loc. cit.

138

GRUIFORMES

Range (c. 4600 m.). Earliest dates recorded in 8 years for incoming migrants overflying the Salt Range in Rawalpindi dist., 15 August; average 25 August (Waite).

GENERAL HABITS. In its winter quarters keeps in large flocks often of several hundred strong, either by itself or in association with the Demoiselle (326) of very similar status and habits. The birds spend the warmer parts of the day, and all night, massed together on open sandbanks of rivers, preening themselves or standing on one leg with neck twisted round and head nestling in the feathers of the back. But there are always a number of sentinels ceaselessly keeping vigil who sound the alert on the least suspicion, so that despite the sleepy spectacle a gathering presents it is impossible to take the birds by surprise. The din of a great concourse taking to the air on alarm, accompanied by the high-pitched calls in varying keys, has been well likened to the distant roar of the sea. From this safe refuge the flocks fly out morning and evening to cultivation within easy reach and do havoc to newly sown and ripening crops especially wheat and gram. They fly in wide V-formation with neck and legs outstretched and heavy flapping of the broad wings punctuated with glides.

The birds circle over the feeding ground before alighting to make sure that the coast is clear, volplaning down in half spirals with legs dangling, as in a vulture arriving at a carcass, and braking vigorously to land.

The *kroon* ranks high as a sporting bird both for its delicate flesh and for the skill, patience and hard work entailed in circumventing it.

FOOD. Chiefly vegetarian. Shoots of grass and cereal crops, tubers, grain, insects and small reptiles. Particularly fond of the young pods of arhar dal (*Cajanus indicus*), and of groundnut (*Arachis hypogaea*) which is vigorously dug out of the soil. Said to do great damage to watermelons grown in the dry river-beds in the Punjab, jabbing into them with the pointed bill.

VOICE and CALLS. A loud, sonorous high-pitched trumpeting *krook-krook* carrying enormous distances. Uttered in varying keys and clearly audible even when the birds are no more than tiny midges up in the sky. Along with the honking of geese it is a sound that bears a peculiar exhilaration for the sportsman's ear.

BREEDING. Extralimital. *Season*, May-June. *Nest*, an untidy heap of vegetable matter in a swamp. *Eggs*, two, greyish olive to greenish brown.

MUSEUM DIAGNOSES. For details of plumage see Baker, loc. cit.; for a fuller account of the biology of the very similar, only somewhat darker nominate race, *Witherby*, 1940, 4: 449-55.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	625-668	124-137	223-252	234-247 mm. (Baker)

COLOURS of BARE PARTS. Iris yellow. Bill horny grey or horny green, more yellow towards the tip. Legs and feet black (F. Ludlow).

322. Hooded Crane. *Grus monacha* Temminck

Grus monacha Temminck, 1835, Pl. col., livr. 94, pl. 555 (Hokkaido and Korea)
Baker, FBI No. 2035, Vol. 6: 51
Plate 7, fig. 11

LOCAL NAME. *Wobumal* (= like a Sarus — Manipur).

SIZE. Considerably smaller than Sarus; Demoiselle Crane ±. Standing c. 90 cm. (3 ft) high.

FIELD CHARACTERS. An elegant dark slaty grey crane with distinctive white head and about three-quarters of the neck — the 'hood'. Lores, forehead and forecrown naked, the last red (brighter in breeding season), overgrown with black bristly feathers. Sexes alike.

In the distance the white head and brown-toned upperparts are striking features.

Young (immature). Paler grey. Head well covered with bristly feathers: whitish on forehead with a black patch on either side, grey with black shafts on crown, black on lores.

STATUS, DISTRIBUTION and HABITAT. Vagrant. Only one definite record within our limits: a young bird shot in North Cachar (December 1899)

Grus monacha

■ Breeding areas ▨ Wintering areas

by Baker who saw several other examples on two occasions on the Subansiri river, N. Lakhimpur district, Assam (NEFA). Apparently winter visitor to Manipur in small numbers (Higgins) but its occurrence and status there need confirming.

Extralimital. Breeding range not definitely known. Recorded with uncertain status in SE. Siberia from Lake Baikal to the Amur, south to NW. Mongolia and Usuriland; also in Korea and Japan. Winters in China south to the Yangtze Valley (Peters). No reliable record as yet from Burma.

GENERAL HABITS. Haunts open plains and marshes. Apparently not numerous anywhere, and keeping only in small parties even when migrating.

FOOD, VOICE AND CALLS. Nothing specifically recorded as different from other cranes, e.g. 320.

BREEDING. Extralimital and very little known.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	510-545	92-110	208-220	155-180 mm. (Baker)

COLOURS OF BARE PARTS. 'Iris yellow. Bill greenish tinged with red towards the base. Legs and feet dull reddish' (Blyth); horny black (Hartert).

323. Indian Sarus Crane. *Grus antigone antigone* (Linnaeus)

Ardea Antigone Linnaeus, 1758, Syst. Nat., ed. 10, 1: 142 (Asia = Farther India, as restricted by Hartert, 1921)

Baker, FBI No. 2038, Vol. 6: 55

Plate 7, fig. 7

LOCAL NAMES. *Sarus* (Hindi); *Khur sang* (Assam).

SIZE. Vulture +; standing the height of a man to top of head, c. 156 cm. (5 ft)

FIELD CHARACTERS. The largest of our Indian cranes. A huge long-legged, long-necked grey bird with naked red head and upper neck. Sexes alike; female slightly smaller.

Young (immature). Rather brownish grey overall, with the whole head and neck covered with short rusty buff or cinnamon-brown feathers.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident, moving locally with conditions of drought and flood, throughout the northern parts of the subcontinent south of the Himalayas (including Nepal terai), from Sind and Punjab eastward through Uttar Pradesh, Bihar and northern Bengal (duars) to W. Assam. Has been seen in Kashmir Valley, c. 1700 m. — (A. E. Ward, 1907, JBNHS 17: 945). This is about the highest elevation recorded though in suitable places up to c. 1650 m. below Dharmasala it is

duetting all the time. In the midst of all this activity the female sometimes crouches invitingly, legs partly flexed, and copulation takes place. More often, however, the dance dies down as it began, the birds presently resuming their normal activities. *Season*, ranges overall from July to December and even to March, but chiefly during the four monsoon months ending October. *Nest*, a huge pile of reeds, rushes, and straw, about a metre in diameter at the top, placed on a bund in the midst of flooded paddyfields, or on a hummock islanded in a swamp or jheel. *Eggs*, normally 2, greenish- or pinkish white in colour, sometimes spotted and blotched with brown or purple; inner membrane bright orange. Average size of 100 eggs 104.4 × 64.3 mm. (Baker). Nest-building, incubation and care of young shared by both sexes, though male chiefly does the watch and ward. Period 28 days (Alipore Zoo, Lahiri, JBNHS 53: 131). The Mogul emperor Jahangir (reigned A.D. 1605-27), whose Memoirs contain some remarkably accurate observations on the Sarus, gives the interval between laying of 2 eggs as 48 hours, and incubation period as 34 days (see Sâlim Ali, JBNHS 32: 57-60).

Post-natal imprinting of vital commands on a newly hatched chick described by Sâlim Ali (JBNHS 55: 166-8). Before leaving nest on suspicious approach of a human, the brooding parent sounded the alert — a short, subdued, staccato *kor-r-r*, obviously also a command to the hatchling to freeze. On chick continuing to fidget and cheep, parent stalked back to nest, repeated the *kor-r-r* note, at the same time administering a gentle peck to the chick. Upon this the chick immediately stopped cheeping and froze. In another pair of Sarus, flanking on either side and leading away a pair of older downy chicks from suspected danger, the same *kor-r-r* command was given by a parent as soon as suitable marshy land and cover were gained, resulting in magical disappearance of the chicks. After careful search one chick discovered lying doggo half submerged in a puddle at the base of a grass tussock while one of the parents gave the 'broken-wing' distraction display, interpolating its agitated trumpeting with *kor-r-r* note commanding the chicks to continue lying doggo.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Entirely covered. *Above*, head, neck (and throat) pale isabelline; from base of hindneck two broad lines of dark brown, enclosing a paler brown median stripe, run to tail; a large buffish spot opposite base of each wing; wings cinnamon-brown, tip buffish white. *Below*, lower neck, sides of breast and belly, vent and thighs darker isabelline; centre of breast and belly white (Tiechurst).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	670-685	172-182	c. 310-355	255-263 mm.
♀ ♀	625-645	—	—	—

Weight 15 lb. 1 oz. to 17 lb. 6 oz. (c. 6-80-8 kg.) — Hume.

COLOURS OF BARE PARTS. Iris orange. Bill pale greenish horny with dark tip. Bare skin of crown and lores ashy green; papillous skin of head and neck orange-red, deeper and brighter in breeding season. Legs and feet fleshy red to red.

apparently more frequent (Hingston, 1921, JBNHS 27: 571). South through eastern Rajasthan, Gujarat and northern Madhya Pradesh, diffusing decreasingly south to a diagonal line roughly from Surat (c. 21°N.) to the west to the Godavari delta (c. 16°30'N.) on the east. Most numerous in Gujarat, eastern Rajasthan, and the Gangetic Plain — almost everywhere protected by popular sentiment. Affects open cultivated well-watered plains, marshland, and jheels.

GENERAL HABITS. Normally seen in pairs; sometimes family parties consisting of parents with one, or two, young of the previous brood. At certain seasons, e.g. late winter, also in loose congregations of 60 to 70, or more (once c. 150), adults and adolescent young. These congregations, attended by a great deal of trumpeting, prancing, and mutual display, are more social 'gatherings of the clan' than integrated flocks, pairs and parties breaking away from time to time for their normal avocations. The bird rises off the ground rather heavily but when well launched flies strongly with powerful rhythmic strokes of the broad splayed wings. Usually only short commuting flights between the feeding ground and the midday resting place on the edge of some jheel or river, and at seldom more than treetop height, but on rare occasions as if to prove the rule the birds will soar and circle aloft in the heavens just like migratory cranes, apparently with no object other than for fun. Sarus pair for life; the faithfulness and devotion of the couple to each other have become legendary in India, and popular sentiment is responsible for the universal protection which the bird enjoys. It is seldom molested by the local inhabitants and, contrary to its migratory congeners, exhibits surprising tameness everywhere.

FOOD. Perhaps less vegetarian than our other cranes. Largely a fish-eater depending on availability. Other animal items include crustaceans, frogs, lizards, locusts, grasshoppers and other large insects. Vegetarian items: grain gleaned in the stubbles, tubers and corms of aquatic and marsh plants, green shoots of grasses and cereals, groundnut pods, etc. Occasionally does considerable local damage to newly sown crops.

VOICE AND CALLS. A very loud sonorous far-carrying trumpeting, usually as a duet by paired birds, both from the ground and on the wing. As soon as one bird starts its mate invariably answers and joins in. The duetting is uttered with neck fully upstretched by both birds, bills pointing to the sky, body feathers fluffed and shuffled, and kept up for half a minute or more. The calls serve variously as a display of affection between the pair, as alarm-signal and warning, a greeting, a summons for help, and as a means of maintaining contact between distant pairs. They may be heard during the night as well as in daytime.

BREEDING. Courtship display during breeding season exceedingly animated, spectacular and also somewhat ludicrous; mutually performed like the duetting, though female sometimes less active. The male usually gives the cue by suddenly flicking his wings half open, bowing, giving a little leap, dipping and pumping his forepart up and down, throwing up his head and trumpeting loudly. This invitation to dance is promptly taken up by the female. For the next two or three minutes the two birds go through a bout of vigorous curtsying, prancing, capering and wildly leaping at, around, and away from each other as if completely demented,

324. Burmese Sarus. *Grus antigone sharpii* Blanford

Grus (Antigone) sharpii Blanford, 1895, Bull. Brit. Orn. Cl. 5: 7 (Burma)

Baker, FBI No. 2039, Vol. 6: 56

LOCAL NAMES. *Khur sang* (Assam); *Woinu, Woinaret* (Manipur).

SIZE. As of 323; standing the height of a man.

FIELD CHARACTERS. As for Indian Sarus (323), q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident. Assam east of Kamrup district (c. 91-92°E.), south to Manipur. Affects the neighbourhood of lakes, swamps and large rivers.

Extralimital. Burma, Thailand, Cambodia, Laos, Vietnam. Sparingly recorded from northern Malay Peninsula (Perlis and Perak).

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the Indian race, but much shier and wilder everywhere due to lack of sentimental protection.

BREEDING. *Season*, July-September. *Nest* and *eggs* as in 323. Average size of 15 eggs 102.5 × 64.9 mm. (Baker).

MUSEUM DIAGNOSIS. Plumage overall darker than in the Indian bird. No ring of white feathers at base of neck. Inner secondaries practically same colour as back.

MEASUREMENTS. Wing ♂ ♀ 600-675 mm. (Baker).

COLOURS OF BARE PARTS. As in 323.

325. Siberian or Great White Crane. *Grus leucogeranus* Pallas

Grus Leucogeranus Pallas, 1773, Reise Russ. Reichs 2: 714 (Swamps bordering the

Ischim, Irtych, and Ob rivers)

Baker, FBI No. 2037, Vol. 6: 53

Plate 7, fig. 6

LOCAL NAMES. *Kare khar* (NW. Pakistan); *Tunhi, Chini kiling* (Uttar Pradesh); *Burmuch* (Bihar). Alternative English name 'Snow-wreath'.

SIZE. Common Crane (320) ±. Standing c. 140 cm. (c. 4½ ft) to top of head.

FIELD CHARACTERS. An exquisitely beautiful snow-white crane with naked reddish face; immaculate, like egret, at rest, showing black wing-quills in flight. On a cursory distant view could be mistaken in flight for White Stork (63), q.v. Sexes alike.

Young (immature). Whole head and face feathered cinnamon-rufous; rest of plumage white tinged and dappled with cinnamon-buff.

STATUS, DISTRIBUTION AND HABITAT. Uncommon and sparse but regular winter visitor chiefly to NW. Pakistan and N. India, straggling east to Bihar (Jainagar 24°23'N., 85°39'E. — Inglis) where apparently familiar to *mirshikars* (professional birdcatchers) as *burmuch*. Recorded once as far south as the Nagpur area in Madhya Pradesh (c. 21°N., 79°E. — McMaster). Selective and faithful to specific wintering grounds, among its better known regular haunts being Pyagpur jheel (Uttar Pradesh) and Keoladeo Ghata Bharatpur (Rajasthan). Two small parties of stragglers recorded from Larkana and E. Narra districts, Sind, and also the Delhi neighbourhood

CRANES

145

(Najafgarh jheel) — Hume, c. 1875. Affects only open jheels and swamps, not cultivated fields like Common and Demoiselle cranes.

Grus leucogeranus

■ Breeding areas ▨ Wintering areas

Extralimital. Breeds locally in SE. Russia and in Siberia, south to Turgai, the upper Ob, N. Turkestan, Transbaikalia, and Ussuriland. Winters also in China.

MIGRATION. Arrives in NW. Pakistan between middle and end October — occasionally somewhat earlier; in its easterly and more southerly haunts seldom before late November or early December. Leaves again end March or early April, but observed (presumably this species) migrating northward high over the Himalayas in Chamba (Himachal Pradesh) c. 1000 metres above observer's level c. 4400 m. as late as May (Donald, JBNHS 51: 270).

GENERAL HABITS. Met with in family parties of 3 or 4, or small flocks of 12-15 birds. Larger gatherings in some years at favourite wintering places, e.g. Keoladeo Ghana where largest flock observed of about 72. More addicted than other cranes to wading and resting in shallow water, and feeding with head submerged. Does not raid winter crops like wheat and gram. Usually wild and wary, but where unpersecuted becomes comparatively trustful.

FOOD. More or less exclusively vegetarian; largely bulbs, corms, shoots and seeds of aquatic plants with which considerable quantities of coarse grit are swallowed.

VOICE AND CALLS. A pleasant, soft, musical *koonk-koonk* uttered chiefly in flight. According to Baker 'their call has been syllabified as *karekhar* rapidly but rather softly repeated'. We have not heard any call answering to this description.

CRANES

147

observers. Winter visitor also to Nepal terai and dun, overflying the Valley on migration; occasionally making short halts. Affects fields of winter crops (especially wheat and gram), paddy stubbles, sandy river-beds, and flat open margins of jheels and tanks.

Anthropoides virgo

■ Breeding range ▨ Winter

Extralimital. Breeds in SE. Europe and the greater part of C. Asia, north to c. 60°, south to N. Mongolia. Also on the high plateaux of Algeria. Winters in NE. Africa to the White and Blue Niles, and Ethiopia; likewise Middle East, India, Burma and China.

MIGRATION. No ringing data. See under Common Crane (320). Observations on the two species combined owing to unreliability of discrete identifications. Regular autumn migration over Kohat (NW. Pakistan) commences punctually between 25 and 27 August. Earliest arrival date in Mysore 20 December; latest departure 5 March.

GENERAL HABITS. As of 320, q.v. Visits the subcontinent in colossal numbers. One typical large feeding flock in the Punjab (apparently mixed with Common Crane) described as a broad band of birds about 1½ miles long. When bunched together on alarm they looked like a pebbly beach c. 500 x 100 yards (A. A. Phillips, quoted by Whistler). Feeds in the mornings and late afternoons in newly sown or stubble fields of wheat, gram, and paddy; also ripening cereal crops. Spends the rest of the day and night lazing on open sandbanks in large rivers or the margins of jheels. Always uncannily vigilant and difficult to circumvent without ruse, but like the Common Crane excellent for the table and keenly sought after by sportsmen.

FOOD. As in 320. The large quantity of wheat, gram, and paddy usually found crammed in stomachs of specimens shot, even though partly gleaned

146

GRUIFORMES

BREEDING. Extralimital and little known. *Season*, c. June. *Nest* and *eggs* said to be indistinguishable from those of the Common Crane (320).

MUSEUM DIAGNOSIS. See Field Characters.

Chick (in down) — captivity bred. 'Entirely covered. Underparts dirty buff, belly white. Head and neck dark isabelline; creamy streak on each scapular, rest of upperparts pale chestnut, darker on mid dorsum' (Ticehurst).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	635-645	185-197	275-285	205-218 mm. (Baker)
♀♀	538-620			

COLOURS OF BARE PARTS. Iris creamy golden yellow. Naked skin of head reddish. Bill: culmen to nostril dusky orange-brown, rest of bill dusky pinkish flesh. Legs and feet flesh pink; claws horny brown.

Genus ANTHROPOIDES Vieillot

Anthropoides Vieillot, 1816, *Analyse*: 59. Type, by monotypy, *Demoiselle* of Buffon = *Ardea virgo* Linnaeus

Bill and legs proportionately shorter than in *Grus*. Head fully feathered. A tuft of long white plumes springing from behind ear-coverts. Feathers of lower neck long and lanceolate; inner secondaries much lengthened and pointed but not disintegrated as in *Grus*.

326. Demoiselle Crane. *Anthropoides virgo* (Linnaeus)

Ardea virgo Linnaeus, 1758, *Syst. Nat.*, ed. 10, 1: 141 ('In Oriente' = India)

Baker, FBI No. 2040, Vol. 6: 57

Plate 7, fig. 8

LOCAL NAMES. *Kārkārā* (Hindi); *Ghanto* (Nepal); *Kārkūcha* (Marathi); *Kārkārō* (Gujarati); *Koonj* (Sind, Kutch); *Kūldm*, *Kūldng* (Deccan); *Kurra* (Bihar); *Gayāra* (Orissa); *Wada koraka* (Telugu); *Karkoncha* (Kannada).

SIZE. Sarus —; standing c. 76 cm. (2½ ft) to top of head.

FIELD CHARACTERS. A dainty little grey crane with black head and neck and conspicuous white ear-tufts behind eyes. Black feathers of lower neck long, pointed, and falling over breast. Elongated sickle-shaped brownish grey secondaries drooping over tail. Sexes alike.

Young (immature). Like adult but with head wholly grey instead of the crown only. Black of neck browner behind, more grey in front with no apron of lengthened plumes on breast. Drooping grey secondaries shorter, only slightly overhanging tail.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. Commonest and most abundant in the northwestern and west-central portions of the subcontinent diffusing eastward, occasionally to Bhutan, Assam and East Pakistan (not common east of Bihar); southward more or less regularly to Mysore (generally rare south of c. 16°N.). Its winter quarters and migration dates and routes largely overlap those of the Common Crane (320), the two species usually found in association, and seldom reliably differentiated by

148

GRUIFORMES

in stubbles, indicates the magnitude of the damage to cereal crops that cranes in their hundred thousands must annually cause.

VOICE AND CALLS. Sonorous high-pitched *krook-krook* like Common Crane's but somewhat softer.

BREEDING. Extralimital. On their breeding grounds pairs said to assemble into large congregations morning and evening and go through elaborate communal displays or dances consisting of vigorous bowing, leaping, and sprinting around with ear-tufts and breast-plumes raised. *Season*, May to July. *Nest* etc. as in other cranes; *eggs* also 2, greenish- or yellowish grey, sparsely blotched with reddish brown and grey.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	450-530	65-70	170-187	165-182 mm. (Baker)

Weight ♂♀ 5 lb. to 6½ lb. (c. 2.25-3 kg.) — Hume.

COLOURS OF BARE PARTS. Iris red-brown to crimson or red. Bill pale greenish with red tip. Legs and feet black.

327. **Turkestan Water Rail.** *Rallus aquaticus korejewi* Zarudny

Rallus aquaticus korejewi Zarudny, 1905, Orn. Monatsb. 13: 209 (Northern Turkestan, Buchara, Transcaspia and east Persia)

Baker, FBI No. 2007, Vol. 6: 6

Plate 36, fig. 1

LOCAL NAMES. None recorded.

SIZE. Grey Partridge —; length c. 28 cm. (11 in.).

FIELD CHARACTERS. A partridge-like bird somewhat slender and longer legged, found in reedy marshes; resembling also a small all-brown moorhen. Above, greyish olive-brown boldly streaked with black. Below, chin and throat white; sides of head, neck, and breast pale slaty grey; flanks barred black and white. The comparatively long and slender orange-red bill immediately distinguishes it from other rails. Sexes alike. See Key to the Subspecies.

Young (immature). Above, much more definitely barred with white on the wing-coverts. Below, with broader pale rufescent edges to the feathers.

STATUS, DISTRIBUTION and HABITAT. Resident and breeding in Kashmir and Ladakh (?); straggling south in winter as far at least as Madhya Pradesh (Sehore). Common in Kashmir Valley (c. 1500 m.) on all extensive jheels — Hokarsar, Anchar, and others. Owing to paucity of specimens and dependable sight records, status of the two races in our area remains uncertain. Affects reedy marshes.

Extralimital. 'Known to breed in Transcaspia, eastern Persia, Turkestan, Zaidam, Kashmir and Ladakh. Winters in NW. India and E. China, casually elsewhere' (Peters).

GENERAL HABITS. Keeps singly or in pairs to swampy reed-beds, inundated sugarcane fields, etc., venturing out to feed at the edge in the early morning and dusk, and in cloudy drizzly weather. Walks about with upright carriage and high-stepping gait, tail partly cocked and jerked up from time to time as in Moorhen. But an inveterate skulker, unobtrusive and shy, scuttling into cover on the least suspicion, legs flexed and with lowered head and tail. Difficult to see and even more to flush, thus possibly much

RAILS, COOTS

151

MEASUREMENTS. Wing ♂♂ 128-136 mm.; ♀♀ 116-126 mm. (Baker).

COLOURS OF BARE PARTS. Iris reddish-brown to brick-red. Bill: upper mandible dark brown with a stripe on the base bright orange-red to vermillion; base of lower mandible also red but paler, the terminal third grey to dark horny brown. Legs and feet fleshy pink to brownish pink.

328. **Indian Water Rail.** *Rallus aquaticus indicus* Blyth

(Lower Bengal and India generally)

Baker, FBI No. 2006, Vol. 6: 4

LOCAL NAME. *Ambukukūt* (Bengal).

SIZE. Grey Partridge —; length c. 28 cm. (11 in.).

FIELD CHARACTERS. As for 327, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION and HABITAT. Winter visitor to eastern Nepal terai (JBNSHS 65: 327) and Kathmandu Valley; Bengal south to Calcutta, Bangladesh and NE. India.

Extralimital. 'Breeds in E. Siberia from the Lena east to Amur and Ussuriland, south to Transbaikalia, Chihili, and Korea; Japanese Islands from Sakhalin to Kyushu. Winters in E. Bengal, Assam, Burma, SE. China' (Peters). Burma (Smythies).

MIGRATION. Nothing recorded beyond Baker's statement that 'On their first appearance in India these birds are often so exhausted as to allow themselves to be captured by hand without attempting to move'.

GENERAL HABITS, FOOD, VOICE and CALLS. As in 327.

BREEDING. Extralimital. Season, May-June. Nest and eggs as in 327. MUSEUM DIAGNOSIS. Differs from Turkestan race (327) in being darker olive-brown, less grey, above and below; distinct brownish wash on upper breast (v. clear grey); more white on throat (v. white largely lacking); brown eye-stripe more prominent behind eye. From nominate *aquaticus* by paler brown edges to feathers of upperparts, paler and more brownish (v. more slaty grey) underparts, and a brown stripe through eye to ear-coverts. For details of plumages of *R. a. aquaticus* see Witherby, 1941, 5: 1967.

GRUIFORMES

Rallus aquaticus

■ Breeding range Black numerals = Winter
1 *R. a. aquaticus* (RE). 2 *R. a. korejewi* (327). 3 *R. a. indicus* (328).

commoner in appropriate habitats than it appears to be. When suddenly come upon, flutters up feebly, flying with dangling legs just above the tall reeds for a few metres and dropping into cover again. But is capable of strong sustained flight over long distances when on migration. Swims jerkily for short distances like Moorhen, with frequent twitches of tail.

FOOD. Small freshwater snails complete with shells, slugs, worms, and insects. Also vegetable matter, e.g. shoots and seeds of grasses and marsh plants, and occasionally paddy.

VOICE and CALLS. Chiefly heard at early dawn and late into the dusk — a curious 'scream' reminiscent of the squealing of 'a small pig in trouble' (B. B. Osmaston). Other calls difficult to fix when issuing from within thick reed-beds tenanted by several species of rails and others, with the producers in hiding.

BREEDING. Season, in Kashmir Valley (c. 1500 m. elevation) late May to early August. Nest, an unlined pad of loosely put-together dry rushes, aquatic weeds, and grass, usually well concealed in herbage in a swamp a few inches above water. Eggs, normally 5-8 (once 10), glossy broad ovals, pale creamy to warm buff faintly tinged with green, flecked and blotched with pale reddish brown or purple-brown, and secondary markings of lavender or pinky grey. Average size of 50 Kashmir eggs 36.2 x 25.9 mm. (Baker). Both sexes partake in nest-building and incubation; female's share greater. Incubation period recorded elsewhere (for nominate race) 19-20 days (Witherby).

MUSEUM DIAGNOSIS. Similar to Indian Water Rail (328) but paler and more grey above and below. Brown eye-stripe faint or absent behind the eye.

Chick (in down). Velvety black all over.

GRUIFORMES

329. **Indian Bluebreasted Banded Rail.** *Rallus striatus albicenter*

Swaipson

Rallus albicenter Swainson, 1838, Animals in Menageries: 337 (India)

Baker, FBI No. 2008, Vol. 6: 7

Plate 36, fig. 2

LOCAL NAMES. *Kānān kochi* (Tamil); *Wadi kodi* (Telugu); *Kirimeti korowala* (Sinhala); *Tuttuterippan* (Malayalam).

SIZE. Grey Partridge —; length c. 27 cm. (10½ in.).

FIELD CHARACTERS. A short-tailed marsh bird like the waterhen, seen skulking amongst reeds etc.

Male. Above, head and sides of neck rufous-chestnut. Rest of upperparts dark brown with irregular wavy white bands and spots. Below, chin and throat white; foreneck and breast ashy blue. Abdomen and flanks blackish, conspicuously barred with white. The partly red bill, reddish eyes, and olive-grey legs are further clues to its identity.

Female, duller above and whitish on belly.

Young (immature). Feathers of back streaked with dark brown, the white bars and spots absent or obsolete. Crown and neck rufous-brown freely streaked with dark brown.

STATUS, DISTRIBUTION and HABITAT. - Resident; moving about locally under stress of drought-flood. Kutch, Madhya Pradesh, eastern Nepal, Darjeeling, Jalpaiguri duars, NE. India. Southward through Bangladesh and peninsular India to Kerala; from plains level to c. 1300 m. Also Sri Lanka. Affects reedy swamps and mangroves, margins of village tanks, inundated paddy cultivation, etc.

GENERAL HABITS. Usually solitary or in pairs. Much commoner than more widespread than apparent, but an inveterate skulker and therefore easily overlooked. Walks about with an upright carriage and high-stepping gait, bobbing head and jerking stub tail at each step, but crouching on slinking away into the reeds on the least alarm. The elongated toes enable it to slip lightly over floating vegetation in quest of food. Flight typical of rails, slow and laboured flapping, with the legs dangling behind. Swims well and can even dive on occasion.

FOOD. Seeds and shoots of marsh plants, molluscs, crustaceans, grub worms, and insects.

VOICE and CALLS. Normally very silent. 'A rather sharp though loud whistled note' by one bird of a pair feeding together (Hume). 'Sho- jerking screams, not very loud.' Also 'a deep low note, probably male's audible only at very close range (Baker).

RAILS, COOTS

153

BREEDING. *Season*, more or less over its entire range (including Ceylon) from the break of the rains in mid June to September-October. *Nest*, a pad of matted weeds, reed stems and grass c. 20-25 cm. across placed on the ground or on the debris of broken-down reeds, well concealed amongst vegetation on the edge of a marsh. *Eggs*, 5 to 7, and up to 9, cream to warm salmon-buff in colour, smooth textured and with a fair gloss, handsomely blotched and spotted with reddish- or purplish-brown or deep red, more densely at the broad end. Average size of 200 eggs 33.7 × 25.8 mm. (Baker). Both sexes partake in building the nest and incubation. Period believed to be 19-22 days. Courtship display *ride* Baker of the normal rail pattern: the male approaches the female with drooping, quivering wings, the stub tail held erect and constantly flicked forward over the back, head held low and stretched out parallel to the ground. When close to the female he stops and jerks himself upright on his toes, spreads out his wings, and soon crouches again. Copulation follows if the female responds, otherwise the antics are repeated.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	108-131	31-34	34-37	38-41 mm. (Baker)

Weight 3.6 to 5 oz. (c. 100-142 gm.) — Hume.

COLOURS OF BARE PARTS. Iris light brown (in young birds) to Indian red (in adults). Bill: upper mandible and tip of lower horny brown to dark brown; lower mandible and commissure dull yellowish red to bright red. Legs and feet olive-grey, olive, or fleshy grey.

330. Andaman Bluebreasted Banded Rail. *Rallus striatus obscurior* (Hume)

Hypotaenidia obscurior Hume, 1874, *Stray Feathers* 2: 302 (Andaman Islands)

Rallus striatus nicobarensis Abdulali, 1966, *JBNHS* 63: 420

(Nancowri, central Nicobars)

Baker, *FBI* No. 2009, Vol. 6: 9

LOCAL NAMES. None recorded.

SIZE. Same as 329; Grey Partridge —.

FIELD CHARACTERS. As for 329, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident and common in both the Andaman and Nicobar groups of islands. Affects forest, marshy meadows, reedy swamps and paddylands.

GENERAL HABITS, FOOD, VOICE AND CALLS. As of 329, q.v. Also a great skulker and adept at hiding itself, only rarely flushed, and then flying heavily with legs dangling. Utters a deep croak very like the note of *Rallina cuningii* (333) — A. L. Butler.

BREEDING. *Season*, more or less throughout the year, chiefly June to November. *Nest*, a pad of dry grass on swampy ground, usually well concealed in thick grass or herbage, or in jungle (A. L. Butler, B. B. Osmaston).

RAILS, COOTS

155

Young (immature). Head and neck like back, rufous-brown. Breast pale dull brown; rest of underparts whitish obscurely barred with brown.

STATUS, DISTRIBUTION AND HABITAT. Status as resident or migratory, and to what extent, uncertain. Baker obtained it on several occasions in N. Cachar (c. 800 m. alt., Assam). No other Indian or E. Pakistan records. Affects reedy swamps and marshes; also shrubby bordering paddyfields etc.

Extralimital. 'Burma south over the Malay Peninsula; Sumatra; Java; Borneo; Lesser Sunda Is.; Philippine Is. (Palawan, Balabac, Mindoro); Palau Is.; Moluccas (Halmahera, Batjan, Buru)' (Peters).

GENERAL HABITS AND FOOD. As of 327, and typical of all rails and crakes. A skulker in marshy reed-beds and undergrowth, difficult to flush or observe, thus comparatively little known.

VOICE AND CALLS. Unrecorded.

BREEDING. Extralimital. Unrecorded within our limits. *Season*, in Burma August-September. *Nest* and *eggs* similar to 332.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	118-131	20-21	—	49-51 mm. (Baker)

COLOURS OF BARE PARTS. Iris crimson or blood-red. Bill blackish, the base paler and tinged with greenish or plumbeous-slate. Gape and orbital skin (fine ring round eye) crimson. Legs and feet coral red; claws slate.

332. Indian or Slaty-legged Banded Crake. *Rallina eurizonoides* (Jerdon)

Z. (epomia) nigrolineata Hodgson, in Gray, G. R., 1844, *Zool. Misc.*: 86 (Nepal). *Nomen nudum.*

In synonymy of *Rallus superciliosus* Eyton, *nomen nudum.*

Porzana amauroptera 'Blyth' = Jerdon, 1864, *Bds. India* 3: 725 (Northern India)

Baker, *FBI* No. 2014, Vol. 6: 16

Plate 36, fig. 5

LOCAL NAMES. *Daobui lei* (Cachar); *Kirimeti kororakā* (Sinhala); *Kānān kāchi* (Tamil).

SIZE. Between Quail and Partridge; length c. 25 cm. (10 in.).

FIELD CHARACTERS. Confusingly similar to 331 but with chin and throat pure white. Most readily distinguished from it by absence of white bars on wing quills and coverts, and above all by slaty (r. coral-red) legs. Sexes alike.

Young (immature) has upper-parts of head and neck dark olive-brown, concolorous with back. Sides of head and neck more ashy brown; scapulars and wing-coverts with sparse white and black bars.

× c. 1

GRUIFORMES

154

Eggs, normally 6, sometimes 7 or 8, slightly glossed, pinkish stone-colour or dun, spotted and blotched chiefly at the broad end with reddish brown or bright chestnut and secondary greyish markings. Average size of 150 eggs 36.0 × 27.5 mm. (Baker).

MUSEUM DIAGNOSIS. Differs from the Indian race (329) in being darker and larger. *Above* much blacker; *below*, chin and throat much less white; breast deeper grey.

Chick (in down). All black. Iris greyish brown; bill blackish; legs and feet dark brown. The first feathers to appear are the grey feathers of the breast (A. L. Butler).

MEASUREMENTS. ♂ ♀ Wing 129-136; bill (from feathers) 33-36 mm. (Baker).

COLOURS OF BARE PARTS. Iris dark brown. Bill Indian red, tips of both mandibles and whole culmen deep horny brown. Legs and feet dark greenish horny (Davison).

Genus RALLINA G. R. Gray

Rallina 'Reichenbach' = G. R. Gray, 1846, *Gen. Bds.* 3: 595. Type, by original designation, *Rallus fasciatus* Raffles

Differs from *Rallus* in having a shorter bill which is much shorter than middle toe, which again is shorter than the tarsus. Wing rounded: 3rd primary (as.) longest. In *Rallina cuningii* (333) secondaries slightly longer than primaries; in other species slightly shorter.

The genus ranges from India and Ceylon to Australia; represented by three species within our limits.

Key to the Species

A Back and wings rufous-brown; culmen 20 to 21 mm.; legs red.....	154
B Back and wings olive-brown; culmen 27 to 28 mm.; legs slaty.....	155
C Upper plumage deep ruddy-chestnut; culmen 29 to 33 mm.; legs olive-green.....	157

331. Malayan or Redlegged Banded Crake. *Rallina fasciata* (Raffles)

Rallus fasciatus Raffles, 1822, *Trans. Linn. Soc. London* 13(2): 328

(Benkulen, western Sumatra)

Baker, *FBI* No. 2015, Vol. 6: 17

Plate 36, fig. 3

LOCAL NAMES. None recorded.

SIZE. Between Quail and Partridge; length c. 23 cm. (9 in.).

FIELD CHARACTERS. A marsh-haunting ground bird like partridge, less plump and longer legged.

Male and Female: Whole head, neck, and breast cinnamon chocolate-brown. Rest of upperparts rufous-brown. Wing quills and coverts blackish with broad white bars. Underparts strikingly banded black and white. Readily distinguished from very similar Banded Crake (332) by coral red (v. slaty) legs.

GRUIFORMES

156

STATUS, DISTRIBUTION AND HABITAT. Resident and local migrant, found in well-wooded, well-watered tracts, especially during the monsoon season, practically throughout our area, from NW. Pakistan to eastern Assam (including Nepal) and to the extreme south of the Peninsula (Kerala, Rameswaram Island). Judging from its calls not uncommon, and locally even numerous. Winter visitor to Ceylon (October/November to March/April). Affects a wide range of jungle habitats, plains and up to at least 1600 metres elevation in the Himalayas (Darjeeling district) and peninsular hills — Western Ghats (Khandala), Biligirirangans, hills of Kerala, Coorg and Mysore, and others.

Extralimital. Burma, Malay Peninsula, Vietnam.

MIGRATION. Little known except that at certain times of year, especially at the commencement and end of the SW. monsoon, exhausted birds widely and commonly reported blundering into houses for refuge from gales, while evidently on some sort of migratory passage. Arrives on the west coast of Ceylon from India about October.

GENERAL HABITS. Like other rails, partly nocturnal. Is shy and scuttles into thick cover on the slightest suspicion, with legs partly flexed and head and tail lowered. Normally walks with a high-stepping gait and upright carriage, tail slightly cocked and twitched from time to time like Moorhen, and wings partly drooping at the sides. When flushed often flies up into a tree, perching on a branch seemingly quite at home. Swims short distances jerkily, also like Moorhen.

FOOD. Animal and vegetable: molluscs, worms, insects, shoots and seeds of marsh plants.

VOICE AND CALLS. Chiefly heard at early dawn and late into the dusk, especially during the breeding season; also in daytime in misty overcast weather. The following calls described: a cry rather like that of a domestic hen after laying an egg; a cry like the Paddy Bird's (*Ardeola grayii*) when suddenly alarmed; a noise like *krrrrr*, pronounced in a subdued voice, when suspicious of danger (T. R. Bell). During breeding season bird answers bird hidden in dense grass and scrub with a *Kok* note which 'said through one's nose is the exact sound' (C. M. Inglis). Calls persistently during night, mostly a double note *kek-kek, kek-kek, kek-kek, kek-kek*, and so on, like the Spotted Scops Owl (*Otus spilocephalus*) but much harsher (W. H. Matthews, in *epist.*). 'A long drumming croak *krrrrrrrrr-kr-kr-kr-kr-kr-kr*' (Mrs Lushington, Ceylon). A repeated hissing like a snake but deeper and more guttural (W. H. Matthews); 'a peculiar noise somewhat resembling the swearing of a cat' (B. B. Osmaston) — both (probably the same) by an incubating bird when nest closely approached.

BREEDING. *Season* during the SW. monsoon, June to September, the months of heaviest rainfall in the Western Ghats. Nests in the densest jungle as well as open scrub, from plains level to at least 1600 m. elevation in the peninsular hills. Also in the outer Himalayas (Dehra Dun dist. c. 750 m., Darjeeling dist., c. 1000 m.). *Nest*, an untidy pad of dead leaves and grasses and a few thin twigs, with a slight central depression. Placed in bamboo clumps, on masses of tangled creepers, on top of an overgrown tree stump etc. up to a metre or so above ground, not necessarily in the vicinity of a swamp. *Eggs*, 4 to 8, pale creamy white with a fair gloss. Average size of

100 eggs 28.1 × 20.0 mm. (Baker). Both sexes incubate and tend the young. Period unrecorded. The incubating bird displays extraordinary pluck and pugnacity, standing up and puffing out its plumage at approach of a hand, pecking viciously at it, and repeating the process without leaving (Osmaston).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.
Chick (in down). Velvety black all over.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	122-132	27-28	39-46	55-64 mm. (Baker)

COLOURS OF BARE PARTS. Iris: adult crimson red; immature dull brown. Bill green; terminal half of upper mandible and tip of lower dark brown. Legs and feet: adult dull greenish plumbeous, plumbeous, or black; imm. greenish plumbeous.

333. Andaman Banded Crane. *Rallina canningi* (Blyth)

Euryzona canningi 'Tyler' = Blyth, 1863, Ibis: 119 (Andaman Is.; type from Port Canning)
Baker, FBI No. 2016, Vol. 6: 18
Plate 36, fig. 12

LOCAL NAMES. None recorded.
SIZE. Grey Partridge ±; length c. 34 cm. (13½ in.).
FIELD CHARACTERS. More or less as for Slaty-legged Banded Crane (332), q.v., but larger. Differs from it also in being deep glossy ruddy chestnut above and on breast (v. rufous-brown). No white on throat; bill pale green. Sexes alike.

Young (immature) has the chestnut parts duller. Lower parts dark grey with a chestnut tinge, narrowly banded and streaked with dirty white instead of black broadly barred with pure white as in adult (Butler).

STATUS, DISTRIBUTION and HABITAT. Resident; common. Andaman Islands. (Details of range not worked out. Apparently absent in the Nicobars.) Affects marshy jungle.

GENERAL HABITS. Typical of the family. A great skulker in reeds and herbage on marshland; seldom seen but readily snared, thus proving its abundance (80 caught within 1 square mile!). 'Carries itself high on the legs, head generally rather drawn in, and feathers always more or less ruffled up to produce a very round and ball-like outline' (A. L. Butler). A peculiarity described by the same observer needs confirming. 'In drinking they seemed to raise the head much less than most birds, drinking steadily for many seconds without lifting the bill at all.'

FOOD. Small fish (?), molluscs, worms, insects (beetles, grasshoppers and caterpillars). Large grasshoppers shaken about and battered before swallowing.

VOICE and CALLS. 'A curious deep croak sounding something as if a man were trying to say *koop! koop!* with his mouth under water.' Alarm-note when a snared bird is approached 'a sharp *chick, chick*'. When handled 'sometimes utters a cry like that of a wounded rabbit' (A. L. Butler).

GENERAL HABITS. Like the other rails, but more restricted to dry grassland and standing crops. Distinctly crepuscular. Very difficult to flush and seldom seen, but its presence advertised by its constant calls.

FOOD. Insects, worms, snails as well as seeds and other vegetable matter.

VOICE and CALLS. Of male, a loud rasping disyllabic *arp-arp* or *crake-crake* persistently repeated throughout the day and night in long unbroken runs. The calls have a peculiar ventriloquistic quality.

BREEDING. Extralimital. Nest on ground in grassland or corn fields. Eggs, 8-12, pale greenish grey to reddish brown.

MUSEUM DIAGNOSIS. For details of plumages (and bionomics) see Witherby, 1941, 5: 174-80. Baker's description, loc. cit., is misleading.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♂	135-150	20-23	34-43	40-50 mm.
♀ ♀	130-145	19-23	—	—

(Witherby)

COLOURS OF BARE PARTS. Iris pale brown. Bill pale brown, darker at tip, more flesh-coloured on lower mandible. Legs and feet pale flesh.

Genus PORZANA Vieillot

Porzana Vieillot, 1816, Analyse: 61. Type, by monotypy and tautonymy, *Marouette* of Buffon = *Rallus porzana* Linnaeus

Differs from *Crex* in having the tarsus shorter than middle toe and claw. Bill short and fairly stout. First primary (as.) about equal to 6th or 7th; 2nd primary longest and subequal with 3rd.

Genus practically cosmopolitan.

Key to the Species		Page
A	Breast spotted with white; wing over 110 mm.	<i>P. porzana</i> 162
B	Breast immaculate; wing under 110 mm.	1
1	Head uniformly brown (both sexes); outer edge of primary brown; wing over 94 mm.	<i>P. parva</i> 159
	Head marked with black (both sexes); outer edge of primary white; wing under 93 mm.	<i>P. pusilla</i> 160
C	Breast (adults) vinous chestnut; young dark olive.	<i>P. fusca</i> 164

335, 336. Little Crane. *Porzana parva parva* (Scopoli)

Rallus parvus Scopoli, 1769, Annus I, Hist.-Nat.: 108 (probably from Carniola)
Porzana parva illustris Gavrilenko, 1926, J. Orn. 74: 700 (Tarim River, Turkestan)
Baker, FBI No. 2012, Vol. 6: 13
Plate 36, fig. 4

LOCAL NAMES. None recorded.
SIZE. Grey Quail ±; length c. 20 cm. (c. 8 in.).
FIELD CHARACTERS. A quail-like swamp bird.
Male. Supercilia and sides of head and neck dark ashy grey; centre of crown and neck rufous-tinged dark brown. Rest of upperparts olive-brown feebly marked with sparse narrow white streaks except on wing-coverts. Upper back, scapulars and innermost secondaries also broadly streaked with black. *Below*, chin, throat and rest of underparts dark ashy grey barred with white posteriorly.

BREEDING. Season so far recorded between June and August. Nest a collection of grass and leaves at the foot of some big tree or under tangled undergrowth in forest, not necessarily close to water. Eggs, similar to those of Indian Banded Crane (332), larger, whiter and more glossy. Average size of 32 eggs 40.6 × 30.8 mm. (Baker). Share of the sexes in incubation, and period, unrecorded.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.
Chick (in down). Rich chestnut, slightly greyish under the wings. Bill dusky olive (Butler).

MEASUREMENTS. ♂ ♀ Wing 151-163; bill (from feathers) 29-33; tarsus 56-62; tail 73-92 mm. (Baker).

COLOURS OF BARE PARTS. Iris scarlet; in some mottled with tiny specks of gold round pupil. Bill bright apple-green, whitish at tip ('this green colour is so delicate that it gives the bill, which is hard and strong, the appearance of being soft and weak'). Legs and feet olive-green (Butler).

Genus CREX Bechstein

Crex Bechstein, 1803, Orn. Taschenb. Deutschl. Th. 2: 336. Type, by monotypy and tautonymy, *Crex pratensis* Bechstein = *Rallus crex* Linnaeus

Differs from other rail species by its comparatively short, stout bill of which depth at base is equal to more than half length of culmen. Tarsus as long as middle toe with claw. Wing rather broad: 1st primary (as.) about equal to 5th or 6th; 2nd primary longest.

Contains a single Palearctic species extending to N. Africa and W. Asia.

334. Corncrake or Landrail. *Crex crex* (Linnaeus)

Rallus Crex Linnaeus, 1758, Syst. Nat., ed. 10, 1: 153 (Europe, restricted type locality Sweden, ex Fn. Svec.)

Baker, FBI No. 2010, Vol. 6: 10
Plate 36, fig. 7

LOCAL NAMES. None recorded.
SIZE. Grey Partridge —; length c. 25 cm. (10 in.).

FIELD CHARACTERS. A quail-like bird, standing somewhat higher on the legs. *Above* yellowish buff or yellowish ashy, the feathers boldly streaked with dark brown. A grey-blue stripe over eye. *Below*, chin and throat whitish, breast pale ashy grey. Flanks and under tail-coverts broadly barred with reddish brown. Sexes more or less alike.

In the sluggish rail-like flight chestnut-coloured wings conspicuous.

STATUS, DISTRIBUTION and HABITAT. Casual vagrant. Only two records from within the subcontinent: one reported to Blyth as having been shot in the 1870s, the other obtained by Scully in Gilgit (8 October, c. 1881) 'while on autumn migration'. More recently, in the 1950s (?), one reported flying on board ship near Ceylon, presumably also on migration (Evenden *in litt*). Two specimens, Colombo (Oct. 1970, Sept. 1972), therefore presumably rare but regular visitor (CBCN, Sept. 1972).

Extralimital. Breeds in the British Isles, N. Europe and Asia north to about the Arctic circle and east to C. Siberia, south to the Pyrenees, N. Italy, Macedonia, N. Persia. Turkestan, and Altai. Winters chiefly in N. and E. tropical Africa. Many instances of casual occurrence' (Peters).

Female. *Above*. Supercilia and face paler grey, otherwise as in ♂. *Below*, chin, throat and foreneck whitish; rest of underparts isabelline-buff, barred brown and white on vent and under tail-coverts.

Young (immature). Like female but with very pale, almost whitish underparts.

STATUS, DISTRIBUTION and HABITAT. Winter visitor, apparently uncommon; hitherto recorded only in Gilgit and W. Pakistan (Baluchistan, Sind). A specimen from Bombay city! (SA & HA, 1968, JBNHS 65: 217-18). Karwar, Karnataka (specimen, BNHS coll.). Its distribution within our limits and numerical status need to be worked out. Paucity of museum skins and liability of misidentification from fleeting glimpses of these small similar-looking crakes renders assessment difficult. Affects reed-beds in and around wheels and swamps.

Extralimital. According to Peters the nominate race breeds locally in E. and S. Europe, SW. Asia, and possibly in NW. Africa. Winters chiefly in the Mediterranean lands, Arabia, Iraq, Sind, and Baluchistan; *P. p. illustris* Gavrilenko breeds from E. Turkestan to the valley of the Tarim in western Chinese Turkestan, and 'doubtless winters in W. India'. However, this race is of doubtful validity, and rejected by both Meinertzhagen (1954, *Birds of Arabia*) and more recently by Vaurie (1965, *The Birds of the Palearctic Fauna* 2). The composite breeding range will therefore stand for the species, which has no races.

MIGRATION. No ringing data or other specific information.

GENERAL HABITS. Very similar to Baillon's and the Spotted Crakes (337, 338), qq.v. Trips lightly over the dry floating lotus leaves and stems, swimming from stem to stem. A great skulker and difficult to flush. Scuds along close to the surface with hurried wing-beats very like quail, but with legs dangling until the bird is well under way. Tumbles headlong into cover after a short flight.

FOOD. Chiefly aquatic insects.

VOICE and CALLS. Unrecorded in India.

BREEDING. Extralimital. Nest and eggs similar to those of 337.

MUSEUM DIAGNOSIS. For description of plumages (and bionomics) see Witherby, 1941, 5: 187-90.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♂	102-110	16.5-19	28-32	50-57 mm.
♀ ♀	95-106	16-18	—	—

(from feathers) (Witherby)
Weight 1.5 to 1.9 oz. (c. 42-56 gm.) — Hume.

COLOURS OF BARE PARTS. Iris and orbital ring crimson. Bill grass green, tip greyish, base of upper mandible at gape red. Legs and feet green.

337. Eastern Baillon's Crane. *Porzana pusilla pusilla* (Pallas)

Rallus pusillus Pallas, 1776, Reise Rus. Reichs 3: 700 (Dauria)
Baker, FBI No. 2013, Vol. 6: 14
Plate 36, fig. 6

LOCAL NAME. *Jhilli* (Nepal, N. Bihar).
SIZE. Grey Quail ±; length c. 19 cm. (7½ in.).

RAILS, COOTS

161

FIELD CHARACTERS. A quail-like swamp bird — our smallest rail.

Adult. *Above.* Supercilium and cheeks ashy grey. A brownish streak through eye over ear-coverts to sides of neck. Rest of upperparts rufescent olive-brown broadly streaked with dark brown. Scapulars, back, rump, and upper tail-coverts with narrow white paint-like smears. Edge of wing at shoulder white, conspicuous in flight. *Below,* neck, breast and anterior abdomen grey; posterior abdomen, vent, and under tail-coverts barred brown and white. Sexes alike.

× c. 1

Young (immature). *Above,* brown eye-streak broader; otherwise more or less like adult but paler. *Below,* almost white; sides of neck, breast, and flanks suffused with ruddy brown.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Breeds abundantly in Kashmir (to c. 1800 metres) where common throughout summer. Very probably also breeds elsewhere within our limits, but no definite records. Spreads out practically throughout the area, including Ceylon and Andaman Is., in suitable biotopes in winter, when there is apparently also an influx of extralimital migrants. Recorded as a passage migrant in many localities, but owing to secretive habits and liability of confusion with the other two *Porzanas* its status remains undetermined. Affects reedy marshes and jheels, irrigated crops, etc.

Extralimital. 'Breeds in C. and E. Asia from the upper Ob to Amurland and Japan, south to Kashmir, Mongolia, N. China and Korea; lower Himalayas in N. India. Winters from Kashmir and the lower Himalayas to India, Ceylon and Burma, and from S. China to the Malay Archipelago and the Philippines' (Peters).

MIGRATION. No ringing data. Recorded as a passage migrant in many northern localities in September-October and again in March-April — even as late as end May or first week June in the NW. frontier of W. Pakistan (Whitehead, JBNHS 12: 345). Often flies into houses at night attracted by the lights.

GENERAL HABITS. Usually keeps singly or in pairs. As great a skulker as its other relations, thus oftener heard among reed-beds than seen, and then mostly when put up in a snipe shoot. On undisturbed jheels or ponds, however, occasionally quite tame, tripping lightly over the floating vegetation or swimming from leaf to leaf in quest of food, twitching up its stub tail every little while in the typical Moorhen manner and unafraid so long as the observer remains quiet. When alarmed, calmly slips under a lotus leaf or similar object, peering out cautiously from its hiding-place from time to time to assure itself that the danger is past.

FOOD. Largely seeds of aquatic plants; also insects, worms, and molluscs.

VOICE AND CALLS. A single loud high-pitched *crak* followed after a pause by another, then by a succession of *craks* in increasing tempo till it ends in an unbroken run. Reminiscent of the trilling of a dabchick.

BREEDING. Season, in Kashmir May to August, chiefly June and July. *Nest,* a collection of grass or reeds placed in soft marsh grass, in grass on the

RAILS, COOTS

■ Breeding range

Extralimital. 'Breeds in the British Isles, Europe and W. Asia, north to Norway, Finland and the upper Ob, south to the islands in the Mediterranean, and NW. Kashmir. Winters in S. Europe, and in Africa chiefly north of the Sahara, but south to Damaraland and Bechuanaland; also in India from Sind to Bengal' (Peters). Its breeding in NW. Kashmir (as above), presumably Gilgit, needs confirming.

MIGRATION. No ringing data. Arrives in N. India in September-October apparently by a different route to that taken in spring. 'Passes through Kohat (NW. Pakistan) in fair numbers in March and April' (Whitehead, 1909, *Ibis*: 270).

GENERAL HABITS AND FOOD. As in 336 and 337, qq.v. Like them also largely crepuscular.

VOICE AND CALLS. Not intelligibly described in its winter quarters when birds mostly silent.

BREEDING. Extralimital. *Nest* and site as in Baillon's Crake (337). *Eggs,* 8-12, greyish to greenish buff profusely spotted and blotched with reddish or purplish brown.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit. Under tail-coverts uniform buff, unbarred.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	112-119	19-21	c. 33-35	47-52 mm. (Baker)

Weight ♂ ♀ 3 to 4 oz. (c. 85-114 gm.) — Hume.

COLOURS OF BARE PARTS. Iris reddish brown to red. Bill yellow, orange at base, darker and more greenish along culmen and at tip. Legs and feet bright olive-green.

162

GRUIFORMES

side of a bank or at the base of a bush, in a swamp or on the edge of a lake. Often anchored in water amongst growing rice crops with a number of stems bending over to form a canopy; in very similar situations to those chosen by Ruddy Crake (339). Position of nest usually given away by bird sitting very close and flying straight off it when almost trodden on. *Eggs,* 5 to 8 or 9 yellow-brown, olive, or pale brown, profusely streaked and freckled with reddish brown. Average size of 82 eggs 28.4 × 20.6 mm. (B. B. Osmaston). Proportionately large for the bird, and how such large clutches are effectively covered by so small a body is puzzling. Both sexes incubate. Period (in European race) 20-21 days; unrecorded in India.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). All black; a greenish tinge to the tips of the down.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	84-91	14-16	27-28	40-46 mm. (Baker)

Weight 1.1 to 1.8 oz. (c. 28.5-52 gm.) — Hume.

COLOURS OF BARE PARTS. Iris red (adult), reddish brown (imm.), dull blue-brown (chick). Bill horny green to green, darker at tip and on culmen. Legs and feet yellowish green to dull green; claws horny brown.

338. Spotted Crake. *Porzana porzana* (Linnaeus)

Rallus Porzana Linnaeus, 1766, Syst. Nat., ed. 12, 1: 262

(Europe = France, ex Brissonian reference)

Baker, FBI No. 2011, Vol. 6: 11

Plate 36, fig. 8

LOCAL NAMES. *Jhilli* (N. Bihar); *Khairi*, *Gurguri khairi* (Bengal); *Venna mudi kōzhi* (Tamil).

SIZE. Grey Quail +; length c. 23 cm. (9 in.).

FIELD CHARACTERS. A quail-like swamp bird.

Adult. *Above.* Supercilium, sides of head and neck grey, speckled with white. Rest of upperparts rufescent olive-brown broadly streaked with black. Hindneck and upper back spotted with white. Scapulars, lower back, rump, upper tail-coverts and inner secondaries narrowly streaked with white. Wing border white at carpal joint. *Below,* chin, throat, and abdomen white. Breast brownish grey speckled with white; flanks brownish grey barred with white. Vent and under tail-coverts buff. Sexes alike.

Young (immature). More brown less grey below, with the white of chin and throat more extensive.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor recorded from practically every part of our area from Sind to Assam and south in the Peninsula at least to Belgaum (Mysore). Perhaps commoner than supposed wherever appropriate facies available, but overlooked due to its skulking habits and silence in non-breeding season. Affects reedy jheels and seepage or spillage marshes from reservoirs and canals.

164

GRUIFORMES

PORZANA FUSCA (Linnaeus)

Key to the Subspecies

Larger; wing 99 mm. or over *P. f. fusca*

Smaller; wing 97 mm. or less *P. f. zeylanica*

339. Northern Ruddy Crake. *Porzana fusca fusca* (Linnaeus)

Rallus fuscus Linnaeus, 1766, Syst. Nat., ed. 12, 1: 262 (Philippines)

Porzana fusca bakeri Hartert, 1917, Nov. Zool. 24: 272 (Bhim Tal, Kumaon)

Baker, FBI No. 2019, Vol. 6: 21

Plate 36, fig. 9

LOCAL NAME. *Di daobui gajao* (Cachar).

SIZE. Grey Quail +; length c. 22 cm. (c. 8½ in.).

FIELD CHARACTERS. A skulking stub-tailed ground bird of reedy swamps, of the general effect of the familiar Whitebreasted Waterhen.

Adult. *Above,* forehead, forecrown, supercilia, and sides of face (the mask) vinous-chestnut. Rest of upperparts dark olive-brown. *Below,* chin and centre of throat whitish; throat to lower breast vinous-chestnut. Abdomen and flanks olive-brown; under tail-coverts blackish with white fringes. Sexes alike. Dangling bright red legs conspicuous in feeble flight.

Young (immature). *Above,* darker than adult. Crown colorous with black; supercilia and sides of head and neck dull white. *Below,* dull white barred with dusky brown. Flanks and thighs dull olive-brown; under tail-coverts as in adult.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident and possibly migratory to some extent. Pakistan and N. India from the NW. Frontier district through Kashmir and Nepal to Assam up to c. 1800 metres along the lower Himalayas. Southwest to Delhi (specimens, Donahue, JBNHS 64: 414), thence eastward to Bengal and E. Pakistan. Curiously enough, occurrences in peninsular India, excepting on the western side as given under *P. f. zeylanica* (340), completely unrecorded save for a specimen from Chanda (Maharashtra, c. 20° N.) in Brit. Mus. Affects swampy localities — edges of inundated rice-fields, reedy banks of canals and spillage marshes, etc.

Extralimital. N. Burma (Chin Hills, Arakan); Thailand.

GENERAL HABITS. Typical of the rails. A shy and extreme skulker, slipping away into the herbage on the slightest alarm, threading its way swiftly through the reed stems, flushed only with difficulty, and usually very silent; thus easily overlooked. Pairs probably roost together in thick bushes at night as do its relatives in Indonesia.

FOOD. Aquatic insects and their larvae, molluscs, seeds and shoots of marsh plants.

VOICE AND CALLS. 'A very soft *crake* uttered as a single note at considerable intervals' (Baker). 'A metallic *teck* repeated every two or three seconds, usually followed by a bubbling note, much like that of the Dabchick but louder' (R. S. P. Bates). A short low *chuck* when feeding (Julian Donahue). Heard rarely, and chiefly in the very early mornings and evenings.

Hume renders another (or the same note ?) as *keek-keek-keek*. Even in the breeding season the bird is apparently much less noisy than other crakes.

BREEDING. *Season*, in Kashmir and NW. Pakistan, June, July and August; in Bengal and E. Pakistan (Sunderbans), July to September. Breeds abundantly in all these areas preferring rice-fields and ditches to large jheels. *Nest*, a pad of dry grass and leaves of aquatic plants placed on swampy ground amongst grass, reeds or rice plants which sometimes bend over to form a canopy over the nest. *Eggs*, 6-9, pale *caft-au-lait* spotted all over, but chiefly at the broad end, with pinkish brown and pale purplish grey markings. Average size of 92 eggs 32.6×23.5 mm. (B. B. Osmaston). Both sexes share in nest-building, incubation and tending the young. Incubation period unrecorded.

MUSEUM DIAGNOSIS. Larger than *zeylonica* (340); variable in tone of plumage, but tending to be darker both above and below.

Chick (in down). Black with fulvous spots behind the ear-coverts.

MEASUREMENTS

	Wing	Bill (from feathers)
♂ ♀	97-110 105-109	21-24 mm. (Baker) — (Whistler)

COLOURS OF BARE PARTS. Iris crimson (ad.), brown (imm.), glaucous blue-brown (downy chick). Eyelids plumbeous grey with a red rim. Bill horny green to brownish green; tip of lower mandible yellowish. Legs and feet reddish orange to brick-red.

340. Southern Ruddy Crake. *Porzana fusca zeylonica* (Baker)

Amaurornis fuscus zeylonicus Baker, 1927, Bull. Brit. Orn. Cl. 47: 73 (Ceylon)
Baker, FBI Nos. 2017, 2018, Vol. 6: 20

LOCAL NAMES. *Punchi korowakā* (Sinhala); *Kānān kōzhi* (Tamil); *Chankōzhi* (Malayalam).

SIZE. Grey Quail ±; length c. 22 cm. (c. 8½ in.).

FIELD CHARACTERS. As for 339, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident, and partially migratory in winter. Ceylon, and the Western Ghats strip of country northward at least to Bombay (specimen in BNHS collection) from plains level to c. 2000 metres. In Ceylon, scattered sparingly through all zones (low country and hills up to c. 1200 m.), its numbers augmented in winter by migrants arriving October-November and leaving March-April (Phillips). Affects reeds and brushwood on the edge of jheels, swamps and inundated rice-fields.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the northern race (339).

BREEDING. *Season*, in both Ceylon and SW. India normally June to September commencing after the break of the SW. monsoon rains. *Nest* and *eggs* as in 339, the latter averaging somewhat smaller — 30.0×22.3 mm. (Baker).

MUSEUM DIAGNOSIS. Differs from the north Indian race (339) only in being smaller. Coloration variable in tone, but size range diagnostic.

Placed on wet ground in forest undergrowth; sometimes a metre or two up in bushes and trees, once c. 6 metres from the ground recorded by Baker. *Eggs*, 5 to 7, occasionally 8, handsome and richly coloured, pale cream to pale salmon-pink, boldly blotched with deep red-brown, purplish brown or brick-red, more densely at the broad end, with secondary markings of grey and lavender. A second type of egg is rather feebly marked and resembles those of the Whitebreasted Waterhen (344) q.v. Average size of 80 eggs 33.9×26.1 mm. (Baker). Both sexes share in nest-building and incubation; period unrecorded.

MUSEUM DIAGNOSIS.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	112-119	21-27 (from feathers)	37-39	57-60 mm. (Baker)

COLOURS OF BARE PARTS. Iris blood red (ad.); brown (imm.). Bill pale bluish green, tipped paler and greyer; a red patch near base, brighter in breeding season. Legs and feet dull red to bright brick-red.

342. Brown Crake. *Amaurornis akool akool* (Sykes)

Rallus Akool Sykes, 1832, Proc. Zool. Soc. London: 164 (Dukhun)
Baker, FBI No. 2024, Vol. 6: 25
Plate 36, fig. 10

LOCAL NAMES. None recorded.

SIZE. Grey Partridge —; length c. 28 cm. (c. 11 in.).

FIELD CHARACTERS. A skulking stub-tailed brown and ashy swamp bird. *Adult.* Above, indistinct supercilia and sides of head and neck ashy grey; rest of upperparts, wings and tail dark olive-brown. Below, chin and centre of throat whitish; rest of underparts ashy grey passing into brown posteriorly. Sexes alike; female somewhat smaller.

Young (immature). ?

STATUS, DISTRIBUTION AND HABITAT. Resident; possibly also local migrant. Kashmir eastward through Nepal (lowlands and duns to c. 800 m. alt.) to W. Assam (Gauhati); south through the Punjab, Delhi and Gangetic Plain, Gujarat, Maharashtra, Madhya Pradesh and Andhra to southern Mysore. Status on eastern side of the Peninsula south of Orissa unknown; also up to what altitudes it occurs in the peninsular hills. Affects swampy reed-beds, *Pandanus* brakes, herbage lining watercourses, irrigation channels, etc.

Extralimital. SE. China, NE. Indochinese countries, the Philippines (Peters).

GENERAL HABITS. Nothing specifically recorded as different from the typical rails. Largely crepuscular. Shy and secretive. Emerges cautiously at the edge of reed-beds and shrubbery to feed in the early mornings and evenings, walking about with characteristic constant jerks of the stub tail and scuttling into cover with lowered head on the least suspicion. When alarmed will sometimes run to earth under a large stone or in a hole in a bank and remain there for many minutes peering out circumspectly before emerging. Clambers among the reeds and on the broad *Pandanus* leaves with the agility of the Whitebreasted Waterhen. Less difficult to flush than some of its congeners, but an equally feeble flier with legs dangling.

MEASUREMENTS

	Wing	Bill (from feathers)
♂ ♀	87-97 (once 99) 90-98	19-20 mm. (Baker) — (Whistler)

COLOURS OF BARE PARTS. As in 339.

Genus AMAURORNIS Reichenbach

Amaurornis Reichenbach, 1853 (1852), Av. Syst. Nat.: xxi. Type, by original designation, *Gallinula olivacea* Meyen

Differs from *Porzana* and *Gallinula* (pp. 159, 174) in its more rounded wing: 3rd primary (as.) longest; 2nd equal to 5th or 6th; 1st much shorter. Tarsus shorter than middle toe with claw. Bill short, about two-thirds length of tarsus; variable in shape, being rather swollen at the base in some species but not in others.

Key to the Species

	Page
A Breast white; bill swollen at base	<i>A. phoenicurus</i> 168
B Breast dark grey; bill not swollen at base	
Back rufous-brown	<i>A. bicolor</i> 166
Back dark olive	<i>A. akool</i> 167

341. Elwes's Crake. *Amaurornis bicolor* (Walden)

Porzana bicolor Walden, 1872, Ann. and Mag. Nat. Hist. 9(4): 47
(Rungbee, Darjeeling)
Baker, FBI No. 2025, Vol. 6: 26
Plate 36, fig. 11

LOCAL NAMES. None recorded.

SIZE. Grey Quail ±; length c. 22 cm. (c. 8½ in.).

FIELD CHARACTERS. A quail-like chestnut and slate marsh bird.

Adult. Above, head and neck dark ashy grey; rest of upperparts rufous-brown. Tail black. Below, sides of head pale grey; chin whitish; rest of underparts dark ashy grey. Sexes alike.

Young (immature). ?

STATUS, DISTRIBUTION AND HABITAT. Resident. Nepal (?), Sikkim, Bhutan to E. Assam; Khasi and Cachar hills; Manipur. To at least c. 2800 metres in Bhutan (Ludlow), and reportedly to c. 3600 m. in Sikkim (Stevens). Affects patches of jungle in and around rice cultivation, grass-bordered streams, pools or swampy patches in forest, often very dense.

Extralimital. Shan States (Burma), Yunnan, W. Szechuan, N. Vietnam.

GENERAL HABITS, FOOD, VOICE AND CALLS. Except that like *Amaurornis akool* (342) and other rails it is a great skulker, emerging at the edge of cover in the early mornings and evenings, and scuttling in on the least alarm, very little specifically known. Call unrecorded.

BREEDING. *Season*, in the Khasi Hills where it breeds freely, mid-May to end August up to c. 1800 metres and possibly higher. *Nest*, a rough pad of loosely put-together twigs and grass with a slight depression in the centre.

FOOD. Insects and their larvae, molluscs, worms, and seeds of marsh plants.

VOICE AND CALLS. As of most rails very imperfectly known. Various described as 'a short plaintive note heard at daybreak and just before sunset' (Blewitt); 'a shrill rattle-like call' frequently emanating from sugarcane fields (around Poona) attributed to this species by Betham, but not proved; 'a long-drawn-out vibrating whistle, gradually descending a little in the scale' (B. B. Osmaston).

BREEDING. *Season*, chiefly May to August, varying with locality: March and October (Poona), and September (Gujarat and Sikkim terai) also recorded. *Nest*, a pad of grass, rush-blades and sticks with a slight depression in the centre, well concealed in raised grass tussocks in or near the edge of a swamp. One nest recorded c. 1.5 metres above ground in a collection of flood-wrack on top of a stunted acacia on a river bank. *Eggs*, 5 or 6, very like richly coloured eggs of *Rallus aquaticus* (327) — creamy buff to pale salmon-pink sparsely flecked and blotched with pale reddish brown, purple-brown or pale brick-red, the markings somewhat more concentrated at the broad end. Some eggs are less richly marked and resemble those of the Waterhen (344). Average size of 50 eggs 34.9×26.5 mm. (Baker). Both sexes take part in incubation; period unrecorded. The birds are close sitters and often betray the nest by running off it like a rat when almost trampled on.

MUSEUM DIAGNOSIS.

Chick (in down). All black.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	114-131	28-33	46-51	54-63 mm. (Baker)

Females average smaller than males.

Weight ♂♂ 4-6 oz. (c. 114-170 gm.); ♀♀ 3.7-4.9 oz. (c. 110-140 gm.) — Hume.

COLOURS OF BARE PARTS. Iris blood red (ad. ♂), brown (imm.). Bill horny green to pale green, bluish at tip. Legs and feet fleshy brown to livid purple.

AMAURORNIS PHOENICURUS (Pennant)

Key to the Subspecies

	Page

LOCAL NAMES. *Davāk*, *Dahāk*, *Dauk* (Hindi); *Pānpairā* (Bengal); *Kināti* (Uttar Pradesh); *Bān mūrghi* (Bihar); *Jāl mūrghi* (Madhya Pradesh); *Kuku kōmbdi* (Marathi, Bombay); *Davāk* (Gujarati); *Būda kōdi* (Telugu); *Kuraki* (Sind); *Kureyn* (Gond); *Pāni dūboi* (Assam); *Uren konthou* (Manipur); *Korowakā* (Sinhala); *Kānān kōchi* (Tamil); *Kula kōchi* (Malayalam).

SIZE. Grey Partridge ±; length ♂. 32 cm. (c. 12½ in.).

FIELD CHARACTERS. A familiar dark slaty grey stub-tailed skulking swamp bird with prominent white facial mask and underparts.

Adult. Above, forehead, supercilia, and sides of head pure white; hindneck, crown and rest of upperparts dark slaty grey. Below, from chin to vent pure white; sides of breast and flanks slaty grey; posterior flanks, vent, and under tail-coverts rufous. Sexes alike.

Young (immature). White facial mask obscured by slaty-tipped feathers. Upperparts more olive-brown than slaty grey.

For downy chick see Museum Diagnosis.

x.c.1

STATUS, DISTRIBUTION AND HABITAT. Resident. Throughout West Pakistan (decreasing in the northwest) and northern India including Nepal (bhabar and duns), Sikkim and Bhutan duars, Assam. South throughout peninsular India, Laccadive (Lakshadweep) and Maldive archipelago, Ceylon (Sri Lanka). Plains and hills up to c. 1500 m. (to 2000 m. in the Nilgiris). Widely dispersed during the rainy season. Affects reedy marshland, edges of inundated rice-fields, rain-filled ponds and roadside ditches, village tanks and their neighbourhood.

Extralimital. Burma, Thailand, S. China, Malay Peninsula south to about the latitude of Malacca, and Cambodia; Formosa (Taiwan) and Hainan.

GENERAL HABITS. Our commonest and most familiar rail; less shy and secretive than most of its tribe. Frequently found in the surroundings of

villages, running about under roadside and boundary hedgerows and shrubbery, even entering rambling compounds and public parks within the limits of populous towns. The stumpy tail is constantly jerked up as the bird saunters about, flashing the chestnut coverts underneath. Clambers up amongst thorny bamboo clumps and shrubs with great agility, especially in the breeding season when it mounts into their tops to command an open view of the surroundings and utter its resounding calls. It does this while remaining partly hidden in the foliage, and withdraws deeper inside or quickly descends to the ground on alarm. Has the typical feeble flight of rails with legs dangling. Swims buoyantly like moorhen.

FOOD. Insects and their larvae, molluscs, worms, seeds and shoots of marsh plants. Among the stomach contents of five specimens analysed at Pusa were found — in addition to vegetable matter such as seeds and roots of water weeds — 169 insects of which 103 were weevils (Curculionidae) of the genus *Mylocherus*, the majority being the species *discolor*. There were also broken pieces of the shells of *Melania tuberculata*, *Corbicula orientalis* and *Unio favidus* (Mason & Lefroy, 1912).

VOICE AND CALLS. Bird very silent in the dry season and thus liable to be overlooked. Becomes exceedingly boisterous as soon as the monsoon commences. The calls begin with loud raucous roars, croaks and chuckles and settle down to a monotonous metallic *krr-kwaak-kwaak*, *krr-kwaak-kwaak*, etc. or *kook . . . kook . . . kook* somewhat like the Coppersmith barbet's but louder, higher in pitch and faster in tempo. They are of astonishing volume for the size of the bird, the roars and cackles in particular being, according to E. H. Aitken (EHA), more appropriate to a bear being roasted over a slow fire! The bird calls throughout the night and also on cloudy overcast days, in unbroken runs of often fifteen minutes or more.

BREEDING. Season, mainly coincident with the SW. monsoon — June-July to October. **Nest**, a shallow, cup-shaped pad of twigs, creeper stems, and flags of bulrushes. Placed on the ground in tangled undergrowth by the margin of a tank, ditch or inundated rice-field, or concealed in the interior of a shrub or thorny bamboo clump up to 2 or 3 metres from the ground. Sometimes it may be well away from water. **Eggs**, 6 or 7, rather long smooth ovals, cream or pinkish white, streaked and blotched with some shade of reddish brown. Average size of 100 eggs 40.5 × 29.7 mm. (Baker). Breeding males pugnacious, but their battles rather formalized and usually innocuous. Both sexes incubate and tend the young, one parent leading the brood while the other brings up the rear. Newly hatched chicks extraordinarily active, and adepts at diving and dispersing when followed. Incubation period unrecorded.

MUSEUM DIAGNOSIS. There is considerable individual variation in the colour of the underparts, some birds having the grey sides of the breast strongly barred with olive. This character is inconstant and does not justify racial separation.

Chick (in down). Uniformly black, with blackish bill and legs.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
12 ♂♂	148-178	38-42	53-63	59-80 mm.
14 ♀♀	138-168	34-36	52-59	46-71 mm.

Weight 10 ♂♂ 152-230 (av. 188.7) gm. — BNHS.

COLOURS OF BARE PARTS. Iris crimson (ad. ♂), brown (imm.). Bill sage green; base of upper mandible red, tip and lower mandible paler and more yellow. Legs and feet dull chrome-yellow or yellowish green.

The descriptions of the Chinese and Ceylonese White-breasted Waterhens, *Amaurornis phoenicurus chinensis* and *A. p. phoenicurus*, are amalgamated under the name of the Indian Whitebreasted Waterhen (No. 343, 344).

345. Andamans Whitebreasted Waterhen. *Amaurornis phoenicurus insularis* Sharpe

Amaurornis insularis Sharpe, 1894, Cat. Bds. Brit. Mus. 23: 162

(Andaman and Nicobar islands)

Amaurornis phoenicurus leucocephalus Abdulali, 1964, JBNHS 61: 412 (Car Nicobar)
 Baker, FBI No. 2023, Vol. 6: 25

LOCAL NAMES. *Jāngli mūrghi* (Andamans); *Takoor* (Car Nicobar).

SIZE. Grey Partridge ±; length c. 32 cm. (c. 12½ in.).

FIELD CHARACTERS. Same as for the North Indian race (343), q.v. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Andaman and Nicobar islands. Affects thick jungle far from water as well as brushwood near streams, and mangrove swamps. Fairly common on volcanic Barren I. (12°18'N., 93°49'E.) despite absence of fresh water.

GENERAL HABITS AND FOOD. As of 343.

VOICE AND CALLS. Some calls apparently peculiar and distinct. 'Emitting a most extraordinary variety of improbable sounds' (B. B. Osmaston). Among various other loud and raucous far-carrying calls 'an extraordinary duck-like quack never heard in Ceylon. From this quacking, unseen bird mistaken for some exceptionally noisy duck' (A. L. Butler).

BREEDING. Season, June-July. **Nest**, sometimes in thick brushwood, sometimes on the ground in rushes and grass (Osmaston). **Eggs**, normally 4 in a clutch; occasionally 5 or 6. Average size of 50 eggs 40.8 × 31.0 mm. (Baker).

MUSEUM DIAGNOSIS. Larger than 343, darker and blacker in general coloration with very little olive tint. White on forehead more extensive.

MEASUREMENTS. ♂♀ Wing 157-173; bill (from feathers) 37-44 mm. (Baker).

COLOURS OF BARE PARTS. As in the Indian races.

[A new race, *A. p. leucocephalus*, has recently been described by Abdulali (1964, JBNHS 61(2): 412) on a single specimen collected by him on Car Nicobar. The characters given for the holotype are: Adult (♀). Whole head and neck white except for irregular grey spots on crown and nape. No olive-green in upper and lower parts. More white on breast than in *insularis*, the white ventral stripe narrower and broken in the middle on anterior abdomen. Six further specimens collected in Car Nicobar since tend to confirm the distinctness of the Nicobar population (Abdulali, H., 1967, *ibid.* 64(2): 158).]

Genus GALLICREX Blyth

Gallixrex Blyth, 1852 (1849), Cat. Bds. Mus. Asiat. Soc.: 283. Type, by monotypy, *G. cristatus* = *Fulica cinerea* Gmelin

Horny shield on forehead pointed posteriorly; much larger in male than female; in breeding male ending in a fleshy horn-like protuberance. Bill stout, moderately long, about equal to hind toe without claw. All toes long, the middle toe without claw longer than tarsus. Wing rounded: 1st primary (as.) between 6th and 8th in length; 2nd and 4th primaries equal; 3rd slightly the longest. Sexes dimorphic; male much larger than female.

Contains a single species spread over a wide area from India to Japan.

346. Kora or Watercock. *Gallixrex cinerea cinerea* (Gmelin)

Fulica cinerea Gmelin, 1789, Syst. Nat. 1(2): 702 (China, ex Latham)
 Baker, FBI No. 2027, Vol. 6: 29

Plate 36, fig. 13

LOCAL NAMES. *Kora*, *Kengra* (Hindi); *Toobka*, *Kora* (Bihar); *Kora*, *Jāl mārāg* (Bengal); *Khōra sorāi* (Assam); *Uthm* (probably from its call — Manipur); *Wāl kākūlā* (Sinhala); *Temir kōchi* (Tamil); *Thepporikkāndā* (Malayalam); *Coeli kākūlā* (Maldives).

SIZE. Grey Partridge ±. Length ♂ c. 43 cm. (17 in.); ♀ c. 36 cm. (14 in.).

FIELD CHARACTERS. A rail-like swamp bird. Both sexes alike in non-breeding plumage: above, dark brown, broadly scalloped with fulvous;

♂, x c. 1

below, pale buffy brown with fine wavy darker bars. A small triangular yellowish horny shield on forehead. Female considerably smaller.

Male (breeding). Overall black, scalloped with grey. Its most striking features are the bright red fleshy horn (continued backward from the frontal shield) projecting above the crown, and the bright red eyes and legs.

Young (immature). Like female but less barred below.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident in well-watered areas, dispersing widely during the monsoon with the creation of adequate marshy conditions in otherwise low-lying dry localities. All India south of the Himalayas from W. Pakistan (Sind, Punjab) east to Assam and East Pakistan, south through the Peninsula, and Ceylon. Andaman Is., Nicobars, Maldive Archipelago. Affects reedy swamps, low-lying rice and irrigated sugarcane cultivation, rush-bordered channels, ponds, ditches, borrow-pits, etc.

Extralimital. Eastward to S. and E. China, Korea, Japan, south to the Malay Peninsula, Indochina, Sumatra, Java, Borneo, the Philippines and Celebes (Sulawesi).

GENERAL HABITS. Rail-like. Largely crepuscular, keeping to cover during daytime and emerging to feed in the early mornings and evenings, or in cloudy, overcast and drizzly weather. Saunters about with characteristic jerking of tail, never straying far from edge and scuttling into cover on the least alarm. Flight feeble, with rapid flaps, the long legs dangling below. Males highly pugnacious during breeding season indulging in furious and long-sustained battles with rivals, jumping and clawing at each other, trying to get hold of opponent's neck in bill and hold him down. In spite of seeming ferocity, little serious damage usually suffered by the combatants beyond scratches and loss of neck-feathers.

FOOD. Largely vegetarian — seeds and shoots of green crops, wild and cultivated rice, to which latter it may do some local damage; also aquatic insects and their larvae, molluscs, worms, etc.

VOICE AND CALLS. Calls of three sorts, all with a remote suggestion of 'booming'. Produced more or less continuously, with a definite rhythm and a few seconds' silence between each series. Posture of bird and sounds produced obviously interdependent. With head up utters a series of 10 to 12 *kok-kok-kok-kok* somewhat like the booming notes of Chestnut Bittern.

frontal shield, red in adults; nostrils long and narrow. Second primary (as.) longest, or 2nd and 3rd subequal; 1st primary about equal to 5th or 6th.

Genus widespread in the Old and New Worlds; only a single species within our limits.

347. Indian Moorhen. *Gallinula chloropus indica* Blyth

Gallinula chloropus? var. *indicus* Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 887 (Calcutta) Baker, FBI No. 2026, Vol. 6: 28

Plate 36, fig. 14

LOCAL NAMES. *Jāl mūrghi*, *Pāni mūrghi* (Hindi); *Tēch* (Kashmiri); *Bodor* (Bihar); *Jāl mūrghi*, *Dakab paira* (Bengal); *Jumbū kōdi*, *Bolli kōdi* (Telugu); *Paat ūren* or *ūrel* (= 'lake waterhen' — Manipur); *Wil kukkulā* (Sinhala); *Tannir kōzhi*, *Kāndā kōli* (Tamil); *Pātta kōzhi* (Malayalam); *Jāl kākādi* (Gujarati); *Pān kōmbdi* (Marathi).

SIZE. Grey Partridge ±; length c. 32 cm. (12½ in.).

FIELD CHARACTERS. General effect on land typical of rail; on water that of a small duck.

Adult. Above black, slaty grey and brown with a diagnostic white border to the closed wings. Below slaty grey, paler and whitish on centre of abdomen. Under tail-coverts white with a black central patch. Green bill, bright red frontal shield on forehead, longish green legs with long slender toes are additional pointers. Sexes alike.

Young (immature). Overall more brown less grey, the lower parts much mixed with white. Bill and frontal shield greenish brown.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident and partly winter visitor, where its numbers everywhere get vastly augmented. All India, both Pakistans, Nepal, Ceylon. Chiefly lowlands, but also breeding up to considerable elevations in the outer Himalayas and peninsular hills, e.g. to c. 2400 metres in Kashmir and c. 2000 m. in the Nilgiris. Affects jheels and swamps, with beds of sedges and bulrushes, and tangles of lotus and other floating vegetation interspersed with sheets of open water. Also reed-margined ponds, village tanks, ditches, etc. Shifts locally with water conditions.

Extralimital. Southern Tibet, S. and E. China, Japan, Burma, Thailand, central Malay Peninsula, Cambodia, Hainan (?), Formosa and the Ryukyu Islands.

MIGRATION. No ringing data. In the Kurram Valley, NW. Pakistan (where small numbers breed) recorded as occurring chiefly on spring migration passage in March and April (Whitehead, 1909, *Bir*: 271). Passes through Chitral in May (Perreau, JBNHS 19: 920). Common only on passage in Gilgit in April and October (Scully, SF 10: 142).

GENERAL HABITS. Keeps in pairs or small parties; after influx of winter migrants in larger congregations, often of 50 or more. Spends most of its time on the water, paddling about amongst the lily pads and other floating

x c. 1

Then suddenly lowers head steeply and utters a number of deeper, hollower, metallic notes *utumb-utumb-utumb* (u as in 'put') more rapidly than the previous series. (The *utumb* sound is of the volume and quality of a lemon-sized pebble dropped into a deep well.) After 10 or 12 *utumbs* raises head again, uttering maybe 5 or 6 *kluck-kluck-kluck* notes while doing so. With head back in the original position the bird is now ready to begin it all over again. The calling continues thus for half an hour (or more) at a stretch. It is accompanied by a puffing out of the neck and raising of its feathers as in a Bittern (*Botaurus*) booming (K. K. Neelakantan, JBNHS 55: 560-1).

BREEDING. Season, chiefly the monsoon months, June to September. In Ceylon, May and possibly July-August (January-February also recorded); in the Maldives June-July (Phillips). *Nest*, a large concave or deep cup-shaped pad of sedges, rush-leaves, grass, etc. sometimes domed over with the surrounding substrate to form a bower. Placed in tangled reed-beds in large swamps and jheels, or amongst standing rice plants in an inundated rice-field. *Eggs*, normal clutch 3 to 6 (sometimes up to 8 and even 9) rather long ovals closely resembling Coot's; from almost white through pale pink or yellowish stone-colour to deep brick-pink, with longitudinal blotches and spots of reddish brown fairly profuse all over but slightly denser at the broad end. Average size of 100 eggs 42.2 × 31.0 mm. (Baker). Cock probably monogynous, but not proved. Also not known whether he assists in incubation; period unrecorded.

MUSEUM DIAGNOSIS

Chick (in down). Black above, more brownish below.

MEASUREMENTS

	Wing	Bill (culmen)	Tarsus	Tail
♂♂	211-227	37-38	75-77	77-83 mm.
♀♀	172-184	32-34	65-68	65-75 mm. (Baker)

COLOURS OF BARE PARTS. ♂ (breeding). Iris bright red. Bill and shield at base blood red, paling to dusky yellow at tip; 'horn' bright red. Legs and feet dull to bright red. ♀ and non-breeding ♂: Iris yellow or yellowish brown. Bill and small triangle at its base (on forehead) yellowish. Legs and feet dull greenish brown.

MISCELLANEOUS. Highly prized as a fighting bird in Sylhet, East Pakistan, large sums of money being wagered on the mains. Fanciers used to collect the eggs and hatch them with the heat of their own bodies in a half-coconut shell for protection, wrapped in cloth and kept tied against their bellies day and night. Incubation takes about 24 days, during which time the human incubator is constrained to eschew all baths! Whether this practice is still in vogue is not known.

Genus GALLINULA Brisson

Gallinula Brisson, 1760, Orn. 1: 50; 6: 2. Type, by tautonymy, *Gallinula* Brisson = *Fulica chloropus* Linnaeus

Toes extraordinarily long, fringed with narrow straight-edged lateral membranes (not broad and lobed as in Coot). Middle toe without claw much longer than tarsus. Bill of moderate length, base of culmen continued on forehead as a flat rounded

vegetation. Rides high like a duck, its swimming accompanied by rhythmical jerky bobs of the head and upward flicks of the erect tail, flashing the white coverts underneath. This action also characteristic as the bird saunters about with an upright carriage over the floating tangles in search of food. Usually keeps to the edge of reed-beds, withdrawing into them quickly and quietly on alarm. Trusts to its legs and paddling for escape, and flies reluctantly, either clambering up reed stems to launch itself from a height or skittering along the water like a coot to get airborne. Is a seemingly feeble flier with rapidly flapping wings and dangling legs but capable of sustained long-distance migration over high mountains. Creditable diver when hard pressed.

FOOD. Omnivorous: seeds, fruits, and shoots of water-plants, molluscs, insects and their larvae, young frogs and small fish. Sometimes wanders into cultivation away from swamps to feed in the early morning and at dusk, and to some extent nocturnally. For some details see Mukherjee, A. K., 1974, JBNHS 71(2): 194-7.

VOICE AND CALLS. Normally very quiet, only an occasional loud *karuck* announcing its presence in a reed-bed. Noisy when breeding, mostly in the mornings and evenings — a sharp, loud and abrupt *kirrik-krek-rek-rek* constantly uttered. Also a number of softer chuckling notes. 'A cackling "laugh" lower in pitch than the Little Grebe's' (Nicholls). Clucking noises when alerting or commanding chicks: 'Unborn chicks even before breaking the shell understand these calls of their parents, ceasing their subdued chirping the moment they hear the danger call' (R. S. P. Bates, 1952: 295).

BREEDING. Season, in Kashmir (where it is perhaps the commonest water bird and breeds abundantly on the Dal, Anchar, and other lakes) May to August, chiefly June and July; in the Peninsula during the SW. monsoon months July, August, September; in Ceylon March to August. Sometimes two successive broods raised. *Nest*, a bulky mass of sedges and bulrush leaves placed in a dense reed-bed a few inches above water level; rarely even in a tree near or overhanging water. *Eggs*, 5 to 12, pale yellowish to warm buff stone-colour, thinly and more or less evenly spattered all over with small blotches of dark reddish brown. Average size of 71 eggs 41.4 × 29.6 mm. (B. B. Osmaston, 1927, JBNHS 32: 146). Both sexes share nest-building, incubation and care of the young; incubation period c. 21 days. The perturbed parents occasionally slap the water with the wings (akin to injury-feigning) in an attempt to draw away the intruder from the brood.

MUSEUM DIAGNOSIS. For details of plumages (and bionomics) of the nominate race see Witherby, 1941, 5: 197-204. *G. c. indica* differs from it only in being somewhat smaller, with a relatively smaller bill.

Chick (in down). Deep grey-black all over.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	152-172	♂♂ 38-41 ♀♀ 32-35	47-50	52-68 mm. (Baker)

Female only slightly smaller than male.

11 ♂♂ tarsus 46-50 mm.; middle toe without claw 55-67 mm. (V. C. Ambedkar).

RAILS, COOTS

177

COLOURS OF BARE PARTS. Iris red. Frontal shield and base of bill red, the terminal third greenish yellow. 'Tibia and front of tarsus greenish yellow, hinder part of tarsus and all toes slaty green; an orange ring round the tibia just below the feathered portion' (Oates).

347a. Malay Moorhen. *Gallinula chloropus orientalis* Horsfield

Gallinula orientalis Horsfield, 1821, Trans. Linn. Soc. London, 13: 195 (Java)

LOCAL NAMES. None recorded.

SIZE AND FIELD CHARACTERS. As of 347. See Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. A single example collected in March 1964 near Port Blair marks an addition to the avifauna of the Andaman Is. as well as of India. Status not known (Abdulali, JBNHS 61(3): 514-15).

Extralimital. Southern Malay Peninsula, Sumatra, Java, Borneo, Kangean, Bali, Lombok, Sumbawa and Celebes (Sulawesi) — Peters.

GENERAL HABITS, FOOD, VOICE AND CALLS. Unrecorded.

BREEDING. Unrecorded.

MUSEUM DIAGNOSIS. Differs from 347 in having the frontal shield wider, extending back on forehead to above the eyes. Plumage somewhat darker, practically the entire upperparts being without any olive-brown tinge.

MEASUREMENTS. Sex? Wing 170; bill (from gape) 30 mm. (Abdulali).

COLOURS OF BARE PARTS. As in 347.

Genus PORPHYRIO Brisson

Porphyrio Brisson, 1760, Orn. 1: 48; 5: 522. Type, by tautonymy,

Porphyrio Brisson = *Fulica porphyrio* Linnaeus

Large moorhens distinguished by blue coloration and by the broad frontal shield covering the whole anterior crown, and truncated posteriorly. Bill deep, short, and compressed. Nostril short, rounded, not placed in a groove. Wing rounded: 1st

From above, $\times c. 1$

primary (as.) equal to 6th or 7th; 2nd, 3rd and 4th longest and subequal. Tarsus and toes very long and powerful. Sexes alike.

Genus represented in Africa, Madagascar, the Mediterranean region, S. Asia, Malay Archipelago to Australia, New Zealand and the Pacific islands. A single species within our limits.

PORPHYRIO PORPHYRIO (Linnaeus)

Key to the Subspecies

Generally larger, particularly tarsus and toes. Tarsus 92 to 97 mm.; middle toe without claw 100 to 104 mm. *P. p. seistanicus*

RAILS, COOTS

179

Young (immature) paler, with frontal shield and bill blackish; legs and feet pale orange-brown.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident and possibly local migrant. West Pakistan from southern Baluchistan (Hingol river area, Las Bela, Sibi) eastward through Assam, Manipur and E. Pakistan, and south throughout the Peninsula: terai and plains. One occurrence in Chitral. Very rare in Kashmir, but a few usually on Anchar and Wular lakes in summer, and doubtless breeding. Andaman and Nicobar Is. Common in Ceylon (low-country Wet and Dry zones). Affects dense reed-beds around large swamps and jheels.

GENERAL HABITS. Usually keeps in parties of 5 to 10; at large swamps sometimes in bigger congregations of up to 50 or more. Stalks through the marshy reed-beds or wades over matted floating vegetation, constantly flicking its stub tail in the typical rail manner, flashing the white patch underneath. Fond of clambering among the reeds working up to the tops in ungainly hand-over-hand style, clinging and balancing itself insecurely on the pliant bending stems. Dozens may frequently be seen thus sunning themselves at the top of a reed-bed on a misty morning. Swims well but is averse to do so unless compelled, preferring to cross even narrow stretches of water by flapping low over the surface with dangling legs; or it will climb up to the tops of the bulrushes and flop across to the other side. Noisy and quarrelsome, especially in the breeding season when the birds are constantly cackling and chasing one another. Not particularly shy except where much harried; then becoming excessively secretive and cunning. Is highly relished as a delicacy by certain classes and often suffers considerable local persecution at their hands. Flight seemingly feeble, attained by laboured wing-beats, but is quite fast once the bird is properly launched: the neck is extended in front, the large ungainly legs and feet trail behind.

FOOD. Mainly seeds, grain and vegetable matter; also insects and molluscs. Recorded fighting in larger numbers to rice-fields in the evenings. Does considerable occasional damage to rice crop not only by cutting the stalks above the roots* to eat the tender pith (J. R. Cripps) and the ripening grain, but also by trampling down the plants with its large and heavy feet.

VOICE AND CALLS. Has a wide repertoire of noisy hooting, cackling, clucking and hoarse rippling notes. While feeding, a party maintains contact by soft *chuck-chuck* notes. The birds scatter on disturbance and fly off in different directions but soon re-unite with the help of louder rallying *chucks* uttered by the members. One caught by a Tawny Eagle (*Aquila rapax*) 'cried very like domestic fowl caught to be killed' (E. A. Butler).

BREEDING. Season, chiefly during the SW. monsoon, June to September. Also recorded in other months locally, e.g. Andhra, November and February; Mysore, November-December-January; Ceylon, January-May and occasionally July-August. *Nest*, a large pad of firmly interwoven rush-, paddy-, or grass stems, placed on a floating islet of matted weeds or up to a metre or so above water level among partially submerged bulrushes and reeds. Eggs, 3 to 7, long ovals pale yellowish stone to reddish buff in colour, spotted and blotched with reddish brown. Average size of 100 eggs 50.5 \times 35.7 mm. (Baker). Apparently both sexes share in building the nest; period

178

GRUIFORMES

Smaller; tarsus 88 to 90 mm.; middle toe without claw 90 to 95 mm. *P. p. poliocephalus*

348. Baluchi Purple Moorhen. *Porphyrio porphyrio seistanicus* Zarudny & Härmis

Porphyrio poliocephalus seistanicus Zarudny & Härmis, 1911, Jour. f. Orn. 59: 240 (Seistan)

Baker, FBI No. 2028 (part), Vol. 6: 32

LOCAL NAME. *Būṭmī* (Persian).

SIZE. Village hen \pm ; length c. 43 cm. (17 in.).

FIELD CHARACTERS. As for 349, q.v. See Key to the Subspecies.

STATUS, DISTRIBUTION AND HABITAT. Resident and partly migratory. West Pakistan, in northern Baluchistan. Birds from c. south of Chagai are closer to the Indian *poliocephalus*. Affects large low-lying reedy swamps.

Extralimital. Shores of the Caspian Sea, Lake of Antioch in Syria, Iraq, E. Iran, W. Turkestan, and Afghanistan. (For details of range see Vaurie, 1965, 2: 358.)

GENERAL HABITS, FOOD, VOICE AND CALLS. As in 349.

BREEDING. Nothing specifically recorded as different from 349, q.v.

MUSEUM DIAGNOSIS. Differs from Indian Purple Moorhen (349) in being larger, with stouter bill, larger casque, and larger legs and feet (see Key). No difference in coloration.

MEASUREMENTS. Wing σ^7 260-270; ϕ σ 241, 256 mm. (Hartert). Dr C. B. Ticehurst measured birds from Baluchistan: 1 σ^7 Wing 269; 2 ϕ σ 258, 268 mm. Other measurements of 3 ϕ σ in Bombay Nat. Hist. Soc. collection:

Bill (from posterior end of casque to tip)	Tarsus	Middle toe (without claw)
63, 67, 72	85, 97, 102	95, 108, 111 mm.

COLOURS OF BARE PARTS. As in Indian birds.

349. Indian Purple Moorhen. *Porphyrio porphyrio poliocephalus* (Latham)

Gallinula poliocephala Latham, 1801, Index Orn., Suppl.: 68 (India)

Baker, FBI No. 2028, Vol. 6: 32

Plate 36, fig. 19

LOCAL NAMES. *Kaim*, *Kalim*, *Kharim*, *Khima* (Hindi); *Kaim*, *Kām pākhi* (Bengal); *Wān tech* (Kashmir); *Kaim* (Cachar); *Karim*, *Korma* (N. Bihar); *Kham charāi* or *sorāi* (Assam); *Lili jalal kauri* (Sylhet); *Omū* (Manipur); *Nila bolli kōdi* (Telugu); *Neela kōzhi* (Malayalam); *Kittā*, *Kittala* (Sinhala); *Neel kūkādī* (Gujarati); *Kambala pittī* (S. Konkani).

SIZE. Village hen \pm ; length c. 43 cm. (17 in.).

FIELD CHARACTERS. A handsome but rather clumsy purplish blue rail with long red legs and enormous toes. The bald red forehead running back from the short heavy red bill, and white patch under the stumpy tail — flashed conspicuously as the bird flicks it up at each step — are additional clues. Sexes alike, but bald forehead (casque) smaller in extent in female.

180

GRUIFORMES

of incubation and male's participation unknown. The male performs an elaborate though ludicrous courtship display, holding up water-weeds in his bill, facing the female and bowing and showing off before her to the accompaniment of loud chuckles. The components of this display have not been studied.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down) c. 2 days old. Uniformly black with whitish shafts (excepting at base and tip) on head, wings, and upper back. Bill pale blue (with white egg-tooth), dark cherry-red or magenta at base of both mandibles. Forehead shield indicated only by slight baldness. Forecrown (above this) dark cherry-red or magenta showing through sparse black down. Legs and feet pale pinkish red; eyelids pale magenta. Newly hatched chick active and precocious; conceals itself by sinking beneath the water surface, only keeping the culmen exposed. When separated from parent utters almost incessantly a comparatively loud *peep, peep* like young drongo (SA).

MEASUREMENTS

	Wing	Bill (culmen)	Tarsus	Tail
σ^7 ϕ	244-271	41-49	88-90	82-108 mm.

Weight 6 σ^7 ϕ 510-785 (av. 662.5) gm. — BNHS.

Female quite as big as male; and largest measurements above refer in each instance to a female. (Baker)

Bill (4 σ^7) from posterior edge of casque to tip 61, 62, 68, 70 mm. Middle toe (without claw) 98, 98, —, 100 mm. (SA).

COLOURS OF BARE PARTS. Iris σ^7 deep blood red, ϕ and imm. brown-red. Bill and casque blood red-brown, generally paler at tip more brown at centre of casque and middle of lower mandible. Legs and feet pale dingy red to dull red, browner at the joints; claws dull red, darker at tips.

Genus FULICA Linnaeus

Fulica Linnaeus, 1758, Syst. Nat., ed. 10, 1: 152. Type, by subsequent designation, *Fulica atra* Linnaeus (Gray, 1840)

Distinguished from all other Indian rails (Rallidae) by the possession of a broad lobed membrane fringing the toes, one to each phalange. Tarsus shorter than middle toe without claw, with a ridge-like membranous fringe behind. Bill of moderate length, rather deep and compressed, the culmen produced posteriorly over forehead in a knob-like flat or horny shield. Sexes alike.

Genus represented in the Old and New Worlds. Only a single species within our limits, resident and partly migratory.

350. Coot. *Fulica atra atra* Linnaeus

Fulica atra Linnaeus, 1758, Syst. Nat., ed. 10, 1: 152 (Europe, restricted type locality Sweden, ex ref. to Fn. Svec.)

Baker, FBI No. 2029, Vol. 6: 34

Plate 36, fig. 15

LOCAL NAMES. *Dasari*, *Dasari*, *Aari*, *Khaskul*, *Thekari* (Hindi); *Kārendab*, *Jāl kēkū* (Bengal); *Kāsar*, *Serār* (Bihar); *Barra goār* (Purnea); *Bolli kōdi* (Telugu); *Kēer*, *Poonar* (Marathi); *Aed*, *Dasadi* (Gujarati); *Kēpūt*, *Kolūr*, *Kolur* (Kashmir); *Aeri* (Sind); *Kekdi* (Kutch); *Perron*, *Ngēru perron* (Manipur).

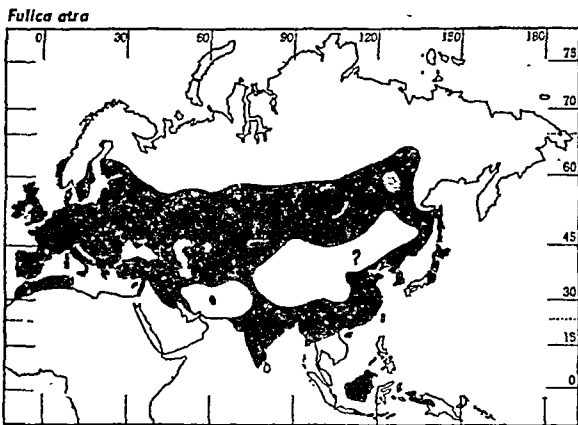

SIZE. Three-quarter grown duck \pm ; length c. 42 cm. (16 in.).

FIELD CHARACTERS. A slaty black, dumpy and practically tailless water bird — rather duck-like when swimming — with stout pointed ivory-white bill and flat, rounded, horny shield covering forehead. Sexes alike.

Young (immature). *Above*, greyish brown. *Below*, paler brown mottled with white.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident as well as common and abundant winter visitor. All India including Assam, both Pakistans, Nepal, Ceylon (uncommon and only recently established). Breeding up to c. 2500 metres locally in the Himalayas — in Kashmir and elsewhere; also in small numbers, widely but somewhat erratically almost throughout the plains. Affects rush-bordered weedy jheels and tanks with expanses of open water. Very abundant in winter, in congregations of tens of thousands on the larger jheels, especially in West Pakistan and northern India.

■ Distributional range

Extralimital. Breeds over the greater part of Europe and Asia south to N. Africa, Asia Minor, and southern China; Azores; Iceland. Migratory in the northern part of its breeding range and occurring in winter south to the Sudan, Arabia, India, Java, and Celebes (Sulawesi) — Peters; Borneo (Smythies).

MIGRATION. A bird ringed in Indore (c. 23°N., 76°E.) on 12.ii.1929 recovered near Veliko Alekseyevskiy (c. 41°N., 69°E.) in Uzbekistan, U.S.S.R., in March 1929; another ringed at Lake Alakol (c. 47°N., 75°E.) in Kazakhstan, U.S.S.R., in July 1938 recovered near Srinagar, Kashmir (c. 34°N., 75°E.) on 19.ii.1939. The straight-line map distance between the points is c. 2240 and 1600 km. respectively.* A common spring and autumn migrant through Gilgit (Scully). Observed on northward passage through Chaman

See Appendix

BREEDING. Non-colonial. *Season*, in Kashmir (where nesting commoner and more regular than elsewhere in our limits) end May to August, chiefly June-July; in N. India till about September; in the Peninsula (more sporadic) chiefly July-August; in S. India November-December. Not yet recorded in Ceylon. *Nest*, a large compact mass of rushes and flags placed amongst reeds, slightly above water-level. *Eggs*, 5 to 12, normally 6 to 10, fine textured, yellowish- or brownish grey in colour, stippled and spotted with reddish brown and purplish black. Average size of 100 Indian eggs 53.1 x 35.6 mm. (Baker). Birds very quarrelsome and pugnacious when nesting, darting at intruders along the water, neck thrust menacingly forward and closed wings raised over the back as in an angry swan. Both sexes share nest-building, incubation and tending the young; incubation period about 21 days. The claret-headed downy chicks sometimes thrust their bills into parents' gullet to receive food.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for the various plumage phases and structure (also bionomics) Witherby, 1941, 5: 204-8. Pure and partial albinos have been taken in India.

Chick (in down). Top of head bare with the exception of some black hairs; a number of minute red papillae at base of forehead and in front of the eyes to the bill; throat and round the neck orange, rest of plumage blackish blue, mixed on the back with orange hairs and on underparts with grey. Iris dull black; bill red at base, pink in the middle and tipped purplish black (Gordon Dalglish).

MEASUREMENTS

	Wing	Bill (culmen)	Tarsus	Tail
♂ ♀	185-220	33-38	56-64	54-63 mm. (Baker)

Weight 20 ♂ ♀ (autumn/winter) 390-800 (av. 540.5) gm. — BNHS. Witherby gives for British birds 'Wing 200-225; bill from shield 33-38 mm.' Sexes more or less equal in size.

Weight 1 lb. to 1 lb. 15 oz. (c. 450-875 gm.) — Scully.

COLORS OF BARE PARTS. Iris red, red-brown, or blood-red. Bill and shield ivory white, the former tinged with pinkish at base. Legs and feet dull greenish; tibia orange.

Family HELIORNITHIDAE: Finfoots

(For morphological details see Stresemann, 1927-34, Aves: 765-6; Baker, 1929 FBI, 6: 36)

Genus HELIOPAIS Sharpe

Heliopais Sharpe, 1893, Bull. Brit. Orn. Cl. 1: 37. Type, by original designation, *Podica personata* G. R. Gray

Bill rather stout, with culmen considerably curved; longer (from gape) than tarsus. No frontal shield as in Coot, but in breeding season a small fleshy horn from base of culmen. Nostril long and narrow, pervious, placed nearly in centre of upper mandible. Tarsus very strong; shorter than middle toe without claw. Toes fringed laterally with a lobed web. Wing rounded: 1st primary (as.) equal to 5th or 6th; 2nd primary (or 2nd and 3rd) longest. Rectrices 18, broad and stiff, slightly graduated, equal in length to about half the wing. Sexes differing slightly. Contains a single Indomalayan species.

(Baluchistan) and Kandahar (S. Afghanistan) in February and March (Ticehurst), and through Chitral in late April and early May (Perreau).

GENERAL HABITS. Gregarious, usually keeping in parties and flocks. In winter, numbers vastly augmented by northern immigrants; then locally in enormous swarms, often blackening large expanses of water. The birds paddle about in great discrete herds or rafts, diving expertly to get at the submerged water-weeds. When disturbed the nearest will merely skitter away towards the centre, half running half flying, and soon flop down to resume the paddling, with the characteristic gentle bobs of the head and neck at each stroke. The pattering din set up by such a close-packed herd at the firing of the first shot on a jheel, or at the stoop of a marauding eagle, is like the roar of the sea, and quite bewildering. Requires a good deal of pattering along the surface to get airborne, but when well under way is capable of strong and sustained flight over long distances and high mountains as shown by its bi-annual migrations. The flight consists of hurried, almost vibrating, flaps of the short blunt wings, neck stretched in front and legs trailing behind the tubby body. Owing to rather feeble flight and rank flavour seldom shot by sophisticated sportsmen. Long after the firing commences in a duck shoot and the more esteemed species such as pintail and gadwall have moved off to other jheels or rocketed high out of gunshot, coots will continue to fly around fussily close above the guns as if fully confident of the immunity they enjoy. Often the birds will merely skitter away into open water to join the other floating herds. They are, however, more highly esteemed as a delicacy than any duck species by the fisherfolk and other lake dwellers. The mounds of coot feathers bestrewn the precincts of fishing villages by the larger jheels in N. India and W. Pakistan (e.g. the Manchar Lake in Sind before the Sukkur Barrage project) testify to their popularity as an article of food, and the vast abundance in which they are killed.* Around many such jheels coots form the staple diet of the local inhabitants for several months in the year besides providing remunerative sustenance to professional netters. Large numbers are rounded up by gangs of villagers and killed with sticks when flightless through moult (end June, Baluchistan — Ticehurst; early and mid October, Rajasthan — Salim Ali). A harried bird will often dive and keep under for inordinately long periods hidden among the weeds, holding on to a stalk with its bill, only the culmen breaking the surface. During the winter months moreover, the birds are subjected to heavy predation by raptors of several species particularly the Ringtailed and Spotted Eagles (*Haliaeetus leucorhynchus* and *Aquila clanga*). Despite these incessant ravages by man and beast the coot as a species continues to hold its own — an indication of its hardiness and resiliency.

FOOD. Chiefly vegetable matter — shoots and seeds of aquatic plants and wild and cultivated rice. Also worms, insects and molluscs, and occasionally small fish. For some details see Mukherjee, A. K., 1974, JBNHS 71(2): 197-200.

VOICE AND CALLS. Often heard at night — a clear and loud trumpet-like cry. Also a variety of soft chuckling and other abrupt, not unpleasant, sounds.

* For some local methods of capture see Salim Ali, 1927, 'A Sind Lake', JBNHS 32: 460-71.

351. Masked Finfoot. *Heliopais personata* (G. R. Gray)

Podica personata G. R. Gray, 1849 (1848), Proc. Zool. Soc. London: 90 (Malacca) Baker, FBI No. 2030, Vol. 6: 36 Plate 1, fig. 7

LOCAL NAMES. None recorded.

SIZE. Domestic duck \pm ; length c. 56 cm. (22 in.).

FIELD CHARACTERS. A cormorant-shaped olive-brown and white water bird, with a velvety black facial mask and throat, bordered by a narrow white line. Conspicuous stout orange or yellow bill. On water could be mistaken for a large grebe at first sight.

Female has chin and centre of throat and foreneck white; black forehead narrower.

x c. 1

Young (immature). Like female but without any black on forehead. Black surrounding throat mottled with white.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Rare. East Pakistan, eastern Assam, and probably NE. Manipur. Ideal biotope: inundated depressions in forest with trees, cane brakes

and dense tangled masses of creepers. **Extralimital** Burma, Thailand, Malay Peninsula, Sumatra.

GENERAL HABITS. Shy and secretive. Keeps singly or in pairs or trios to dense forest pools and streams. Normally rides high on the water with much of the body above water line. When alarmed sinks low like a darter, finally only with the head and neck showing. Swims with coot-like rhythmic movements of head and neck at each paddle. Dives well on occasion, but whether does so in feeding not known. On land carries body rather upright — at 45 degrees to ground. Runs like rail at great pace, climbing up on shore and retreating into nearest jungle on alarm. Rises off water after pattering along surface for several metres like coot, legs dangling till properly airborne. Flight fairly strong but usually low. Commonly perches on boughs and tree-trunks overhanging water. Other habits not known; probably also similar to those of the African Finfoot, *Podica senegalensis* (Vicillot). (See C. R. S. Pittman, Bull. Brit. Orn. Cl. 82: 156-60.)

Both its flesh and eggs highly relished by locals. Flesh described as 'delicious' by W. Davison.

FOOD. Molluscs, crustaceans, insects, small fish (perhaps also frogs), and vegetable matter.

VOICE AND CALLS. A loud grunting quack while settling on water. A rather high-pitched bubbling sound like blowing air through a tube into water, whence its Burmese name *Te balon* = 'water bubbler' (Hopwood).

BREEDING. Only once recorded within our limits — Assam, July 1904. *Season* (in Burma) July-August. *Nest*, a more or less circular pad of twigs,

BUSTARDS

185

c. 40 cm. in diameter, with a central depression; placed from a metre to 3 metres in a horizontal branch of a partially submerged tree in dense jungle swamp. Eggs, normally 5 or 6, rather spheroidal, fine textured, highly glossed, reminiscent of some of the bustards. Ground colour cream faintly tinged pinkish or greenish, with small primary blotches of reddish brown or blackish brown all over (sometimes more numerous at the broader end), and secondary markings of lavender grey. Average size of 44 eggs 52.0 × 43.7 mm. (Baker). Both sexes incubate; incubation period, share of the sexes in nest-building, and other details unknown.*

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'Whole chick well covered with down. Upper parts dark grey-brown; dusky white over eye and on cheeks; chin and upper throat whitish, lower throat mixed with grey-brown; breast and belly white; flanks grey-brown.'

*Note: The large strong bill, well-marked digital claw as in other rails, long soft downy tail (unlike the Rallidae), and the "finned" feet. The red papillomatous specialized down on the head of *Fulica atra* is not represented in *Haliastur* (Ticehurst, Bull. BOC. 49: 65-6).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	248-253	52-56	46-51	98-124 mm.
♀♀	232-241	41-50		(Baker)

COLOURS OF BARE PARTS. Iris dark brown; eyelids pea-green. Bill bright chrome yellow, brownish in the centre. Legs and feet pea-green; edges of lobed webs yellow. Erectile horn or wattle at base of culmen (in breeding male) c. 15 mm. long, bright yellow.

Family OTIDIDAE: Bustards

(For morphological details see Baker, 1929, FBI 6: 59; Witherby, 1940, Handbook 4: 436; Stresemann, E., 1927-34, Aves: 774.)

Genus OTIS Linnaeus

Otis Linnaeus, 1758, Syst. Nat., ed. 10, 1: 154. Type, by subsequent designation, *Otis tarda* Linnaeus

Tetrax T. Forster, 1817, Syn. Cat. Brit. Bds.: 20. Type, by tautonymy, *Otis tetrax* Linnaeus

Wings ample, rounded; 3rd primary (as.) usually longest. Tarsi equal to about quarter length of wing; together with bare portion of the tibia covered with small scales. Hind toe absent; three front toes short, stout, scutellated above. Bill shorter than head, broader than high at base. No crest or ruff, though in some species the male has long bristly feathers with few and short webs on each side of throat.

* See Appendix

BUSTARDS

187

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	595-635	41-47	142-150	210-235 mm.
♀♀	455-495	35-40	113-126	176-210 mm.

Weights recorded for European birds ad. ♂♂ 24-37 lb. (c. 11-17 kg.); ad. ♀♀ average c. 15 lb. (c. 7 kg.).

COLOURS OF BARE PARTS. Iris dark brown. Bill plumbeous with black tip. Legs and feet earthy brown or greenish brown; claws black.

MISCELLANEOUS. Apparently like the Snowcock (*Tetrao gallus*) emits a disgusting stench soon after being killed.

333. Eastern Little Bustard. *Otis tetrax orientalis* Hartert

Otis tetrax orientalis Hartert, 1916, Nov. Zool. 23: 339, pl. 2

(Sarepta, southern Russia)

Baker, FBI No. 2042, Vol. 6: 62

Plate 37, fig. 1

LOCAL NAMES. *Chhota tiloor*, *Obāra* (Punjab); *Chānāz* (Baluch).

SIZE. Country hen; length c. 46 cm. (18 in.).

FIELD CHARACTERS. Superficially reminiscent of the floricans, 356 and 357.

Male (breeding). Above, crown and upperparts finely vermiculated sandy buff. Face blue-grey. Neck (all round) black, distinctly patterned like a white loosely hanging necklace with a prominent black-and-white pectoral collar below it. Rest of underparts white.

Female (winter). Above more or less like female with finer vermiculations. Below, black crescentic markings on breast ill-defined.

Female. Above sandy buff with the head and neck streaked with black and buff. Below, chin and throat whitish; breast pale buff irregularly barred with black crescentic markings; rest of underparts white.

STATUS, DISTRIBUTION AND HABITAT. Rather rare but fairly regular winter visitor to northern West Pakistan; frequently taken in Peshawar and adjoining districts. One record from Gilgit and several sporadic ones from Kashmir, the latest in January 1964 (Haigam, Col. H. Nedou). Stragglers have been obtained in Ludhiana and Gurdaspur districts, Punjab, and Saharanpur district, U.P. Status in Baluchistan needs investigating. According to C. B. Ticehurst (JBNS 34: 481) confusion with some other bustard is implicit in Baker's records of its abundance there. So far only one definite record (specimen) of a straggler from Baluchistan—from Ormara in Makran. Affects open coarse grassland and mustard crops.

Extralimital. Breeds in E. Europe and W. Asia from Poland to NE. Kazakhstan, south to Greece, the Black Sea, Transcausia, and Afghanistan. Migratory in the northern part of its breeding range to winter quarters in Syria, Iraq, and NW. India.

GENERAL HABITS. Usually keeps in small parties of 3 or 4, sometimes up to a dozen birds. Lies close in cover, but when flushed is easy to shoot. More highly esteemed as quarry for trained Saker or Charagh falcon and often hunted thus. Called 'Butterfly Houbara' from its peculiar vagaries

352. Great Bustard. *Otis tarda dybowskii* Taczanowski

Otis Dybowskii Taczanowski, 1874, Jour. f. Orn. 22: 331 (Dauria)

Baker, FBI No. 2041, Vol. 6: 60

Plate 37, fig. 2

LOCAL NAME. *Doodagh* (Chitral).

SIZE. Vulture +; length c. 102 cm. (c. 40 in.).

FIELD CHARACTERS. A huge ground bird reminiscent of a small ostrich; readily distinguished from Great Indian Bustard (354) even at long range by whitish instead of black crown of head.

Male. Above, head and neck pale grey with conspicuous whitish bristly 'moustaches'. Rest of upperparts rufous-buff finely barred with black. Below, white with a broad rich chestnut band across breast, sometimes visible only as chestnut patches on sides of upper breast.

Female smaller than male and without chestnut breast-band or moustaches.

In flight—long neck extended forward, legs tucked under tail—the broad rounded wings look very white with contrasting black tips.

STATUS, DISTRIBUTION AND HABITAT. Rare vagrant in winter. Has been recorded less than a dozen times in the last 70 years at long intervals, in West Pakistan—Chitral, Peshawar district (Mardan, Risalpur), N. Baluchistan, N. Sind (Jacobabad); all in years of particularly severe winters further north in central Asia. Of the 6 specimens procured within our limits 4 were in Peshawar district. Keeping around and feeding in gram and mustard cultivation.

Extralimital. 'Breeds from the southeastern Altai, Transbaikalia and the Amur region south to N. Mongolia, Manchuria, and Ussuriland. Winters in China, Korea, and Japan; casual in N. India' (Peters).

GENERAL HABITS. Closely resembling those of Great Indian Bustard (354), q.v. Keeps in droves of 5 to 15 birds. Usually very wild and shy, flying off at long range. Said to feed and fly in flocks like geese, whereas *Choriotis* feeds widely scattered and flies individually.

FOOD. Mainly vegetable matter—leaves and grain of crops, in NW. Pakistan chiefly gram and mustard. A specimen weighing 17 lb. (c. 8 kg.) had in its gizzard solid vegetable matter weighing 2 lb. (c. 900 gm.). Insects and other small animals also eaten.

VOICE. Very silent in winter; no call recorded in India. During the bizarre nuptial display male utters a deep moan with ludicrously puffed-out throat.

BREEDING. Extralimital. Eggs—2 or 3—laid on a trampled-down spot amongst crops.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for further details of plumage phases and structure (also bionomics) of the nominate (European) race, Witherby, 1940, 4: 437-41. Our race *dybowskii* differs from it in the adult male having a much paler grey head and neck and more grey (v. white) on the wings (coverts).

GRUIFORMES

188

in flight which is otherwise strong and direct attained by very rapid wing-beats and reminiscent of both partridge and florican. The bird often rises to a height and turns and twists erratically before resuming a straight course. The noise produced by its quick movement through the air is likened by one observer (Willoughby Verner, Spain) to 'a sibilant see-see-see suggestive of steam from a railway engine as it gets under way'.

FOOD. Chiefly vegetarian: shoots, leaves and grain. Also insects and small animals.

VOICE AND CALLS. Very silent. None recorded in India.

BREEDING. Extralimital. Season, May to July. Nest a scanty pad of grass amidst crops. Eggs 3 or 4.

Fourth primary (as.) of adult ♂ showing emarginations

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumage phases and structure (also bionomics) Witherby, 1940, 4: 441-4; Hartert, 1916, *Neotoma Zoologica* 23: 337-9.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	247 (two)	22-25	64-70	91-108 mm.
	241-257 (14 measured)			
♀♀	242-260	—	—	—

(Witherby)

Weight of Indian-collected specimens 1½ to 2 lb. (c. 600-900 gm.).

COLOURS OF BARE PARTS. Iris light yellow to orange, browner in young. Bill blackish, tinged with grey or greenish horny; greenish or yellowish at base. Legs and feet yellow or greenish yellow to yellowish brown.

Genus CHORIOTIS G. R. Gray

Choriotis 'Pr. B.' = G. R. Gray, 1855, Cat. Gen. Subgen. Bds.: 109. Type, by original designation, *Otis erab* Linnaeus

Distinguished from all other Indian genera of Otidae by its great size, black-crested head, and lengthened feathering of the throat and foreneck. Bill and legs comparatively longer than in *Otis*. Wings broad, very long and pointed.

Male much larger than female. Only a single species confined to peninsular India with its nearest congener in Australia.

354. Great Indian Bustard. *Choriotis nigripes* (Vigors)

Otis nigripes Vigors, 1831 (2 March), 1830-31, Proc. Zool. Soc. London: 35

(Himalayas = Foothills of NW. India side Ticehurst, 1950, J. Bom. nat. Hist. Soc. 34: 482-3)

Baker, FBI No. 2043, Vol. 6: 64

Plate 37, fig. 5

LOCAL NAMES. *Sokān*, *Gagmān*, *Hān* (Hindi); *Tepār*, *Gargān* (Punjab); *Godān* pronounced *Godān* (Jaikhar, Rajasthan); *Gānān*, *Gargān* (Sind);

Gūdīd (Kutch); *Chōrār* (Gujarati); *Hām* (Marathi); *Serailu*, *Bherār* (Madhya Pradesh); *Mardhōnk*, *Maldhōnk*, *Karadhōnk*, *Karlōnk* (Deccan); *Heri hākki*, *Arkujina hākki*, *Tere-laddu* (Kannada); *Bat-mela* or *Bat myka* (Telugu); *Kānal myle* (Tamil = 'mirage peacock'), and variants.

SIZE. Vulture +; standing over a metre to top of head. Length ♂ c. 122 cm. (48 in.); ♀ c. 92 cm. (37 in.).

FIELD CHARACTERS. A huge ground bird reminiscent of a small ostrich. Horizontal carriage of body and stout bare legs characteristic.

Male. *Above*, deep sandy buff finely vermiculated with black. Crown of head black and crested. *Below* white, with a black band or gorget across lower breast.

In flight the large size, white neck stretched in front with contrasting black cap on head, white underparts with dark breast-band, and large whitish patches near tips of the broad wings make its identity unmistakable.

Female similar but much smaller, with the white of head and neck less pure, more vermiculated with black. Pectoral band absent or merely indicated on the sides; occasionally fairly complete.

Young (immature) male differs from female in having buff spots on the crown, hindneck, and upper back.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident and seasonally nomadic, dispersing widely in monsoon with creation of grasslands. Once (c. century ago) ranged from the present Pakistan (Sind, Punjab) east to W. Bengal and Orissa, and southward through the Peninsula to southern Madras (Tiruchirappalli). Distribution now much constricted and numbers dwindling due to human population-pressure — encroachment on its habitats by cultivation, plus direct persecution. Presently rare or absent over much of its former range, but still not uncommon in remote areas of Rajasthan, e.g. Jaisalmer. Casually or regularly seen, and also breeding in small numbers, in parts of Gujarat (Saurashtra, Kutch), and Deccan (Ahmednagar district), sporadically south to Mysore. Affects wide open spaces of scanty grassland interspersed with scrub and cultivation in more or less semi-desert country.

GENERAL HABITS. Normally met with in scattered pairs, or parties of 5 or 6, but droves of up to 25 or 30 not unknown; largest recorded 34. Excessively shy and wary; can seldom be approached within gunshot except by subterfuge — in a bullock-cart or on or behind a camel to which the birds have become inured. However, surprisingly, and foolishly, unperturbed by noise and rattle of jeeps which now largely responsible for its rapid decimation by poachers. Runs at great speed and prefers to squat and freeze behind a bush rather than fly away. Takes a few steps before rising in air; with favourable wind almost straight off the ground. Flight rather vulture-like, with deliberate rhythmical strokes of the huge wings, never very high above ground, but often sustained for many miles before realighting.

FOOD. Omnivorous. Grain (whole ears of barley recorded) and tender shoots of various crop plants of which mustard is a favourite. Drupes and berries, e.g. *Zizyphus* and *Carissa*. Also locusts, grasshoppers, beetles (Cantharidae, Scarabidae and Buprestidae); at certain seasons largely the green

of the breast of others is excellent; the flesh of every part of the *Kharchal* is delicious' (Sálim Ali, 1927, JBNHS 32: 60). This is precisely the reason for the present-day deteriorating status of the bird, and unless effective practical measures are taken for its preservation, the species is in real danger of early extinction; this despite the total official ban on its killing and the taking of its eggs. In the defunct *Oriental Sporting Magazine* a writer proudly signing himself 'Lover of all Sports' claimed that in the 20 years between 1809 and 1829 he shot no less than 961 Great Indian Bustards in the neighbourhood of Ahmadnagar in the Deccan — an indication of their abundance in those days.

A pure albino among a flock of 9, glistening white 'like an egret', recorded from Kutch (M. K. S. Vijayarajji, 1926, JBNHS 31: 526).

Genus CHLAMYDOTIS Lesson

Chlamydotis Lesson, 1839, Rev. Zool.: 47. Type, by monotypy, *Otis houbara* Desfontaines = *Prophias undulata* Jacquin

Separable from all other genera of Otididae by the presence of a curious crest of isolated feathers thinly webbed at the base. A ruff on either side of neck; feathers of lower-neck lengthened, overhanging breast. Sexes alike; female somewhat smaller.

Contains a single species with two races, the nominate N. African, and the other central Asian wintering in NW. India.

355. Houbara Bustard. *Chlamydotis undulata macqueneii* (J. E. Gray)

Otis Macqueneii J. E. Gray, 1832, in Hardwicke's Ill. Indian Zool. 2(12): pl. 47 (Himalayas = foothills of NW. India vide Ticehurst, 1930, J. Bom. nat. Hist. Soc. 34: 482)

Baker, FBI No. 2044, Vol. 6: 67

Plate 37, fig. 4

LOCAL NAMES. *Tiloor*, *Hobāra*, *Obāra* (Punjab); *Taloor* (Sind); *Tilōr* (Rajasthan); *Sīārā tiloor* (Kutch); *Chārz*, *Chārūs* (Baluchi); *Sārā*, *Sārē* (Pushtu).

SIZE. Domestic hen +; standing c. 60 cm. (2 ft) to top of head. Length ♂ c. 73 cm. (29 in.); ♀ 66 cm. (26 in.).

FIELD CHARACTERS. Superficially a smaller edition of the Great Indian Bustard, also with longish bare legs and horizontal carriage of body.

Male. *Above*, sandy buff, pencilled, vermiculated and splodged with blackish. A short black-and-white crest, a ruff of black-and-white feathers on each side of neck, and a tuft of greyish plumes from lower throat overhanging the breast. *Below*, white, barred with blackish on flanks.

Female. Somewhat smaller with ruff and neck-plumes less developed.

Young (immature). Differs from female in having numerous sandy-coloured arrowhead markings on upper plumage, smaller crest and ruff.

In flight, with neck outstretched, the white underparts and the round white patches near the blackish wing-tips are prominent.

STATUS, DISTRIBUTION AND HABITAT. Breeds in small numbers in Baluchistan (Makran). Common winter visitor to the rest of West Pakistan (Sind, Punjab) straggling east to Delhi. Southward through Rajasthan and N. Gujarat (Banaskanta, Kutch, NW. Saurashtra). Abundance varying locally

blister beetle (*Cantharis tenuicollis*), which often taints its flesh. Lizards, centipedes and snakes (one 2 ft long, and a poisonous phoorsa — *Echis carinata*) likewise recorded. Pebbles usually found in stomachs (stones of 1 inch and 1½ in. recorded), and once a complete egg of quail (*Coturnix*).

VOICE AND CALLS. Usual alarm call, a bark or bellow something like *hook*, whence one of its local names *Hookna* (Gwalior). In nuptial display a deep booming moan audible up to 500 metres away.

BREEDING. Season, principally between March and September; locally also in other months. *Nest*, a shallow depression in the ground at the base of a bush in grass-and-scrub country, sometimes sparsely lined with grass. *Eggs*, normally a singleton, very rarely two, drab or pale olive-brown in ground colour, faintly blotched with deep brown. Average size of 88 eggs 79.4 × 59.6 mm. (Baker). Polygynous, each cock having 3 to 5 hens. Nuptial display of cock, given from some slight eminence or mound, consists of strutting and posturing and inflating the special gular sac (with opening under the tongue) to grotesque proportions so that it stretches all down the throat protruding below like a wobbling bag between the legs. The tail is erected well over the back and moved quickly up and down. Sometimes performed when there is no hen in the vicinity; when there is one she usually seems quite uninterested. The sequences leading to copulation have not been observed. Incubation by hen alone; period unrecorded.

(For details of the fantastic and extravagant nuptial display see Hume & Marshall, 1879, *Game Birds of India, Burma, and Ceylon* 1: 9-10; Dharmakumarsinhji, R. S., 1962, 'Display, Posturing and Behaviour of the Great Indian Bustard *Chlorotis nigricaps* (Vigors)', *Proc. 2nd All-India Congr. Zool.* (1962), pt. 2: 277-83.)

Eggs suffer great destruction from marauding House Crows. On approach of an enemy the hen indulges in a distraction display, flying about zigzag with legs dangling (Dharmakumarsinhji).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). *Above* buff, with black marks on head and back. *Below*, buffy white.

	MEASUREMENTS			
	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	614-762	c. 85-95	c. 190-208	— mm.
♀♀	460-540	—	—	—
1 ad. ♀ (Kutch)	564	88 (from skull)	162	250 mm. (SA)

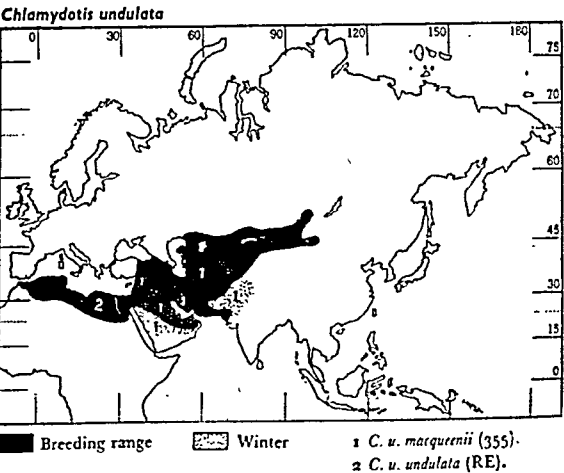

Weight ♂♂ 18-32 lb. (c. 8-14.5 kg.); ♀♀ 8-15 lb. (c. 3.50-6.75 kg.). — Various authors.

Crest feathers c. 5 cm. long; less developed in ♀.

COLOURS OF BARE PARTS. Iris pale to bright yellow. Eyelids (unfeathered) cream colour. Bill greyish white to greyish brown, blackish at tip and base of upper mandible, yellowish on lower. Legs and feet yellowish cream, greyish white, or pale plumbeous.

MISCELLANEOUS. In his *Memoirs* the Mogul emperor Babur comments on the savouriness of its flesh thus: 'The flesh of the leg of some fowls, and

from year to year. Affects open hummocky semi-desert country with sand-dunes and flat salt-encrusted plains or *pats*, sparsely dotted with xerophytic bushes (e.g. *Gapparis*, *Salvadora*, *Suaeda*, *Salola*) interspersed with mustard fields and other winter cultivation around the far-flung desert canal colonies. In Kutch and Saurashtra in the sandy undulating grassland along the edge of the Rann, and among the coastal sand-dunes covered with *khip* (*Leptadenia spartium*) and similar vegetation; in riverain Punjab in low sparse tamarisk scrub on the sandy flood plains flanking rivers.

Extralimital. Breeds from the Syrian desert, SE. Transcaucasia, and Transcaspia, north to about lat. 51° in Turgai and Turkestan, east to Zaissan Nor, south to the Sinai Peninsula, Arabia, E. Persia, and Baluchistan. Winters chiefly in Palestine, Arabia, NW. India, and Egypt (Peters).

MIGRATION. No ringing data. Passes through the Quetta area of Baluchistan on spring migration from end of March and in April. Then in large numbers on the plains between Pishin and Khwaja Amran (where 4 guns have shot 60 birds in a day at this season — Meinertzhagen). Passes through again in autumn (Ticehurst). Fairly plentiful on spring migration in March in the Kohat and Kurram valleys, NW. Pakistan (Whitehead). In the Sirsa area of the Punjab c. 29°N., 75°E. 'a few birds began arriving in September, but were not plentiful till December' (Heath).

GENERAL HABITS. Similar to 354, q.v. Excessively wild and unapproachable on foot, especially on a cloudy windy day. Normal method of shooting it is from camel back or from behind a good stalking camel which is walked round the bird in ever-narrowing circles. When closely approached thus, the bird squats, sometimes behind an absurdly diminutive bush, often on

BUSTARDS

193

the open sand with no protection at all. It lies doggo here with neck outstretched flat in front, the unblinking yellow eye closely following the intruder's movements. The bird's contours and coloration blend so perfectly with the substrate that special effort is needed to pick it out, even at 15 metres distance, even knowing all the time that it is there! In Kutch the nature of the coastal sand-dunes lends itself to the birds being driven over the guns by a line of beaters, and good sport can sometimes be had. The flight, seemingly heavy with slow wing-beats, is in fact considerably swifter than it appears. But the Houbara provides best sport when hunted with trained falcons, particularly the Cherrug (*F. cherrug*) and the Peregrine (*F. peregrinus*) as is still quite popular in NW. Pakistan. When chased by the falcon the bird constantly tries to spiral upwards to avert a stoop from above. If successful it is said to squirt a gummy liquid (anal) on to its pursuer, clogging its wings and sometimes causing it to fall to the ground like a stone.

FOOD. Omnivorous, but largely vegetarian: young shoots of wheat, mustard and other oilseed crops, flowers of various ground weeds, drupes and berries of bushes such as *Zizyphus jujuba* and *Grewia populifolia*. Also insects: black ants, termites, locusts and grasshoppers, and beetles (Tenebrionidae, Scarabidae, Cantharidae and others). Rarely centipedes, lizards, and small snakes as well.

VOICE AND CALLS. Very silent. None recorded.

BREEDING. Chiefly extralimital; in small numbers in Baluchistan (Makran). Nowhere else authentically reported within our boundaries. Nest, a bare depression in the sand or amongst stones in desert, under shelter of a small bush or grass tussock. Eggs, 3 or 4 brownish stone colour, tinged with olive and blotched and spotted with amber-brown and pale secondary markings. Average size of 140 eggs 62.3 x 45.1 mm. (FBI).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.: for further information (plumage phases, structure, bionomics, etc.) Witherby, 1940, 4: 446-9.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	363-411	34-38	c. 125	216-241 mm.
♀♀	342-381	30-34	—	—
♂♂	383-430	35-42	93-102	185-205 mm. (Baker)
♀♀	345-380	32-36	—	— (Witherby)

Middle toe 42-51 mm. (Baker).

Weight ♂♂ 4 lb. to 5 lb. 4 oz. (c. 1.80-2.40 kg.); ♀♀ 2 lb. 10 oz. to 3 lb. 12 oz. (c. 1.20-1.70 kg.).—Hume.

COLOURS OF BARE PARTS. Iris pale to bright golden yellow. Bill: upper mandible blackish, lower mandible and gape greenish or yellowish horn. Legs and feet greenish, plumbeous, or brownish yellow.

Genus *EUPODOTIS* Lesson

Eupodotis Lesson, 1839, Rev. Zool.: 47. Type, by subsequent designation, *Otis rheas* Rüppell not Gmelin = *Otis senegalensis* Vieillot

Very like the next genus, *Sypheotides*, differing from it only in that the adult male does not have a non-breeding or 'eclipse' plumage, retaining sexual dimorphism throughout the year. Represented in our area by a single Indochinese species.

BUSTARDS

195

FOOD. Omnivorous; largely vegetarian: shoots and flowers of mustard and other oilseeds and crops, succulent grasses, seeds, berries, wild cardamom. Among insects chiefly locusts, grasshoppers, beetles, ants. Occasionally takes lizards and small snakes. A good deal of gravel usually found in stomachs.

VOICE AND CALLS. Normally very silent. When startled a shrill metallic *chik-chik-chik*. Ordinary note same, but softer and more plaintive.

BREEDING. Season, in Assam March to June, chiefly late March and early April; elsewhere June-July-August recorded. Nest, a slight depression on the ground in the vast expanses of grassland along the Himalayan foothills. Nests very difficult to find as incubating female runs off through the rootstocks, flying only when a long way away. Eggs, almost invariably 2, smooth, glossy, regular ovals, olive-green with small and large blotches of purple and purple-brown and a few secondary markings of pale purplish grey. Average size of 100 eggs 64.3 x 45.8 mm. (Baker). Incubation by female alone; period c. 30 days. On circumstantial evidence male promiscuous, attracting individual ready-to-breed females by his extravagant display. He springs up vertically 8 or 10 metres above the grass-tops with a little croak and a peculiar deep humming, hovering on extended quivering wings, and floats down perpendicularly to the same spot, repeating the manoeuvre every little while. Courts approaching female in the manner of a turkey cock, raising and spreading tail, trailing wings on ground, and humming as before. (Mechanics of this sound unknown.) After copulation he apparently takes no further interest in raising a family.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). Above and below warm rufous-buff. Crown rufous mixed with rufescent brown and bordered by a stripe of the same colour from each side, meeting behind at the nape and continuing partly down the back of the neck; ear-coverts bordered with rufescent brown; back and wings mixed rufous-buff and rufescent brown; a patch of rufous bordered by rufescent brown from lower neck to breast and a patch of rufescent brown on each side of the breast; thighs with three broad rufescent brown bands on outer side. Iris hazel brown (C. M. Inglis, JENHS 28: 1134).

MEASUREMENTS. ♂♂ Wing 338-368; Bill (from feathers) 38-39 mm. (Baker).

Tarsus c. 165; Tail c. 190 mm. Female only slightly larger than male but usually heavier. Weight ♂♂ 4 to 5 lb. (1.60-2.25 kg.).

COLOURS OF BARE PARTS. Iris yellow or brown. Bill dark horny or plumbeous brown, yellowish on lower mandible and at gape. Legs and feet straw-yellow, sometimes tinged with green or plumbeous, or paler and dingier.

Genus *SYPHEOTIDES* Lesson

Sypheotides Lesson, 1839, Rev. Zool.: 47. Type, by subsequent designation, *Otis erilis* Latham = *Otis indica* J. F. Miller

Differs from *Otis* and *Chlorotides* in its comparatively longer tarsus equal to about one-third length of wing. Primaries very attenuated; notched on inner web. Unlike *Eupodotis*, male has a seasonal female-like non-breeding or eclipse plumage, but separation of the genus on this character alone inconsistent with other similar cases and seems doubtfully necessary.

Has only a single species confined to the Indian subregion.

194

GRUIFORMES

356. Bengal Florican. *Eupodotis bengalensis bengalensis* (Gmelin)

Otis bengalensis Gmelin, 1789, Syst. Nat. 1(2): 724 (Bengal)

Baker, FBI No. 2046, Vol. 6: 71

Plate 37, fig. 3

LOCAL NAMES. *Chārās*, *Chārg*, *Chārāt* (Hindi); *Dāhār* (Bengal); *Abāk* ♂, *Bor* ♀ (Terai); *Ūlī rāra* (= peacock of the *ulū* grass. Nowgong, Assam); *Deo tīrling* (Cachar).

SIZE. Domestic hen +; standing c. 55 cm. (c. 2 ft) to top of head. Length ♂ c. 66 cm. (26 in.); ♀ slightly larger.

FIELD CHARACTERS. A typical bustard with longish bare legs and horizontal carriage of body.

Male. Moppy crested head, neck, and underparts velvety jet black. Back buffy brown, heavily mottled and vermiculated and with bold black arrowhead marks. A bunch of elongated plumes overhanging breast. Exposed parts of closed wings showing up as a glistening white patch. In flight large size, outstretched neck, legs tucked under body, and conspicuous black-and-white (or pied) plumage make its identity unmistakable.

Female and ♂ in first plumage. Overall rufous-buff and sandy-buff, mottled with black on back and with bold arrowhead marks. No white patch on wings. Crown of head dark brown with a bold buff coronal streak or 'centre parting'.

Young (immature) males, vide Baker, assume the adult or a semi-adult plumage at the first spring moult, but often revert to the juvenile plumage the following autumn. Once fully acquired (presumably at the second spring moult) the adult ♂ plumage is retained in all seasons.

STATUS, DISTRIBUTION AND HABITAT. Resident. Assam, East Pakistan, duars and terai of Bhutan, Bengal, Nepal, and Kumaon (Uttar Pradesh), west to about the Jumna (Yamuna) river. Commonest in Assam Valley from about the Mishmis east of Sadiya westward to the Manas river, chiefly north of Brahmaputra in the extensive grassland and *chairs* going right into the Bhutan and NEFA foothills. Rare south of Brahmaputra Valley; stragglers obtained in Tippera and Chittagong; absent in Manipur. Less common, rare, or a straggler west of the Manas in Nepal and Kumaon terai. Affects tall grassland interspersed with scattered scrub and bushes, especially where grazed down to about half-metre height or regenerating after the seasonal firing.

GENERAL HABITS. Unlike bustards of the genus *Otis*, not gregarious. Keeps in widely spaced solos, sometimes 4 to 8 birds thus in a restricted vicinity. Feeds out in fairly open short grassland or burnt patches in the early morning and evening, retiring into thicker cover as the morning advances. The sexes also keep more or less segregated, males and females usually to different patches. Very wary in open country, but in tall concealing grass lies low and flushes only when within a few metres. Flies long distances at grass-top height when flushed and runs on speedily upon alighting so that the bird has moved a long way off by the time the observer reaches the spot. Flight like other bustards, by rhythmic strokes of the broad wings, neck outstretched and legs and feet tucked under body — not trailing behind as in a stork or crane.

GRUIFORMES

196

357. Leekh or Lesser Florican. *Sypheotides indica* (J. F. Miller)

Otis indica J. F. Miller, 1782, Icon. Anim., pl. 33 (India)

Baker, FBI No. 2045, Vol. 6: 69

Plate 37, fig. 6

LOCAL NAMES. *Leekh*, *Chhota chārāt* or *chārāz*, *Bārsāti* or *Kālā chārāz* or *tūgdār* (Hindi); *Chhota dāhār*, *Likh* (Bengal); *Khār mār* (Gujarat); *Tūloer* (Kutch); *Khār mār* = grass peacock, *Tārnār* (Sind); *Khār tūtār* (Bhil); *Chini mār* (Belgaum); *Kannoul* (Kannada); *Niala nimli* (Telugu); *Waragu kōzhi* (Tamil); *Chāitta kōzhi* (Malayalam).

SIZE. Domestic hen. Length ♂ c. 46 cm. (18 in.); ♀ c. 51 cm. (20 in.).

FIELD CHARACTERS. A small bustard with the typically longish bare legs and horizontal carriage of body.

Male (breeding). Chiefly black-and-white with a tuft of narrow spatulate-ended upcurving black plumes projecting behind the head, three on either side.

Male (winter: non-breeding). Similar to female, but with much white on wing.

Female. Overall sandy buff, mottled and with blackish arrowhead marks on back. Two parallel blackish stripes down centre of throat and

foreneck. Forehead and crown black with a pale median stripe or 'centre parting'. No head plumes. Slightly larger than male.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident; irregular local migrant, and also nomadic in the rainy season (SW. monsoon). W. Pakistan (coastal Makran, southern Sind), Punjab, Rajasthan, Gujarat (including Saurashtra and Kutch), south through the Peninsula to Mysore and Madras; straggler to Kerala. Wandering erratically eastward through Uttar Pradesh, Nepal (Valley? and terai), Bihar, Orissa, W. Bengal to slightly east of Teesta river in Bhutan duars (c. 89°E.). Rare in the coastal strip between the Western Ghats and the sea. Affects tall grassland with scattered bushes, and standing crops of cotton and millets; chiefly plains, but a vagrant has been obtained in the Nilgiris at c. 1000 metres.

MIGRATION (local). Of about 500 males in breeding plumage ringed by Rao Shri Dharmakumarsinhji in the erstwhile Bhavnagar State of Gujarat in seven successive seasons (between 1943 and 1949), 18 have so far been recovered. Ten of these were in the same area where ringed, the others mostly well within a radius of 50 kilometres. The recoveries were all in subsequent breeding seasons, of birds that had presumably returned to breed; they ranged from one to four years after ringing. No recoveries have been reported in the non-breeding season, or from peninsular India whence

the birds are believed to be derived (excepting one of a male from Baroda), therefore the off-season migratory movements still remain obscure.

From his observational data Dharmakumarsinhji suggests that the majority of breeding birds in Saurashtra and Kutch are immigrants from peninsular India. They arrive on the south-east coast of Saurashtra from the direction of Gujarat and Bombay across the Gulf of Cambay (flying individually, not in flocks) from the end of May to August depending upon the timing and intensity of the SW. monsoon, returning in the same south-easterly direction about October/November, the males apparently leaving before the females.

GENERAL HABITS. Broadly similar to 356, q.v. Much less shy and wild than other bustards or Bengal Florican. When flushed usually flies a considerable distance, running on immediately upon alighting and difficult to flush a second time. Wing-beats more rapid than other bustards' and reminiscent of Redwattled Lapwing. Capable of astonishing turn of speed when flushed by beaters and chased by trained 'waiting on' Peregrine or Cherrug falcon. Normally relies for safety chiefly on lying low and running through cover.

FOOD. Insects of all kinds, mainly grasshoppers (Acrididae), beetles (Cantharidae, Chrysomelidae, Buprestidae, Scarabidae); sometimes centipedes, lizards, and frogs. Also takes vegetable matter: shoots of crops, grass and herbs, seeds, drupes and berries, e.g. *Zizyphus*. At certain seasons feeds very largely on blister beetles (*Mylabris*), tainting the flesh which is otherwise highly esteemed as a table delicacy. Insects secured on ground and on grasses by jabbing at them with pointed bill like cattle egret, or leaping up in the air to snap at such as a flying grasshopper.

VOICE AND CALLS. A characteristic harsh frog-like croak emitted by male during his jumping display; sometimes from the ground. Also 'a short whistle-like call when frightened' (Dharmakumarsinhji). A low chuckle constantly uttered while feeding. Croak of female similar but distinctive. Another 'q' call, *peeco*, apparently meant to attract attention of male.

BREEDING. Season, chiefly July, August, and September as soon as sufficient grass cover becomes available in otherwise dry areas. Disperses to breed over vast tracts of country in years of good rainfall. No special nest. Eggs normally 4, sometimes 3 or 5, laid on the bare ground often even without any depression, in some bare patch of short grass or in crops. Colour: some shade of olive-brown, variously mottled, streaked and blotched with brown. Average size of 57 eggs 49.1 x 41.3 mm. (Baker). Incubation by hen alone; period unrecorded. On circumstantial evidence male promiscuous, like Bengal Florican, attracting individual ready-to-breed females by his well-known springing display, mating with them, and taking no further interest in raising the family. The attraction or advertisement display serves to repel rivals from a territory and attract eligible hens. It is given from a bare spot, usually some little eminence in grassland or standing crops. The cock flexes his legs and springs perpendicularly in the air to a height of two or three metres depending on the surrounding grass. At the apogee the neck is arched backwards till almost resting on the back and he utters a guttural frog-like croak. The wings are partially open level with the body and fluttering rapidly, the legs pulled in as in the sitting

358. Pheasant-tailed Jacana. *Hydrophasianus chirurgus* (Scopoli)

Tringa chirurgus Scopoli, 1786, Del. Flor. et Faun. Insubr., fasc. 2: 92

('In nova Guiana' = Luzon ex Sonnerat)

Baker, FBI No. 2032, Vol. 6: 42

Plate 36, fig. 16

LOCAL NAMES. *Piho*, *Pihya* (Hindi); *Gund kân*, *Gair koo* (Kashmir); *Surdal*, *Sakdal*, *Mitwa*, *Dal kûkra*, *Bhepi*, *Jâl manjor*, *Jâl mûyâr*, *Jâl kokra*, *Chitra billai* (Bengal, Bihar); *Lobo dak* (Santhal); *Râni didao gophita* = 'Little White Water Princess' (Cachar); *Tem pârâbâ* = Cock fowl (Manipur); *Pân kukkulâ*, *Ballal sêru*, *Vil girâvâ* (Sinhala); *Alîwa*, *Manal purâ* (Tamil); *Tâmara kôchi* (Malayalam).

SIZE. Grey Partridge. Length (excluding tail) c. 31 cm. (12 in.).

FIELD CHARACTERS. In breeding plumage a striking white and chocolate-brown rail-like marsh bird with enormous spidery toes and pointed sickle-shaped pheasant tail. Face and foreneck white; hindneck pale silky golden yellow. In flight, the large amount of white in plumage and pointed down-curved tail are diagnostic pointers. In the distance pied colour pattern, long gently curving tail and slow flapping wing-action reminiscent of Magpie (*Pica pica*). Sexes alike; female slightly larger.

In non-breeding (winter) plumage chiefly pale brown and white with a black 'necklace' on upper breast, and minus the long tail. In flight, hair-brown head and back, and white wings with black tips conspicuous.

Young (immature). No yellow on sides of neck; dark gorget broken up with white. Crown dull rufous-brown; feathers of upperparts pale-edged producing a faintly scalloped effect.

STATUS, DISTRIBUTION AND HABITAT. Resident; moving locally with conditions of flood and drought. All India (including Assam and Manipur), both Pakistans, Nepal, Ceylon. In summer normally up to c. 1500 metres in Kashmir Valley (once recorded on Vishan Sar lake, c. 3700 m.) and the outer Himalayas. A straggler taken in Gilgit (Scully, 1882, SF 10: 142), and once recorded at Patseo in Lahul, c. 3800 m. (Whistler, 1925, *Ibis*: 203). Mostly descending to the plains in winter. Affects lotus, *singara* (*Trapa*), water hyacinth (*Eichhornia*) and other floating-vegetation-covered jheels, tanks, and ponds.

Extralimital. Burma, Thailand, and eastward to S. China and Formosa, south to Malay Peninsula, Java, Cambodia, Philippine Islands.

GENERAL HABITS. Feeds in the open among the surface vegetation on large jheels as well as small village and temple tanks, sometimes submerging head completely. Trips about lightly on the floating water-lily and *singara* leaves and tangles, the enormous spreading toes functioning like snowshoes to distribute and support its weight; calmly steps on to the next leaf when the supporting one has slowly sunk down to belly level. Normally not shy; frequently seen moving about complacently on village tanks in the proximity of people noisily bathing and washing round the edge. Gregarious in winter, then often collecting in flocks of 50 to 100 birds. Non-breeding dress very obliterative when feeding amongst the surrounding dry lily pads, but black-tipped white wings flash into prominence, as in pond heron, when the bird rises. Flight feeble and rail-like, reminiscent also of lapwing, with the large feet dangling behind; seldom more than 2 or 3 metres above the surface. The purpose of the wingspur is obscure. It is apparently not used in fighting.

position. The bird then floats or parachutes down vertically to the starting-point; tail spread, legs gradually lowered for landing and often kicked forward and back as if running on air, to steady himself. A complete spring occupies 4 or 5 seconds and is soon repeated. Activity is most intense in the early mornings and late afternoons, but continues more or less throughout the day if cloudy and drizzly. While serving to safeguard his territory and attract hens, the display unfortunately renders the cock particularly vulnerable to enemies, chiefly human, and is responsible for much of the decimation of the species by poachers and vandalistic 'sportsmen'.

(For an excellent study of the courtship display, behaviour, and habits of the Lesser Florican see Dharmakumarsinhji, K. S., 1950, *J. Bom. nat. Hist. Soc.* 49: 201-16.)

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

Chick (in down). 'An almost uniform dirty pale yellow colour with an unclosed V on the crown of the head in dingy black, and blotches, rather stripy, of black on the wing, back and sides, and about the ears; legs and beak a colour between pale blue and pale pink and on the tip of the beak a little lump of pale pearly white (Davidson quoted by Hume).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	180-204	31-38	c. 85-95	82-114 mm.
♀♀	209-248	37-42	—	—

(Baker)

Weight ♂♀ 1 lb. 2 oz. to 1 lb. 10 oz. (c. 510-740 gm.) — Hume.

COLOURS OF BARE PARTS. Iris pale yellow or brownish fawn colour. Bill: upper mandible horny brown, lower yellowish flesh. Legs and feet fleshy or dusky yellow ('old discoloured ivory' — SA).

Order CHARADRIIFORMES

Stresemann, E., 1927-34, *Aves*: 774-5 (Laro-Limicolae); Witherby *et al.*, 1940, *Handbook*, 4: 151-2

Family JACANIDAE: Jacanas

(For morphological characters see Baker, 1929, FBI 6: 39; Stresemann, E., op. cit.: 767-8; Van Tyne & Eerger, 1959, *Fundamentals of Ornithology*: 437);

Key to the Genera

	Page
A A lappet at base of bill resting against forehead (less pronounced in young birds); primaries not attenuated.....	201
B No frontal lappet; first and fourth primaries attenuated.....	198

Genus HYDROPHASIANUS Wagler

Hydrophasianus Wagler, 1832, *Isis von Oken*, col. 279. Type, by original designation, *Parra chinensis* auct. = *Tringa chirurgus* Scopoli

Bill more slender than in *Metopidius* with no lappet at base. Toes similarly elongated, but hind claw shorter. 1st and 4th primaries (as.) attenuated, the first into a barbed shaft terminating in a spatulate web, the fourth prolonged into an attenuated point. Wing furnished with a strong sharp spur at the carpal joint, or bend. Both sexes assume a nuptial plumage and are alike, but female larger.

Contains a single species.

* See Appendix

FOOD. Chiefly vegetable matter — seeds, roots, etc. Also aquatic insects and their larvae, and bivalves and other molluscs.

VOICE AND CALLS. In winter a peculiar nasal mewling *teun, teun* uttered chiefly when a flock flies off on alarm. In breeding season — 'a loud musical me-e-ou, me-e-ou or me-onp' often taken up by another bird in the vicinity. It has many shortened variants 'perhaps the commonest being a loud open kloo' (R. S. P. Bates). A third call described as uttered by the cock alone to attract the female (A. Hoffmann).

BREEDING. Season, in Kashmir from about 2nd week of May into July; in the plains during the SW. monsoon, principally June to September; in Ceylon mainly March to July, but also in January. Nest, an insignificant skimpy pad or raft of grass or weed stems freely floating or resting on partly submerged vegetation (*Hydrilla*); sometimes eggs laid directly on *singara*, water-lily, or water hyacinth (*Eichhornia*) leaves. Eggs, 4, peg-top shaped, glossy greenish bronze or rufous-brown, unmarked. Average size of 100 eggs 37.4 x 27.6 mm. (Baker). Incubation by male alone; period c. 26 days.

Contrary to accepted belief and published accounts, now ascertained that the larger female is polyandrous as in Painted Snipe (*Rostratula*). The following facts also established: Male acquires territory in rivalry with other males which female later helps to defend vigorously while her liaison with the owner lasts. Eggs laid at 24-hour intervals, in the morning. Male commences incubation from the first egg. Frequently removes the clutch to a distance maybe of several metres, when disturbed, as by observer's hide. This done by pressing egg between throat and breast and dragging or rolling it over the matted vegetation, himself walking backwards. Eggs similarly floated across any intervening narrow channels of clear water or over partly submerged mat of *Hydrilla* (confirmed and photographed by Peter Jackson). Sometimes by holding pointed end in bill and dragging egg backwards (J. S. Serrao & P. B. Shekar, 1962, *Newsletter for Birdwatchers* Vol. 2(1)). Male tends the nidifugous chicks in early stages with 'great solicitude, performing 'broken-wing' and 'rat-run' distraction displays to mislead an intruder. Downy chicks lie doggo at command often fully submerged, hidden under a floating leaf, except for the bill sticking out at an angle. He rears two, and sometimes three families in a season. How many clutches a female lays in a season here unknown; in China 7-10 clutches recorded at intervals of 9-12 days between each (Hoffmann, A., 1949, *Zoologischer Jahrbücher*, Bd. 78, Hft 4, Jena).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

For description of chick just getting out of down plumage, see Whistler, H., 1940, *JBNHS* 41: 483.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	182-242	25-29	54-59	145-325 mm.

(generally over 200 mm.)

(Baker)

Weight 10 ♂♀ 120-180 (av. 143.4) gm. — BNHS.

COLOURS OF BARE PARTS. Breeding. Iris brown. Bill slaty blue, paler at tip. Legs and feet pale bluish plumbeous. Non-breeding. Iris pale yellow. Bill basal half yellow, terminal half brown. Legs and feet dull greenish to dull plumbeous (Baker).

JAÇANAS

201

Genus METOPIDIUS Wagler

Metopidius Wagler, 1832, Isis von Oken, col. 279. Type, by subsequent designation, *Parra centa* Cuvier = *Parra indica* Latham

Head small. Bill moderately long, straight, and compressed, the culmen curved at tip; a lappet at base resting against the forehead and rounded behind. Tail short. Wing not rounded: 1st and 2nd primaries (as.) subequal and longest; a tubercular

× c. 2/3

spur on carpal joint. Toes greatly elongated: middle toe without claw longer than tarsus; hind claw excessively long. Tarsus with transverse shields in front and behind. Sexes alike in all seasons; no special nuptial plumage, but female larger than male. Contains a single species.

359. Bronzewinged Jaçana. *Metopidius indicus* (Latham)

Parra indica Latham, 1790, Index Orn. 2: 765 (India)

Baker, FBI No. 2031, Vol. 6: 40

Plate 36, fig. 18

LOCAL NAMES. *Dāl pipi*, *Jāl pipi*, *Karaiya* (Bengal); *Pipi*, *Kundai* (Bihar); *Kattai* (Purnea); *Kālo jāl mājār* (Gujarati); *Pipi* (Cachar); *Thamāñchenbi* = 'running on lotus leaves' (Manipur).

SIZE. Grey Partridge ±; length ♂ c. 28 cm. (11 in.); ♀ c. 31 cm. (12 in.).

FIELD CHARACTERS. A leggy swamp bird somewhat like a moorhen, with enormous spidery toes. Head, neck, and breast glossy black. Back and wings metallic greenish bronze. Stub tail chestnut-red. A broad white stripe from eye to nape. Sexes alike; female somewhat larger.

Young (immature). Above, crown and nape rufous-brown; a short dull white supercilium. Back more or less as in adult but paler; upper tail-coverts barred white and brown. Tail rufous with terminal black band. Below, chiefly sullied rufous-white.

STATUS, DISTRIBUTION and HABITAT. Resident; common and widely spread. All India (excepting western Punjab and western Rajasthan), east through Assam and Manipur, south through the Peninsula to Kanyakumari. Also Nepal (terai) and East Pakistan. Absent in West Pakistan and Ceylon. Affects floating-vegetation-covered jheels, and tanks in the plains and plateau country largely co-existing with 358. Does not ascend the hills.

Extralimital. Burma, Thailand, Vietnam, Cambodia, Malay Peninsula, Java, Sumatra.

GENERAL HABITS. Very similar to 358, q.v. When surprised in the open, far from cover, partially submerges itself for concealment, keeping only the bill exposed. If persistently harried, as sometimes by local shikaris, will take refuge on dry land amongst standing crops whence it will flush like Painted Snipe when walked up. Is a good diver and swimmer, but poor on the wing.

CHARADRIIFORMES

202

flying coot-like with neck extended and large feet trailing clumsily behind. After a few metres, low above the surface, re-aligns on the floating weeds to continue 'leaf trotting'.

FOOD. As in 358, chiefly vegetarian, but also insects and molluscs.

VOICE and CALLS. A short harsh cry, or grunt, given as contact note between individuals. An agonistic or aggressive shrill, wheezy, piping seek-seek-seek etc.

BREEDING. Season, June to September, commencing soon after the SW. monsoon has properly set in. Nest, a flimsy pad of a few roughly put-together grasses or weed stems, placed on matted vegetation. Eggs often laid directly on floating lotus or *singara* (*Trapa*) leaves. Eggs normally 4, very glossy and handsome, peg-top shaped, bronze-brown with an irregular network of blackish scrawls. Average size of 120 eggs 36.4 × 25.1 mm. (Baker). Female occasionally helps male by bringing a few grasses to the nest during their temporary liaison. Contrary to published accounts, and correlated with her larger size, female polyandrous with a similar breeding biology to 358 and Painted Snipe (D. N. Mathew, 1964, JBNHS 61(2): 295-302). Incubation by male alone; period not definitely determined, but certainly longer than the '14 to 16 days' presumed by Baker. Details require further study. Chicks tended entirely by male. When alarmed, one observed scurrying off over floating weeds with a newly hatched chick tucked under his wing completely hidden except for its long legs dangling, and dropping it by opening wings when safety attained (Kingsley Kefford).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail
3 ♂♂	153-177	37-41	65-68	40-52 mm.
4 ♀♀	170-184	40-45	70-72	43-51 mm.
Hind claw ♂	65-70; ♀	54-75 mm.		(SA)

Weight 10 ♂♀ (ad. & imm.) 94-210 (av. 154.6) gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill greenish yellow, tinged with red at base, pure yellow at tip; frontal lappet livid red. Legs and feet dull green.

Family HAEMATOPODIDAE: Oystercatchers

Treated as a genus (*Haematopus*) of the family Charadriidae by many authors. Characters as of the genus (below). See also Van Tyne & Berger, 1959, *Fundamentals of Ornithology*: 439.

Genus HAEMATOPUS. Linnaeus

Haematopus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 152. Type, by monotypy, *Haematopus ostralegus* Linnaeus

Characters as of the family. Bill very long, compressed, slightly truncated at end. Nostril linear, narrow, placed near the base of a groove which extends about half way to tip of upper mandible. Wings long and pointed: 1st primary (as.) longest. Tarsus short, stout, and reticulated throughout. No hind toe; anterior toes short, stout, and edged laterally with a narrow membrane; slightly webbed, especially between 3rd and 4th toes.

Genus cosmopolitan; one species with two races within our limits.

OYSTERCATCHERS

203

HAEMATOPUS OSTRALEGUS Linnaeus

Key to the Subspecies

Outer web of first and occasionally second primary black; outer web of remaining primaries marked with white.....*H. o. ostralegus*
Outer web of first five or six primaries black; outer web of remaining primaries marked with white.....*H. o. osculans*

360. Oystercatcher or Sea-Pie. *Haematopus ostralegus ostralegus* Linnaeus

Haematopus Ostralegus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 152

(Europe and America = *Oland*)

Baker, FBI No. 2110, Vol. 6: 165

Plate 39, fig. 5 and Plate 42, fig. 1

LOCAL NAMES. *Darya gajpān* (Hindi); *Terra kali ulanka* (Telugu); *Dōbāh* (Sind).

SIZE. Grey Partridge ±; length c. 42 cm. (16 in.).

FIELD CHARACTERS. A striking black and white shore bird with stoutish bare red legs, and long straight laterally compressed orange-red bill, snipe-like but blunt or truncated at tip. In flight the broad white band across the black wings, white lower back and underparts contrasting with the black head, breast, and tail are diagnostic pointers. Sexes alike.

Juvenile, × c. 2/3

Young (immature) has the black parts browner, feathers of mantle narrowly edged or scalloped with white. Centre of chin and throat whitish; a broad white patch on foreneck.

STATUS, DISTRIBUTION and HABITAT. Winter visitor mainly to the sea coasts and offshore islands. Commoner on the west coast than the east; abundant in W. Pakistan on the Makran coast and about Karachi. Ceylon (northern coasts). Has been recorded once (subspecies?) at Wular Lake, Kashmir, obviously on passage (Ward, JBNHS 17: 946), and sporadically on shingle banks of large rivers inland and fairly high up in the hills also on migration. Considerable numbers of non-breeding birds overwinter on the West Pakistan coast (Karachi, Makran). Affects sandy and rocky sea shores.

Extralimital. Breeds on the coasts of Europe, south to N. Spain. Also on the coasts of the Black and Caspian seas. Winters south to Africa.

MIGRATION. No data.

CHARADRIIFORMES

204

GENERAL HABITS. Keeps in small scattered flocks on the seashore amongst dunlins, sand plovers and other waders, running about and probing into the wet sand for food at low tide, bunching up on rocks and marking time when the water rises. Always exceedingly wild and wary. In fading light, silhouette when flying away from or towards the observer very like Whistling Teal (*Dendrocygna*).

FOOD. Largely marine molluscs; also sand worms (Annelida) and small crustaceans. The specialized bill helps to prise limpets off rocks and chisel out the contents from the shells.

VOICE and CALLS. A loud plaintive whistle or pipe repeated in varying tempo and shrillness depending on whether uttered as a contact note or alarm call. Curiously enough this whistle is also sometimes very reminiscent of the Whistling Teal's.

BREEDING. Extralimital. Season, c. May-June. Nest, a depression on the shingly seashore above high-tide mark. Eggs, 3 or 4, brownish buff spotted with black and dark grey.

MUSEUM DIAGNOSIS. For details of plumages, structure, etc. (also bionomics), see Witherby, 1940, 4: 418-21.

Some of our winter visitors possibly belong to the rather paler — more brownish less black — race *longipes* Buturlin, as suggested for Sind birds by Ticehurst. In that race bill 84-97 mm. (aver. 89.5), tarsus 47-55 mm. (aver. 50.3) in 14 adults (Vaurie, 1965, 2: 369).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂ ♀	240-261	77-90	c. 48-54	99-114 mm. (Baker)

COLOURS OF BARE PARTS. Iris red or orange-red. Bill bright orange-red, paler and duller at extreme tip. Legs and feet dull brownish purple or purple-red.

361. Chinese Oystercatcher. *Haematopus ostralegus osculans* Swinhoe

Haematopus osculans Swinhoe, 1871, Proc. Zool. Soc. London: 405 (North China)

Baker, FBI No. 2111, Vol. 6: 166

LOCAL NAMES. As for 360.

SIZE. Same as 360.

FIELD CHARACTERS. Indistinguishable from 360, q.v. (see Key and Museum Diagnosis).

STATUS, DISTRIBUTION and HABITAT. Unknown except that a pair of oystercatchers once found breeding in the Khulna Sunderbans of E. Pakistan presumably belonged to this eastern race. But no specimens collected at the time and no confirmation since.

Extralimital. 'Breeds on the coasts (and probably some of the larger rivers) of NE. Asia from E. Siberia, Kamchatka and the Commander Is., south to Korea, N. China and Japan. Winters south to S. China, N. Burma and Bengal' (Peters).

GENERAL HABITS, FOOD, VOICE and CALLS. Presumably as of 360.

BREEDING. Two fresh eggs taken on 22 April (1922) on stony ground near the seashore in Khulna Sunderbans of East Pakistan, where young

PLOVERS

205

also seen the following year (Stanford, JBNHS 39: 867). The eggs — deep brownish buff spotted with black, lavender and dark grey — measured 53.6 × 39.7 and 52.5 × 40.0 mm. (Baker).

MUSEUM DIAGNOSIS. Like 360 but slightly larger and with a longer bill. The amount of white on the primaries is generally less, the first primary (as.) seldom showing any white at all on the inner web.

MEASUREMENTS. Wing ♂ ♀ 260–277 (once 284); bill (from feathers) c. 90–98 mm. (Hartert).

COLOURS OF BARE PARTS. As in 360.

PLOVERS

207

Vanellus leucurus

■ Breeding range ■ Winter

Extralimital. Breeds on the Kighiz Steppes, Transcaspiya, parts of Syria, Iraq and Iran. Winters chiefly in NW. India; in small numbers also in Egypt and Sinai.

MIGRATION. One ringed Bharatpur 11. xii. 1969 recovered Tipdeh, Zabol, Iran (31° 01' N., 61° 29' E.) 3. iii. 1978. Passes through Quetta Valley and N. Baluchistan in large flocks on spring and autumn migration (Delme-Radcliffe, Ticehurst).

GENERAL HABITS. Gregarious; in large flocks when migrating. Usually in smaller flocks or parties of 6 to 25 birds in winter quarters, commonly in association with Redshanks and other waders. While a flock is standing inert in a marsh (resting), frequently one bird then another stretches both wings vertically upwards back to back ('flag-waving') — evidently a contact signal. Flight and behaviour similar to the Redwattled and other lapwings.

FOOD. Aquatic insects, worms, tiny freshwater shrimps and molluscs.

VOICE AND CALLS. Rather silent in winter. Calls variously described as 'a soft whistle... also a *chee-ziz* call like that of a Shikra' (Dharmakumar-sinhji); 'much more mellow than that of *Vanellus indicus*' (Fleming); 'more like that of the Lapwing [Pewit] but not so plaintive' (Meinertzhagen); a double-noted rather subdued *pi-wick* of lapwing quality (SA).

BREEDING. Extralimital; in Iraq (on the Euphrates marshes) gregariously among mixed nesting colonies of pratincoles and terns. *Season*, mid May to mid June. *Eggs*, 4, laid in shallow depressions on the edges of marshes or semi-submerged islets.

MUSEUM DIAGNOSIS. No crest; much white in wings. Tarsus with small scutellations. Hind toe small but distinct. For details of plumage see Baker, *loc. cit.*

362. Whitetailed Lapwing. *Vanellus leucurus* (Lichtenstein)

Charadrius leucurus Lichtenstein, 1823, in Eversmann's Reise von Orenburg nach Buchara: 137 (Between the Kuwan and Jan Daria, Turkestan)

Baker, FBI No. 2123, Vol. 6: 183

Plate 38, fig. 14 and Plate 39, fig. 4

LOCAL NAMES. None recorded.

SIZE. Grey Partridge ±; length c. 28 cm. (11 in.).

FIELD CHARACTERS. A light brown and white plover, very like Yellow-wattled Lapwing (370) in general effect but minus the black cap and, unlike it, always seen near water. Long yellow legs. *Above* head and back pinkish brown with indistinct pale greyish white forehead and supercilia. *Below*, chin, throat and foreneck ashy grey; breast darker grey; abdomen pinkish buff; under tail-coverts rosy white. Sexes alike. In flight readily identified by its white lower back and tail, and the bold black and white bands on the wings.

Young (immature). *Above* much darker, almost blackish, the feathers broadly edged (scalloped) with rufous-brown. *Below* sullied white.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor (c. September to March). Not uncommon in West Pakistan (southern Baluchistan, Sind, Punjab) and northwestern India (Punjab, Rajasthan, Gujarat) diffusing in smaller numbers through Uttar Pradesh, northern Madhya Pradesh. N. Bihar and Nepal (terai) east to W. Bengal and E. Pakistan. Has straggled as far south as Bombay and may do so further, but Baker's record of Mysore untraceable. Affects marshy grassy edges of large jheels.

208

CHARADRIIFORMES

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	173–189	35–38	72–75	71–78 mm.
♀♀	167–186	—	—	—
	(from skull)			(SA)

Weight 20 ♂ ♀ (autumn/winter) 100–185 (av. 129.9) gni. — BNHS.

COLOURS OF BARE PARTS. Iris brown to blood red. Bill black. Legs and feet pale yellow.

363. Sociable Lapwing. *Vanellus gregarius* (Pallas)

Charadrius gregarius Pallas, 1771, Reise Russ. Reichs 1: 456 (Volga, Jaiku, and Samara)

Baker, FBI No. 2122, Vol. 6: 182

Plate 38, fig. 15

LOCAL NAMES. None recorded.

SIZE. Grey Partridge ±; length c. 33 cm. (13 in.).

FIELD CHARACTERS. In winter (non-breeding plumage) as mostly seen in India (and as shown on the plate): *Above*, crown brown; forehead buffy white running backward in broad white supercilia meeting on hindneck; a brown line from lores through eye and ear-coverts bordering the supercilia

× c. 1

below. Rest of upperparts ashy grey; lower back and tail white, the latter with a black subterminal band. A good deal of white in wings (outer secondaries). *Below*, chin and throat white; breast smoky grey mottled with brown. Rest of underparts smoky white. Legs black.

In flight the distinctive head pattern, large white patch (secondaries) in the black wings, and black subterminal tail-band, are diagnostic clues.

In summer (breeding plumage) the crown and eye-stripe become black, the forehead and supercilia pure white. *Below*, throat and upper breast ashy grey; lower breast black and chestnut; abdomen and vent white.

Sexes alike.

Young (immature). Like non-breeding adult but with feathers of upperparts edged with light rufous.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, September–October to March–April. Regular and fairly common in W. Pakistan (Baluchistan, Sind, Chitral Valley), and NW. India (Kashmir, occasional) and Uttar Pradesh, diffusing east through N. Bihar, sporadically to W. Bengal. South through Rajasthan and Gujarat, erratically farther south in the Peninsula (Bombay, Ahmednagar, Ratnagiri); straggling to Kerala (Trivandrum)

PLOVERS

209

Vanellus gregarius

Breeding range

and Ceylon. Less addicted to jheels and marshes than Whitetailed Lapwing (362). Affects dry waste land in the neighbourhood of cultivation, ploughed fields and stubbles, in plains and plateau country.

Extralimital. Breeds in southern and middle Russia, Kirghiz Steppes, Transcaspiia, W. Siberia to Tomsk and Zaisan-nor. Winters in NE. Africa to Sudan, besides N. India.

MIGRATION. No ringing data. Recorded on spring (March-April) and autumn passage migration through the Kurram Valley (Rattray, Whitehead) and Gilgit (Scully).

GENERAL HABITS. Keeps in small parties of 5 or 6 or flocks of 20 to 100 or more, the latter chiefly before spring emigration when many birds have assumed the handsome breeding plumage. Actions, flight and behaviour typical of the plovers, e.g. Redwattled and Yellow-wattled Lapwings, more particularly like the Peewit (364).

FOOD. Chiefly insects such as grasshoppers and crickets, but very little specifically recorded.

VOICE AND CALLS. Also unrecorded in India, the birds being very silent in winter. According to Meinertzhagen call not at all like that of 364. A single wailing note uttered on the ground and in the air (Baker).

BREEDING. Extralimital. *Season*, mainly between mid April and mid June. *Eggs*, 4, site etc. very similar to those of the Peewit.

MUSEUM DIAGNOSIS. No crest. Wing pointed: 1st primary (as.) minute, 3rd primary longest, 2nd equally long or slightly shorter. Tarsus reticulated. Hind toe small but distinct.

For details of plumage see Baker, loc. cit.; for structure and plumage phases (also bionomics), Witherby, 1940, 4: 392-5.

PLOVERS

211

MIGRATION. No ringing data. Passes through Thal, NW. Pakistan 33°24'N., 70°36'E. (alt. c. 750 m., at the junction of Kurram and Miranzai valleys) in February (Rattray); through Gyantse (Tibet, 28°55'N., 89°38'E.) in March-April, and again in autumn (Ludlow).

GENERAL HABITS. Keeps in pairs or small scattered flocks, running about with short mincing steps, stopping now and again to pick up some titbit, tilting the body at a steep angle without flexing the legs, as typical of the plover family. Often foraging on wet meadows or grazing land in proximity of cattle. Assembles in large flocks before migration, and on passage. Normal flight rather sluggish and wobbly, with slow wing-beats, but bird capable of considerable speed when occasion demands. In nuptial display—not seen in winter quarters—male performs extravagant aerobatics, rising, falling and tumbling in the air.

FOOD. Chiefly insects, molluscs, and worms.

VOICE AND CALLS. Largely silent in winter; a rather plaintive mewing *pee-wit* uttered singly, unmistakable when once heard. Birds as noisy as Redwattled Lapwing at nesting time.

BREEDING. Extralimital. *Season* chiefly end March to end May. *Eggs*, 4, laid in scrape on bare ground in open fallows or pastures; peg-top shaped, olive-brown or drab, spotted and blotched with blackish.

MUSEUM DIAGNOSIS. Wing: in ♂ 3rd primary (as.) longest, 2nd equals 4th; in ♀ 2nd and 3rd primaries longest, 1st equals 4th. Tarsus reticulated. A small hind toe present. For details of plumage see Baker, loc. cit.; for plumage phases and structure (also bionomics), Witherby, 1940, 4: 395-403.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	220-236	23-27	44-48	108-119 mm.
		(from feathers)		(Hartert)

Weight 2 oo? 180, 200 gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet orange-brown.

365. Greyheaded Lapwing. *Vanellus cinereus* (Blyth)

Pluvialis cinereus Blyth, 1842, Jour. Asiat. Soc. Bengal 11: 587 (Calcutta)

Baker, FBI No. 2129, Vol. 6: 191

Plate 38, fig. 12 and Plate 39, fig. 3

LOCAL NAME. *Selarg* (Manipur).

SIZE. Grey Partridge +; length c. 37 cm. (14½ in.).

FIELD CHARACTERS. Above, entire head and neck grey; back light brown; rump, upper tail-coverts, and tail white, the last with a broad black subterminal band. Primaries black, secondaries white. Below, neck and breast ashy grey bordered by a chocolate-and-black pectoral band. Rest of underparts, including underwing, white. Sexes alike.

Young (immature) has head, neck, and breast light brown like back and no dark pectoral band.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor (September-October to end March-April). Regularly in small flocks in W. Bengal (near Calcutta); quite common in Assam, Manipur, and East Pakistan; also in Kathmandu Valley, Nepal. Occurs in N. Bihar, and stragglers recorded in Kashmir,

♀ ♀	199-212	27-30	—	—
				(Witherby)

COLOURS OF BARE PARTS. Iris brown. Bill, legs and feet black.

364. Peewit, Lapwing or Green Plover. *Vanellus vanellus* (Linnaeus)

Tringa Vanellus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 148

(Europe, Africa. Restricted type locality, Sweden)

Baker, FBI No. 2121, Vol. 6: 180

Plate 38, fig. 9 and Plate 39, fig. 1

LOCAL NAME. *Sābāz titi* (Bengal).

SIZE. Grey Partridge; length c. 31 cm. (12 in.).

FIELD CHARACTERS. An apparently black and white plover with long slender upstanding pointed crest. Sexes alike; female's crest somewhat smaller.

Adult winter (non-breeding). Crown blackish brown; face, chin, throat and foreneck white more or less speckled with brown or black; scapulars, innermost secondaries and black breast-feathers scalloped with fulvous; rest of underparts as in summer.

Summer (breeding). Above, forehead, crown, and long crest of narrow feathers black, glossed with green; sides of head and neck white with black patches. Upperparts metallic glossy bronze-green and violet-purple; upper tail-coverts cinnamon; tail white with a broad metallic black subterminal band. Below, throat, foreneck, and breast black; rest of underparts white; under tail-coverts cinnamon.

In overhead flight the apparently pied plumage, black breast and white underparts, including underside of wings, are leading pointers. ♂ distinguishable from ♀ in air by broader rounder wings obviously correlated with his aerobatic nuptial display.

Young (immature). Above, brown narrowly scalloped with fulvous, the back and wings slightly glossed with purple, bronze, and green. Below, like adult in winter.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor: September-October to March-April. Fairly common in W. Pakistan (Baluchistan, Sind, N.W.F. Province including Chitral, Punjab) and in NW. India (including Gilgit, Ladakh, Kashmir) and Uttar Pradesh. Erratically and in small numbers east through N. Bihar, Nepal (Valley and lowlands), NEFA (Subansiri Frontier Division) to Cachar and Lakhimpur, south and east of Brahmaputra river in Assam; Manipur and E. Pakistan. A straggler to Rajasthan and probably N. Gujarat. Affects fallow land and stubbles, irrigated fields, shingly river banks, marshland bordering jheels in cultivated plains country.

Extralimital. Breeds in Europe and N. Asia east to Siberia, south to Spain, N. Italy, Transcaspiia, Turkestan, and N. China. Migratory in the northern part of its range. Winters in S. Europe, N. Africa, Asia Minor, SW. Asia, and across northern India and Burma to S. China and Japan.

212

CHARADRIIFORMES

Dehra Dun, Rajasthan (JBNHS 65: 484) and the Andaman Islands. A large proportion of our visitors are young birds without the pectoral band. Affects marshy places—the edge of jheels etc. (typical snipe ground), banks of rivers, and wet grazing grounds, ploughs and stubbles.

Extralimital. Breeds in Mongolia, China south to the Yangtse Valley, Manchuria, Korea, and Japan. Winters in S. China, E. India, Burma, Malaya and the Indochinese countries (Peters).

MIGRATION. Nothing recorded. In eastern China migrates in successions of large flocks (La Touche).

GENERAL HABITS. Gregarious; keeps in parties of 5 or 6, or flocks of up to 50 or so. Actions and behaviour typical of the lapwings, e.g. the Redwattled, with which it commonly associates.

FOOD. Mainly insects, worms, molluscs.

VOICE AND CALLS. Seldom heard in winter. 'A harsh version of the Redwattled Lapwing's call' (R. L. Fleming). 'A plaintive *chee-it, chee-it*' (Baker). 'When approached, rises with a cry of "Did all eat?"' (W. Davison).

BREEDING. Extralimital. *Season*, apparently mid May to end June. *Eggs*, 4, peg-top shaped, similar in colour and markings to those of 364. Laid in a slight depression on bare ground.

MUSEUM DIAGNOSIS. Tarsus long and slender, scutellated in front reticulated behind. A small hind toe present; also a lappet at base of bill (lores) as in *V. indicus* and *V. malabaricus*. For details of plumage see Baker, loc. cit.

MEASUREMENTS

in front of each eye. A prominent broad white band from behind eyes running down sides of neck to meet the white underparts. Producer of the well known *Did-ye-do-it?* calls. Sexes alike.

Young (immature). *Above*, black feathers of the head fringed with brown. *Below*, chin, throat and foreneck white; sides of neck

sullied white.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident; migrating altitudinally in spring and autumn (e.g. in N. Baluchistan and NW. Pakistan) and spreading out widely in the monsoon on creation of requisite habitats. Both Pakistans and all India (including Assam north of Brahmaputra river) south through the Peninsula to Kanyakumari, up to c. 2000 m. in the Nilgiris and c. 1800 m. in Kashmir, Kulu etc. Nepal (terai, bhabar, and dun, to c. 1100 m. even in winter. 'Very common during monsoon in Nepal Valley' — Proud), Sikkim terai, Bhutan duars. Affects the neighbourhood of water in open country and cultivation — jheels, tanks, rivers, ditches and puddles. In the rainy season pairs very commonly seen on the grassy shoulders of motor highways.

Extralimital. Eastern Transcaspiia, Iraq, SW. Iran, S. Arabia, Afghanistan.

GENERAL HABITS. Usually keeps in pairs or trios — occasionally small loose flocks of 6 to a dozen — in open well-watered country, sometimes in grassy glades within deciduous forest with rain puddles and pig-wallows. Here often a source of great annoyance to the sportsman, spoiling his stalk by its ceaseless vigilance and frantic screaming, betraying him to the quarry. Somewhat crepuscular and nocturnal, feeding casually during the day but spending most of the time standing about drowsing on a rock amid stream or bund separating fields. Feeds more actively in the early mornings and evenings and throughout the night, especially when moonlit. Runs about with mincing steps in irregular zigzag spurts, dipping forward steeply now and again (with unflexed legs) to pick up a morsel. Flight rather slow, with deliberate flaps and often a rapid fluttering action of the wing-tips, but bird capable of remarkable speed when chasing off an intruder from proximity of its nest or young, and of astonishingly agile turns and twists and other antics when hunted with a hawk.

FOOD. Ants, beetles, caterpillars and other insects, molluscs, and a quantity of vegetable matter.

VOICE AND CALLS. The most familiar and diagnostic is a loud penetrating *Did ye do it? or Pity to do it!* shrieked either placidly or frantically, just once or twice or repeatedly, as occasion demands. Varied by *did-did-did-did*, or *káb-káb-káb-káb* and quite frenzied when accompanying the 'dive-bombing' demonstrations. Both sexes apparently have the same calls.

BREEDING. Season, principally from March to August-September, the peak periods varying locally. *Nest*, a natural depression or scrape in the

PLOVERS

215

SIZE. Grey Partridge +; c. 33 cm. (13 in.).

FIELD CHARACTERS. As of 366, q.v. For subspecies see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Ceylon. Common in the low-country Wet and Dry zones, to c. 300 m. elevation. Affects well-watered open terrain and paddyfields.

GENERAL HABITS, FOOD, VOICE AND CALLS. As in the Indian race (366).

BREEDING. Season, April to August, occasionally March and September (Phillips). *Nest*, site, and eggs as in 366.

MUSEUM DIAGNOSIS. Differs from the Indian race in being somewhat smaller,

and deeper coloured above with the gloss — especially the purple gloss — more pronounced. South Indian birds show some intergrading between the peninsular Indian and Ceylonese forms.

MEASUREMENTS

	Wing	Bill (from skull)	Tarsus	Tail

Lobivanellus atronuchalis 'Blyth' = Jerdon, 1864, Bds. India 3: 648 (Burma)

Baker, FBI No. 2127, Vol. 6: 189

LOCAL NAMES. *Deo duyip* (Cachar); *Salangkak* (Manipur).

SIZE. Grey Partridge +; c. 33 cm. (13 in.).

FIELD CHARACTERS. As of 366, q.v. For subspecies see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Resident. Assam south of Brahmaputra river, Manipur, Mizo (Lushai Hills) and East Pakistan (Surma Valley, Tipperah, Chittagong). Affects well-watered open country and up to c. 600 m. elevation.

Extralimital. Burma, SW. Yunnan, Malay Peninsula and the Indo-chinese countries.

GENERAL HABITS, FOOD. Not different from the Indian race (366).

VOICE AND CALLS. Also similar but recorded as being only a trisyllabic *Did ye do?*, whence its Burmese name *telededu*.

BREEDING. Season, March to June, chiefly March-April. *Nest*, site, and eggs as in the Indian race, the last said to average somewhat darker. Average size of 48 eggs 41.5 x 29.8 mm. (Baker).

MUSEUM DIAGNOSIS. Differs from the Indian race in having the white line down side of neck restricted to a patch on and just behind the ear-coverts, leaving the whole neck black all round. The black neck is divided from the bronze-brown back by a narrow white or lilac band.

MEASUREMENTS. ♂♀ Wing 200-221 mm.; bill (from feathers) 27-32 mm. (Baker).

COLOURS OF BARE PARTS. As in 366.

214

CHARADRIIFORMES

ground sometimes lined with mud pellets or goats' droppings and paraped with bits of dry cowdung or pebbles. Sited on waste or stony land, fallow fields, dry beds of village tanks, and shingle banks or islets in rivers. Some unusual sites recorded, e.g. the flat concrete roof of a residential bungalow in New Delhi, and a heap of ballast between two railway tracks in Ghosana station yard (Rajasthan). Every time a train came in the incubating bird flew up, returning immediately the train left! (McCann, JBNHS 42: 442, photo). Eggs, 4, pyriform or peg-top shaped, variable in coloration but some shade of grey-brown or drab, blotched with blackish. Average size c. 42 x 30 mm. Incubation by both sexes; period 28-30 days. In very hot weather, on sunbaked substrate, the birds regularly wet their breast and belly feathers before taking turns on the eggs. On a high-pitched warning note, *pit*, by the partner incessantly on guard, incubating bird leaves nest and slinks off rising in the air only when some distance away to join its mate in the noisy aerial demonstrations. (For behaviour when incubating see Naik, R. M., et al., 1961, JBNHS 58: 222-30, 3 photos.)

Both eggs and downy chicks superbly camouflaged: on a subdued *pit* or *cluck* command from the parents the chicks instantly squat behind a stone or clod and lie doggo becoming completely obliterated. Immediately they receive the 'all clear' — a series of high-pitched *clucks* — they rise mechanically, as on the press of a button, and resume their feeding actively, completely unperturbed by the recent emergency! The parents also indulge in the 'broken wing' distraction manoeuvres on occasion.

MUSEUM DIAGNOSIS. In common with *V. cinereus* and *V. malabaricus*, possesses curious fleshy wattles in front of eyes. Bill of moderate length: culmen flattened at base; dertrum slightly swollen. Nostrils linear placed in grooves extending over more than half length of upper mandible. Wing long, furnished with a spur at the bend; 2nd primary (as.) longest in both sexes. Tarsus long, reticulated throughout; a small hind toe present. For details of plumage see Baker, loc. cit.; for subspecies, Key.

Chick (in down). 'Upperparts grey-brown mottled with black; behind eyes and round occiput a broad black collar, under this from below eyes, a broad white collar. Pectoral band black; chin and rest of underparts white, tinged with buff on belly and flanks' (Ticehurst).

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	217-238	34-40	65-76	108-125 mm.
♀♀	208-237	33-38	70-77	106-127 mm.
		(from skull)		(SA)

Weight 20 ♂♀ (ad. & imm.) 149-229 (av. 189.3) gm. — BNHS.

COLOURS OF BARE PARTS. Iris red-brown to red; eyelids and wattle crimson-red. Bill red or orange-red, black at tip. Legs and feet greenish yellow to bright yellow claws black.

367. Ceylon Redwattled Lapwing. *Vanellus indicus lankae* (Koelz)

Lobivanellus indicus lankae Koelz, 1939, Proc. Biol. Soc. Washington 52: 82

(Galgamuwa, Ceylon)

Baker, FBI No. 2125 (part), Vol. 6: 186

LOCAL NAMES. *Kiraluwa*, *Kirala* (Sinhala); *Alkatti* (Tamil).

216

CHARADRIIFORMES

369. Spurwinged Lapwing. *Vanellus spinosus duvaucelii* (Lesson)

Charadrius Duvaucelii Lesson, 1826, Dict. Sci. Nat., ed. Levrault, 42: 38 (Calcutta)

Charadrius centralis Wagler, 1827, Syst. Av. no. 2 (Calcutta)

Baker, FBI No. 2124, Vol. 6: 184

Plate 38, fig. 10

LOCAL NAME. *Ngahoihi* = 'fish chaser' (Manipur).

SIZE. Grey Partridge; length c. 31 cm. (12 in.).

FIELD CHARACTERS. General effect unmistakably like Redwattled Lapwing. *Above*, forehead, crown and full occipital crest black. Upperparts chiefly vinous-grey and sandy brown; upper tail-coverts and tail white, the latter black on its terminal half. Primaries and primary coverts black; central secondaries white. *Below*, chin, cheeks and throat black bordered with white; upper breast white shading into vinous-grey on sides of neck and browner grey on lower breast. Centre of abdomen black; rest of underparts white. Sexes alike.

In flight the black wings with a broad white patch or band, together with the contrasting black-and-white patterned head, throat and belly are diagnostic pointers. On ground the hunched posture with body rigid and horizontal and head and neck almost furtively sunk into the shoulders is characteristic.

Young (immature). Undescribed.

STATUS, DISTRIBUTION AND HABITAT. Resident, with some seasonal nomadic movement. East Pakistan and eastern and central India — Assam, Manipur, Bengal, Bihar, Orissa, Andhra, northern and eastern Madhya Pradesh; west in Uttar Pradesh to c. 76°E., Nepal and Sikkim (terai and bhabar and to c. 900 m. alt. in the former even in winter), Bhutan. Not Kashmir as given by Baker. Affects sandbanks and shingle beds in flowing rivers above tidal limits. Normally not at jheels or stagnant waters.

Extralimital. Eastward to SW. Yunnan and N. Vietnam, south to peninsular Thailand and S. Vietnam.

GENERAL HABITS. Normally keeps singly or in pairs; rarely parties of 3 to 6, hardly ever in large flocks. In general effect, ecology and behaviour very similar to other lapwings, especially Redwattled (366) and Peewit (364). Coloration remarkably obliterative in its native environment of dry river sand and shingle (on this colour scheme and its utilization see Hingston, JBNHS 32: 219). Flight seemingly sluggish with deliberate steady flaps, but bird capable of considerable speed on the wing, as well as of swimming and diving when occasion demands. One on a shingle bank apprehending attack by Peregrine was observed launching out in the water, swimming with ease and diving expertly at each stoop of the falcon, remaining submerged for 3 or 4 seconds, bobbing up and then diving again at the second stoop, thus baffling the marauder. The bird then swam ashore and resumed its normal activities (Livesey).

Whether the well-developed pointed spur on the wing is employed in fighting, and how it is used, remain to be shown.

FOOD. Insects, worms, crustaceans — sometimes of considerable size. Also said to take frogs and tadpoles, and 'pursue fish cut off in pools of water'. Eight stomachs examined at Pusa all contained small molluscs only, chiefly *Melania tuberculata* (Mason & Lefroy, 1912).

PLOVERS

217

VOICE and CALLS. A sharp, insistent, high-pitched *did, did, did* several times repeated as the bird rises, sometimes ending with 2 or 3 staccato notes sounding like *did-did-do-weet, did-did-do-weet*. Distantly resembling the Redwattled Lapwing's calls yet quite distinctive.

BREEDING. Season, March to June. Nest, a shallow scrape or form on an exposed sand- or shingle bank in a river — quite in the open, unprotected by stone or bush. Eggs, normally 4 sometimes only 3, very similar to those of the Redwattled Lapwing, olive- or yellowish stone colour, blotched and spotted with shades of brown and black. Average size of 100 eggs 41.1 × 29.4 mm. (Baker). Baker's statement that the female alone incubates needs confirming, as also the incubation period '22 to 24' days.

An elaborate display (nuptial?) has been described on two separate occasions by independent observers with the following sequences: Four birds standing apart on a sandbank in a river; two approach each other slowly; stoop body to horizontal and whirl or spin themselves rapidly round in several complete circles to the accompaniment of vocal clamour; draw themselves bolt upright (in position of penguin or standing man) heads thrust high, and puff out breasts showing off the black-and-white patterned underparts ostentatiously. In this strutting position run or shuffle with short quick steps side by side exactly as if 'dressing by a flank' in military jargon; at times all four birds (only 3 in one case) shuffle side by side thus, almost touching each other. Occasionally one bird bobs his body up and down and squares up to another with a threat of a blow from his wing, without any actual fight resulting. The birds chatter continuously. In one case all four birds actively engaged in the antics, in the other only 3 — the 4th (♀?) seemingly just an uninterested spectator; the latter observation made in September, after the breeding season, the former in March before its commencement (Hingston, JBNHS 32: 219; Stanford, *ibid.* 37: 223-4).

(For a fuller account of habits and breeding biology of the nominate race, see Helversen, O. v., 1963, 'Beobachtungen zur Verhalten und zur Brutbiologie des Spornkiebitzes', *Jour. für Ornithologie* 104(1): 89-96.)

MUSEUM DIAGNOSIS. No lappet on bill. Wing rounded, armed with a long curved spur on the bend or carpal joint; 2nd primary (as.) longest. Tibia bare for c. 20 mm. above joint; tarsus long, slender, reticulated throughout; no hind toe. For details of plumage see Baker, *loc. cit.*

Chick (in down). Undescribed.

Wing spur, × c. 1

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♀	185-205	26-28	c. 64-67	88-94 mm.
	(from feathers)			(Baker)

Weight 3 ♂♂ 164-185, 1 ♀ 143 gm. — BNHS.

Bill (from skull) c. 34-36 mm. — Biswas, SA.

There is no difference in the measurements of the sexes.

PLOVERS

219

or *kankar* (mud pellets). Eggs, 4, of the normal peg-top shape of plovers' eggs, usually arranged in nest with pointed ends inward to occupy least space. Colour, buff to olive-stone, irregularly blotched with dark brown and purplish grey. Average size of 200 eggs 36.4 × 26.9 mm. (Baker). An erythristic type of egg often found which when laid on red laterite soil (as usual but not invariable), proves adaptively coloured in a high degree. Both eggs and downy chicks superbly camouflaged on the bare ground — the latter buffy or fawn-grey, disruptively stippled with black and rufous. A broad white collar on hindneck further disrupts the pattern in an astonishing way, but once spotted, this same feature becomes conspicuous enough thereafter to betray the chick 'freezing' in the open every time. Both sexes share in incubation; period not recorded. As in Redwattled Lapwing the birds regularly wet their belly feathers in very hot weather before taking turns on the eggs. Water carried thus even after hatching of the first chicks evidently for quenching their thirst; possibly also to small chicks after they wander away from the nest. (For observations on incubatory adaptations in this species see Jayakar, S. D. & Spurway, H., 1955, *Zool. Jahrb., Abt. allgemeine Zool. u. Physiol.*: 53-72.)

MUSEUM DIAGNOSIS. Bill slender than in *Vanellus indicus* (366). Tarsus long and slender with transverse shields in front instead of reticulations throughout. No hind toe. 2nd primary (as.) generally longest in both sexes; 1st and 3rd subequal.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	186-205	26-29	60-65	72-84 mm.
♀♀	181-205	28-30	57-62	71-80 mm.
	(from skull)			(SA, HW)

Weight 2 oo? 108, 109 gm. — BNHS.

There is a clinal increase in size from south to north but no difference in coloration.

COLOURS OF BARE PARTS. Iris white to silver-grey or pale lemon-yellow. Bill black, yellow or greenish yellow at base and gape. Legs and feet bright yellow.

Genus *PLUVIALIS* Brisson

Pluvialis Brisson, 1760, Orn. 1: 46; 5: 42. Type, by tautonymy, *Pluvialis aurea*

Brisson = *Charadrius pluvialis* Linnaeus

Squatrola Curvier, 1817 (1816), Règne Anim. 1: 467. Type, by tautonymy, *Tringa squatarola* Linnaeus

Wings long and pointed: first primary (as.) longest. Tail short and rounded. Tarsus covered with hexagonal scales all round; outer and middle toes connected by a small web at their base. Sexes alike but with a distinct breeding plumage sometimes partially seen whilst the birds with us. A small hind toe present in *P. squatarola*; absent in *P. apricaria* and *P. dominica*.

Genus more or less Holarctic.

218

CHARADRIIFORMES

COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs and feet horny brown or reddish black.

370. Yellow-wattled Lapwing. *Vanellus malabaricus* (Boddaert)

Charadrius malabaricus Boddaert, 1783, Table Pl. enlum.: 53

(Malabar Coast, ex Daubenton, pl. 880)

Baker, FBI No. 2128, Vol. 6: 190

Plate 38, fig. 13

LOCAL NAMES. *Zirdi* (Hindi); *Jithiri* (W. Pakistan); *Laori* (Mhow, M.P.); *Chilawa* (Telugu); *Alkatti* (Tamil); *Marjakkanni* (Malayalam); *Kiralawa*, *Kiralā* (Sinhala). **SIZE.** Grey Partridge —; c. 27 cm. (10½ in.).

FIELD CHARACTERS. A leggy sandy brown plover with white belly, black cap, bright yellow lappets of skin above and in front of eyes and bare yellow legs. In flight a white bar (secondaries and greater coverts) on the black wings conspicuous. Above, crown of head ('skull-cap') silky black, surrounded by a thin white line. Upperparts sandy brown; tail white, with a broad black terminal band. Below, chin and throat black; breast sandy brown; rest of underparts white separated from breast by a thin black line. Sexes alike.

Young (immature). Above, pale sandy brown narrowly barred with rather darker brown. Below, chin whitish; throat and upper breast with traces of darker brown marks.

STATUS, DISTRIBUTION and HABITAT. Resident, with some local migratory or nomadic movement away from wetter areas in monsoon; thus appearing in many parts only as a winter (dry-season) visitor. From cis-Indus lower Sind in West Pakistan eastward through N. India to W. Bengal and E. Pakistan. Nepal Valley (occasional). Southward throughout the Peninsula; Ceylon (low-country Dry zone). Affects barren waste land, stubbles, and fallow fields in drier biotope than Redwattled Lapwing. Much less dependent on proximity of water; even near jheels keeps to a higher zone away from muddy shores.

GENERAL HABITS. Very similar to those of the Redwattled Lapwing (366) except that it frequents drier facies and is less dependent on the proximity of water: sometimes the two species occur side by side. Usually met with in pairs, only occasionally in small parties of 5 or 6. On the whole much less noisy and demonstrative than Redwattled. Under excitement the black cap sometimes stands up on the crown like the long erect pile of a silken carpet, reminiscent of a miniature steep-sided tableland!

FOOD. Chiefly insects — grasshoppers, beetles, etc.

VOICE and CALLS. Not like Redwattled Lapwing's as stated by Baker but a plaintive long-drawn *ti-ee, ti-ee* punctuated by a high-pitched, quick-repeated *twit-twit-twit*. Uttered chiefly when nest or chicks approached, the parents circling agitatedly overhead, diving at and making as if to strike the intruder.

BREEDING. Season, over most of its range March-April to July; occasionally (as in Ceylon) to August. Nest, an unlined shallow scrape on dry open sunbaked fallow- or waste land, sometimes encircled by a parapet of pebbles

220

CHARADRIIFORMES

371. Blackbellied or Grey Plover. *Pluvialis squatarola* (Linnaeus)

Tringa Squatarola Linnaeus, 1758, Syst. Nat., ed. 10, 1: 149 (in Europa = Sweden)

Charadrius hypomelus Pallas, 1776, Reise Russ. Reichs 3: 699 ('Colit paludes borealis orae'). New name for *Charadrius helvetica* Linnaeus

Cf. Delacour, J., 1951, op. cit.: 6

Baker, FBI No. 2102, Vol. 6: 156

Plate 38, fig. 6 and Plate 44, fig. 1

LOCAL NAME. *Bādā bātēn* (Hindi, Bengali).

SIZE. Grey Partridge; length c. 31 cm. (12 in.).

FIELD CHARACTERS. Winter (non-breeding plumage, as commonly seen in India). Above, forehead and lores white speckled with black; sides of head and neck white streaked with brown. Rump, upper tail-coverts and tail white narrowly barred with brown. Rest of upperparts dark brown conspicuously scalloped with pale brownish grey. Below, foreneck, breast and flanks streaked and spotted with brown; rest of underparts white. Sexes alike.

Summer (breeding plumage). Above, black profusely barred and spangled with silvery grey or pearly white. Below, from chin to middle of abdomen black; lower abdomen and under tail-coverts white. Sexes alike. In flight a large black oval patch (axillaries) under the wing (armpit), the whitish rump and tail and whitish wing-bar are conspicuous and diagnostic in both winter and summer plumages.

STATUS, DISTRIBUTION and HABITAT. Winter visitor chiefly to the seaboard — Pakistan (Makran, Sind), Kutch, Saurashtra, down the western side of the Peninsula and up the eastern coast. Ceylon (commoner along the NW coast); Andaman, Nicobar, Laccadive and Maldive Islands. Less commonly to inland waters — erratically or as a straggler — mostly on migration passage

Pluvialis squatarola

■ Breeding range ▨ Winter

PLOVERS

221

in autumn and spring. Recorded thus in Kashmir, Uttar Pradesh, Bihar, Nepal, Assam, Rajasthan, Madhya Pradesh and Deccan. Doubtless also occurs inland elsewhere. Affects sandy seashore between the tidemarks, and mudflats by lagoons, estuaries and tidal creeks.

Extralimital. Breeds on the Arctic tundra of Europe and Asia from the Kanin Peninsula to E. Siberia; Kolguev, Great Lyakov and Wrangel Is. (also in Arctic N. America). In the Old World migrates south through Europe and Asia to winter quarters in Africa, Madagascar, India, Burma, Thailand, Malaya, etc.

MIGRATION. No ringing data. Arrives on the Sind coast (Karachi harbour) in early August; leaves by end April, earlier than most waders. Latest date in two successive years 6 May (Ticehurst). Small numbers in non-breeding plumage stay behind and may be seen in the winter quarters in all months. They moult into the non-breeding dress again in autumn.

GENERAL HABITS. Gregarious. Sometimes seen in very large flocks; more commonly of 20 to 30 birds. Usually pairs or parties of 5 or 6 mixed with redshanks, dunlins, and other waders. Keeps more to the open sandy seashore and tidal mudflats than Golden Plover, which prefers marshy meadows slightly above this zone. Occasionally seen at freshwater pools not far from tidal influence. Actions on ground typical — running about in short spurts with mincing steps, dipping forward body obliquely to pick up food, and so on. Flight very swift with much agile turning, twisting and banking in unison, as characteristic of the gregarious plovers. Always excessively wary and difficult to approach. Is good eating and a coveted sporting bird.

FOOD. Almost entirely animal: insects, tiny molluscs and crustaceans, worms, etc. Occasionally seeds of marsh plants.

VOICE AND CALLS. A shrill musical pipe not unlike the Golden Plover's, constantly uttered in flight; occasionally while feeding. Alarm note a double whistle repeated 2 or 3 times at intervals of a couple of seconds.

BREEDING. Extralimital. Normal clutch 4 eggs laid in a depression in the tundra moss, June-July.

MUSEUM DIAGNOSIS. Unlike Golden Plover possesses a small hind toe and claw. Nostrils linear placed fairly close to base of bill in a rather deep, broad groove. For description of plumage see Baker, loc. cit.; for further details of morphology (also bionomics), Witherby, 1940, 4: 377-81.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	182-202	27-32	43-50	69-82 mm.
♀♀	186-202	27-31	—	—
	(from feathers)			(Witherby)

Weight 7 oo? (winter) 138-188 (av. 164) gm. — BNHS.

COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs and feet dusky grey.

372. Golden Plover. *Pluvialis apricaria apricaria* (Linnaeus)

Charadrius apricarius Linnaeus, 1758, Syst. Nat., ed. 10, 1: 150 ('Oelandia, Canada' restricted type locality, Lapland ex Fn. Svec., where based on a Rudebeck drawing)

Cf. Lönnberg, E., 1931, *Ibis* 306-7.

Baker, FBI No. 2119, Vol. 6: 176

Plate 44, fig. 5

LOCAL NAME. *Chhōla bātān* (Hindi).

PLOVERS

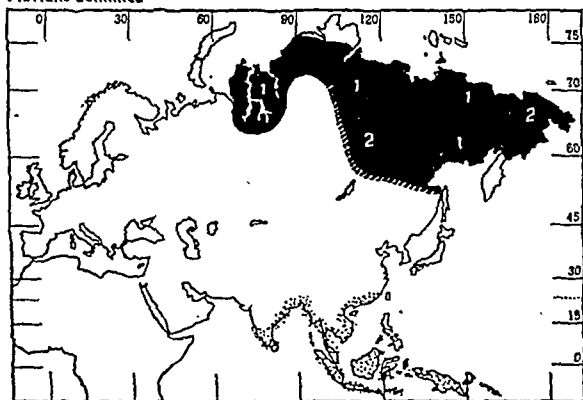

223

In flight the very narrow and pointed wings and fanned-out tail (as in a pigeon) are suggestive pointers. Smaller size, absence of white wing-bar, and smoky grey underwing and axillaries (v. white underwing and black axillaries) distinguish it from Grey Plover; from Golden Plover (372) by colour of underwing and axillaries, which in that species are pure white.

Summer (breeding). Above, forehead white running back in a broad band over the eyes and down sides of neck and breast. Rest of upperparts blackish brown spangled with white and golden yellow. Below, from throat to vent black.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor, chiefly September-October to April. Most abundant in Assam (N. Cachar), Manipur, East Pakistan and eastern India (West Bengal, N. Bihar), more thinly diffused westward to West Pakistan (Sind, N.W.F. Province) and southward through the Peninsula to Mysore, Madras, and Kerala. Nepal (passage migrant?); Ceylon (regular and abundant in the low-country Wet and Dry zones,

Pluvialis dominica

■ Breeding range ▨ Winter 1 *P. d. fulva* (373).
2 *P. d. dominica* (RE).

wandering up to c. 1300 m. in the hills); Andaman, Nicobar, Laccadive and Maldiva islands. Affects muddy shores of jheels and coastal lagoons, ploughed, freshly sown and partially inundated fields, wet grazing grounds and maidans, tidal mudflats, etc.

Extralimital. Breeds in N. Siberia from the Yalmal Peninsula to the Yenisey river (overlapping the range of *P. a. apricaria*), east to W. Alaska, south in E. Siberia to the Stanovoy Mountains and Kamchatka. Winters in India, Burma, Thailand, Malaysia, Indochinese countries, S. China; also in Oceania, Australia, and Hawaii Is.; straggles west to E. Africa and east to the Pacific coast of N. America.

222

CHARADRIIFORMES

SIZE. Grey Partridge —; length c. 27 cm. (10½ in.).

FIELD CHARACTERS. Similar to Grey Plover (371).

Winter (non-breeding). Like the commoner Eastern Golden Plover (373), q.v., also without a white wing-bar, but with brighter black and gold-spangled upperparts. In flight the pure white underwing and axillaries distinguish it from the above which has them greyish brown and from Grey Plover (371) in which the underwing is white and axillaries black. Seen alike in all plumages.

Summer (breeding). Brightly gold-spangled above, black below. More or less as Eastern Golden Plover (373) and doubtfully distinguishable from it except in flight, again by the pure white v. sooty grey underwing and axillaries.

STATUS, DISTRIBUTION AND HABITAT. Winter vagrant. Singly or in small flocks mixed up with Eastern Golden Plover and other waders. Odd specimens identified from West Pakistan (Baluchistan and Sind — Gwadar on Makran coast, Karachi and Schwan) and from Uttar Pradesh (Lucknow), and Assam (Dibrugarh). Doubtless sometimes overlooked in sportsmen's bags of Golden Plover. Affects muddy shores of jheels, wet pastures, and grassy maidans.

Extralimital. Breeds in Arctic Europe and Asia from Scandinavia to the Yenisey river, south to Latvia and W. Siberia. Winters chiefly in the Mediterranean countries, straggling widely.

GENERAL HABITS AND FOOD. As in 373.

VOICE AND CALLS. A mournful but not unpleasant musical disyllabic whistle *loo-ee* constantly repeated, chiefly on the wing. Said to be shriller than of Eastern Golden Plover.

BREEDING. Extralimital. Similar to 373.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumage phases and morphology (also bionomics), Witherby, 1940, 4: 364-9.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	188-192	22-25	38-41	60-76 mm.
♀♀	180-191	21-25	—	—
				(Witherby)

COLOURS OF BARE PARTS. Iris brown. Bill, legs, and feet black.

373. Eastern Golden Plover. *Pluvialis dominica fulva* (Gmelin)

Charadrius fulvus Gmelin, 1789, Syst. Nat., 1(2): 687 (Tahiti)

Baker, FBI No. 2120, Vol. 6: 178

Plate 38, fig. 7 and Plate 44, fig. 7

LOCAL NAMES. *Chhōla bātān* (Hindi); *Sona bātān* (Bengal); *Olyiyā, Rana watanā* (Sinhala); *Kōtān* (Tamil); *Manal kōzhi* (Malayalam); *Nong-gāng* (Manipuri).

SIZE. Grey Partridge —; length c. 24 cm. (9½ in.).

FIELD CHARACTERS. A typical plover with the thick rounded head and short pigeon-like bill, swollen at base.

Winter (non-breeding). Above, mottled brown, white, and golden yellow. Below, whitish, the breast mottled with brown, grey, and yellow.

224

CHARADRIIFORMES

MIGRATION. No ringing data. Little known beyond that the vanguard already arrives in the first half of August at places as distant from one another as Assam, Ceylon, and the Nicobar islands; mostly young birds of the year accompanied by a few adults in remnants of the breeding plumage. The species is well established over most of its winter range by mid-September, though Ludlow found it still on migration passage on the marshy flats of the Tsangpo river in SE. Tibet and around Lhasa at the end of September (*Ibis* 1944: 386; 1950: 43), and Scully in the Nepal Valley in September-October (SF 1880, 8: 351). Thus autumn migration is apparently a long-drawn process. Return emigration commences by mid-April, but small numbers in partial summer dress commonly linger on till end May or later — a party of 4 in full breeding plumage observed in the Bombay neighbourhood on 17 July (Sálim Ali). Odd birds in non-breeding plumage stay behind all year. Known to be one of the world's longest distance non-stop migrants, flying continuously over more than 3200 km. of the open ocean between the Aleutian islands and Hawaii in an estimated period of 35 hours under favourable weather conditions.

GENERAL HABITS. Gregarious. Usually in flocks of 20 to 50 by itself or in association with other waders. Larger close-packed flocks of several hundred strong not uncommon in eastern India, especially in autumn and spring. Excessively wary and difficult to approach, a feeding flock usually posting sentries at its periphery who give the alarm long before the birds can be approached within gunshot. The flock rises *en masse* almost simultaneously, flying fairly low and at great speed, turning, twisting, and banking in the air in regimented unison: On touching down after a flight the bird suddenly closes its wings and comes to a dead stop, assuming an erect stance. Though so extremely cunning and wide awake on the ground the birds are curiously simple when on the wing. When driven by beaters will often fly past or over an unconcealed gunner with little suspicion till bitter experience has proved their folly. They are good eating and rank high as sporting birds.

FOOD. Grasshoppers, beetles and other insects, tiny molluscs, crustaceans, and worms. Possibly berries and seeds of marsh plants as on its breeding grounds.

VOICE AND CALLS. The only calls commonly heard in winter are a clear single whistle *teeh*, or a high-pitched disyllabic *tee-ee* or *tee-tew*, much richer than the Greenshank's.

BREEDING. Extralimital. Similar to 373.

MUSEUM DIAGNOSIS. Axillaries greyish brown as against pure white in *P. apricaria*. For description of plumage see Baker, loc. cit.; for details of plumage phases and morphology (also bionomics), Witherby, 1940, 4: 374-6.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail

PLOVERS

227

N. Baluchistan (Quetta, Chagai), Nepal, Rajasthan (Jodhpur, Sambhar Lake). Some non-breeding birds stay back all summer. Affects sandy sea beaches between the tidemarks, mud flats, salt pans, and estuaries.

Extralimital. Breeds on the Kirghiz Steppes and in NW. Mongolia, putatively across Asia from Transcaspiya to Korea, south to Iran and possibly to the Red Sea. Winters on the coasts of southern Asia south of Turkestan and Korea, to S. Africa, India, Burma, Thailand, Malaysia and Australia. (For details of range see Vaurie, C., 1965, *Bds. Pal. Fauna* 2: 381.)

MIGRATION. No ringing data. Arrives on the coasts of W. Pakistan and NW. India in early August, largely in worn breeding dress; departs chiefly in April-May (some as late as June) when most adults are again in freshly moulted partial or complete breeding dress, and very fat. A few non-breeding individuals remain in the winter quarters throughout the year without any trace of breeding plumage or migratory fat.

GENERAL HABITS. A truly maritime species. Gregarious; in small parties or large flocks usually in association with Lesser Sand Plovers, dunlins, and other waders. Behaviour typical of the family and very like the commoner Lesser Sand Plover (384), q.v.

FOOD. Small crabs, marine worms, insects. Among the last the beetle *Sphenoptera aenea* (Buprestidae) has been identified.

VOICE AND CALLS. Very silent in winter. Except for a low *trrrt* when flying off, nothing recorded.

BREEDING. Extralimital. Apparently similar to Lesser Sand Plover.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit. In non-breeding and immature plumage could be confused with *Charadrius hiaticula* (378), but its longer tarsus (dusky greenish or orange-yellow) and longer bill will distinguish it at all times.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
20 ♂♀	134-150	24-27	35-38	48-58 mm.
		(from feathers)		(Ticehurst, SA)

Weight 8 ♂♀ (winter) 65-84 gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet dusky greenish (sometimes almost sage-green) to olive-slate colour.

375. Australian Blackfronted Plover. *Charadrius melanops* Vieillot

Charadrius melanops Vieillot, 1818, Nouv. Dict. Hist. Nat. 27: 139

('Terres Australes' = New South Wales *apud* Mathews)

Omitted in Baker

SIZE. Lesser Sand Plover (384) —; length c. 16-17 cm. (6-6½ in.).

FIELD CHARACTERS. The distinctive black and white patterning on the head, very different from the Ring Plover group, and prominent maroon-chestnut scapulars should be diagnostic. Sexes alike. (For description of plumage see Museum Diagnosis, below.)

STATUS, DISTRIBUTION AND HABITAT. Vagrant. A single specimen collected by Dr T. C. Jerdon at Pulicat Lake near Madras in June (i.e. during the austral winter). Breeds in Australia and Tasmania where it frequents muddy river banks and shores of lakes and inlets.

226

CHARADRIIFORMES

374. Large Sand Plover. *Charadrius leschenaultii* Lesson

Charadrius Leschenaultii Lesson, 1826, Dict. Sci. Nat., ed. Levrault, 42: 36

(Pondicherry, India)

Baker, FBI No. 2118, Vol. 6: 175

Plate 40, fig. 6

LOCAL NAMES. None recorded.

SIZE. Grey Partridge —; length c. 22 cm. (8½ in.).

FIELD CHARACTERS. Winter (non-breeding). *Above*, forehead and supercilia fulvous-white, with a broad brown band from lores under eye to ear-coverts. Rest of upperparts ashy brown. *Below* white, with a pale brown band across breast generally broken in the middle.

In flight a narrow whitish bar on the pointed wings, and white-tipped tail-feathers noticeable.

Summer (breeding). *Above*, crown, hindneck and sides of neck rufous; no pale supercilia; forehead black with a white spot on each side; a black patch below eye thinning to ear-coverts. *Below* white, with a broad rufous band across upper breast continuous with sides of neck. Female. Black on head replaced with blackish speckling. Chestnut parts very pale.

Sexes alike in winter.

Young (immature). Like adult in winter plumage, but with faint buff edges to the upperparts and pale edges to wing-coverts.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to the seaboard of West Pakistan (Makran, Sind), India (Gujarat, Maharashtra, Kerala,

Charadrius leschenaultii

■ Breeding range ■ Winter

Madras, Andhra, Orissa, W. Bengal), and East Pakistan. Also Ceylon, Maldiva, Andaman, and Nicobar islands. Except perhaps in W. Pakistan, less abundant than Lesser Sand Plover (384) with which it is usually associated. Rare inland, and apparently only on migration passage: recorded in

228

CHARADRIIFORMES

MUSEUM DIAGNOSIS. *Above*. Crown brown; forehead and a stripe commencing at eye and passing over ear-coverts round hindneck black. A conspicuous white stripe over eyes continuing round hindneck separating the black band from crown. Back and wings (tertiaries) brown; scapulars maroon-chestnut; greater coverts white-tipped forming an obscure band across wing; primaries black. Middle pair of tail-feathers brown at base black at tip: next three pairs white at base passing into blackish brown and largely white-tipped. Remaining rectrices entirely white. *Below*, a broad black band across breast, starting from the black ear-coverts, encroaching somewhat towards abdomen in its middle. Throat, abdomen, and under tail-coverts white. (After Gould, *Birds of Australia*.)

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
		(from feathers)		
♂♂	110-112	15-17	23-25	53 mm.
♀♀	c. 109	—	—	—
				(SDR)

COLOURS OF BARE PARTS. Iris dark brown; eyelids bright red. Legs and feet pale fleshy to orange-flesh.

CHARADRIUS ASIATICUS Pallas

Key to the Subspecies

- Smaller; wing under 152 mm.; axillaries white.....*C. a. asiaticus*
 Larger; wing over 152 mm.; axillaries light brown.....*C. a. nerodius*

376. Caspian Sand Plover. *Charadrius asiaticus asiaticus* Pallas

Charadrius asiaticus Pallas, 1773, Reise Russ. Reichs 2: 715

(Salt Lakes of the South Tartar steppes)

Baker, FBI No. 2104, Vol. 6: 158

Plate 40, fig. 7

LOCAL NAMES. None recorded.

SIZE. Grey Quail ±; length c. 19 cm. (7½ in.).

FIELD CHARACTERS. Winter (non-breeding). Difficult to tell from Lesser Sand Plover (384) of the same size, but when together should be noticeable as somewhat higher on the legs. *Above*, forehead, supercilia, lores, and cheeks buffy white. A brown patch behind eye to ear-coverts. Back and upperparts brown. Tail-feathers brown, darker near end and tipped white. *Below*, chin and throat buffy white continuing from cheeks; foreneck and breast brown; rest of underparts white. Underwing mixed brown and white; axillaries pure white. Sexes alike.

Summer (breeding). Foreneck and upper breast chestnut, separated from white lower breast and abdomen by a black band.

Young (immature). Upperparts narrowly scalloped with dull rufous.

STATUS, DISTRIBUTION AND HABITAT. Vagrant. A single specimen shot near Ratnagiri on the west coast in c. 1880, another in Ceylon in February 1951, and a pair in the Maldiva Is. in November 1958 constitute the only authentic records for our area. Sight-recorded in Ceylon (Norris, C. E., 1964, *Loris* 10: 119). Possibly less rare but overlooked. Affects sea coast and mudflats, but said to prefer grassy plains inland.

PLOVERS

229

Charadrius asiaticus

■ Breeding range ▨ Winter
1 *C. a. asiaticus* (376).
2 *C. a. veredus* (377).

Extralimital. Breeds from the lower Volga in SE. Russia to Dzungaria south to E. Iran and the Tian Shans. Migrates through Iran, Arabia and eastern Africa; winters chiefly in S. Africa — Peters.

GENERAL HABITS AND FOOD. Unrecorded in India; presumably as of the Lesser Sand Plover.

VOICE AND CALLS. 'A plaintive treble whistle' (Baker). 'A whistling ku-wit' (Meinertzhagen).

MUSEUM DIAGNOSIS. Distinguished from Lesser Sand Plover (384) by its longer tarsus. Shafts of all primaries usually white. For details of plumages see Baker, loc. cit.; for plumage phases and morphology (also bionomics), Witherby, 1940, 4: 381-3.

MEASUREMENTS	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	141-155	19-23	37-41	49-60 mm.
♀♀	140-150	20-23	—	—
				(Witherby)

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet dusky olive.

377. **Eastern Sand Plover.** *Charadrius asiaticus veredus* Gould

Charadrius veredus Gould, 1848, Proc. Zool. Soc. London: 38
(Northern Australia)

Baker, FBI No. 2105, Vol. 6: 159

LOCAL NAMES. None recorded.

SIZE. Grey Quail +; length c. 24 cm. (9½ in.).

PLOVERS

231

line above black forecrown-band, and orange-yellow (v. dusky-olive or greenish yellow) legs; in flight by presence of a narrow white wing-bar (lacking in 380). Sexes alike.

Young (immature) doubtfully possible to tell in the field from young 380.

STATUS, DISTRIBUTION AND HABITAT. Straggler or very rare winter visitor; possibly sometimes confused by observers with Little Ringed Plover, and in immature plumage with Lesser Sand Plover. So far recorded with specimens only from Gilgit (1881, SF 9: 359), Sultanpur near Delhi (1879, SF 8: 197), and Maldiv Islands (1958, JBNHS 60: 571). Authentically sight-recorded: Karachi harbour (C. B. Ticchurst, *Ibis* 1923: 655), Jaffna Peninsula, Ceylon (G. M. Henry, 1944, *Loris* 3: 132).

Extralimital. 'Breeds on the Arctic tundras of northern Scandinavia, Finland, N. Russia and N. Siberia to the Chuckchi Peninsula. Winters chiefly along the coasts and islands of the NE. Mediterranean and the coasts of E. Africa . . . — Peters.

GENERAL HABITS, FOOD, VOICE AND CALLS. Not recorded in India. Elsewhere noted by SA as a full, liquid *tootit* (disyllabic), lower pitched than the (monosyllabic) *phiu* or *pheoo* of Little Ringed Plover (379, 380).

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for description of plumage phases, morphology (also bionomics) of the nominate race and of *C. h. tundras* (which is decidedly darker and also slightly smaller), Witherby, 1940, 4: 347-53.

Black pectoral band much broader, legs and bill coarser, and feet larger than in *Charadrius dubius*. For other distinguishing characters of *hiaticula* from *C. dubius*, *C. mongolus* and allied plovers see A. O. Hume, 1879, SF 8: 197-201.

MEASUREMENTS of breeding birds from Siberia and N. Norway:

	Wing	Bill	Tarsus	Tail
♂♂	122-132	13-15	24-27	55-61 mm.
♀♀	125-129	13-15	—	—
		(from feathers)		(Witherby)

Weight 1 ♂ 42 gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown; eyelids yellow. Bill orange-yellow, black at tip. Legs and feet orange-yellow.

CHARADRIUS DUBIUS Scopoli

Key to the Subspecies

Smaller; wing 102 to 114 mm. *C. d. jerdoni*
Larger; wing 115 to 121 mm. *C. d. curonicus*

379. **European Little Ringed Plover.** *Charadrius dubius curonicus* Gmelin
Charadrius curonicus Gmelin, 1789, Syst. Nat. 1(2): 692 (Kurland)

380. **Indian Little Ringed Plover.** *Charadrius dubius jerdoni* (Legge)
Aegialitis jerdoni Legge, 1880, Proc. Zool. Soc. London: 39 (Ceylon and middle India). New name for *Aegialitis minuta* Jerdon, nec *Charadrius minutus* Pallas
Baker, FBI Nos. 2114, 2115, Vol. 6: 171
Plate 40, fig. 3 and Plate 41, fig. 2

LOCAL NAMES. *Zerra*, *Mitrad* (Hindi); *Jiria* (Bengal); *Kola kaffi* (Kashmiri); *Bytu ulanka*, *Ricca* (Telugu); *Punchi olbjaya* (Sinhala); *Sinna kittān* (Tamil); *Motira Mēchi* (Malayalam).

CHARADRIIFORMES

230

FIELD CHARACTERS. Very like Caspian Sand Plover (376) but larger.

Winter (non-breeding). Above, supercilia less distinct; hindneck paler than crown or back. Sexes alike. In flight the light brown underwing and axillaries are suggestive clues.

Summer (breeding). Above, whole head and neck white excepting a brown nape patch; a brown band from behind eye over ear-coverts to nape. Below, throat white; foreneck rufous (connected with brown nape-patch), turning to chestnut on upper breast and sides of breast. A black band separating chestnut breast from white of rest of underparts.

Young (immature) have the upperparts scalloped with rufous. Below, brown feathers of breast with dark centres.

STATUS, DISTRIBUTION AND HABITAT. Vagrant. A single example (in winter plumage) collected in the Andamans in May 1872. No other record within our limits.

Extralimital. Breeds in Mongolia and N. China. Migrates through China and Japan and winters in the Sunda Islands, Celebes, Moluccas, and Australia — Peters.

GENERAL HABITS AND FOOD. As of Caspian and Lesser and Large Sand Plovers.

VOICE AND CALLS. 'When disturbed utters a sharp whistling note' (Cayley, Australia).

BREEDING. Extralimital.

MUSEUM DIAGNOSIS. In winter plumage distinguishable from *Charadrius mongolus atrifrons* (384) by larger size and longer tarsus; from *C. leschenaultii* (same size) by colour of shafts of the primaries. In *C. a. veredus* whole shaft of first primary (as.), white; a portion of second primary usually white but occasionally second primary all brown like the rest; in *leschenaultii* whole shaft of first primary and all but the tips and bases of the others are white. For details of plumage see Baker, loc. cit.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	153-167	22-24	c. 44-46	59-64 mm. (Baker)

COLOURS OF BARE PARTS. Iris hazel. 'Bill olive-brown. Legs pale brownish flesh colour; feet washed with grey, blackish on joints' (Swinhoe).

378. **Eastern Ringed Plover.** *Charadrius hiaticula tundras* (Lowe)

Aegialitis hiaticula tundras Lowe, 1915, Bull. Brit. Orn. Cl. 36: 7

(Valley of the Yenesei)

Baker, FBI No. 2112, Vol. 6: 168

Plate 40, fig. 2 and Plate 41, fig. 1

LOCAL NAMES. None recorded.

SIZE. Grey Quail ±; length c. 19 cm. (7½ in.).

FIELD CHARACTERS. Very like Little Ringed Plover (380), q.v. — also with a double collar on hindneck (the upper white, the lower black), black pectoral band, and bold black-and-white head markings. Distinguished from it at rest chiefly by somewhat larger size, absence of the thin white

232

CHARADRIIFORMES

SIZE. Lesser Sand Plover ±; length c. 17 cm. (6½ in.).

FIELD CHARACTERS. A typical little plover with thick round black-and-white patterned head, bare yellowish legs and short pigeon-like bill. Above,

forehead white; forecrown black, separated from the sandy brown crown by a thin white line running back over eyes and ear-coverts. A black band from lores enclosing yellow-rimmed eye and ear-coverts. A double collar on hindneck (the upper white, the lower black) separating crown from sandy brown upperparts. Below, chin, throat and foreneck white narrowing on sides of neck into the white collar; black nuchal collar continuing down into a pectoral band across upper breast. Rest of underparts white. Sexes alike.

Absence of white wing-bar (in flight), and yellowish v. brownish grey legs distinguish it from Kentish Plover (381, 382) in comparable plumage.

Young (immature). No clear-cut black and white markings on head or breast, these being replaced by brown. The black pectoral band when first assumed has whitish fringes.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Status of the races uncertain since their separation rests solely on slightly larger wing in *curonicus*; impossible to discriminate the two without specimens in hand, therefore they are both combined here.

C. d. curonicus. Breeds for certain in West Pakistan (Quetta Valley, N.W.F. Province (?)) and Kashmir to c. 1500 metres and possibly higher elevations (Ladakh ?). Winter visitor and/or on migration passage (August/September to April/May) over practically our entire area as far east as the Naga and Mishmi Hills and including Andaman Is. and Ceylon. Recorded (presumably this subspecies) on passage in Chitral (April) and Kohat (February to mid May), as well as breeding abundantly in the Kurram Valley from May onwards (Perreau), and about Thal (Rattray). Double passage migrant, October and April, in Punjab Salt Range (Waite).

Extralimital. 'The greater part of Europe and N. Asia from lat. 62°N. in Sweden, 67°N. in Finland, the White Sea, lat. 60°N. in Asia, south to NW. Africa, Egypt, Kashmir, N. China and N. Japan; Island of Madeira. Winters in Africa south of the Sahara, Arabia, India, S. China, the Malay Archipelago and Papuan Islands' (Peters).

C. d. jerdoni. Resident throughout the subcontinent from the Himalayan foothills to Kanyakumari, and from Sind to Assam. Nepal; Ceylon. Moves about locally with water conditions.

Extralimital. 'Burma, Thailand, Malay Peninsula, Indochina, New Guinea, Bismarck Archipelago, apparently also the Greater and Lesser Sunda Islands' (Peters).

Affects shingly banks of rivers, streams and tanks, wet grazing grounds, the seashore between tidemarks, and tidal mudflats and estuaries.

GENERAL HABITS. Keeps in pairs or small scattered feeding parties and flocks of 6 to 12 or more, either by itself or mixed with other small waders.

PLOVERS

233

Runs about with rapid mincing steps, head partly drawn into the shoulders, in short zigzag spurts punctuated by pauses to pick up some titbit with the peculiar steep 'hinged to knee-joint' forward tilt of the body characteristic of the family. Has a clever technique of stampeding tiny insects and crustaceans lying doggo in unevennesses of the ground by drumming or tapping with the toes of one foot in a rapid vibratory motion. Success of this manoeuvre evident from the frequency of the darting forward 'dips' to snatch the fleeing refugees, immediately resulting. In its native environment its colour pattern is astonishingly disruptive, making the bird quite invisible even at close range unless it moves. Though scattered over a wide area when feeding the birds will rise more or less simultaneously on alarm and fly off in a compact agile flock turning and twisting in the air in regimented unison, their white undersides flashing in the sun as they bank and wheel. The flight, attained by rapid strokes of the pointed wings, is swift but seldom more than a few metres above ground.

FOOD. Insects (weevils, beetles, dipterous larvae), worms, tiny crabs, etc. Among stomach contents the following insects have been identified: *Chrotonotus* sp. (Acrididae), *Hypera variabilis* (Curculionidae), *Scleron denticolle* (Tenebrionidae), *Chrysopa* larvae (Hemeroptera).

VOICE AND CALLS. A short rather plaintive single whistle *phiu* or *phewo* constantly uttered in flight; noticeably higher pitched and thinner-sounding than the full liquid double-noted *toot* of Ringed Plover (378).

BREEDING. *Season.* *C. d. curonius* in Kashmir, April-May. *C. d. jerdoni* in continental and peninsular India chiefly March to May; in South India, December to June, chiefly March, April and May; in Ceylon, June and July, occasionally August. *Nest,* a shallow unlined depression or scrape on a shingle bank or islet in a stream, or in a dry gravelly river-bed; usually in the open, sometimes near a bush or boulder. *Eggs,* 4, of the typical peg-top shape of plovers' eggs — broad at one end, abruptly pointed at the other. Variable in coloration from buffish stone to greenish grey with hieroglyphic-like squiggles and scrawls and spots of dark brown and phantom purplish markings. Average size of 100 European eggs of *curonius* 29.8 × 22.1 mm. (Jourdain); of 8 taken in Kashmir 28.9 × 21.5 mm. (Osmaston); of 60 *jerdoni* 27.5 × 20.7 mm. (Baker). Both sexes share in incubation and tending the chicks, brooding them against rain and performing 'broken-wing' distraction displays to lead off suspicious intruders. Incubation period c. 22 days.

The nuptial display is a remarkable performance described by two independent observers with the following sequences:

1. A pair feeding. Male flattens body horizontally, partially fluffs out feathers on sides of breast, lowers head (neck telescoped into shoulders and with bill pointing at female), scuttles up to her. She moves away in the same manner, leading him on. After a few metres female halts. Male comes up and with bill almost 'digging her in the ribs' rapidly vibrates his fanned-out tail up and down, at the same time prancing quickly from one foot to the other. After about 5 seconds of this hops on to female's back, she still with body horizontal and legs upright. Stands with unflexed legs on female's back and repeats the shivering for over 10 seconds. Female now tilts forward raising her posterior and quick copulation takes place. Male slips off female's

PLOVERS

235

381. Kentish Plover. *Charadrius alexandrinus alexandrinus* Linnaeus

Charadrius alexandrinus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 150

(Egypt, ex Hasselquist)

Baker, FBI No. 2106, Vol. 6: 161

Plate 40, fig. 4 and Plate 41, fig. 3

LOCAL NAMES. Unspecific and general. *Sinna kōtān* (Tamil); *Manal kōchi* (Malayalam).

SIZE. Grey Quail —; Lesser Sand Plover ±. Length c. 17 cm. (6½ in.).

FIELD CHARACTERS. Winter (non-breeding). ♂ ♀ very similar to immature Little Ringed Plover, and not easily distinguished from it. But blackish v. yellowish legs, narrower brownish stripe through eye, white forehead continued unbroken as supercilium, and a small dark patch on each side of upper breast v. a complete pectoral band, are leading pointers.

Summer (breeding). Male: Crown bright rufous, and head markings more contrasty. White collar on hindneck not separated from back by a black band as in Little Ringed Plover. Female more or less as in winter, but when freshly moulted has edges of feathers of the crown and breast-patches rufescent.

C. hiaticula

C. alexandrinus

In flight a narrow white wing-bar and more prominent white sides of tail readily distinguish it from Little Ringed Plover at all times.

Young (immature). Like female but with the upperparts narrowly scalloped with sandy buff.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION AND HABITAT. Breeds, as so far proved, in West Pakistan (Baluchistan, Sind), northern India (N. Bihar — Darbhanga dist.), Gujarat — Bhavnagar, Porbunder, Kharaghoda (race presumed). Doubtless also elsewhere and more widely. Winter visitor to the rest of India (recorded as rare in Assam [N. Cachar] and Manipur), Nepal terai, Ceylon, Maldives and Laccadive islands. Affects the sea coast (mostly); also shingly river banks inland.

Status of this race and the next uncertain as winter sightings racially inseparable, and breeding records outside W. Pakistan not authenticated by skins.

Extralimital. Breeds on the Canary, Madeira, Azores, and Cape Verde Islands, south coast of England and the greater part of Europe and C. Asia from Sweden and Latvia east to Korea, south to the northern Sahara, Egypt, Arabia, and Sind. Migrates in winter to tropical and southern Africa, India, S. China, Japan, Formosa and the Sunda Islands (Peters).

234

CHARADRIIFORMES

back and moves off some distance in same 'furtive' manner, and resumes feeding (Sálim Ali).

2. A female feeding. Male comes flying over with rapidly beating wings, calling excitedly *sweet-you, sweet-you, sweet-you*. Lands nearby, fluffs out side feathers of breast, runs towards her pointing his bill as if to chase her off. She trots away and halts at a short distance, he follows at a crouching run. When a few centimetres away he straightens out of his crouch, draws himself to his full height rapidly goose-stepping the intervening distance, stiffly raising one leg in front of him then the other in 'a curious, comical, preposterously cock-of-the-walk performance'. The rapidly goose-stepping legs look from the side like a pair of scissors snipping away at speed. On his close approach female crouches slightly while he advances waving his legs in the air. Finally male jumps on female's back and stands ('perhaps 20 seconds') literally treading her, his feet working strenuously. After quick copulation runs off, breast feathers again fluffed out, and expanded tail twitching (Loke Wan Tho).

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumage phases and morphology (also bionomics) of *curonius*, Witherby, 1940, 4: 356-9. *C. d. jerdoni* differs from it only in being slightly smaller, but size difference in the two races clinal. However, subspecies *jerdoni* (tropical) differs considerably from *curonius* (palaeartic) in its moult pattern. The latter has a juvenal-like winter plumage whereas *jerdoni* lacks a winter plumage (Stresemann, in *efst.*). All examples with wing over 114 mm., especially non-breeding birds collected in the plains in winter, probably referable to *curonius*.

Chick (in down). *C. d. jerdoni*. 'Forehead, carpus, edge of ulna and collar of hindneck white; circle round crown from eye to eye and above white collar, black; lines on thighs and forearm, tail, black; rest of upperparts grizzled black, white and ginger points' (Ticehurst).

MEASUREMENTS

Weight *C. d. curonius* 20 ♂ ♀ 28-39 (av. 31.8) gm.

C. d. jerdoni 20 ♂ ♀ 21-33 (av. 27.9) gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown; naked ring round eye (eyelids) yellow, becoming greatly swollen in breeding season. Bill horny black, yellow at base of lower mandible. Legs and feet dusky greenish yellow; claws horny black.

MISCELLANEOUS. Longevity (ring record) 8 years (Ring, 1962, 33: 149).

CHARADRIUS ALEXANDRINUS Linnaeus

Key to the Subspecies

Smaller; wing 93 to 107 mm.	<i>C. a. seeshahii</i>
Larger; wing 106 to 118 mm.	<i>C. a. alexandrinus</i>

CHARADRIIFORMES

236

MIGRATION. No ringing data. Common at Bannu (NW. Pakistan) in spring and autumn (Whitehead & Magrath). Arrives in Quetta district (Baluchistan) early April, leaves in September (Ticehurst). Spring passage migrant in Delhi, chiefly end April and first half May (Frome).

GENERAL HABITS. Very similar to the Little Ringed Plover (379, 380), with immatures of which it may easily be confused. Parties and flocks, often mixed with other waders. Runs about with neck drawn into the shoulders as typical of the smaller plovers.

FOOD. Small crabs, sandhoppers and other insects.

VOICE AND CALLS. A soft *trr* uttered when flying off; 'a sweet trill in butterfly-like display flight' (Baker). A shrill double alarm note 'too-it, too-it, itup, itup' (Witherby).

BREEDING. *Season* in Baluchistan (Quetta dist.), Sind and Gujarat March to July chiefly May and June. *Nest,* a slight depression in sand sometimes lined with fragments of shells, in a dry river-bed, or on the seashore above high-tide mark or on mounds of windblown sand collected at the base of salt-plants like *Suaeda* or among runners of *Ipomoea biloba*. *Eggs* normally 3, occasionally 2, exceptionally 4; pyriform, pale to dark sandy brown sometimes tinged greenish; stippled and blotched with blackish brown often mixed with or largely replaced by twisted hair lines and scrawls. The eggs often lie in the scrape half buried in windblown sand with only the broad ends showing as rounded studs or domes. Average size of 100 extralimital eggs 32.5 × 23.5 mm. (Jourdain). Indian eggs agree with this (Baker). Both sexes incubate; period 15-17 days (Naumann). Both parents tend the young and indulge in 'broken-wing' distraction displays to draw off intruders from the vicinity of nest and chicks. A case of egg predation by the Great Stone Plover (*Esacus m. recurvirostris*, 437) has been reported (Dharmakumarsinhji).

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumage phases and morphology (also bionomics), Witherby, 1940, 4: 350-3.

In winter plumage may be distinguished from the very similar non-breeding and immature *Charadrius dubius* as follows:

<i>C. alexandrinus</i>	<i>C. dubius</i>
1. Three outer pairs of rectrices all white	1. Only the outermost pair all white; 2nd and 3rd pairs partly brown
2. Shafts of all primaries white	2. Shaft of first primary only white
3. Brown pectoral band widely broken	3. Pectoral band unbroken
4. Legs blackish	4. Legs yellowish

Chick (in down). 'Forehead and carpus white; black line on forearm and behind each eye; white hind collar; crown and rest of upper parts mottled black and buffish white; underparts white' (Ticehurst).

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
		(from feathers)		
12 European ♂ ♂	109-118	14-15	25.5-29	43-45 mm.

		(one 16)		(Witherby)
		(from skull)		
8 Indian ♂ ♂	105-111	19-22	26-29	46-47 mm.
8 Indian ♀ ♀	105-114	18-21	27-28	43-49 mm.
				(CBT, HW, SA)

Weight 22 ♂ ♀ (winter) 27-41 (av. 35.6) gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet plumbeous grey or blackish.

382. Ceylon Kentish Plover. *Charadrius alexandrinus seebohmi* Hartert & Jackson

Charadrius alexandrinus seebohmi Hartert & Jackson, 1915, Ibis: 529. New name for *Charadrius cantianus minutus* Seebohm (Aripo, N. Ceylon), *nee* *Charadrius minutus* Pallas *Leucopoliis alexandrinus* Legge Whistler & Kinnear, 1937, J. Bom. nat. Hist. Soc. 39: 251 (Hambantotta, SE. Coast, Ceylon) Baker, FBI No. 2107, Vol. 6: 162

LOCAL NAMES. *Punchi oléyja* (Sinhala); *Uppu kotthi* (Madura dist., Madras).

SIZE. As 381; length c. 17 cm. (6½ in.).

FIELD CHARACTERS. As of the nominate race (381), q.v. Slightly smaller and lacking the bright rufous cap in the breeding season. In winter the two races indistinguishable.

STATUS, DISTRIBUTION and HABITAT. Resident. Common. Ceylon (low-country Dry zone) and southern peninsular India, how far north not known. Affects the seashore and tidal mudflats, and margins of large tanks inland.

GENERAL HABITS, FOOD, VOICE and CALLS. As of the nominate race (381).

BREEDING. Season in Ceylon May to August; occasionally as early as February in the Jaffna Peninsula (Phillips). In Madras (Cuddalore 11°43'N., 79°46'E.) April and July/August, possibly throughout the period. Rev. Axel Krebs, who found both eggs and chicks there, categorically noted the absence of the rufous cap in breeding birds as is diagnostic of the race *seebohmi* (JBNHS, 1956, 53: 703). Site, nest and eggs as in the nominate race, the last smaller. Average size of 40 eggs 29.9 × 22.0 mm. (Baker).

MUSEUM DIAGNOSIS. Differs from 381 in its smaller size and in the fact that it does not assume the distinctive breeding plumage with the bright rufous cap.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
5 Ceylon ♂♂	103-104	18-20	25-27	43-46 mm.
3 Ceylon ♀♀	96-104	17-20	25-28	39-43 mm.
		(from skull)		(HW)

Weight 20 ♂♀ (winter) 20-40 (av. 30.4) gm. — BNHS. (Pt Calimere)

1 ♂ 29 gm. — SDR (Ceylon).

COLOURS OF BARE PARTS. As in 381.

383. Longbilled Ringed Plover. *Charadrius placidus* J. E. Gray

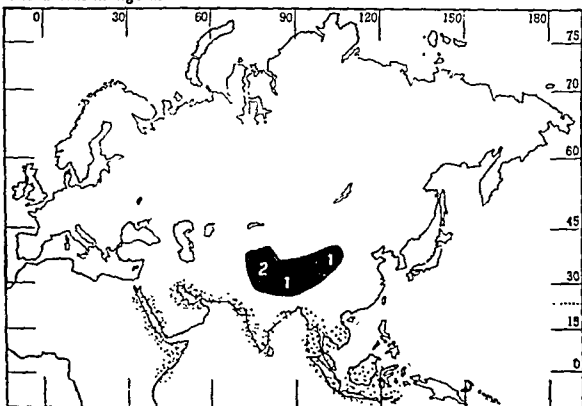

Charadrius placidus J. E. Gray, 1863, Cat. etc. Mamm. Bds. Nepal and Tibet... Brit. Mus., ed. 2: 70 (Nepal) Baker, FBI No. 2116, Vol. 6: 172 Plate 40, fig. 1

LOCAL NAMES. None recorded.

SIZE. Grey Quail +; Large Sand Plover ±. Length c. 23 cm. (c. 8½ in.).

FIELD CHARACTERS. Very similar to the Ringed and Little Ringed Plovers (378, 380) — also with black bill and yellow legs — and doubtfully distinguishable from them. But larger size and much longer bill are suggestive clues. (For differentiation in the hand see Museum Diagnosis.)

Charadrius mongolus

■ Breeding range ▨ Winter 1 *C. m. atrifrons* (384).
2 *C. m. pamirensis* (RE).

Pakistan round the entire Peninsula to W. Bengal and E. Pakistan. Also the coasts on Ceylon, Andaman and Nicobar, and Maldivian islands. Recorded inland south of the Himalayas sparingly and irregularly, chiefly on migration passage (stragglers?) in N. Bihar, Nepal, Assam, Manipur, Rajasthan. A few odd birds in non-breeding dress remain behind on the sea coast throughout the year. Affects seashores, and tidal mudflats and estuaries in winter; stony, sandy plains in the vicinity of high elevation lakes, streams, and bogs in summer.

EXTRALIMITAL. Breeds on the Kirghiz Steppes (probably also in other parts of southern Siberia and Turkestan), and Tibet. Migrates south in winter to Persia, eastward to Malay Peninsula and Greater Sunda Is. Also Red Sea coasts, E. Africa south to the Zambesi, and islands of the Indian Ocean.

MIGRATION. No ringing data. Arrivals on the sea coasts begin early August; the birds becoming fairly abundant by early September. In Ceylon arrives during September and October and leaves in April and May (Phillips). Spring emigration evidently commences about early May when some individuals already in partial breeding plumage with accumulation of migration fat and enlarged gonads. Exodous gradual and not in a body; by end of May most birds have gone. From paucity of inland records it is evident that migration from sea coast to Tibetan uplands normally performed in a single hop non-stop.

GENERAL HABITS. Gregarious. Keeps in scattered flocks — sometimes very large — often mixed with Large Sand Plovers, dunlins, stints and other waders, dotted about on tidal mudflats or the shiny wet sand left by

STATUS, DISTRIBUTION and HABITAT. Winter visitor. Rare but evidently regular in eastern and upper Assam. Has been obtained also in Nepal, N. Bihar, the duars of Bengal and Bhutan, and in East Pakistan. Affects shingle banks of large rivers.

EXTRALIMITAL. 'Breeds in Ussuriland, Manchuria, Korea, N. China and N. Japan. Winters south to China, N. India, Burma and Annam [central Viet Nam]' — Peters. Possibly breeds along the Tsangpo river in SE. Tibet (Ludlow).

GENERAL HABITS, FOOD, VOICE and CALLS. Very little specifically recorded. Usually solitary. Coloration remarkably obliterative on the shingle banks it frequents, rendering the bird liable to be overlooked.

BREEDING. Extralimital. In general similar to the Ringed Plovers.

MUSEUM DIAGNOSIS. Shaft of first primary brown, paler and yellowish towards tip but never white as in Ringed Plover. Forehead wholly white; the black on the lores and cheeks replaced by brown or blackish brown.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♀	139-152	18-20	c. 31-34	76-78 mm. (Baker)

COLOURS OF BARE PARTS. Iris brown; rim of eyelid yellow. Bill black, base of lower mandible yellowish. Legs and feet light yellowish (La Touche).

384. Pamirs Lesser Sand Plover. *Charadrius mongolus atrifrons* Wagler

Charadrius atrifrons Wagler, 1829, Isis von Oken, col. 650 (Bengal).

Baker, FBI No. 2117, Vol. 6: 174

Plate 40, fig. 5 and Plate 41, fig. 4

LOCAL NAMES. *Oléyja* (Sinhala); *Kūtūn*, (Tamil); *Manal kōzhi* (Malayalam).

SIZE. Grey Quail; length c. 19 cm. (7½ in.).

FIELD CHARACTERS. A typical little plover with thick round head, bare greenish grey legs, and short pigeon-like black bill.

WINTER (non-breeding). *Above*, forehead fulvous or tawny. Ear-coverts brownish, conspicuous as a dark patch behind eye on white sides of head. White collar on hindneck very faint or absent. Upperparts sandy greyish brown. *Below*, white.

SUMMER (breeding), as sometimes seen just before emigration. *Above*, forehead and sides of head black; crown and hindneck rust coloured or pale chestnut. Rest of upperparts sandy brown. *Below*, upper breast and flanks pale chestnut, separated from glistening white throat by a blackish half collar. Sexes alike.

YOUNG (immature) has pale fringes (scalloping) to the feathers of the upperparts.

For downy chick see Museum Diagnosis.

STATUS, DISTRIBUTION and HABITAT. Within our limits breeds in the Tibetan plateau facies of the High Himalayas between c. 3900 and 5500 m. elevation in Ladakh, Lahul, and Sikkim. Abundant winter visitor — perhaps the commonest wader — to the seaboard from Makran and Sind in W.

the receding tide. The birds run about in short spurts with quick mincing steps, neck pulled into the shoulders, dipping forward obliquely now and again to pick up some titbit. They bunch up on high ground to rest when the tide is in, and scatter again as it recedes, often feeding till well past sunset. When resting the bird stands inert on one leg, the other remaining tucked even while repelling a neighbour, hopscoching up to him comically with bill threateningly levelled.

When just arrived from their breeding grounds much territorial rivalry is still in evidence resulting in frequent but innocuous skirmishes. Two birds will run parallel to each other in an almost furtive posture — bills horizontal and necks telescoped — as if patrolling an imaginary boundary. Of a sudden one will turn upon the other, rush at him with open wings, and jump clean over him. To vary the tactics the patrolling birds will sometimes pretend to ignore each other's proximity, making as if to sheer off. Suddenly they will whip round and rush at each other to repeat the clinch.

On disturbance the scattered flock rises almost simultaneously, the birds closing up and flying swiftly in well-drilled unison, turning, twisting and zigzagging on the wing all together, their white undersides flashing from time to time as they bank and wheel. Has been observed preparing to roost for the night (?) crouching in scattered hoof-prints in dry sand above high-water mark, looking in the gathering dusk like little stones strewn over an extensive area of beach (SA).

FOOD. Chiefly small crabs (including *Ocyropsis* sp.), sandhoppers and marine worms. Hole of last approached by bird stealthily lifting and gently putting down each foot. Often both feet planted squarely on the ground the bird leaning back and tugging at the worm till its tail almost touches the ground!

VOICE and CALLS. Very silent in winter: only a low *trr* or *twip* when flying off. In courtship chase on breeding grounds a peculiar hard *tk-tatrr-tatrr* sometimes varied to *tit-tit-trr-trr* of the same quality of sound as the 'stone-on-ice' call of the Indian Nightjar (*Caprimulgus asiaticus*). This uttered also in the nature of a 'war-cry' when chasing off a territorial rival or intruder. Alarm note a chatter of two syllables, *corrup*, not unlike the croak of a frog (Whistler).

BREEDING. Season in Ladakh (Tso Kar, Tso Moriri and Pangkong lakes), Lahul and Spiti (Chandra lake) — c. 3900 to 5500 m. — chiefly early June to mid July. Nest, an unlined scrape or saucer-like depression on dry stony or shingly ground about the margin of a lake or bog. Eggs normally 3, pyriform, glossless pale green to dark biscuit colour or khaki, stippled fairly evenly all over with reddish brown (colour of dried blood). Average size of 12 eggs 36.7 × 26.3 mm. (B. B. Osmaston).

Pre-nuptial chase of female as well as territorial defence consists of the bird flying close above the ground on rapidly vibrating wings uttering its peculiar 'war-cry'. Both birds partake in incubation and care of the young, commonly giving the broken-wing distraction display to lead off intruders from nest (particularly when eggs hard set) and chicks. Incubation period unknown.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit. Bill shorter than middle toe without claw.

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 241

Chick (in down). "Upperparts deeper buff than in *alexandrinus* [381], mottled with black on crown; wings and whole of back, tips of wings and collar of neck grey-buff; narrow, short black lines on lores, behind eyes and on the ear-coverts. Underparts white, greyish buff at the sides; legs and feet plumbeous" (Ticehurst).

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
34 ♂ ♀	122-132 (one 118)	16-19	32-35	44-49 mm. (CBT, HW, SA)

There is no difference between the sexes.

Weight 8 ♂ ♀ (autumn) 39-50 gm. (aver. 43.75)—SA.

COLOURS OF BARE PARTS. Iris dark brown. Bill black. Legs and feet fleshy grey-yellowish- or olive-slate colour.

Genus NUMENIUS Brisson

Numenius Brisson, 1760, Orn. 1: 48; 5: 311. Type, by tautonymy, *Numenius* Brisson = *Scolopax arguta* Linnaeus

Bill very long, slender, and curved downwards over the greater part of its length; tip of upper mandible blunt and projecting beyond the lower. Nostril linear placed in a groove which extends over about three-quarters length of the bill. Legs moderately long; tarsus reticulated except on the lower half in front, where transversely

242 CHARADRIIFORMES

scutellated. Hind toe of moderate size; middle toe much longer than the others; toes webbed at base; claws dilated. Wing long and pointed: first primary (as.) longest; inner secondaries very long. Sexes alike.

The genus contains the curlews and whimbrels which have an almost worldwide distribution.

Key to the Species

Plate 39, fig. 9 and Plate 42, fig. 7

LOCAL NAMES. *Chhōtā gōmgh*, *Chhōtā gūlindā* (Hindi, Bengal); *Chhōtā gūnyār* (Bihar); *Tetti kokku* (Malayalam); *Māhā waturā* (Sinhala); *Kuthirai mālai kōttān* (Tamil); *Bulithumbi*, *Bulithunga*, *Orana* (Maldives).

SIZE. Country hen; length c. 43 cm. (17 in.).

FIELD CHARACTERS. A smaller edition of the more familiar Curlew (387), also with long downcurved bill. Distinguished by its blackish crown with white 'centre parting' and long white superciliary stripes on either side.

Above, forehead and crown dark brown with a white median band; long supercilia from base of bill, and sides of head whitish. A dark brown band from lores through eye to ear-coverts. Upperparts sandy brown with whitish spots; lower back and rump white; upper tail-coverts barred brown and whitish. Tail ashy brown barred with blackish. Below, chin, throat, and abdomen white; rest of underparts sullied white narrowly streaked with blackish on foreneck and breast, and barred on flanks. Sexes alike.

Young (immature) has the mantle scalloped with pinkish buff or buff, and rump suffused with same. Lower back, rump, and upper tail-coverts white finely scalloped with brown.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to West Pakistan (Baluchistan, Sind—chiefly passage migrant), and western India in Gujarat (chiefly Kutch and Saurashtra) and sparingly along the entire seaboard south to Kerala, Ceylon, and the Andaman, Nicobar, Laccadive and Maldivé Is. Also up the east coast to Bengal and E. Pakistan, but the winter distributions of this race and *variegatus* (386) not yet properly worked out though both occur in the Ganges delta. Stray individuals regularly seen throughout the year especially in the Kutch area, but no evidence of breeding as yet. Affects the sea coast, tidal mangroves, creeks and mudflats. Occasionally at inland jheels during migration passage. Recorded and/or collected thus in Baluchistan (Sibi), Kashmir (Hokarsar), Uttar Pradesh

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 243

Numenius phaeopus

1 *N. p. phaeopus* (385).
2 *N. p. variegatus* (386).

(Lucknow Division), Nepal, Bihar (Darbhanga), Madhya Pradesh (Sehore) and also up in the Western Ghats.

Extralimital. Breeds in northern Scandinavia, Lapland, Finland, northern Russia and W. Siberia to Tobolsk and the upper Irtysh. Winters throughout Africa, Madagascar, Arabia, NW. India and islands in the western Indian Ocean. Burma (Smythies).

MIGRATION. No ringing data. Recorded on autumn passage in Iraq, July-August to end September. In West Pakistan (Makran (?) and Sind coasts) first arrivals early August continuing to mid September; then in smaller numbers also along the west coast of the Peninsula. By early October main body has moved on leaving only small lots of wintering birds on Sind coast. Females believed to comprise the vanguard of southern migrants in autumn, the males following later with young birds of the year. This proposition needs testing. Return (spring) passage, possibly partly from our area, noted at Enzeli (Bandar-e-Pahlavi) on the southwestern shore of the Caspian Sea in Iran, from second week of April to early May. Unravelling of movements in India complicated by the considerable numbers, presumably of non-breeding birds, which overwinter within our limits.

GENERAL HABITS. Very similar to Curlew (387), but more gregarious. Often met with in parties or flocks of 5 to 15 in winter; larger flocks on first arrival, e.g. in Sind. Partial to tidal mudflats and mangrove-lined creeks, running about and feeding on the squelchy ooze at low tide. The slender curved bill is admirably adapted for probing into the oblique burrows of fiddler crabs (*Uca* spp.). The bird inserts it into a hole and drags out the inmate by its large 'arm'. A smart sideways jerk detaches the arm which remains in the bill as the crab tries to escape. The bird

244 CHARADRIIFORMES

promptly drops the arm and seizes and swallows the crab. The cool, matter-of-fact way in which this operation is performed as the bird trots from hole to hole is amusing to watch. At high tide when the mudflat is submerged, it often perches on the tops of the mangrove bushes waiting for the ebb.

When flying to and from alternative feeding-grounds among the creeks with the changing of the tides the birds can be readily decoyed over an ambush by an imitation of their calls, and afford good sport with the gun. They are swift on the wing, wary and difficult to circumvent, and excellent for the table—all the qualities that most appeal to the sportsman.

FOOD. Chiefly molluscs and crustaceans. Stomachs of specimens usually crammed with remains of snails and crabs, of which the fiddlers *Uca* spp. often form a considerable proportion. Other species identified are *Thalassidroma crenata* (Latreille) and *Sesarma longipes* Krauss.

VOICE AND CALLS. The only call heard in winter is a musical quick-repeated titting whistle *tetti-tetti-tetti-tet* of 7-9 syllables chiefly uttered on the wing, quite diagnostic even when the birds are passing over at night unseen. Bubbling, musical breeding call or song uttered in curlew-like aerial display flight closely resembles the Curlew's, but is more prolonged and trilling.

BREEDING. Extralimital. Season, May-June. Nest, a shallow circular grass-lined depression in marshland. Eggs, 3 or 4, pear-shaped olive-green, blotched and spotted with brown. After the recent unexpected finding of the Avocet breeding in the Great Rann of Kutch, the breeding of this species, as frequently alleged, becomes less improbable; the birds are fairly numerous in the Gulf of Kutch area during June, July, and August as in other months.

MUSEUM DIAGNOSIS. For details of plumage see Baker, loc. cit.; for plumage phases and morphology (also bionomics), Witherby, 1940, 4: 172-6. C. B. Ticehurst remarks that Sind birds are more spotted on the lower back and rump than European examples, but less so than *variegatus* (386).

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂ ♂	232-250	76-86	50-61	87-99 mm.
♀ ♀	243-265	80-90	—	—
		(from feathers)		(Witherby)

Weight 10 ♂ ♀ (autumn/winter) 255-400 (av. 329.3) gm. — BNHS.

COLOURS OF BARE PARTS. Iris hazel to dark brown. Bill dark horny brown, fleshy pink at base of lower mandible. Legs and feet greenish grey.

Smaller size of male noteworthy. Correlated with this would seem the assertion that he takes the major share in incubation and tending the young.

386. Eastern Whimbrel. *Numenius phaeopus variegatus* (Scopoli)

Tentulus variegatus Scopoli, 1786, Del. Flor. et Faun. Insubr., fasc. 2: 92 (No locality = Luzon, ex Sonnerat)

Baker, FBI No. 2136, Vol. 6: 204

LOCAL NAMES. As for 385.

SIZE. Same as 385; country hen. Length c. 43 cm. (17 in.).

FIELD CHARACTERS. As of 385, q.v. Indistinguishable from it except in the hand; see Museum Diagnosis.

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 253

Limosa lapponica

■ Breeding range ■ Winter
 1 *L. l. lapponica* (391).
 2 *L. l. baueri* (RE).

Extralimital. 'Breeds locally in N. Europe and N. Asia from N. Scandinavia east probably to the Taimyr Peninsula. Winters south to the coasts of tropical Africa (Senegambia and Somaliland), Makran Coast, Persian Gulf, and NW. India' (Peters).

MIGRATION. No ringing data. One of the earliest migratory waders to arrive on the Makran, Sind, and Kutch coasts. August-September (earliest dates 22 July, 5 August). Then many still in worn breeding dress which is moulted soon after arrival in winter quarters. By first week April many, and by last week April most, have again donned breeding dress and the majority have left, a few lingering on till first half May. Small numbers in grey non-breeding plumage remain behind throughout the year.

GENERAL HABITS. Not significantly different from Blacktailed Godwit's except that it keeps mainly on the sea coast and is seldom met at fresh waters inland. Often in large flocks mixed with Blacktailed Godwits, dunlins, oystercatchers, and other waders.

FOOD. As of 389 — molluscs, marine worms, insects.

VOICE AND CALLS. In winter only a pleasant low whistle or 'low piping note' (Hume), uttered singly or rapidly repeated while taking off or landing. Alarm call (chiefly when nesting) a bisyllabic *te-tén, te-tén*, or *chiliu, chiliu, chiliu*.

BREEDING. Extralimital. Season, June-July. Nest a slight depression on a grassy hummock around a bog or in open grassland — same as Whimbrel. Eggs 3 or 4, greyish green with umber brown spots; indistinguishable from Whimbrel's.

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 255

392. Spotted or Dusky Redshank. *Tringa erythropus* (Pallas)

Scolopax erythropus Pallas, 1764, in Vroeg's Cat., Adumbr.: 6 (Holland)
 Baker, FBI No. 2149, Vol. 6: 223
 Plate 44, fig. 9

LOCAL NAMES. Bātān, Gatni, Sūrma (Hindi); Yerra kal ulanka (Tamil); Ngāhoibi (Manipur).

SIZE. Grey Partridge ±; length c. 33 cm. (13 in.).

FIELD CHARACTERS. A medium-sized greyish brown-and-white wader with longish orange-red legs and slender straight bill.

Winter (non-breeding). Above, narrow forehead, crown, hindneck and back ashy brown; lores darker brown; prominent white scarilia from base of bill. Lower back, rump, and upper tail-coverts white, the last barred with black. Wings mottled and barred with white. Tail ashy brown, barred with white on edges.

A

B

Secondaries, x c. 1
 A. *T. erythropus* B. *T. lotanus*

Below, white, indistinctly spotted and mottled with brown on neck and upper breast; flanks tinged with dusky, and barred. Sexes alike. In fresh winter plumage distinctively grey-brown, profusely spotted and barred with white. Stands somewhat taller than the Common Redshank (393) but most readily distinguished from it in flight by absence of broad white bar along trailing edge (secondaries) of wing.

Summer (breeding). Overall sooty black more or less narrowly scalloped and spotted with white. Lower back and rump white; tail barred with broader black and narrower white bars. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. West Pakistan (common in Sind; reportedly only on autumn and spring passage in Baluchistan); all India; Nepal (vagrant);

Ceylon (rare vagrant). Everywhere less common than Redshank (393, 391). Recorded from Punjab, Kashmir, Delhi, Uttar Pradesh, Bihar, W. Bengal, Manipur, Orissa, Rajasthan, Madhya Pradesh, Gujarat, Maharashtra, Mysore, Madras. Doubtless occurs also in Assam and elsewhere within our limits. So far not recorded in the Andaman and Nicobars.

Affects jheels and tanks inland, as well as tidal creeks and estuaries.

Extralimital. 'Breeds in Scandinavia north of the Arctic Circle, N. Russia south to Moscow, Kazan, and Orenburg, and in N. Asia east to Kamchatka. Winters south to Africa, India, Burma, China, Japan and the Malay States' (Peters). Borneo (Smythies).

MIGRATION. No ringing data. Arrives in Sind as early as mid August, in N. India c. mid September. Mostly gone by end April when many birds are in partial or full breeding plumage. A few linger into early May (last date 8 May, Allahabad).

CHARADRIIFORMES

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit., but as Ticehurst points out (JBNS 34: 486) female's breeding dress when assumed is complete though rather different from male's, being much browner. For details of plumages and morphology (also bionomics) see Witherby, 1940, 4: 155-60.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	202-216	72-83	46-51	67-77 mm.
♀♀	211-227	95-106	—	—
	(from feathers)			(Witherby)

Weight 20 ♂♀ (autumn/winter) 162-277 (av. 220.5) gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill pinkish flesh colour, horny brown or blackish on terminal half. Legs and feet greenish grey to almost black.

Genus *TRINGA* Linnaeus

Tringa Linnaeus, 1758, Syst. Nat., ed. 10, 1: 148. Type, by tautonymy, *Tringa ochropus* (emend. of *ocrophus*) Linnaeus

Totanus Bechstein, 1803, Orn. Taschenb. Deutschl. 2: 282. Type, by tautonymy,

Totanus maculatus Bechstein = *Scolopax totanus* Linnaeus

Actitis Illiger, 1811, Prodr.: 262. Type, by subsequent designation, *Tringa hypoleucos* Linnaeus

Glottis Koch, 1816, Syst. Zool.: 42, 304. Type, by monotypy, *Scolopax nebularia* Gunnerus

Xenus Kaup, 1829, Skizz. Entw.-Gesch. Eur. Thierw.: 115. Type, by monotypy, *Scolopax cinerea* Gtldenstädt

A predominantly Palaearctic composite genus of Sandpipers, Redshanks, Green-shanks and Avocet-Sandpiper, previously split up into discrete genera on characters now considered unwarrantable.

For particulars see Thomson, A. L., 1964. Article 'Sandpiper' in Thomson, A. L. (ed.), *New Dict. Birds*, London & New York.

CHARADRIIFORMES

Tringa erythropus

■ Breeding range ■ Winter

GENERAL HABITS. As in 393, but oftener seen feeding in fairly deep open water. A compact flock will swim energetically back and forth with bills and heads fully immersed, the birds freely up-ending like ducks to reach the bottom mud.

FOOD. As in 393. One with 'gullet full of small fish' (Ingilis).

VOICE AND CALLS. A shrill piping *tiu-it* or *tiu-tiu-tiu* uttered when taking off, or in flight; very similar to Common Redshank's and easily confusable with it except after sufficient experience of both.

BREEDING. Extralimital. Season June-July. Nest, a scantily lined depression in a grass tussock in a bog. Eggs, normally 4, olive-brown blotched with umber-brown.

MUSEUM DIAGNOSIS. Distinguished from Redshank (393) by the outer secondaries being barred brown and white c. all white. Also by white back and rump, barred tail-coverts, and longer bill and legs. For description of plumage see Baker, loc. cit.; for details of plumages and morphology (also bionomics), Witherby, 1940, 4: 332-5.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
		(from feathers)		
♂♂	158-168	53-59	53-59	60-68 mm.
♀♀	166-177	57-64	—	—
				(Witherby)

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 257

Weight 13 ♂ ♀ (winter) 108-187 (av. 146.9) — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, orange-salmon at base of lower mandible. Legs and feet orange-red; claws blackish brown.

The Eastern Redshank, *Tringa totanus eurhinus* (Oberholser) is no longer separated from the Common Redshank.

393, 394. Common Redshank. *Tringa totanus totanus* (Linnaeus)

Scolopax Totanus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 145 (in Europa = Sweden)
Totanus totanus eurhinus Oberholser, 1900, Proc. U.S. Nat. Mus. 22: 207
(Tso Moriri Lake, 15,000 ft, Ladakh)

Tringa totanus terrignotae R. & A. Meinertzhagen, 1926, Bull. Brit. Orn. Cl. 46: 85
(Koko Nor)

Baker, FBI Nos. 2147, 2148, Vol. 6: 221, 222

Plate 43, fig. 1 and Plate 44, fig. 12

LOCAL NAMES. *Chhōtā bātān* (Hindi); *Māli kōtān*, *Segapū kāl ūllān* (Tamil); *Māhā totanū* (Sinhala); *Ngāhoibi* (Manipur).

SIZE. Grey Partridge ±; length c. 28 cm. (11 in.).

FIELD CHARACTERS. A large-sized sandpiper.

Winter (non-breeding). Above, greyish brown with white lower back and rump. Tail white, barred with brown. Below, white, finely streaked with brown on breast. Bare slender orange-red legs and straight slender orange-red and black bill. Sexes alike.

In flight the white rump, a broad white border to trailing edge of wing (secondaries), and long slender red legs projecting behind are leading pointers. Combined effect of legs of large feeding flock — a red patch moving about on the sands (Armstrong).

Summer (breeding) — as sometimes seen before emigration — upperparts somewhat streaked and spotted with black and fulvous. Below, more

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 259

regularly than Dusky Redshank. Sometimes feeds in salt pans in concentrated brine. When alarmed or suspicious bobs head and posterior violently up and down in the seesaw action typical of sandpipers.

FOOD. Molluscs, crustaceans, worms, aquatic insects and larvae. A considerable quantity of coarse sand and grit usually found in stomachs.

VOICE AND CALLS. In winter quarters only a shrill, piping *tiuee-tiuee-tiuee* or *tiu-tiu-tiu* uttered chiefly while taking off or on the wing. Easily confused with almost identical calls of Greenshank (396), from which distinguished only with practice, by its somewhat higher pitch. In breeding season male has beautiful nuptial song of strung-out quick-repeated trilling notes delivered as he circles at speed in dipping flight over the nesting ground, the white tail fully expanded and white rump fluffed out and flaunted prominently.

BREEDING. Breeds in the Tibetan Plateau facies at c. 4000 to 5000 m. elevation, of Ladakh and Kashmir (Tsokar, Tso Moriri, Pangong lakes, Rupshu, Shushal, etc.) and Sikkim (?). Season, May to July. Nest, a grass-lined deepish depression usually concealed in a grass tussock in a swamp. Eggs, normally 4, pale stone colour to bright reddish buff, speckled and spotted with purplish brown or blackish, chiefly at the broad end. Elongated pyriform in shape and remarkably large for the size of the bird. Average of 8 Kashmir eggs 46.1 × 31.8 mm. (Osmaston); of 60 Asiatic-taken eggs 44.3 × 30.4 mm. (Baker). Both sexes partake in incubation and tending the young, resorting to 'broken-wing' distraction tactics to lead off intruders. Incubation period 23-25 days (Witherby). For courtship display see under Voice etc. (above); further details in Witherby, 1940, 4: 324-9 under race *britannica*.

MUSEUM DIAGNOSIS. Somewhat larger than nominate *totanus*. In winter paler, more grey less brown above; whiter below. In breeding plumage upperparts paler than in nominate *totanus* but edges of feathers more rufous. Below, throat usually purer white and less streaked; streaking and spotting on rest of underparts also showing a tendency to be more reduced (Vaurie).

MEASUREMENTS. Vaurie (1965) gives for 20 ♂♂ of this race: Wing 152-165 (av. 157.5); bill from skull 48-53 (av. 50.2) mm.

Indian collected birds measure:

	Wing	Bill	Tarsus	Tail
4 ♂♂	158-161	45-51	49-51	63-72 mm.
2 ♀♀	162-165	51-54	—	67 mm.
	(from skull)			(SA)

Weight 12 ♂ ♀ (winter) 107-127 (av. 116.9) gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill black, orange-reddish on basal third. Legs and feet orange; claws black.

395. Marsh Sandpiper or Little Greenshank. *Tringa stagnatilis* (Bechstein)

Totanus stagnatilis Bechstein, 1803, Orn. Taschenb. Deutschl. 2: 292, pl. 29 (Germany)
Baker, FBI No. 2144, Vol. 6: 216
Plate 43, fig. 2

LOCAL NAMES. *Chhōtā gātra*, *Bīlā mākhān* (Bengal).

SIZE. Grey Partridge —; slenderer and lankier. Length c. 25 cm. (10 in.).

258

CHARADRIIFORMES

heavily streaked with brown on upper breast than in winter; crescent-shaped dark spots, like broken bars, on lower breast.

Young (immature). Above, more rufous, the fulvous spots on the scapulars etc. more pronounced. Below, more banded with black on flanks.

STATUS, DISTRIBUTION AND HABITAT. Breeds in Kashmir and Ladakh, between c. 3300 and 5200 m. alt.; winter visitor to both Pakistans, all India,

Tringa totanus

Nepal, Sikkim, Ceylon, Andaman, Nicobar and Maldive Is. Affects river banks and jheel margins inland; tidal creeks, salt pans and estuaries on the seaboard.

EXTRALIMITAL. Breeds from Scandinavia to W. Siberia and in C. and E. Asia (probably from the Altai) east to Transbaikalia and W. Kansu. Winters in India, Ceylon, Burma, Malay States, S. China, Philippines, Sunda Is., and Celebes. (Peters).

MIGRATION. Himalayan-breeding winter visitors to the Peninsula vastly augmented by influx from extralimital areas between August-September and end March to early May. An example ringed in Bharatpur, Rajasthan (27°13'N., 77°32'E.) on 6.x.1965 recovered in Altai, near Blagoveshchenka (52°50'N., 79°53'E.), U.S.S.R., in spring 1966. Vast concentrations of Redshanks together with thousands upon thousands of Ruff and Reeve and assorted small waders assemble on the squelchy mud and shallows at the mouth of Banas river, Little Rann of Kutch (Gujarat), prior to emigration, presenting a truly astonishing spectacle.

GENERAL HABITS. Keeps solitary, in small parties and large flocks, often in association with other small waders. Runs about on the muddy edges picking up tibbits, sometimes wading into shallow water and feeding with the bill and head completely immersed. Swims on occasion, but much less

260

CHARADRIIFORMES

FIELD CHARACTERS. Perhaps the daintiest and most beautiful of our sandpipers. In winter plumage, both at rest and in flight (no wing-bar), a perfect miniature of Greenshank (396) even to the slight upcurve in bill. Above, greyish brown with forehead, supercilium, sides of head, lower back and rump pure white. Tail narrowly barred brownish. Below, pure white; sides of breast more or less marked with brown. Fine almost straight black bill; very slender greenish legs. Sexes alike.

Summer (breeding). Above, sandy grey, the feathers dark-centred forming angular spots on back and 'herring-bone' pattern on inner secondaries. Below, white; foreneck and upper breast spotted with brown; flanks irregularly barred.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. Not uncommon, but numerically perhaps the least of the commoner sandpipers. All India, both Pakistans, Ceylon. Not yet specifically recorded from the Andamans. A

Tringa stagnatilis

sight record from Nepal (GD 1968). Affects swampy edges of freshwater ponds and jheels, inundated paddyfields, etc.; to a lesser extent brackish lagoons and tidal mudflats.

EXTRALIMITAL. 'Breeds in SE. Europe, C. and S. Russia and across middle Asia south of lat. 56° at least as far east as Transbaikalia, south to Turkistan and N. Mongolia. Migrates in winter to Africa, Arabia, India, Burma, Indo-chinese countries, Sunda Is. and the Moluccas to Australia' (Peters).

MIGRATION. Begins to arrive in N. India about mid August; mostly gone again by end April or early May, a few non-breeding birds loitering throughout the summer months. Two Marsh Sandpipers ringed at Point Calimere, Madras (c. 10°N., 79°E.) on 12.xi.1962 were recovered in the Novosibirsk Region, U.S.S.R. between 54°-55°N. and 76°-77°E., at a

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 261

straight-line map distance of c. 5100 km.—one on 4.v.1963, the other almost exactly four years later (8.v.1967); from the dates of recovery, presumably on their breeding grounds.

GENERAL HABITS. Keeps in parties or small flocks in company with other sandpipers running about on marshy ground, probing the soft mud with its bill for food, pivoting in semicircles methodically from side to side and prospecting in a transect as it were rather than at random. Frequently wades into shallow water feeding with head and bill completely submerged.

FOOD. Small molluscs, crustaceans, insects and worms.

VOICE AND CALLS. Rather silent. A shrill piping *che-weep, che-weep* uttered as the bird rises and makes off.

BREEDING. Extralimital. More or less as in Redshank (394).

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of structure etc. (also bionomics), Witherby, 1940, 4: 341-3.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	132-139	37-40	47-52	53-58 mm.
♀♀	133-143	40-50	—	— (Witherby)

Weight 40 ♂♀ (autumn) 48-73 gm. (aver. 60.7)—SA.

COLOURS OF BARE PARTS. Iris brown. Bill dark horny brown to blackish, paler and greenish at base of lower mandible. Legs and feet dull sage-green, olive-green or bluish-green.

396. Greenshank. *Tringa nebularia* (Gunnerus)

Scelopax nebularia Gunnerus, 1767, in Leem, Beskr. Finn. Lapper: 251

(District of Trondhjem, Norway)

Baker, FBI No. 2150, Vol. 6: 225

Plate 43, fig. 3 and Plate 44, fig. 10

LOCAL NAMES. *Tāntāndā*, *Timtimā* (Hindi); *Gūtra* (Bengal); *Peria kōttān* (Tamil); *Māhā wēwā* (Sinhala); *Pachakkālī* (Malayalam); *Timblā* (Marathi for all sandpipers).

SIZE. Grey Partridge +; length c. 36 cm. (14 in.).

FIELD CHARACTERS. The largest of our sandpipers.

Winter (non-breeding). Above, dark greyish brown, with white forehead, lower back, rump, and tail; the last with faint, almost invisible barring. Below white, greyish on foreneck and sides of head. Sexes alike.

Summer (breeding). Above, darker and richer coloured, the feathers of back and scapulars with broad black centres. Head and neck whitish streaked with brown. Below, white; foreneck and sides of breast spotted with dark brown.

Distinguished from Marsh Sandpiper by larger size; from Redshank by absence of white wing-bar (in flight), olive-green v. red legs, and by the slender bill being slightly upcurved.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. All India, both Pakistans, Nepal, Ceylon, Andaman, Nicobar, and Maldivé Is. Affects river banks and mudspits, margins of puddles, tanks and jheels, as well as tidal creeks, mudflats, coastal lagoons and salt pans

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 263

flying in wide circles at top speed high up above the nesting ground (D. Nethersole-Thompson).

BREEDING. Extralimital. In general similar to Redshank (394).

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumage phases and morphology (also bionomics), Witherby, 1940, 4: 335-40.

MEASUREMENTS

	Wing	Bill (from feathers)	Tarsus	Tail
♂♂	184-194	50-56	55-61	68-80 mm.
♀♀	184-200	53-59	—	— (Witherby)

Weight 15 ♂♀ (autumn/winter) 143-212 (av. 159) gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill dark horny brown or greenish brown, blacker at tip. Legs and feet yellowish green or olive-green.

(For an admirable biography of the species see D. Nethersole-Thompson, 1952, *The Greenshank*. New Naturalist Monographs (M 5), Collins, London.)

397. Green Sandpiper. *Tringa ochropus* Linnaeus

Tringa Ochropus Linnaeus, 1758, Syst. Nat., ed. 10, 1: 149 (in Europa = Sweden)

[Name emended to *ochropus*]

Baker, FBI No. 2143, Vol. 6: 215

Plate 43, fig. 6 and Plate 44, fig. 8

LOCAL NAMES. *Nēlla ulanka* (Telugu); *Kāta kokku* (Malayalam), *Timblā* (Marathi — all sandpipers); *Leeli tūwāri* (Gujarati).

SIZE. Grey Quail +; length c. 24 cm. (9½ in.).

FIELD CHARACTERS. A medium-sized sandpiper.

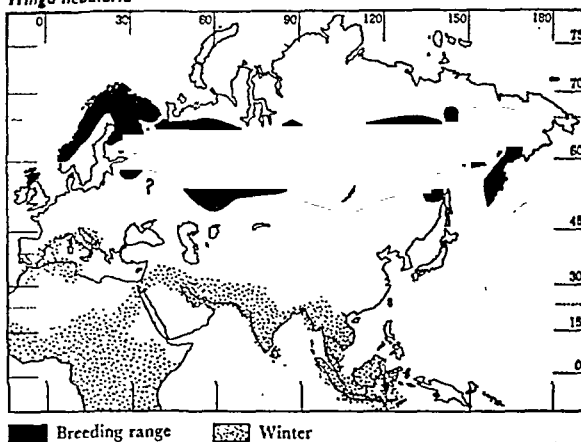

Winter (non-breeding). Above. Head and neck ashy brown; rest of upperparts dark brown glossed with bronze-green. Rump and tail more or less pure white, the latter faintly barred with blackish. Below, white, finely streaked with brown on throat, breast, and flanks. Sexes alike.

In flight the very dark upperparts contrasting sharply with the white rump, tail and lower plumage, no wing-bars, and blackish underside of wings are pointers to its identity, confirmed by its shrill flushing notes (see under Voice).

Summer (breeding). Above, crown and hindneck with white edges to the feathers; sides of face boldly streaked with brown. Upperparts lightly spotted with whitish. Below, brown streaks on foreneck and upper breast very broad and distinct.

Young (immature) has upperparts narrowly scalloped with bronze. Tail narrowly barred, and with a broader terminal band.

STATUS, DISTRIBUTION and HABITAT. Winter visitor. All India (including Assam and Manipur), both Pakistans, Nepal, Sikkim, Bhutan, Ceylon, Andaman Is., Nicobars (?). Affects jheels, village tanks, puddles, streams

*Tringa nebularia*

Extralimital. Breeds in N. Europe south to Leningrad, Kazan and across N. Asia to Kamchatka south to about 55°N. Winters in the Mediterranean countries, Africa and eastward through SE. Asia to Australia and New Zealand.

MIGRATION. Like most waders arrives in the second half of August and is mostly gone by end April or early May. A few non-breeding birds stay behind all the year. By mid March moult into summer dress begins; by mid April most birds have acquired considerable migration fat. A bird ringed in Bharatpur (Rajasthan) 24. x. 1966 recovered in Arkhangelsk region, near Vozhgora, USSR, 64°35'N., 48°25'E. on 10.vi.1968 — c. 4800 km. NNW.

GENERAL HABITS. Mostly met with as a solitary bird or in small parties of 3 to 5; rarely in flocks of more than 15 or 20 except when migrating. Frequently associated with Redshanks. Often wades in water up to the belly and feeds with head and neck fully submerged. Has frequently been observed feeding in quite shallow water with neck stretched out in front and merely the bill immersed, the bird moving forward at a run, as if pushing a lawnmower — not zigzagging or sweeping from side to side. Cf. 395.

When alarmed or suspicious, bobs or 'pumps' head violently up and down and also tail end of body.

FOOD. Molluscs, crustaceans, insects, worms and tadpoles. A frog recorded in the crop of a specimen, seemingly far too big for the narrow bill and gullet.

VOICE AND CALLS. In winter only a shrill piping *tiue-tiue-tiue* or *tiu-tiu-tiu* when flushed and going off; very similar to, and easily confused with, calls of the Redshank but somewhat lower in pitch. In breeding season has a remarkably beautiful continuous song delivered while the singer is

Tringa ochropus

Extralimital. Breeds in northern Europe and Asia, north to the Arctic Circle (locally to c. 68°N.), south to Transcaspiya, Turkestan, NW. Mongolia and the Amur river. (For details see Vaurie, 1965, 2: 414.) Winters in the British Isles, Mediterranean region, Africa south to Angola and Kenya, and southern Asia, Hainan, Taiwan and the Philippines. Burma, Borneo (Smythies).

MIGRATION. Abundant on passage at Kohat and through Kurram Valley (NW. Pakistan) from end August till November, and again in April-May (Whitehead, 1909, *Ibis*: 275). Earliest arrivals in Sind end July; more in August and September when many pass through Lower Sind. Return passage early April; most gone by end of that month 'noticeably earlier than most other species' (Ticehurst, 1924, *Ibis*: 122-3).

Gilgit: Very common in migration mid August to end September, and again beginning of April to mid May (Scully, 1882, SF 10: 141). Nepal Valley: earliest date 17 August, latest date 17 April. Large numbers on passage. On 16 September during afternoon over 20 parties observed, mostly of 3 birds each, all calling and flying steadily in same direction; on 21 September again numbers flying past (Desirée Proude, 1949, JBNHS 48: 718). Gujarat: Earliest 13 August latest 17 April (SA). Bombay environs: Earliest 5 August, latest 9 May. Ceylon: Arrives end August and September, leaves towards end April and in May (Phillips, 1952, Checklist: 38). Odd non-breeding birds stay behind throughout the year.

A bird ringed in the environs of Kazan, U.S.S.R. (c. 56°N., 49°E.), presumably on its breeding grounds, in June 1929 was recovered in

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 265

September 1933 in Kottayam district, Kerala (c. 9°N, 76°E.)—a straight-line map distance of c. 5600 km. (c. 3500 miles).

GENERAL HABITS. Typical of the sandpipers, but is less gregarious than most species. Keeps singly or in twos and threes, and seldom in voluntary association with other species; small flocks of usually not more than 15 or 20 even on migration. Runs about and feeds at edge of water, sometimes wading into the shallows, probing into the soft mud with its bill. When perturbed, bobs violently up and down before taking wing, this almost invariably accompanied by the distinctive flushing notes.

FOOD. Molluscs, crustaceans, aquatic insects, worms. Mosquito larvae (Husain & Bhalla).

VOICE AND CALLS. A shrill piping *ti-tui* or *tuwe-tuwe-tuwe* as it flushes and is flying off. A beautiful nuptial song in the breeding season.

BREEDING. Extralimital and peculiar. As a rule lays its 3 or 4 eggs in the deserted nests of thrushes and other birds fairly high up in trees; only rarely on the ground like most other sandpipers, e.g. Redshank.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumages and morphology (also bionomics), Witherby, 1940, 4: 310-14.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	136-148	33-35	32-34	52-61 mm.
♀♀	142-153	33-36	—	—
	(from feathers)	(from feathers)	(from feathers)	(Witherby)

Weight 20 ♂♀ (autumn/winter) 59-87 (av. 74.5) gm. — BNHS.

COLOURS OF BARE PARTS. Iris brown. Bill dull greenish, black at tip. Legs and feet dull greenish brown or olive-green.

398. Wood or Spotted Sandpiper. *Tringa glareola* Linnaeus

Tringa glareola Linnaeus, 1758, Syst. Nat., ed. 10, 1: 149 (in Europa = Sweden) Baker, FBI No. 2146, Vol. 6: 219

Plate 43, fig. 5 and Plate 44, fig. 11

LOCAL NAMES. *Chūpla*, *Chobāha*, *Titāri* (Hindi); *Bālu bātān* (Bengal); *Chinna ulanka* (Telugu); *Kāta kokku* (Malayalam); *Sili watunā* (Sinhala); *Kōttān*, *Vājā ūllān* (Tamil).

SIZE. Grey Quail ±; length c. 21 cm. (8½ in.).

FIELD CHARACTERS. A small snipe-like, rather gregarious wader.

Winter (non-breeding). Above, greyish brown and sepia-brown indistinctly spotted and marked with white. A whitish supercilium. Lower

× c. 1

back, rump and tail white, the last barred with blackish. Below, breast pale dusky; rest of underparts white. Sexes alike.

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 267

Tringa glareola

■ Breeding range ■ Winter

6200 km. From the recovery date presumably the bird was on its breeding grounds.

GENERAL HABITS. More gregarious than most sandpipers, e.g. Green and Common. Often seen in flocks of 20 to 30 birds, and much larger ones on migration. Occasionally also solitary or in small parties. When feeding, sometimes wades into water up to the belly giving the impression of swimming, and probes the bottom mud with head and neck completely immersed. When newly arrived on migration, and again just prior to departure late in the season, territorial rivalry apparent. One bird suddenly rushes at a neighbour and leaps at him with open wings as if to strike with imaginary spurs, the other usually ducking to avoid the onslaught. In one case observed, the attacker leapt viciously on the head and neck of his adversary and pinned him down in the water in a seemingly deliberate attempt to drown him.

When wounded and trying to evade capture has been seen to dive for a few seconds quite 'professionally'. Its predilection for snipe marshes and confusingly snipe-like flight-silhouette sometimes bring it to grief at the hands of tyro snipe-shooters.

FOOD. Tiny molluscs, crustaceans, insects, worms. 'Small fish about 2 cm.' (SA).

VOICE AND CALLS. A sharp quick-repeated *chip, chip, chip*, etc. (at c. 2-3 chips per second) from the ground, usually by individual birds, not together. A shrill *pee-pee-pee* by several birds in disorderly chorus as a flock flushes and flies away. The latter call 'similar to that of Green Sandpiper but more metallic' (A. E. Jones).

BREEDING. Extralimital. In general like Redshank and other sandpipers. Female does most of the active courting (Malcolm Macdonald, 1947,

In flight sepia-brown upperparts, with conspicuous white rump, barred brown-and-white tail, and no wing-bar, together with characteristic flushing notes are diagnostic clues.

Summer (breeding). Plumage much brighter; markings above and below better defined giving a distinctly spotted appearance.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor. Common and widespread: all India (including Assam and Manipur), both Pakistans, Nepal, Ceylon, Andaman, (Nicobar ?) and Maldivian islands. Affects squelchy margins of wheels, wet paddyfields, seepage marshes round irrigation tanks—chiefly lowlands but also up to at least 2000 m. altitude. Also mudflats along tidal creeks on the seaboard.

Extralimital. Breeds in N. Europe and N. Asia east to the Amur river, Kamchatka and northern Kurile islands. (For details see Vaurie, 1965, 2: 415.) Winters throughout Africa, and SE. Asia; Japan, Philippines, Malay Archipelago to Australia.

MIGRATION. Begins to arrive in the northern districts in early August; fair numbers in by end August or early September. Spring (outward) passage end March and April, trickling on till mid May. The same in Ceylon. Apparently overwintering of this species in India unusual and unrecorded. Among the extralimital recoveries (to January 1968) of Spotted Sandpipers ringed in India, the following are suggestive of the general provenance of our wintering populations.

Ringed at	on	Recovered at	on
Manjhaur, Monghyr district, N. Bihar (c. 25°N, 86°E.)	17.iii.64	Nuya, Mukhtuya dist., Yakutian, U.S.S.R. (c. 60°30'N, 116°10'E.)	16.v.64

do.	2.iv.65	Almaznyi, near Mirnyi, Yakutian, U.S.S.R. (c. 62°30'N, 113°50'E.)	25.v.65
Bharatpur, Rajasthan (c. 27°13'N, 77°32'E.)	9.x.65	Near Ushakovo, Tyumen region, U.S.S.R. (57°49'N, 68°4'E.)	5.v.67

All the above recovered at straight-line map distances of between 4500 and 5200 km.

Since then, many more recoveries of Spotted Sandpipers ringed in Bharatpur, Bihar and Bengal have been reported from the same general area in NE. Siberia. The most noteworthy of these is of one ringed near Calcutta on 6.iv. 1967 and recovered 48 days later (on 24.v.1967) near Susuman (68°48'N, 148°12'E.) in the Magadan Region of the USSR — at a map distance of c.

The Birds of Brewery Creek, p. 141). This is probably true of many other sandpipers as well, and correlated with the larger size of their females.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumages and morphology (also bionomics), Witherby, 1941, 4: 305-9.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
		(from feathers)		
♂♂	120-128	25-29	34-38	44-52 mm.
♀♀	125-130	25-31	—	—
				(Witherby)

Weight 50 ♂♀ (autumn and winter) 36-66 gm. (aver. 52.8)—SA.

COLOURS OF BARE PARTS. Iris brown. Bill blackish brown, olive at base. Legs and feet pale sage-green or olive-green; claws brown.

399. Spotted Greenshank or Armstrong's Sandpiper. *Tringa guttifer* (Nordmann)

Totanus guttifer Nordmann, 1835, in Erman's Reise, Naturh. Atlas: 17 (Okhotsk) Baker, FBI No. 2151, Vol. 6: 226 Plate 43, fig. 4

LOCAL NAMES. Unrecorded.

SIZE. Grey Partridge ±; slightly smaller than Greenshank. Length c. 33 cm. (13 in.).

FIELD CHARACTERS. Difficult to distinguish from Greenshank (396) especially as it occurs mingled with it and with Redshanks and liable to be overlooked. Wing like Greenshank's—without white bar, stouter bill (also slightly upcurved) noticeably longer than tarsus, and yellow legs, are points to look for.

Winter (non-breeding). Above, forehead, supercilium, and sides of head white. Sides of face, and hindneck, streaked with brown. Rest of upperparts ashy brown. Lower back and rump white, faintly barred with brown on upper tail-coverts. Tail ashy and white. Primaries black. Below, white.

Summer (breeding). Above, blackish brown with a few white spots on scapulars. Below, scattered dark spots on foreneck and breast. Sexes alike.

STATUS, DISTRIBUTION AND HABITAT. Rare winter visitor to Assam and East Pakistan. Possibly overlooked and may be actually less rare than apparent. Affects grassy meadows near streams, sand- and mudflats in the larger rivers and near the sea.

Extralimital. Breeds on Sakhalin Island and probably in E. Siberia. Winters in Ussuriland, Japan, Korea, Malaya, Burma. (For details see Vaurie, 1965, 2: 414.)

MIGRATION. No data.

GENERAL HABITS. Very little specifically known; apparently similar to Greenshank (396).

FOOD. Stomachs of Indian-shot specimens contained small mudfish, crustacea, mollusca and insect larvae (Baker).

VOICE AND CALLS. A sharp whistling note as they rose (Baker).

BREEDING. Extralimital and little known.

MUSEUM DIAGNOSIS. Bill slightly upcurved as in Greenshank but stouter and appreciably longer than tarsus. Web between 2nd and 3rd toes well developed as in Redshank. For description of plumage see Baker, loc. cit.

CURLEWS, SANDPIPERS, SNIPE, WOODCOCK 269

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂	178	50-57 (from feathers)	45-47	62-67 mm. (Baker)
♀	174-181			

Tarsus 41-42 mm.; middle toe with claw 35 mm. (Hartert).

COLOURS OF BARE PARTS. Iris dark brown. Bill dusky; yellow near base, black at tip. Legs and feet dull ochreous yellow or greenish ochreous (Armstrong).

400. Terek Sandpiper or Avocet-Sandpiper. *Tringa terek* (Latham)
Scolopax cinerea G\u00fcldenst\u00e4dt, 1774, Novi Comm. Sci. Petropol. 19: 437, pl. 19, pre-occupied in genus *Tringa* by *Tringa cinerea* Br\u00fcnnich, 1764 (Shores of the Caspian Sea about the mouth of the Terek river)

Scolopax terek Latham, 1790, Index Orn. 2: 724, new name for *Scolopax cinerea* Baker, FBI No. 2141, Vol. 6: 212

Plate 43, fig. 7 and Plate 44, fig. 14

LOCAL NAMES. None recorded.

SIZE. Grey Quail +; length c. 24 cm. (9 1/2 in.).

FIELD CHARACTERS. Unmistakable by its long, slender upcurved bill and rather short orange-yellow legs. In flight pale ashy brown rump and white trailing edge of dark wings conspicuous.

Winter (non-breeding). Above, greyish brown with conspicuous white forehead and supercilia. Below, white. Sexes alike.

Summer (breeding). Above, with bold black streaks on mantle forming a prominent V-shaped mark (scapulars). Below, sides of head and neck, and breast, distinctly striated with brown.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to the entire seaboard from W. Pakistan (Makran, Sind) and western India from Kutch and Saurashtra south to the tip of the Peninsula and up the east coast to W. Bengal and East Pakistan; Ceylon (northwest coasts); Andaman Is. Affects the seashore, mangrove swamps, tidal creeks and mudflats, and coastal lagoons. Rarely at inland fresh water and that chiefly on migration and near the seacoast, but ascends the larger rivers in the Sunderbans, Bangladesh.

Extralimital. Breeds in N. Russia to Siberia (north locally to lat. c. 70°N.) east to Kolyma river, south from southern Urals to Lake Baikal and beyond. (For details see Vaurie, 1965, 2: 418-19.) Winters in E. Africa, Madagascar, Mauritius, India, Burma, Malay Archipelago, Australia, and Tasmania.

MIGRATION. No ringing data. Like many other waders begins to arrive on the Makran, Sind, Kutch and Saurashtra coasts in early August. Is fairly spread out by September south to Ceylon and east to Orissa. (Chittagong?). Birds in April in partial summer plumage and very fat; exodus well advanced by end April; nearly all gone by mid May, but staybacks commonly observed June-August (Pt Calimere). Apparently migrates mainly along the littoral. Once taken on autumn passage in Bharatpur and once observed in Delhi (JBNS 65:781-2); otherwise not reported from far inland in India or Pakistan.

GENERAL HABITS. Keeps in parties and small flocks of up to 10 or 15 birds running about actively and feeding on the seashore between the tide-

CHARADRIIFORMES

Tringa terek

■ Breeding range ■ Winter

marks or on the mudbanks of tidal creeks, scattered amongst dunlins, sand plovers and other maritime waders. When feeding probes with its bill deep into the squelchy ooze almost to the eyes so that the base of the lower mandible and chin usually become bare of feathers due to the constant attrition. Often a morsel is shaken in water and carefully washed before being swallowed. At high water the birds bunch up on a raised sandspit or rock on the seashore resting on one leg, or settle on the bushes in mangrove swamps until the receding tide exposes the feeding ground. Whether the peculiar upturned shape of the bill has any special adaptive significance remains to be studied.

FOOD. Tiny molluscs, crustaceans and insects.

VOICE AND CALLS. In winter only a subdued twittering or trilling especially as a flock rises.

BREEDING. Extralimital. Season late May and June. Nest a grass-lined depression in ground moss in willow scrub. Eggs, 4, very like those of Marsh Sandpiper (395), yellowish grey or buff blotched with sepia.

MUSEUM DIAGNOSIS. Bill slender, upcurved, nearly twice as long as tarsus. Both mandibles grooved. Nostril in upper groove close to base of bill. Hind toe and claw well developed; anterior toes webbed; middle claw dilated but not pectinated. Wing pointed: 1st primary (as.) longest; second nearly as long. For description of plumage see Baker, loc. cit.

MEASUREMENTS

COLOURS OF BARE PARTS. Iris brown. Bill black or dark brown, yellowish or orange at base. Legs and feet dull yellow to bright orange-yellow.

401. Common Sandpiper. *Tringa hypoleucos* Linnaeus

Tringa hypoleucos Linnaeus, 1758, Syst. Nat., ed. 10, 1: 149 (in Europa = Sweden)

Baker, FBI No. 2145, Vol. 6: 217

Plate 43, fig. 9 and Plate 44, fig. 13

LOCAL NAMES. *Potte ulanka* (Telugu); *K\u00f6t\u00e1n* (Tamil); *S\u00edli watu\u00f4* (Sinhala); *Nerik\u00e1ta* (Malayalam); *S\u00e4m\u00e4ng\u00e1 tuta\u00f4ri* (Gujarati); *Findon* (Maldive Is.).

SIZE. Grey Quail; length c. 21 cm. (8 in.).

FIELD CHARACTERS. A small-sized sandpiper with a vertical white stripe between wing-shoulder and dusky breast-band. A narrow white wing-bar, conspicuous in the peculiar rapid, stiffly vibrating jerky flight low over water, and the shrill piping *tee-tee-tee* are diagnostic pointers.

Winter (non-breeding). Above, sides of head and neck ashy brown, streaked darker. A broad pale rather indistinct supercilium. Upperparts olive-brown. Rump and tail brown with only the outer tail-feathers white. Below white with a broad diffuse dusky band across breast. Sexes alike.

Summer (breeding). Above, darker, less olive, with broader dark shaft-strips and cross-barring. Below, foreneck and breast boldly striated with brown.

STATUS, DISTRIBUTION AND HABITAT. Breeds in Kashmir, Ladakh and Garhwal to at least 3200 m. altitude, perhaps higher. Possibly also in N. Baluchistan.

Winter visitor to all India (including Assam, NEFA, Nagaland, Manipur), both Pakistans, Nepal, Sikkim, Ceylon, Andaman, Nicobar, Maldiva and Laccadive Is. Up to c. 2100 m. (Nilgiris). Affects inland waters — streams, tanks, ditches, puddles — as well as rocky seashores, harbours and docks, coastal lagoons, tidal creeks and mangroves.

Extralimital. Breeds throughout Europe and Asia south of the tundra, south to N. Spain, N. Italy, S. Russia, Iran, Mongolia, Manchuria, Japan. Winters in Africa, India, Ceylon, SE. Asia north to S. China, Taiwan, the Philippines, Malay Archipelago to Australia.

MIGRATION. No ringing data. Apparently migrates along the coast. Very few definite records of overland migration in India, but see above. Once of a flock at a pool of fresh water in the desert a couple of miles inland from the coast near Karachi, apparently just arrived. Arrives near Karachi between middle and end August. Leaves late in the season; a few flocks still present between middle and end May (Ticehurst, 1924, *Ibis*: 111) and at end June in Pt Calimere.

GENERAL HABITS. Usually keeps solitary or in scattered twos and threes running about at the water's edge, picking up tibbits cast up by the wavelets

Tail, x c. 1

CHARADRIIFORMES

Tringa hypoleucos

■ Palearctic breeding range ■ Winter

and ripples; wags its tail end incessantly and jerks its head, or bobs, vehemently from time to time, particularly when agitated. Hardly ever collects in flocks, but numbers (40-50 or more) sometimes bunch up together on rocks on the seashore at high tide while waiting for the ebb to resume feeding. The way a bird follows a receding wave to pick up any morsels it may expose, and hastily withdraws to avoid being engulfed by the oncoming next, is amusing to watch. In keeping with the harder ground it normally frequents, does not probe into the mud for food but picks it up from the surface, like the Grey Wagtail with which it is very commonly associated on inland streams and trickles. The jerky 'vibrating' flight (see Field Characters) is typical. When wounded has been observed to dive and swim hither and thither with quick wing-strokes two feet below the surface, diving again immediately on rising to the top (Butler, JBNS 13: 148).

Much rivalry for feeding territories noticeable among first arrivals. Two birds will run parallel to each other casting malicious sidelong glances. One will abruptly spring at his rival, the assailed one drooping his wing on that side and screwing round his expanded tail in anticipation, and as if to

GURLEWS, SANDPIPERS, SNIPE, WOODCOCK 273

ward off the attack. These assaults, repeated in turn by either belligerent, are mostly formalized and innocuous.

FOOD. Tiny molluscs, crustaceans, and insects.

VOICE AND CALLS. A characteristic shrill flushing note *lee-lee-lee*. A pretty, long-drawn trilling or piping nuptial song *wee-it, wee-it, or kiti-wee-it, kiti-wee-it* repeated several times. This is frequently heard when the bird is resting and completely at its ease, just prior to emigration and also till shortly after return to winter quarters. It is delivered from the ground, from a rock or mangrove bush, or during the male's elaborate aerial courtship display. The latter consists of flying around in circles at top speed above the nesting area, the bird often soaring to a considerable height and descending on quivering wings.

BREEDING. Season in Kashmir, Ladakh, Garhwal, etc. principally May-June. Nest, a hollow in the ground lined with dead leaves and dry grass under the concealing shelter of a bush or boulder. Placed on a tamarisk- or other scrub-covered shingle islet amid a rushing Himalayan stream. Eggs, 4, rather glossy pyriform ovals, creamy buff, blotched and speckled with reddish brown, and with phantom marks of lavender or pinkish grey. Average size of 120 Indian-taken eggs 35.6×26.2 mm. (Baker). Both sexes take part in incubation and tending the young. Period 22-23 days; longer than in domestic hen! Eggs disproportionately large and heavy for size of bird. According to Heinroth combined weight of full clutch (4 eggs), laid at 24-hour intervals, is $48-52$ gm., exceeding the normal weight of the layer.

MUSEUM DIAGNOSIS. For description of plumage (including chick in down) see Baker, loc. cit.; for details of plumage phases and morphology (also bionomics), Witherby, 1940, 4: 297-302.

MEASUREMENTS

	Wing	Bill	Tarsus	Tail
♂♂	106-114	23-25	22-24	50-59 mm.
♀♀	111-119	24-26	—	—

(from feathers)

(Witherby)

Weight 8 ♂ ♀ (autumn/winter) 38-50 (av. 44) gm. — BNHS.

COLOURS OF BARE PARTS. Iris dark brown. Bill horny brown, greyer or greenish at base of lower mandible; mouth pale flesh grey. Legs and feet greenish grey or greyish sage-green; claws dusky.

Genus ARENARIA Brisson

Arenaria Brisson, 1760, Orn. 1: 48; 5: 132. Type, by tautonymy,

Arenaria Brisson = *Tringa interpres* Linnaeus

Bill distinctive, conical and pointed with the culmen nearly straight and lower mandible inclined upward. Nostril linear, situated in a groove which extends nearly half way down upper mandible from base. Wing long and pointed: first primary (as.) longest. Tarsus short, reticulated behind, scutellated in front. Hind toe well developed. No web between the anterior toes.

Genus Holarctic, the Palearctic race of one species migratory to India.

GURLEWS, SANDPIPERS, SNIPE, WOODCOCK 275

Arenaria interpres

■ Breeding range ■ Winter

rocky beach. Runs actively in plover-like spurts on the sand, shingle and sheet rock, turning over algae or poking with its bill under stones and seashells at the tide's edge in search of food. Scuttles up the beach to avoid each incoming wave, following it closely as it recedes to seize any washed-up morsels, and withdrawing hurriedly again before the next one.

In the Laccadives has been repeatedly observed swimming out buoyantly (like Phalarope) — in spite of completely unwebbed feet — to just beyond the breakers on the outside of the atolls, never in the still lagoons. The birds rose off the water quite easily and settled on the sea again after short flights (Hume, SF 4: 464). What they were after is not mentioned, but is worthy of investigation since it may represent an unrecorded method of feeding.

FOOD. Molluscs, crustaceans, sandhoppers, and marine worms. Sand crabs (*Oxydora*) with carapace up to c. 5 cm. across recorded elsewhere; also berries of *Scaevola* (Child, 1960, Atoll Res. Bull. 74: 26).

VOICE AND CALLS. The only note heard in its winter quarters is a metallic twitter as a flock flushes.

BREEDING. Extralimital. Season, mid-May to July. Nest, a grass-lined ground hollow on Arctic islands. Eggs, normally 4.

MUSEUM DIAGNOSIS. For description of plumage see Baker, loc. cit.; for details of plumage phases and morphology (also bionomics), Witherby, 1940, 4: 223-7.

MEASUREMENTS

402. Turnstone. *Arenaria interpres interpres* (Linnaeus)

Tringa interpres Linnaeus, 1758, Syst. Nat., ed. 10, 1: 148

(Europe and North America = Gotland, Sweden)

Baker, FBI No. 2101, Vol. 6: 154

Plate 43, fig. 8 and Plate 44, fig. 6

LOCAL NAMES. *Tirakkata* (Malayalam); *Ratafy* (Maldives); *Olijiya* (Sinhala); *Kittin* (Tamil).

SIZE. Grey Quail ±; length c. 22 cm. (8½ in.).

FIELD CHARACTERS. A medium-sized dark brown-and-white wader distinguished by its glistening white chin and throat, straight conical black bill and orange-red legs. Sexes alike.

Winter (non-breeding). Above, dark brown and white. Lower back, rump, and tail-coverts white, the last with a dark brown cross-bar. Tail dark brown tipped with whitish and with the outermost pair of feathers white. Below, foreneck and sides of breast brown. Rest of underparts including chin and throat pure white.

Summer (breeding). Above, head white streaked with black on crown. A black band from forehead to eye and to a black patch below eye. Rest of upperparts largely black and deep rufous. Below, foreneck and sides of breast, and a partial collar on sides of neck, black. Rest of underparts white.

In flight the middling size, black-and-white plumage (with white back and dark pectoral band), pointed wings with a white wing-bar and white shoulder-patch, and bright-coloured legs, are diagnostic pointers.

Birds in mottled black-and-white and chestnut intermediate plumage phases common.

STATUS, DISTRIBUTION AND HABITAT. Winter visitor to the entire seaboard of India and both Pakistans, Ceylon, Andaman, Nicobar, Maldives, and Laccadive islands. Affects rocky sea coasts; very rarely fresh waters.

Exceptional vagrant inland; solitaires or twos and threes (on migration?) recorded once each from Lucknow (U.P.), Patna (Bihar), Sambhar Lake and Bharatpur (Rajasthan) and Manipur in the last 95 years.

Extralimital. Breeds on arctic coasts and tundras from Scandinavia eastward across Siberia, locally to Alaska to c. lat. 76°N. Winters *inter alia* on the coasts of southern Asia — India, Burma, Malay Peninsula and Archipelago. (For details see Vaurie, 1965, 2: 391.)

MIGRATION. No ringing data. Apparently migrates along the coast. Very few definite records of overland migration in India, but see above. Once of a flock at a pool of fresh water in the desert a couple of miles inland from the coast near Karachi, apparently just arrived. Arrives near Karachi between middle and end August. Leaves late in the season; a few flocks still present between middle and end May (Ticehurst, 1924, *Ibis*, 111) and at end June in Pt Calimere.

GENERAL HABITS. Predominantly maritime. Usually keep in small parties either by themselves or dotted about among feeding sand plovers on the

276

CHARADRIIFORMES

COLOURS OF BARE PARTS. Iris brown. Bill black. Legs and feet orange-red; claws black.

MISCELLANEOUS. Longevity (from ringing data) 19 years. Ring, 1962, 33: 149.

Genus LIMNODROMUS Wied

Limnodromus Wied, 1833, Beitr. Naturg. Brasil, 4, Abth. 2: 716. Type, by monotypy,

Scolopax noveboracensis Gmelin = *Scolopax grisea* Gmelin

Paruscolopax Blyth, 1859, Jour. Asiat. Soc. Bengal 28(1): 280. Type, by monotypy,

Macrorhamphus semipalmatus 'Jerdon' = Blyth

Cf. Rand, A. L., 1950, *Condor* 52: 228-31.

Bill like snipe (*Cepello*), very long, straight and slender, swollen towards the tip where it is pitted. Both mandibles grooved at the sides, upper mandible also above, towards tip. Nostrils near base. Wing long and pointed: first primary (as.) longest, 2nd subequal. Tarsus shorter than bill, scutellated in front reticulated behind. Hind toe well developed; anterior toes webbed near base, the web between outer and middle toe the larger. Winter plumage grey-brown, summer plumage rufous as in Godwit (*Limosa*).

The genus contains two species one of which is a rare migrant to India.

403. Snipebilled Godwit or Asian Dowitcher. *Limnodromus semipalmatus* (Blyth)

Macrorhamphus semipalmatus 'Jerdon' = Blyth, 1848, Jour. Asiat. Soc. Bengal 17(1).

252 (Madras)

Baker, FBI No. 2140, Vol. 6: 210

Plate 39, fig. 12 and Plate 42, fig. 2

LOCAL NAMES. None recorded.

SIZE. Grey Partridge ±; length c. 34 cm. (13½ in.).

FIELD CHARACTERS. A rare, large-sized wader similar to Godwit but with a conspicuously slenderer, longer bill, somewhat swollen towards tip.

Winter (non-breeding). Above, forehead and lores dark brown; a broad white supercilium; crown and mantle dark greyish brown, back dark brown, both scalloped with whitish. Inner primaries and secondaries broadly bordered with white. Rump and upper tail-coverts white with irregular arrow-shaped brown bars. Rectrices barred brown and white. Below, sides of head, chin, throat, foreneck, and upper breast white streaked with pale brown forming wavy vertical bands. Flanks and under tail-coverts irregularly spotted and barred with brown. Sexes alike.

Summer (breeding). Above, head, neck and upperparts bright rufous, the mantle feathers with black centres. Below, uniform rufous.

STATUS, DISTRIBUTION AND HABITAT. Rare vagrant (?). Has been obtained at long intervals since first described by Jerdon from Madras in 1848, in W. Bengal (Calcutta), Assam (Dibrugarh, Shillong), Orissa (Chilka lake) and Tamil Nadu (Pt Calimere). Mostly on the sea coast and muddy banks of estuaries of large rivers, but has also been taken at c. 1500 m. in the Khasi

Genus GALLINAGO Brisson

Cf. Wetmore, A., 1958, *Ibis* 100: 125-7.

Bill as in Woodcock long, straight, slender, rather soft and swollen at tip, finely pitted and provided with sensory nerves. Differs from the Woodcock genus (*Scolopax*) in having a denser, harder plumage with a different colour pattern on the head and scapulars — longitudinal streaks instead of transverse bars on the former, and streaks instead of blotches on the latter. Lower part of tibia bare instead of feathered throughout. Wing longer in proportion and less rounded. Tail more or less fan-shaped but feathers varying in number from 14 or 16 in Common Snipe to 26 in Pintail, and in shape from short attenuated pins to normal rectrices with broad vanes.

Contains a great number of species, many of which are cosmopolitan. Seven species occur in India in winter.
